The Impediments of the Application E-Business to Classified the Restaurants in the Aqaba Special Economic Zone

Omar Jawabreh, Ra'ed Masa'deh, Tamara Yassen, and Muhammad Alshurideh

Abstract The study aims research paper seeks to study the status of tourism promotion in Jordan, in particular via the Internet, with a future plan to develop this type of promotion based on the needs of the country of this research paper is to draw conclusions that help to know and understand this type of tourism promotion, And to know how to develop it in Aqaba Special Economic Zone Disseminatethe maximum information about the restaurant in the Aqaba, this research paper is designed to determine the conditions of websites used in tourism promotion of the restaurants to find out the obstacles that face this type of promotion via websites, and the factors that affect its the promotion is to be a primary tool for economic development in tourism destinations, The objectives are to increase the contribution of the tourism sector to the obstacles of e-business in the classification of restaurants and to benefit economically from the tourism industry through employment opportunities and investment, product Development and tourism experience, promotion of tourism in restaurants, between the public and private sector in Aqaba.

1 Introduction

With the growth of tourism, the industry has become the world's biggest (Goeldner et al., 2000; Masa'deh et al., 2018; Yannopoulos & Rotenberg, 1999). A Social, Cultural, and Economic Phenomenon: Tourism is described by the World Tourism Organization as an activity involving individuals going to nations or locations outside of their normal surroundings for personal or commercial purposes. Consequently, tourism focuses on visitor behavior, which necessitates a deep understanding of how technology and consumer behavior impact travel-related data dissemination and accessibility. Understanding the content of information that may be available to internet visitors is a key step in developing successful tourist marketing campaigns, better information systems (Al Khasawneh et al., 2021; Fesenmaier et al., 2006; Jawabreh, 2017; Jawabreh & Al Sarayreh, 2017; Masadeh et al., 2019; Xiang et al., 2008); and acquiring superior innovations (Alrowwad et al., 2020; Mahmoud et al., 2021; Obeidat et al., 2019; Qandah et al., 2020). Though it seems that social media is on the rise in the online travel information search industry, there is no scientific data to support or explain this trend.

Websites that utilize a search engine to find appropriate travel information may expose tourists to social media content to a greater extent. When each seller focuses on nurturing and increasing their various channels of information and persuasion, this is referred to as promotion, the marketing of a place is intertwined with cultural aspects. (Herbig, 1998) says customers' needs vary between cultures. One conclusion can be drawn: all destination images and marketing materials produced by the local tourism industry should include a level of authentic destination identity (Go et al., 2004; Noordman, 2004; Onians, 1998; Rekom & Go, 2003; Riel, 1996). This tourism development strategy consists of two stages: creating a tourism "product," and commercializing the offering using that identity and the authenticity of the place (whether staged or real). Then, a projected tourism destination image is created through planned marketing and communication, or through vicarious experiences (Cohen-Hattab & Kerber, 2004). Destination image formation agents (Gartner, 1993), and Internet interactivity may allow these destination photos to be presented in novel ways. If a destination's brand identity and tourist product presentation don't match, there may be a tourism development strategy mismatch. Jordan's tourism promotion, namely the Internet, was studied by Alananzeh et al. (2019); Jahmani et al., 2020; Jawabreh et al., 2020), with the hope of extending this approach in the future to suit the needs of the tourism sector.

This study is intended to uncover facts that will help us to better understand this type of tourism marketing and to assist the Hashemite Kingdom of Jordan in their tourism promotion (Jawabreh, 2021). This coastal city has an excellent temperature all year. During the summer, it is hot and invigorating, while in the winter it is warm and comfortable. The city is designed to meet the requirements and wants of the whole population, including both summer and winter. There are many things to choose from while in Aqaba, including watersports, sailing, diving, and a variety

of other exciting desert-based activities, including camelback riding and exploring Petra. Aqaba is a desert oasis where these activities occur.

Because of the location's unique aquatic environment, which includes 140 different kinds of coral reefs and colorful and unusual fish species found only in the seas of Aqaba, the ocean scenery in Aqaba is a breathtaking spectacle. Aqaba has archaeological sites that date back at least 5,500 years, which provide evidence of the early human presence in the area. By placing Aqaba in this context, it highlights the importance of Aqaba's role in the military. Land and sea connections link Asia, Africa, and Europe through this city. This newly discovered structure, which is widely believed to be the world's oldest church, comes from the Mamluk period, and it is the grandfather of His Majesty King Abdullah II. Aqaba is a unique place where the red of the sky combines with the blue of the sea to create a vivid, underwater scene. It is also a wonderful destination for conferences, holidays, and business retreats, especially Aqaba. If you are here for pleasure or business, you'll find enough to do, see, and enjoy, as the absence of monotony and boredom are also guaranteed. When in Aqaba, it leaves you with many wonderful memories and urges you to return. This place is a veritable Mecca for people from all over the world. It is a city in the desert. Think about how much you'll enjoy spending time in this beautiful oasis, and plan a vacation to Aqaba where you can relax in the sun (ASEZA, Aqaba Special Economic Zone Authority).

2 Literature Review

Managers and business owners in the hotel and tourism sectors spend the majority of their time concentrating on changing each of these components to provide a competitive offer to customers (Kotler, 2003). The researchers in this study examined the challenges faced by the online commerce sector while using the idea of the internet. Pillars of Content Performance, developed by the Arab country (and available on N.D.), laid forth a framework for identifying factors that affect website success. The main actors in website success are quality of information and service, system use, interactivity, and design. To achieve success, an e-commerce website should contain these criteria: a user-friendly online interface, superior customer and supplier assistance, a robust search engine to fuel the website, ensuring that the site's customers are satisfied, and providing up-to-date information. The articles in this review demonstrate that technology is utilized in the design, planning, production, and development of manufacturing. Also referred to as electronic commerce and the economic and financial consequences of such activity, this phrase relates to the term "electronic commerce" (Hoffman & Novak, 1996).

The goal of this study is to investigate Aqaba's unique economic zone, the progress made in online commerce, and the difficulties restaurants have with websites. Specifically, 36 restaurants were surveyed using questionnaires. These surveys discovered that the majority of these restaurants' websites were not used for electronic commerce. Internet business is difficult in Aqaba because of security, trust, and a

Licensed to (putm@utm.my)

lack of understanding about technical problems. This study looked at the speed of information and communication development, which allowed for the wide-ranging transmission of information. The current report said that it saw new discoveries in this area as a key component of economic development and online commerce. It included topics such as e-tourism and mobile tourism, as well as the issues that arise when tourists claim that there is competition among them. as well as how electronic services such as e-books, photos, videos, e-booking, and e-cards can serve tourists in Arab countries. Despite the efforts of the tourism industry, nothing has been written on the monetary worth of shopping as a tourist attraction (Heung & Qu, 1998; Law & Norman, 2000). Because tourism retailing research is just starting, it seems that we have a clear need to find out what tourists buy when they visit tourist attractions. The rise in domestic tourism observed in recent years may be attributed to Jordan.

Due to the increasing wealth of the Jordanian people and the growing interest of tourist organizations in promoting domestic tourism to assist in reducing the Kingdom's seasonal demand for tourism, this was a primary factor behind the rise in domestic tourism (Magablih, 2005). According to this theory, in order to increase the amount of tourist activity, "push" and "pull" motivations must be used (Josiam et al., 1999; Kim & Lee, 2000). Push motivations are the external societal and psychological forces that push a person to travel. The web also provides greater possibilities for regional tourist promotion than traditional marketing and advertising channels, and it is very cheap (Standing & Vasudavan, 2000).

Another significant aspect is the information included on tourist websites, and one study shows that this is what travelers are searching for (Ho & Liu, 2005). The chance of return visits is increased (Rosen & Purinton, 2004). For these reasons, when tourism businesses have shifted from simply giving information to interactive designs, they may uncover consumers' interests and help encourage their return. Personalizing service offerings empowers these businesses to better understand customer needs, which allows them to engage with customers on a personal level and to provide tailored services (Doolin et al., 2002). As a consequence, the information found on government tourism websites affects the destination's gastronomic image. It also offers a realistic tasting experience for food-oriented visitors, and the design of a website influences how people react (Rosen & Purinton, 2004).

The reorganization of municipal administrations in response to the change brought on by globalization and economic restructuring may be linked to the concept of place promotion. The future of post-industrial towns depends on attracting inward investment and migration, and in order to do so, places have been conceptualized in new ways. The achievement gap exists even among minority children who attend majority-minority schools. While according to Ashworth and Voogd (1994), the promotion of a particular bundle of facilities or the selling of a place as a whole may be referred to as marketing, promotion in the context of this research refers to targeting key employees to advance the sales team's objectives. Placement of an advertisement is a facet of location marketing, which is concerned with linking "local activities" to the wants of targeted. A wide range of techniques, not just advertising campaigns, are used to promote places, depending on the product, its surroundings, customers, and manufacturers. The purpose of place promotion is to create an appealing identity

which will entice target groups such as investors and tourists (Palmer & McCole, 2000; Young & Lever, 1997). Increasingly, the Internet (with the most current web technology) offers a wide range of information in an incredibly rapid manner, necessitating it as a tourism-sector marketing and promotion tool (particularly for hotels and travel companies, e.g., DMOs and national tourist organization NTOs) (Abuhashesh et al., 2019; Brey et al., 2007; Choi et al., 2007; Kim et al., 2007).

The web also provides greater possibilities for regional tourist promotion than traditional marketing and advertising channels, and it is very cheap (Standing & Vasudavan, 2000). Because your website is accessible 24 h a day, 7 days a week, from anywhere on the globe, it may reach a global audience. Website material is essential, and it must be kept up to date (Lin & Huang, 2006). In order to find out why tourists frequent shopping malls, the purpose of this study was to investigate why tourists buy. To what extent are Jordanians motivated to purchase property in Aqaba? It may be concluded, based on the quantity of shopping malls in the location, that what attracts visitors is having the freedom to select among various shopping malls.

The rise in domestic tourism observed in recent years may be attributed to Jordan. Due to the increasing wealth of the Jordanian people and the growing interest of tourist organizations in promoting domestic tourism to assist in reducing the Kingdom's seasonal demand for tourism, this was a primary factor behind the rise in domestic tourism (Magablih, 2005). The goal of this research is to offer advice to business managers who wish to do a better job of marketing to meet the needs of their consumers.

3 Research Methodology

This section provides the methodology applied in the current study. It consists of the research operational definitions of the study's variables, besides data collection tool and research population and sample.

3.1 Research Operational Definitions

The current research considers five variables regarding (Jawabreh et al., 2010). These includes Financial problems, Technical problems, Security problems, Management problems, and Legal problems; which were measured in the research questionnaire through seven, seven, seven, six, and seven items respectively.

3.2 Population and Sampling

The targeted population of this study consisted of all staff that is responsible of disability services in Aqaba city hotels located in Jordan, specifically hotels 5, 4 and 3 stars. Thus, a judgment sampling technique was conducted. A total of 142 questionnaires were returned and applicable for statistical analysis. Indeed, the primary data was collected through a drop-and-collect survey technique. The surveys were distributed to the targeted staff working in the hotels that agreed to participate in the study.

The questionnaire consisted of two sections; the first section in questionnaire presents general personal information about a respondent, the gender, age, educational level, career level and ranking of the hotel. The second section includes questions to measure the ENAT standards based on their operational definitions.

4 Data Analysis and Results

In order to explore the degree to which Aqaba city hotels apply ENAT standards towards disabled tourists, in which the items for these variables have been measured using 5-points Liker scale that varies between strongly disagree = 1; 2 = disagree; 3 = neutral; 4 = agree and strongly agree = 5; reliability and validity analyses were conducted, descriptive analysis was used to describe the characteristic of sample and the respondents to the questionnaire's items.

4.1 Validity and Reliability

Validity and reliability are two important measures to determine the quality and usefulness of the primary data. Validity is about accuracy and whether the instrument measures what it is intended to measure while reliability is about precision; it is used to check the consistency and stability of the questionnaire. Indeed, the researchers depended on scales and items that were previously developed and used by Jawabreh et al. (2010).

Also, a draft of the questionnaire was formulated, and then it was reviewed by three academic lecturers–who have a sufficient knowledge and experience in this scope-to ensure that each item is measuring what is intended to be measured, and to avoid the ambiguity and complexity in the phrasing of questions. The reliability of the instrument was measured by the Cronbach's alpha coefficient. Further, some scholars (e.g., (Bagozzi & Yi, 1988; Creswell, 2009)) suggested that the values of all indicators or dimensional scales should be above the recommended value of 0.60. Table 1 represents the results of Cranach's alpha for the research variables. Cronbach's alpha

Table 1 The Cronbach's alpha coefficients of study variables

Variables	Number of items	Cronbach alpha
Financial problems	7	0.715
Technical problems	7	0.722
Security problems	7	0.730
Management problems	6	0.786
Legal problems	7	0.883

coefficients of all the tested variables are above 0.60 which suggesting the composite measure is reliable.

4.2 Respondents Demographic Profile

As indicated in Table 2, the demographic profile of the respondents for this study showed that they are typically females work in private sector, most of them between 20 and 40 years old, the majorities hold bachelor degrees; and most of them got a monthly income 350JD and more.

4.3 Descriptive Analysis

In order to describe the responses and thus the attitude of the respondents toward each question they were asked in the survey, the mean and the standard deviation were estimated. While the mean shows the central tendency of the data, the standard deviation measures the dispersion which offers an index of the spread or variability in the data (Pallant, 2005; Sekaran & Bougie, 2013). In other words, a small standard deviation for a set of values reveals that these values are clustered closely about the mean or located close to it; a large standard deviation indicates the opposite. The level of each item was determined by the following formula: (highest point in Likert scale - lowest point in Liker scale) / the number of the levels used = (3–1) / 5 = 0.66, where 1–1.66 reflected by "low", 1.67–2.33 reflected by "moderate", and 2.34–3 reflected by "high". Then the items were being ordered based on their means. Tables 3 and 4 show the results.

As presented in Table 3, data analysis results have shown that all problems in Aqaba hotels are applied to a high level in which the range of the mean score is 2.34–2.45. Table 4 demonstrates the mean, standard deviation, level, and order scores for items for each variable/standard.

Table 2 Description of the respondents' demographic profiles

Category	Category	Frequency	Percentage (%)
Gender	Males	38	38.4
	Females	61	61.6
	Total	99	100
Age	Less than 20	20	20.2
	20 years—less than 30	41	41.4
	30 years—less than 40	22	22.2
	40 years—less than 50	8	8.1
	50 years—less than 60	3	3.0
	More than 60 years old	5	5.1
	Total	99	100
Monthly income	Less than 250JD	15	15.2
	250—less than 350 JD	25	25.3
	350—less than 450 JD	31	31.3
	More than 450 JD	28	28.3
	Total	99	100
Occupation	Private sector	53	53.5
	Public sector	46	46.5
	Total	99	100
Educational level	High school	24	24.2
	Bachelor	54	54.5
	Masters	13	13.1
	PhD	8	8.1
	Total	99	100

Table 3 Overall mean and standard deviation of the study's variables

Type of variable	Mean	Std. Dev	Level	Order
Financial problems	2.4026	0.64419	High	3
Technical problems	2.4556	0.69395	High	1
Security problems	2.3997	0.75039	High	4
Management problems	2.4394	0.85165	High	2
Legal problems	2.3478	0.67073	High	5

5 Discussion and Conclusions

When confronted with the findings of the research, hypotheses and questions are answered. Thirty-six restaurants that provide websites and utilize them for Internet trading performed the research and found that of those, less than one-third have not

Table 4 Mean and standard deviation of the study's variables

Lack of legal legislation regulating electronic commerce	1.94	1.284	Moderate	7

been used for online trading, but problems arose in implementing the Internet trade securely and confidently in Aqaba. This mostly resulted from the increase in the net worth of Jordanians and an increased focus on domestic tourism as a means of reducing seasonality in the Kingdom (Magablih, 2005).

Tourists have different requirements, desires, and preferences. Therefore, in order to succeed, marketing strategists must understand and fulfill their needs and preferences while competing (Magablih, 2005). The idea of tourist motivation is outlined in a well-documented theoretical framework, which is known as the "increase motivation through inspiring via drawing inspiration" (Josiam et al., 1999; Kim & Lee, 2000). When considering travel motives, you must also look at the socio-psychological requirements that drive a person to go on a trip. This opportunity to help rural tourism thrive will be unique, and much less costly compared to other marketing and advertising methods (Standing & Vasudavan, 2000). Global audiences may be reached by using an excellent website: it is available around the clock from

anywhere on the globe. Website content is critical, and must be updated frequently in the tourist marketing industry.

The primary subject of this study was the Aqaba special economic zone and how e-commerce impacts the economy in the area. A smart question about electronic commerce and restaurants in the Aqaba special economic zone: What effect has electronic commerce had, and what complications have businesses in the Aqaba special economic zone faced when utilizing the internet to market their products? E-commerce websites, on the whole, are not typically utilized. With online commerce, the Aqaba has the most trust, security, and understanding of technical problems as obstacles. In this study, the rise in information access was shown to be mostly due to the massive expansion in the quantity of information in the information and communication industry.

The research also addressed the reality of e-tourism in Arab nations and what the e-services may offer visitors, such as e-books, pictures, video, e-booking and e-cards. It is now very impossible to get much information about shopping as a tourist attraction (Alshurideh et al., 2021; Heung & Qu, 1998; Law & Norman, 2000). Research on tourism retailing is a new area of study, and there seems to be a need for researching tourists' buying habits while visiting tourist destinations. The number of domestic tourists in Jordan has grown in the past few years. When it comes to meeting the varied wants, interests, and tastes of tourists, marketing experts must be very knowledgeable about the industry and able to offer goods and services in a cost-effective manner (Jawabreh, 2017).

Push and pull provide a well-established theoretical framework for assessing tourist motivation excitement (Josiam et al., 1999; Kim & Lee, 2000). Indeed, (Josiam et al., 1999; Kim & Lee, 2000) argued that for the most part, travel motives are motivated by social and psychological motivations. Additionally, it also serves as a useful tool for marketing the area's tourism. Coupled with more modern means of advertising, including the internet, it is less expensive than conventional media like television and radio (Standing & Vasudavan, 2000). To be successful, a website must target the whole world's population, and it may be done from any place at any time of day. Website content is essential, and it should be updated regularly in the industry (Lin & Huang, 2006).

Of the many resources on the internet, one of the best sources of travel information is websites like this (Ho & Liu, 2005). Once again, invite individuals back to the website and over (Rosen & Purinton, 2004). To enhance tourist returns, there are two possible routes. One way to provide information is through interactive design, while the other is to use interactive design to offer information. Additionally, these businesses are in a better position to understand their visitors' preferences, which allows them to provide personalized services to individuals rather than generic packages (Doolin et al., 2002). Gastronomic image and virtual culinary experience are both greatly affected by the content of government tourist websites. People's interests and preferences change (Rosen & Purinton, 2004).

Promotion is said to be connected to local government shifting to meet the changing nature of the economy because of globalization. New place identities that have been created to promote investment and in-migration are important tools in

attracting inward investment and migration to local post-industrial areas (Law & Norman, 2000). In regards to location promotion, the idea of promoting a certain bundle of amenities was explored by Ashworth and Voogd (1994), and their research indicates that location promotion is the process of marketing a location as a whole by using pictures containing numerous different characteristics linked to it. Placement of promotional forms is inadequate when used alone. The requirements of targeted consumers should be taken into consideration while considering local activities. A question by Ashworth and Voogd (1994) is left open: Advertising is not the only strategy that places and goods use to get attention. Some of them include the context of the product, the intended audience, and the creator. Creating an appealing identity that draws a particular set of investors and tourists is key in a location marketing strategy (Young & Lever, 1997). This is typically done by deconstructing pictures of the location and then rebuilding them, as described by Jawabreh (2020). Electronic commerce has revolutionized the tourism sector by providing a case study (Palmer & McCole, 2000). New online technology makes the Internet a potent marketing and promotion tool for tourism.

Adoption Factors of Digitize Facilities: A Management Review

Alaa Ahmad and Muhammad Turkih Alshurideh

Abstract This research study specified the Building Information Model has structures such as formation and sharing of the data with other associates of the project. Building Information model was used as a tool for the improvement of sustainability of constructions by consuming the energy effectively and upholding a waste organisation process in the post constructed level in the business highlighting the facility management. The objective of this systematic review is to provide the digitalization technology to have a better understanding which accomplishes the development of electrical devices, approaches and organisations that make the statement more precise and flexible by focusing on previous studies. Surveyed the strategies of showing the systematic review for which the investigators have focused on two main records which are google scholar and emerald insights from which the case studies were selected by clarifying the scholars based on year (2018–2020) and concentrating on eligibility standards. The three studies that were certain of which 2 were from google scholar and one was from emerald insights. These were choose based on sustaining the aims of the present study. The outcomes of the current study revolve the significance of combination between technological digitalization, capabilities, business, and organisation of digital Facility Management. To conclude, the digital practices of the sustainable facility management are experiencing appraisal and transformation.

1 Introduction

With the increasing digitalization of operations, facilities digital transformation creates challenges, the most crucial challenge present organizations adaptation (Tilson et al., 2010; Yoo et al., 2012). As a result, organizations must constantly monitor and assess the capabilities and risk posed by evolving digital technology (Bharadwaj et al., 2013). Scholars and practitioners alike have acknowledged the value of digital technology in organizations. This comprehension of how new digital technology practices affect businesses in remarkable ways has an influence on internal operations and how they interact with their external environment. Scholars and practitioners alike have acknowledged the value of digital technology in organizations. This comprehension of how new digital technology practices affect businesses in remarkable ways has an influence on internal operations and how they interact with their external environment (Carbonari et al., 2015). There is an added incentive for customers and facility managers since they stand to gain the most financially from the digitization of facility management services and use (IoT) (Eadie et al., 2013). More precisely, the research seeks to provide the groundwork that will lead to understand factors that influence facilities managers acceptance of digitalization facility management operations and utilize (IoT) projects.

2 Digitization of Facilities Management

The evolution of building technology has altered the way FM functions. Building technologies are rapidly being used in buildings (Wong et al., 2005). Many analogue, electrical, and mechanical equipment are gradually being converted to digital technologies, which has had a significant influence on industry (Alaloul et al., 2020). To comprehend digitization significance, In our study, we must look at the term digitization, Chapco-Wade (2018) defines *digitization* as "the conversion of analogue to digital" and *digitization* as "the use of digital technology" and digitized data to affect how work gets done, revolutionize how organisations connect and interact, and generate new digital income streams. The shift will be unlike anything civilization has ever seen in terms of its scale, range, and complexity (Fomunyam, 2019). This is causing significant disruption in the facilities management (FM) sector where "technology is an enabler of the workplace" and "smarter buildings are just around the corner" (Atta & Talamo, 2020; Cudmore, 2017; Kazado et al., 2019). Building technologies are rapidly being used in buildings, the rise of intelligent users' where knowledge is gathered in integrating building technology with building operations to provide an optimal building environment. As a result, there is a need to modify the way buildings are managed (Lee et al., 2001; Wong et al., 2018). Many researchers and facility managers have recommended leveraging data from building technologies to help with building and operations administration (Kensek, 2015).

3 Methodology

The study focused on providing all existing evidence digitalization on FM adoption and acceptability from the perspectives of facilities managers via a systematic review from the perspectives of various stakeholder. A literature review is defined as a "complete examination and interpretation of literature on a certain topic" (Grant & Booth, 2009). Given the study's objectives and questions in the first phase, a systematic review was conducted: first, to present robust evidence of the status of digitalization in FM service adoption and acceptance with specific and focused questions such as (Population, Intervention (or focus of Interest), Context, and Outcome); second, to identify the knowledge gap in the literature; and finally, to inform the study's subsequent phases. We intend to Using an explicit method, such as a systematic review, has proven to bring some significant benefits (Gopalakrishnan & Ganeshkumar, 2013), such as: reducing bias, producing accurate and reliable conclusions, making information easier to deliver to healthcare providers, researchers, and policymakers, developing new hypotheses about subgroups of study populations, and, most importantly, increasing the performance and quality of the results (Greenhalgh & Donald, 2000). Google Scholar, ScienceDirect, and Scopus were the three electronic databases included. These sites were chosen because of their reputation for covering a wide range of digitization and technology articles from scientific and academic journals. The search was limited to research done in English because this has been demonstrated to be the predominant language for digital facilities management literature. The following search terms were applied: ["Digitize Facilities management" OR "Digitize FM"] AND ["Facilities manager" OR "Facilities professionals"] AND [adoption OR acceptance]. The PRISMA checklist for reporting scope search results was used, as illustrated in (Fig. 1). Furthermore, an alert was set up in all databases to notify us of any freshly published articles that met the search parameters.

4 Data Extraction Table

This data extraction table is shown by aiming on the study style, whether it contains state, members, objective, limitations, results, along with the methodology of each study (see Outcomes section) (Table 1).

5 Discussion

The existing section will deliver the literature knowledge gap by aiming on studies that will support and have a contradictor effect on the studies that have been involved. This will help the researchers in focusing on other facility Management which is a productive device to find the positive and negative ascribes of the home-grown help,

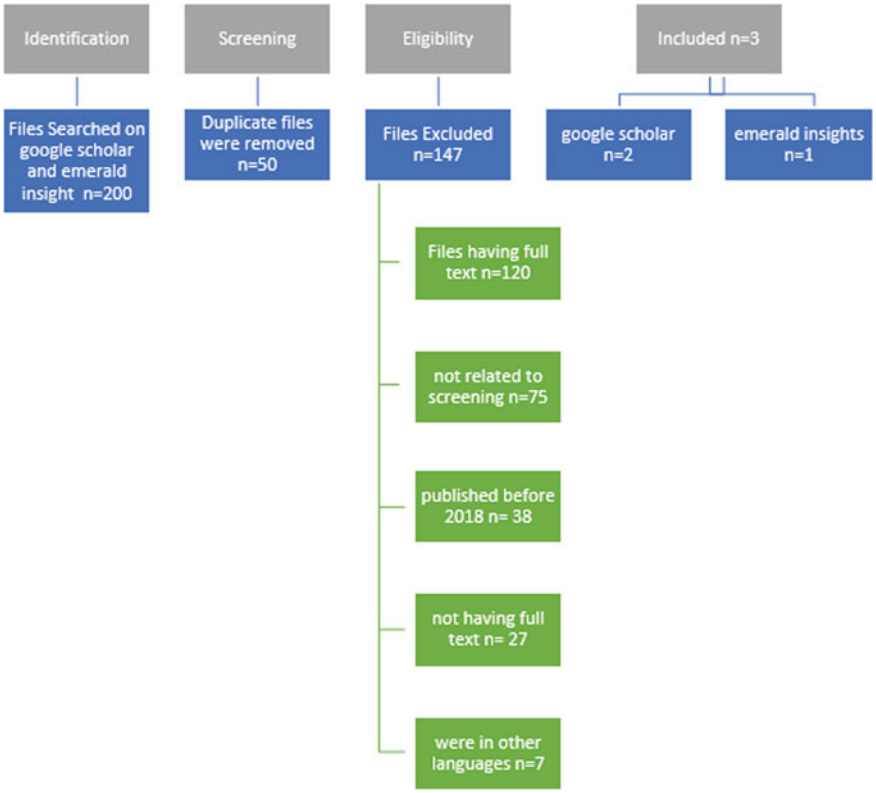

Fig. 1 Prisma chart (self-formed)

assist the important navigation, function as a source of perspective highlight balance past execution levels with the current ones and recognise mistakes and backing with reasonable solutions to be attempted. The literature review established that main execution indicators Key Performance Indicators are, for the most part, utilised in Facility Management for appraising the performance of the facilities as one of the important estimation devices. It is also maintained that the contribution of the facility management managers is significant in the study of value management, specifically with respect to answering the questions presented below:

6 Customer Satisfaction

The facility management managers should coordinate with the customers to recognise the need of the users and management businesses. The connection between the facility management and the society influences the sharing of skills appropriate to several aspects of the facility management with both the customers and the inventors. Earlier

Table 1 Data extraction table (Self-formed)

Reference	Country of Publishing	Participant Involvement	Aim	Methods	Outcomes	Limitations
Charef et al. (2018)	Europe	Studies contain stakeholders, businessman	The aim of the research is to proof the adoption in facility management and adequacy from the outlook of the management facility managers through the overview of various shareholder's outlook	The studies from databases cconcentrated on 28 European states as clear in the EU Commission website (2018) containing quantitative study	The data analysis raises the lack of consensus, and it is also highlighted on the digitization of the facility management	Limitations of having the great chance that the nature of operation where the information collection method is weak
Lu et al. (2018)	UK	Studies contain Businessman	The objective of the research is to determine the facility management manager during the building process can ensure sustainable policies which are not affected by following the facilities of delivery that plans and strategies which is kept up to Date	systematic literature searches of articles business literature from the user and organizational perspectives data and hand-searched the reference lists of retrieved articles containing qualitative	The results of this article give rise to advanced new claims and facilities	Limitation in having problems with models and selection Insufficient sample size for information measurements

(continued)

Table 1 (continued)

Reference	Country of Publishing	Participant Involvement	Aim	Methods	Outcomes	Limitations
Koch et al. (2019)	UK	Studies contain directors and patients	The aim of the research is to focus and highlighted the the significance of combination between the mechanical digitalization, abilities, association, and organisation of digital Facility Management	A community-based descriptive study	The outcome of the studies external advisors is involved, posing a problem of the in-house outsourced HR in the upcoming digital facility Management operation	The limitations of the study two case articles provide understandings, but those studies have the limited access on generalizability

studies have primarily shown the notion of significant creator interest in structuring all the activities at the occupancy stage. In many other studies, Wang et al. (2020) found that facility management helps in the training of the plan requirement. All the data are removed from the previous plans and buildings, which must be evaluated to grow design concerns for new services. The post-occupancy evaluations accordingly with the design of the facility which includes three main strategies (the high quality effect of organisational structures on the preferred results, the contribution of the organisation designs to cut off the non-relevant prices and increase the profits, and in last the effects of the organisational structure to improve the growth of human resources. Facility managers use the post-occupancy evaluation to improve building activities, and according to Stojanovic et al. (2018), the customer needs are frequently stated through the service level contract. The facility management services control the decision making of the facility management, which contain the growth of the administration, expenses, and human resources.

7 Sustainability

It has been decisively shown that numerous roles are required to involve and integrate sustainability into the value management study. It is also stated by Proskurin and Vorobeva (2019) that facility management manager must give the response of growth, including the sustainable issues. Though focusing too heavily on sustainable development, it might reduce problems at the macro-scale stage during the operational level, then the designs should have the capacity to lessen maintenance prices and ensure security. Pishdad-Bozorgi et al. (2018) reported that the active contribution of the facility management manager during the building process could also ensure sustainable policies which are not affected by following the facilities of delivery that plans and strategies which is kept up to Date. The usage of new materials and technological advancement could assist the control of energy consumption in the setting of adding up all the value of the current structures (Koch et al., 2019). The primary expert of the facility management is undoubtedly the facility director, away from the authorities stated above. According to Moretti et al. (2018) a facility director reports straight to the manager or top management of the organisation on facility matters and the performance. It is also received the official training in various skills like “human resource management skills”, economic, organisational skills, and practical skills to achieve the firm for the purpose of increasing business goals. It is more likely to guide and accomplish a facility organisation team, which helps the daily operations process in the office while focusing on the strategic office development and organising matters (Lu et al., 2018). Furthermore, a facility director is also called the business director, who is accountable for endorsing the administration’s efficiency and being protective of the workers’ excellence of life. Output is approved by the facility director by guaranteeing that each facility that is significant in manufacturing functions correctly and successfully, and as detailed above, each space in the office gives in output. A facility director defends the excellence of life on workers

by making comfortable and secure services and offices that assist workers doing the task efficiently. A facility director guarantees that no skill can generate harm, risk or threat to workers through preservation and regular examination of services. The business director, by accomplishing duties not only at the functioning level but also the corporate level, that has also performed jobs purposefully to make development and give the company a reasonable advantage. At the corporate level, a facility director needs to guarantee that facility policy plans match business planned strategies, capital costs are calculated and measured, worker productivity is exploited, and prices are minimalised and projected.

8 Digitalization and Performance Measurement in Facility Management

Immense information, internet effects and block cable are measured as digital technical tools in any business. Facility Management has been emerging through the close link with high technical developments in instant data and flexible statements. When the Digitalization Technology method started in the building, manufacturing, and the construction business, it was clear that workplace design was consecutively changed. Nowadays, the skill-driven variations in organisational work are moderately minor, though the full effects of current data and Public Services Skills on lessening the office service continue to be seen. An information management organisation for advantage care that can generate information and share data which is provided by the plan of the team associates who have a significant result on the activities of buildings. In the earlier units, the contributions of organization claims in Facility Management operations are argued with the previous case studies (Levo, 2021). The main aim of facility management is actually to support an organisation in increasing office management. The office, on the other hand, includes the individuals, the physical and fiscal resources, and the procedures and processes of a commercial; thus, the facility management activities should have an optimistic influence on these assets. Moreover, the planned aim of facility management is the actual organisation of facility assets and services in providing the primary support to all the operational processes of the organisations (Charef et al., 2018).

9 Building Information Model

Building Information Model is the procedure of data design and organisation for buildings through the design growth and process. The idea of the Building Information Model times back the previous year the 1970 and far along in the year 2000; it was effectively used mainly by the industry. Building Information Management was created from computer-assisted projects using Information and Communication

Technology and progressively established to generate BIM representations using the software equipment. The Building Information Model the idea was clear and studied in various research objects with different outlooks. This kind of research study specified the Building Information Model has features like the formation and sharing includes the data with other associates of the project. BI model was used as a tool for the improvement of sustainability of constructions by consuming the energy effectively and upholding a waste organisation procedure in the post created level in the organization. Building Information Model can be used for operational stage purposes with the great possibility, separately, for procedures and care management, the energy organisation, emergency organisation and quality organisation, along with the space organisation. Furthermore, BI Model is rarely applied in the operational phase, such as renovations and alterations. According to Kazado et al. (2019), the essential purpose of applying the Building Information Model is to make a facility notion that is nearly applicable to the complete development of a plan. BI Model used in the whole lifecycle of a project is applied Skill of producing, upholding, and using structure data for dealing with the operations and the strength preservation in their complete growth operations. The literature evaluation of study articles linked to Digitalization Technology of Facility Management specified that Facility Management has been developing with different certainty capture knowledge, such as involuntary ID, laser scanning, point influence and more, which can assist managers in gathering data about the operations of a created facility. Also, this expertise has enormous contributions to Facility Management as it allows facility executives and engineers to directly capture end users' requirements and preferences. Hosseini et al. (2018) claimed that knowledge of certainty charging deliver support by making digital models observing performance and certification. Evaluating Facility Management execution provides office managers with a clear summary of the strategy and plan of Facility Management. Decision taken by office managers for the policies generally vast effect on the effectiveness of facilities. Moreover, PM in Facility Management empowers resource managers to recognise the over a wide span of time operational productivity of the facilities and settle on compelling decisions for key preparation.

10 Project Stakeholder Management

Project "Stakeholder" Management includes the ways needed to identify the overall population, meetings, or connections that might disturb or be affected by the given task, to examine partner needs and their outcome on the responsibility, and to generate proper management techniques for effectively appealing partners in task selections and implementation. Partner management likewise focuses on constant communication with the partners to understand their needs and desires, inclining to matters as it happens, controlling clashing interests, and inspiring proper partner meetings in task picks and training. This contentment must be supervised as the main project aim. It is additionally characterised in the article that Preventive Management could be a proportion of how sufficient Facility Management is at recognising the necessities of

Licensed to (putm@utm.my)

the clients and its capacity to set up appropriate arrangements to fulfil such requirements and upgrade their worth. On the other hand, Ermolli (2019), represented PM as the most common way of evaluating progress towards acquiring pre-decided objectives, which remembers data for the proficiency as a way to such an extent that assets can be changed into labour and products, the nature of these results and yields and the adequacy of hierarchical destinations. Evaluating Facility Management execution provides office managers with a clear summary of the strategy and plan of Facility Management. Decision taken by office managers for the policies generally vast effect on the effectiveness of facilities. Moreover, PM in Facility Management empowers resource managers to recognise the over a wide span of time operational productivity of the facilities and settle on compelling decisions for key preparation. Emich (2020) opposed that PM refers to the ways of developing the sustainability of facilities by contributing the basic approaches to getting client fundamentals with least expenses and helps the course of asset shares and relocations. In the short-term, Dixit et al. (2019), placed that PM in The Key Performance Indicators can provide office managers with a precise examination to evaluate the performances of an office by utilising fitting boundaries produced from reviews and field studies. In their examination work, Che-Ani and Ali (2019) utilised a device of Key Performance Indicators coordinated from maintenance of board model to measure support of public consideration.

11 Conclusions

The study conducted mainly focused on the digitalization technology proof for its adoption in facility management and adequacy from the outlook of the management facility managers through the overview of various shareholder's outlook. In the first place the digitalized technology of the facility management has been discussed and the knowledge gap along with the service played an important role in this whole literature review. To conclude, the digital practices of the sustainable facility management are experiencing appraisal and transformation.

A Review of Civilian Drones Systems, Applications, Benefits, Safety, and Security Challenges

Khalifa Al-Dosari, Ziad Hunaiti, and Wamadeva Balachandran

Abstract Among the plethora of technologies revolutionising modern life, Unmanned Aerial Systems, also known as self-piloting drones, offer scope for profound changes in a variety of applications across many sectors. Commercially available drones of various shapes and sizes serve numerable practical user needs. Drones are expected to achieve great economies and improve sustainability, but significant legislative and technical challenges face their adoption and deployment in many counties. This chapter reviews civilian drone systems, and their applications, benefits, safety, and security challenges.

Keywords Drones · Civilian drones systems · Applications · Benefits · Safety · Security challenges

1 Introduction

A drone is a vehicle capable of flying or propelling itself into the air without the need for an on-board human pilot. Airborne drones can be controlled from the ground using flight controllers, remote control, or a ground control centre (GCC). A flight controller or remote control can be used by civilians to control their drone, often (for visual applications) with a small mounted camera so that the operator can see what the drone sees (i.e., the surrounding environment). A GCC is usually used in large-scale projects, such as military research, to access a variety of information (e.g., for aerial monitoring or surveillance).

This chapter focuses on civilian drones, which come in various shapes and sizes, of which the four main commercially available civilian types are multi-rotor, fixed-wing, single-rotor helicopter, and fixed-wing hybrid VTOL drones (Smith, 2017). They all share essentially similar functional designs in terms of their flight properties, such as a fast-spinning propeller to generate enough thrust energy to lift the drone off the ground and stay afloat in the airspace. The selection of particular properties and specifications depends on the type or size of the drone and the intended application. For example, a relatively larger propeller with increased mass on a smaller drone would increase structural weight, which could actually inhibit drone flight. Therefore, a smaller propeller or the use of lightweight materials is more appropriate for smaller drone.

The most popular image of the application of drones is for localised aerial photography and recreational use, and potential delivery to consumers. This is the culmination of a long period of mainly military-led research and development, during which unmanned aerial vehicles and drones have evolved significantly. Drone research was particularly pioneered by the US Navy, which incorporated Sperry's three-axis gyroscopic flight control system (Altawy & Youssef, 2016) in a plane to test if it was able to fly on its own (unmanned). The first drone or unmanned plane was able to fly a distance of 1,000 yards. This time period was dominated by the prospect of world wars, and drone research thus had little interest in potential civilian applications. The prospect of the integration of drones into civilian life emerged during recent decades, commensurate with research into making drones safe for civilians, ensuring safety and security. The US Federal Aviation Administration (FAA) and the UK Fleet Air Arm are instrumental in the formulation of legislation and regulation governing drone production and use, for the safety of human operators, drones themselves and surrounding infrastructure and environments, and the general public.

While most commercial applications of drones nowadays relate to recreational use and aerial photography, there are many serious purposes and functions of drones, such as engineering inspections (e.g., to view structural integrity in accessible structures, such as offshore rigs or high-rise buildings, where direct human access would be expensive and difficult), monitoring sea level changes, and preparing evacuation plans for high-intensity rainfall events. Drones can also be used to help perform large-scale tasks productively, limiting the risk of human error. Aerial drones have applications that can benefit society by enabling the development of mapping technology, aerial photography, animal tracking, and delivery. These benefits can increase labour efficiency, produce aesthetic photographs or videos that add social value to product, and which can also provide political and economic value, by developing forecasting and mitigation methods for hazardous natural events to protect humans.

However, drones also raise challenges and concerns, which can be split into four categories: data and technical issues, privacy and ethics (mainly relating to personal data and privacy), security, and safety issues. The most direct potential threats of drones are unwanted surveillance and potential collisions with humans or infrastructure, causing injuries or damages. Cyber threats such as malware infecting the drone and allowing for unauthorised personnel to take control of the drone are issues that

human operators need to be cognisant of, along with physical threats to drones themselves, such as malicious vandalism or theft. Due to such issues, security, safety, and privacy measures are being enforced to keep the surrounding areas, communities, and drones safe. There are different mitigation strategies pertaining to the application of security and safety measures that can prevent or reduce risks.

Sense-and-avoid mechanisms are excellent for the prevention of collision with obstacles such as buildings or tress, especially if the human operator does not react fast, or visualisation and communication with the drone is cut or disrupted. In such contexts, drones can have artificial intelligence (AI) capabilities to make appropriate autonomous decisions in the field. Such strategies are useful and beneficial in maintaining the security and safety of the drone as well as its surroundings. However, there are also disadvantages associated with potential drone add-ons, most notably the financial, time, and training costs associated with the purchase, installation, and use of advanced programmes or mechanisms. Furthermore, drones with such defences still face costly mitigation strategies, which could deter human operators from buying them, and instead choose to purchase a cheaper drone that may not have effective mitigation strategies; put simply, drone purchasing decisions involve cost-safety trade-offs relative to particular applications.

2 History of Drones

2.1 Military Research and Development

In modern society, drones embody the peak of technological advancements in many fields, located at the convergence of aeronautical engineering, smart technologies, AI, digital photography, and renewable energy and sustainable solutions. However, the history of drones is long and extensive, and is firmly rooted in military applications, as mentioned previously. The first recognised drone was documented by the US Navy (Parsch, 2005), resulting from a research project led by Elmer Sperry, the founder of the flight navigation control firm Sperry Corporation (Altawy & Youssef, 2016). The drone ("three-axis gyroscopic flight control system") successfully flew down the River Seine in France a month before WWI began (Flight Journal, 2018). Based on this success, Peter Cooper Hewitt began the Automatic Airplane or Aerial Torpedo partnership with Sperry in late 1916, which was fitted with the Sperry system and was able to fly a distance of 1,000 yards autonomously, following pre-set mechanical commands. This event, which occurred on March 6, 1918, is considered the first substantive unmanned aircraft vehicle (UAV) flight.

The next invention was the Sperry-Curtiss "Pilotless Flying Bomb" (Fig. 1). This attempt at a cruise missile had minor success in 1918, combining cutting-edge aeroplane and munitions technology, both of which were being fast-tracked by WWI. It was never produced or used again, and by WWII jet engines and rocket technology became the main concerns of military research for the areas tentatively addressed by

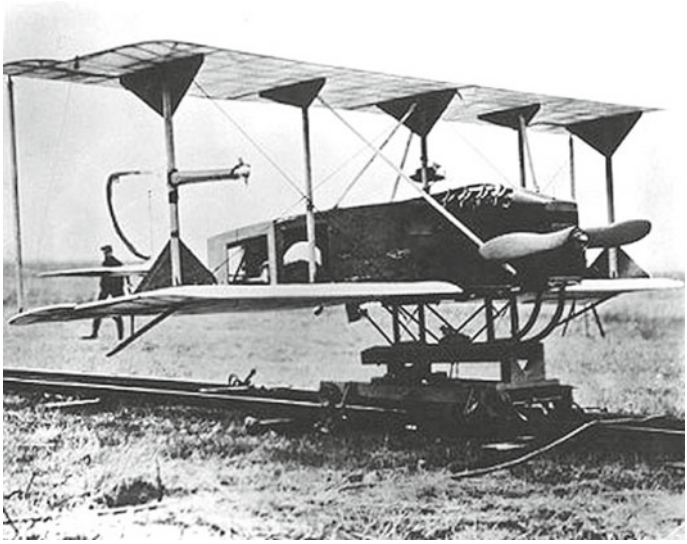

Fig. 1 "Pilotless flying bomb" (Parsch, 2005)

"drones" during WWI. There was a tentative resurgence of drones during the 1970s during the Vietnam War, for surveillance of Vietcong fighters and US prisoners of war, but more substantive use was evident in the widespread use of weaponised drones (in "drone strikes") by the US following the 2001 invasion of Afghanistan (Flight Journal, 2018). However, it should be noted that this was presaged by the use of drone reconnaissance during the US invasions of Panama (1989) and the Gulf War (1991) (O'Hanlon, 2011).

The main rationale for drone use was to minimise risks and casualties among US combat personnel (Satia, 2014). This lack of consequence for aggressors in drone strikes, and their technical imprecision, means that civilian massacres by drones have been one of the most egregious cases of US defence policy in Afghanistan, Iraq, and elsewhere, including the extra-judicial assassination of US citizens abroad, and legal provision for military drone strikes against US citizens within the US itself (posing legal and constitutional issues beyond the scope of this study) (Thompson, 2013). However, from the defence industry, drone development has been accompanied by conventional platitudes about the surgical nature of drone strikes and minimising civilian casualties, including the direct potential of drone observation of areas targeted for airstrikes to minimise civilian casualties (US Department of Defence, 2011).

2.2 Civilian Issues

Naturally, in the context of the carnage of the Western Front, these early military applications had no consideration of civilian safety, and they were in fact so limited in application that they posed no substantive threats. More recent military research and drone tests took place in US military testing grounds, with minimal human populations to get in the way (Altawy & Youssef, 2016). However, in the modern age, with the rapid deployment of commercial drones, civilian safety issues are paramount. The FAA and UK Fleet Air Arm are driving forces in reshaping the laws surrounding drones, with mandatory registrations of purchase and use of drones, to help identify any criminal uses (violating national airspace or conventional criminal laws). Drones are becoming a normalised commodity, accessible and serviceable to the public. Drones could be used for many purposes (mainly for aerial photography, mapping, and video recording), and may be deployed in commercial uses (such as delivery and transportation) and recreational applications (e.g., drone flying per se, racing with friends, entertainment, leisure, and photography) (Jones, 2017).

3 Different Types of Drones

There are four main types of drones commonly used by the general public, as mentioned previously: multi-rotor, fixed-wing, single-rotor helicopter, and fixed-wing hybrid VTOL drones (Smith, 2017).

Multi-rotor drones are widely used by creative industries and the academic sector, most commonly for aerial photography. These can be used in science research when observing inaccessible areas, such as densely forested green spaces, and to produce aerial digital content of urban landscapes. This type of drone is easier and cheaper to manufacture and use in comparison to other market-leading products. Multi-rotor drones are available in a number of different shapes and sizes, including a tricopter (with three rotors). However, these models have restricted flying time, rendering them unsuitable for long-term applications like mapping extensive areas and surveillance (Smith, 2017).

Fixed-wing drones have more particular design parameters than multi-rotor models, resembling the structure of a plane, with wing-like structures adorning the drone's main body to aid flight. They do not utilise energy to stay afloat, instead needing a remote unit for synchronous operation or implanted asynchronous guided control to remain airborne. This type of drone is more proficient for long-distance uses, and can be operated for long time periods, unlike the multi-rotor drone. These drones are more suitable for projects that need a huge distance or long hours, thus they are commonly used for aerial mapping or surveillance. However, they cannot be used for precise photography, due to their velocity of motion and inability to hover, although they are suitable for video-recording. This drone is relatively costly and requires expertise to operate (Smith, 2017).

Single-rotor drones resemble helicopter morphology. Whereas multi-rotor drones have multiple rotors, single-rotor drones have one eponymous rotor (accompanied by a smaller ancillary one on the tail, to control the heading). Much like the fixed-wing drones, this drone has long flying time, and it is more stable than the multi-rotor drone. However, it is complex and difficult to understand and operate. In addition, fatal injuries have been recorded with the use of this drone, and it could be very hazardous for inexperienced users (Smith, 2017).

Finally, hybrid VTOL is a drone model specialising in manual gliding and automation. Manual control or remote control or programmed flight course in the drone are some ways to control this drone. This drone has been used for commercial uses such as delivery services (Smith, 2017).

These four types are the most commonly used drones among the general public, and each has its particular advantages and disadvantages. They can all be used effectively for specific purposes, making them attractive to a customer in need of aerial support to execute various tasks. However, drone services come at the cost of dangers, for operators, infrastructure, and the general public. Drones are "airborne machines" that depend greatly on "cyber capabilities," which may pose many risks (Altawy & Youssef, 2016). The main risk of drones is collision, with people, property, or livestock etc. Drones could collide with airplanes when used (knowingly or unwittingly) in restricted airspace. Some units weigh over 10 kg (22 lbs), and any collision (particularly at high speed) can be catastrophic (Cerbair, 2020). While malfunctions are relatively rare in drones, bad weather or loss of battery are fundamental risks that can reduce operational efficiency and safety.

4 UAV/Drone System Architecture

Civilian drone technology utilises software to aid flight, ensuring its safety and security. Drones are available for purchase in a number of different sizes and shapes, depending on operator needs. A child could want a drone for entertainment purposes, and therefore purchase a small model, while a researcher who needs drones to map out the elevation of hills or mountains can purchase larger, high-specification models, equipped with different cameras and sensors to collect and generate large data sets. Figure 2 shows the design of a UAV in detail, illustrating the remote control and computer-based GCC methods of control. It shows the different vehicle properties and data links, and the individual components of a UAV (consisting of a propeller, compass, motor, and landing gear).

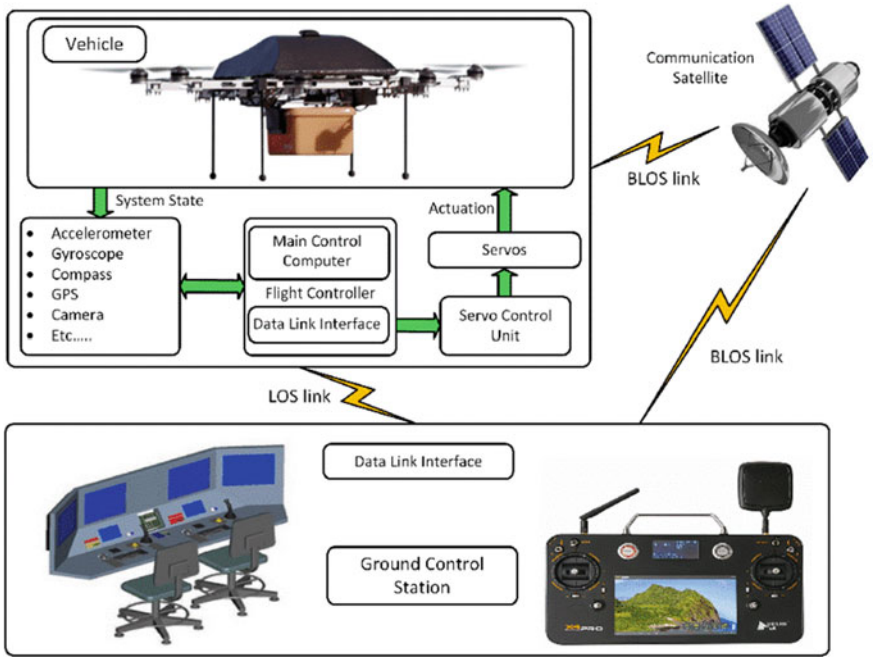

Fig. 2 Detailed overview of drone communication with human operator (Altawy & Youssef, 2016)

5 Civilian Drone Applications and Benefits

Technology advances relative to time and society moves forward with it. With drones evolving from one purpose to another, inevitably public access demand will increase. Previously, drones were very large and needed a GCC, but modern commercial and civilian drones are small, and only require a flight or remote controller. They have many applications that are beneficial to owners. The functions and purposes of drones are also increasing, which makes them more attractive to civilians who can afford to purchase them. These functions can vary from commercial to non-commercial sectors. The FAA suggests that the sales of civilian or commercial drones could approximately reach $2.7 million by 2020, which has important economic implications (Chang et al., 2017). Drone purchase and usage have the potential to improve and transform business, creating new industries and businesses, and cutting financial and environmental costs inherent in the current commercial delivery industry (Association for Unmanned Vehicle Systems International, 2013). The following subsections explore some of the applications of drones in more detail.

Licensed to (putm@utm.my)

5.1 Delivery

Businesses can use drones to deliver products directly to customers, door-to-door, whether direct from sellers or via courier drone services. Drones for delivering goods have been dubbed "parcelcopters" (Altawy & Youssef, 2016). These can be more closely integrated with supply chain management and logistics, reducing the potential for human error, such as losing parcels or delivering to the wrong address. In the Covid-19 context, drone delivery also limits inter-human contact involved in delivery, reducing virus transmission. Furthermore, customers can request deliveries at times convenient to them, with less human mediation, facilitating online ordering and shopping. Drone delivery can be more efficient, and can utilise renewable energy, thus reducing environmental pollution and transportation costs. Some estimates predict that local economies in the US can accrue approximately $20.8–34.8 million over the next 25 years (McIlrath, 2019).

5.2 Internet Access

UAVs can be used to provide Internet access to individuals who live in rural areas lacking accesses to conventional communication networks, which is increasingly essential in the era of smart technologies and global interconnectivity.

5.3 Cinematography and Aerial Photography

Filmmakers can use aerial drones to film areas that are hard to reach or inaccessible to humans. For example, drones can be used to video tape an area from the sky, should the scene need the tops of buildings. These drones create countless possibilities for creative scenes and give the opportunity for the filmmaker or photographers new platforms to expand their artworks (traditionally, helicopters were used for aerial shots used in films, which is extremely expensive). Drones can also be used to document intangible cultural heritage for 3D reconstruction and preservation. They are also used by individual photographers to capture pictures with a bird's eye view (Rango et al., 2006). Aerial photography is popular for both recreational and business purposes. Indeed, one of the main advantages of drones for many commercial users is their high-quality imaging and live streaming. Drones have cameras that can take high-quality photos and videos, and a wide range of high-resolution data, such as the exact coordinates of the location. This helps if a person wants to go back to the area. Drones can capture video footage in high resolution, and they are commonly used for live steaming events, important occasion, or memories. Drones can be used of live streaming for political events, such as presidential election debates, or for entertainment events such as music concerts.

5.4 Mapping

Drones can collect a variety of high-resolution data that can be used to create accurate 3D maps and models, which has numerous applications. For instance, this can discover erosion or conservation needs, and map disaster areas to streamline relief, ensuring that rescue teams understand the terrain and are equipped with pertinent knowledge before entering hazardous zones.

5.5 Agriculture and Crop Management

Drones can be used to perform specific tasks after system customisation, such as to fertilise, irrigate, or monitor crops, warning operators of particular water or nutritional deficiencies (Altawy & Youssef, 2016).

5.6 Construction

Construction activities or tasks can be aided by the use of civilian drones to accelerate data collection, improve data quality, and reduce the costs of data collection. Drones can help with different aspects of construction projects, such as in geological survey (McIlrath, 2019). This is beneficial as drones' multipurpose functions can assist a wide range of project stakeholders. The usage of drones for this purpose can also help with local economies, with potential benefits of $690.1–1,116.7 million over the next 25 years (McIlrath, 2019).

5.7 Ambulance and Medical Services

Drones can be used to deliver emergency response equipment or medication to different patients, which is especially important when human paramedics or doctors are unable to reach patients in a timely fashion. Traditional delivery methods may be hindered by a variety of reasons, particularly during emergencies such as natural disasters, so this drone function is highly useful. In terms of everyday healthcare services, "medical parcelcopter" drones are already used to deliver medication to patients. Ambulance drones can provide emergency medication when external roads are blocked by debris. They can also be equipped with monitoring sensors to assess the state of the survivors and report back to human paramedics or medical services the injuries or trauma of survivors, as well as being used to assess the general damage done by disasters.

5.8 Ensuring a Safe Environment Exists

Drones can be used to promote safe environments, enabling local authorities to monitor areas clearly and in live moments, instead of relying on CCTV that could be old, broken, or missing required coverage and footage. Drones can monitor situations and potentially be able to report potential threats to local authorities and warn people of potential dangers and unsafe conditions (Altawy & Youssef, 2016). For instance, drones equipped with cameras that can evaluate traffic patterns. This is beneficial in helping drivers avoid high risk areas and can reduce the risk of traffic collisions or accidents, and consequently casualties and deaths. Adding to the military uses discussed previously, drones also help to scope target sites and check areas prior to the deployment of human troops.

6 Civilian Drone Safety Challenges

Civilian drone challenges include those to application or programme used for the safety of the drone itself, or those to surrounding people and areas.

6.1 Weather

Different weather conditions, particularly storms, can hinder drone manoeuvrability and navigation systems. Different systems such as a sense-and-avoid or situational awareness must be implemented to ensure drone safety.

6.2 Friendly Drone Collision

It is not uncommon for multiple drones to be in use simultaneously, raising the potential for collision if operators are unable to react fast enough and steer their drones to safety. Sense-and-avoid systems or AI can be beneficial to avoid this issue.

6.3 Theft and Vandalism

Drones can be stolen or vandalised by humans if in close range. AI or a facial recognition systems can be used to avoid this issue.

6.4 Protective Programmes

Numerous protective programmes may be installed within the UAV to protect the surrounding environment, including people, property, and other aircraft from unexpected consequences of dribe operation, as described below.

6.4.1 Sense-and-Avoid

Sense-and-avoid systems allow aerial drones to autonomously detect potential collisions with other aircraft or aerial objects and to take evasive actions, dodging aerial hazards like a human pilot would, ensuring drone safety. This reduces the risk of the drone being damaged, and therefore minimises any repair costs. However, sense-and-avoid does not give a blanket guarantee of collision avoidance; the FAA regulation states that drones must deploy an automated sense and-avoid intelligent system that provides safety levels equal to or even exceeding that of manned aircraft (Altawy & Youssef, 2016). One example of how a drone senses and avoids a collision is a safety parachute system being activated when it senses that the drone is out of batter or terminated. This aids in minimising the damage when a collision is unavoidable.

6.4.2 Situational Awareness

Drones must possess a minimum level of situational awareness to ensure they are able to deal with any situation that may occur in their location. This system can predict real-time information and data about the location or situation to the human operator concerning weather and human population size (according to need). For example, weather data is useful to determine if it is an important factor in erosional landforms looking the way they do (when using drones for geological survey). The system could also have a thermal camera (Altawy & Youssef, 2016). Benefits of this awareness system are that it mitigates any risk of collision. It is able to sense and observe any collision obstacles and set a trajectory course to avoid them safely.

6.4.3 Artificial Intelligence

AI drones operate autonomously, without direct supervision by human operators. Algorithms allow drones to fly and react to their situation in a quick and responsive manner. AI mathematical features and control theory-based algorithms allow quick autonomous decisions and reactions. Civilian drones need to have some sort of AI capable of sensing danger or scanning for threats in the vicinity. After they sense this, they will then need the AI to out a reaction plan or different ways to avoid the threat. This type of drone could have tactical sensors to observe the area, or any changes

that could potentially harm the drone, and facial recognition software to allow only authorised personnel to access the system.

A localisation algorithm and technology could also be installed in AI drones to ensure they know where they are located, and where to go, should a human operator install co-ordinates for the drone to land at a specific time. This technology is beneficial as it can tell the drone where buildings are located, or which properties forbid the possibility of landing (e.g., should the batteries run out). Another advantage of this technology is that it is also able to tell the drone which airspace is illegal to enter, thereby reducing the risk of human owners or operators facing fines or criminal charges for trespass.

General benefits of AI algorithms installed in a drone mainly relate to improved capability to fly safely due to mathematical algorithms for collision avoidance and decision-making to avoid or respond to collisions. It can recognise operators or different locations, using facial recognition. AI capabilities are also essential in tasks in agriculture and military deployment due to faster reaction times than humans.

General disadvantages of this system include its expensive cost price, and objections to the use of facial recognition, and related privacy and security issues. Experienced programmers are also required to safely and successful implant AI programmes in drones, involving complex programming and long installation times. Additionally, the very efficiencies of AI drone systems can reduce employment in related fields rendered redundant by advanced technologies.

7 Cyber-Physical Security Challenges

7.1 General System Challenges

Cyber-physical security is created and then implemented in drones to protect different technologies and processes. The main components of a drone are a propulsion, autopilot, and recovery systems, aside from the physical structural airframe. Drones can be vulnerable to cyber attacks because of their dispersed physical systems. This can cause defective operation of the control loop, which is why cyber-physical security is necessary to ensure the security and effectiveness of the drone. Unauthorised personnel or attackers can manipulate drone processes and functions and misuse, such as denial of service attacks, whereby human operators lose all control of the drone. They can also sabotage operations, deny process or system functions, and corrupt data (Siddappaji et al., 2020).

However, drone cyber-physical security systems are quite efficient, and are able to deal with various real-world processes, adapting themselves to deal with changes in the surrounding area. They can perform calculations quickly, without wasting time, ensuring the safety and effectiveness of the drone, while avoiding obstacles or crashes (Siddappaji et al., 2020).

The main disadvantage of such systems is their cost. For an operator to ensure its drone is safe, they would need to have money on hand to install different security programmes to tackle different areas. They also only target certain areas, so again the operator would need to buy and install an ancillary system to deal with other processes that the cyber-physical security system does not address. These systems are relatively new to civilian drones, and therefore little research has studied their impacts, or potential installation in smaller drones (Altawy & Youssef, 2016). Also, the security community has started to identify categories and spectrums of emerging threats a civilian could encounter, and a lot of areas have been barely looked at (Altawy & Youssef, 2016).

7.2 Civilian Drone Security Challenges

7.2.1 Authentication

Aerial drones must have the means to ensure that only the authorised personnel can access them. They must be protected from hackers or cyber threats. One threat to a UAV is the possibility of it being hacked by unauthorised personnel who can then take control of the UAV, or inject falsified flight controller sensor data. A core security requirement of every drone is the guarantee that only authorised personnel can access the drone and its resources. Authentication mechanisms can implement distance protocols for authentication, determining the physical proximity of communicators within a system. This extra measure can mitigate spoofing attacks, as it is difficult for attackers to get close to the their target (Altawy & Youssef, 2016). This mechanism must be implemented in aerial drones to reduce chances of unauthorised personnel from either accessing the aerial drone or the GCC. It mitigates the risk of hacking or unauthorised personnel stealing the drone, or committing criminal acts with it.

This mechanism is beneficial as it allows the drone to always be safe from external threats. It reduces the risk of the authorised personnel accessing or stealing drones. This reduces the chance that the owner of the drone will need to pay for a new drone, or worry about the data such as photos taken on the drone being lost. It could also reduce the risk of insurance being paid for ether the stolen item or damages that the unauthorised personnel is creating with the drone. Other examples of mitigation techniques include cross-verification with readings from alternative sensors or firewalls. Cross-verification with readings from alternative sensors allows authorised personnel to ensure that the drone's main sensor has not been hijacked or is not displaying falsified data. Firewalls are beneficial and effective if they are implanted in drones, filtering threating from authorised communications. They are capable of excluding unauthorised communications, but they could be ineffective against malware, hence additional protection for the drone is required. This includes additional costs, and it can take time to install the new anti-malware or protection systems and programmes.

7.2.2 System Integrity

Common cyber threats of concern include unauthorised disclosure of the GCC, telemetric signals from the remote controller, and data stored within the drone. Aerial drones should be able to guarantee the authenticity of their software and hardware components, which consumer trust about their data being stored in hardware. Some trusted techniques that can help with this include memory curtaining, sealed storage, and remote attestation (Altawy & Youssef, 2016). Other ways to mitigate risks include the encryption of telemetric channels and data links, which guarantees the authenticity of system firmware and sensitive data. For extra protection, especially against viruses or malware, anti-virus software and firewalls can be used (Altawy & Youssef, 2016). These mitigation strategies are beneficial in reducing the risk of data falling into the wrong hands, and the costs of covering data breaches. If a business uses a drone for research or purposes, data breaches can cost an average of approximately $3.86 million (Ponemon Institute, 2018).

7.2.3 Accountability of Actions

The aerial drone should have multiple mechanisms to ensure operators of the drone are accountable and responsible for their actions. To do this an aerial drone can have a digital signature algorithm to authenticate operators and then to bind them to an issued action (Altawy & Youssef, 2016). In addition to this, logging procedures should also be implemented to track the sequence of actions in a chronological manner, tracking who executed what actions, and when. However, the possibility of holding the owner accountable for their actions using this mechanism is relatively low, as the drone is not able to physically stop the owner, who may have authorised remote accesses. On the other hand, drones could send alerts or warning messages to nearby police stations if owner actions are detected as potentially criminal.

Furthermore, laws and registration schemes are becoming more prevalent. In the UK for example, drone users must take an online test and pay a £9 fee licence per year if they wish to fly a drone weighing between 250 g and 20 kg. Other requirements are not exceeding an altitude of 400 ft above the ground or surface level (Cunliffe et al., 2017). If a user is caught flying a drone without a three-year flyer's ID or one-year operator ID they could face a fine of £1,000. This registration scheme has become mandatory due to civilian fears about the possibility of drone misuse, such as stalking and unauthorised voyeur photography. New laws and requirements brought by the UK's Civil Aviation Authority are a safety measure to identify the owners of a drone if unacceptable actions occur, making it easier to hold owners accountable. However, there is no way of knowing if everyone registers, particularly as drones become more widely available in supermarkets etc. and online, and therefore many illegal actions could go unnoticed. However, *effective* registration schemes can be advantageous in guaranteeing accountability in drone use.

7.2.4 Information Confidentiality

The confidentiality of telemetric information and GCC signals is a safety requirement that an aerial drone should protect, without which data can be disclosed to unauthorised personnel. One mitigation technique is the authentication of communication links or the encryption of data links. Aerial drones should be able to control the information being placed in them and keep it confidential, with systems and mechanisms to reduce the risk of unauthorised disclosure of telemetric and control information. Different encryption standards such as AES can be used for data link encryption, to enhance data security and strengthen protection and firewalls used to keep drone data confidential. Auto encryption of data is generally used for additional protection against unauthorised access, which avoids the costs of manual encryption and potential encryption errors.

Disadvantages of these methods include the minimal protection of data in transit, such as during transfer to a computer, and they slow down device speed to view data (e.g., possibly demanding an authentication key every time a user tries to access data). These factors also complicate data recovery.

7.2.5 Spoofing Attacks

Spoofing is a method by which unauthorised personnel or attackers disguise their manipulation or hacking into a system as something else, exploiting fake data or normal system aviation readings. This ensures that the owner or operator is not aware of the breach, and rather just thinks it is a normal system. Spoofing attacks render a variety of sensors redundant, further allowing the drone to be breached, whereby attackers can gain access to the server or networks, and to data or information stored within a drone. This threatens the integrity of telemetric information, control signals being sent form controller or control centre to the drone, and potentially to GPS locations. Some mitigation strategies against this include the installation of anti-malware, firewall, intrusion detection system, and defences against sensor readings being fabricated.

8 Key Challenges for Civilian Drone Safety and Security Applications

Civilian drones face challenges that can hinder deployment and cause serious harm to those around them, or to the drone itself. Drones are becoming increasingly popular, due to natural market development and improved commercial viability of drone purchasing, and the uptake of alternative hobbies following the Covid-19 pandemic and lockdown experiences. Business and education have started to move online or find new ways to adapt to modern technologies, and drone delivery to online customers

is a trailblazer in this process. The increasing proliferation of drone usage creates many challenges, which fall under four categories: design and technical, privacy and ethics, drone security, and drone safety challenges.

8.1 Design and Technical Challenges

Delayed responses to instructions can cause technical issues. The control of civilian drones is dependent on control signals from either the GCC or the flight controller/remote controller. Sometimes delays can occur; if the drone is far away from the main control signal, then information being sent form that point could delay reaching the drone. Consequently, the operator might instruct a drone to swerve to avoid an obstacle, but the lag time in communication can result in collisions and damage.

Injecting falsified sensor data is a challenge that can create technical issues and destabilisation for drones, by comprising some drone sensors by inserting false and fabricated readings in the sensors and flight controllers. This undermines the authorised personnel's control of the drone and causes the drone to be easily accessible by unauthorised personnel. The design of the civilian drone can make it easier for unauthorised personnel to manipulate the drone, such as through external influence on sensors, such as radar.

Malevolent and malicious hardware and software can create a lot of issues in the drone. The civilian flight controller can be vulnerable to software or hardware Trojans, which are viruses deigned to disrupt service, steal data, and otherwise inflict damaging actions on data or networks. In 2011 a Trojan was detected at a ground control unit in Creech (UK), which infected Royal Air Force systems with viruses and malware (Hartmann and Steup, 2018). One of the soldiers, a key-logger, found traces of malware in the operators of drones that flew over Iraq and Afghanistan. There was no consequence of this incident, but was security increased due to the worry that sensitive data was copied. This could happen to civilian drones if they are not properly protected. One example of a malware or virus that can impact negatively or infect a drone is a software known as Maldrone (Altawy & Youssef, 2016), which allows unauthorised personnel to control the drone by opening a back-door connection whereby it acts as a proxy for flight control, sensors, and all communications. The malware opens a back-doored connection with its botmaster to receive commands, enabling unwanted access to communication and data. Overall, this malware is able to grant the unauthorised personnel the opportunity to control and land the drone as they wish (Altawy & Youssef, 2016).

A more basic design challenge is the size of drones; relatively large drones can be intrusive and objectionable for the public. The visual perception of drones can lead to people feeling threatened, and the reality of the drone can create new notion and perceptions relating to security and privacy. Small drones generally do not scare people, and can make them feel at ease, particularly when there is no evidence of the presence of cameras. However, some people may also react in a negative manner or feel suspicious to smaller drones and potential stealthy surveillance activities.

People could worry that small drones could sneak into air vents or other small places and restricted locations within and outside buildings. Areas that are not accessible to humans can be accessed by drones undetected; a study on understanding human perception on drones found that people thought that drones smaller than the Parrot AR were preferable (Chang et al., 2017).

8.1.1 Privacy Ethics and Cultural Challenges (Personal Data)

The general reflexive public opinion of drones is that they do not feel safe with the idea of having civilian drones flying in the sky (Chang et al., 2017). There is a high possibility of such drones taking photos or videos of them, and the difficulty of knowing if drones are present (e.g., drones with long-range cameras) can make people scared and paranoid. People are worried about their privacy being violated by drones capable of surveillance, photography, and video-recording, which frightens people. The challenge therefore is to educate the public in understanding or accepting drones. They need to understand the ethical and legal frameworks prepared for responsible drone use. Drones have multiple functions that can assist human life, and understanding the different purposes could put people at ease. Legislation and regulation of drone ownership and use can also comfort the public, particularly with regard to data protection. Images or videos obtained from drones should not be used without the consent of subjects, and conventional data protection legislation should apply to drone footage and other data.

Ultimately, responsible drone use depends on the responsible actions of owners and operators, and the basic presumption of innocence and trust. However, this is not a realistic proposition given the easy potential for misuse and increasing drone usage makes it harder to detect and monitor drone activity. Unregistered users unknown to the government or other authorities can be harder to identity. Ineffective laws and regulation make it easier for civilian drones to be used in harmful and illegal ways that genuinely threaten civilians. Common ways drones can be misused for illegal purposes are unauthorised tracking and surveying people and property without consent, but criminal uses of drones can be as severe as terrorist attacks or targeted assassination (Altawy & Youssef, 2016).

8.1.2 Security of Drone Itself

The main challenges to drone security come from cyber threats. One way to endanger the security of a drone is through a cyberattack on the wireless link. Drones can be operated by computers or a remote control, which can take over on-board multiple networks of sensors and actuators, which normally feedback or communicate to the operator on the ground via a wireless link (Altawy & Youssef, 2016). This communication channel is vulnerable to cyber-attacks. An example of this occurring was when military operators lost control of a drone due to being taken over by unauthorised personnel employing a mix of cyber-attacks on unmanned aerial vehicles.

Licensed to (putm@utm.my)

All communications from the GCC to the drone were shut off by jamming both the ground control signals and the satellite. A GPS spoofing attach was employed by the unauthorised personnel into the feed of the unmanned aerial vehicle with a modified GPS data, which forced the drone to land in a new destination, while making the drone think it was landing back to its original destination that the military coded into it. This attack was carried out on a military drone, but the technology in this drone can be similar to civilian ones. The approach employed by the unauthorised personnel can be used to hijack a civilian drone.

A physical or cyber attack on the flight control or GCC causes the drone to be unmanned. This can create malfunctions within the drone, causing it to crash and potentially cause harm, due to the drone's dependence on information being fed to it from the flight controller or GCC. This is achieved via a data link and a sensor feeding back information about the surrounding environment. If unauthorised personnel are able to manipulate the internal communication system or data link they can falsify data, making the operator think they are in control, or making the drone think it has not been hijacked, therefore safety measures are not activated to counter the attack.

8.1.3 Safety of Drone Itself

Physical damage to the drone interacting with its surroundings is a safety issue. Collison is the main risk threatening drones and objects with which they collide. Inexperienced or amateur operators can easily accidently collide with other drones or with objects, and the drone may lose connectivity with the flight controller in the hands of the operator. Collision with people or animals can cause injuries or even death, and collision with infrastructure (e.g., buildings) can completely destroy the drone, and potentially cause criminal damage (Chang et al., 2017). For a successful and safe drone flight, the operator needs to see what the drone sees, and thus when to dodge or turn left or right if an obstacle is in the flightpath. Video footage captured by drones mounted with cameras is beneficial for collision avoidance and navigation, keeping the drone safe and reducing the risk of damage. An operator requests live video footage from the kernel of the operating system via a computer by issuing a system call. Unauthorised personnel or attackers who have knowledge of the system and its parameters are also able to gain access to the flight controller via this route. They can intercept the system call that the operator issues to the kernel, and then fabricate the footage that the operator sees. With a GPS spoofing attack, the attacker has full control of the drone.

This can consequently lead to the operator thinking they have control of the drone, when in reality the attacker has the control. The attacker can then land the drone with no consequence from the operator. Having the drone stolen or vandalised is an issue that operators could face. Flying low to the ground or at a distance that is easily seen by people makes drones attractive targets to thieves, and targets of vandals. There are multiple ways in which a drone can be brought down, such as dart guns and rifles, or physically grabbing it (e.g., with a net) if the drone is low enough. Police are issued with specialist anti-drone rifles, to shoot down drones in violation of laws (e.g.,

unlawful surveillance of civilians). These rifles are designed and created to disable drones immediately, without damaging them. They use radio pulses to disrupt the data link communication within a drone, forcing the drone to activate failsafe protocols, whereby it hovers closer to the ground in preparation to land safely. As mentioned above in relation to security challenges, the use of malware and software can be used to bring a drone down. The intentional infection of a software virus, such as Maldrone, can bring a drone down, whereby attackers can retrieved the drone from the landing site.

9 Summary and Conclusion

This chapter explains the history of UAVs, the architecture of drones, different applications and mechanisms within drones, and associated benefits and challenges. We have also classified the different types of cyber and physical attacks that can affect private and public sector drones, as well as the different techniques used for this to occur. Some case studies and examples have been explored to evidence common attack methods. Mitigation strategies have been provided to inform operators of the different safety techniques available. Finally, we have also discussed the consequences of drone use on civilian privacy. In conclusion, drones have great potential to modernise and digitise many industries, but there are number of challenges that need to be seriously addressed in order to facilitate the appropriate deployment of drones applications, in order to ensure the safety and security of drones and people.

How to Build a Risk Management Culture that Supports Diffusion of Innovation? A Systematic Review

Mohammad N. Y. Hirzallah and Muhammad Turki Alshurideh

Abstract This research paper aimed to produce a systematic review of two of the critical terms in any organisation: risk management (RM) and diffusion of innovation (DOINV). The research sought to examine the relationship between RM and DOINV. The systematic review comprised 27 articles published from 2007 to 2020 sourced from different databases, such as; ProQuest, Emerald, ScienceDirect, IEEE, Scopus, and Google Scholar. A set of inclusion and exclusion criteria were used to filter the results, which were then assessed using a quality assessment process. Factors that appeared more frequently were highlighted as the main findings for future study. A proposed framework for future study was also defined at that point. Next, a comprehensive analysis was conducted on the 27 selected articles to answer the five research questions. This researches' main finding of this research was that a risk management culture positively supported the diffusion of innovation in firms. Several factors affected this relationship, such as; organisation learning, intellectual capital, human resources management, information technology, soft total quality management, knowledge management practice, strategy and structure.

Keywords Systematic review · Risk management · Firm performance · Diffusion of innovation

1 Introduction

Establishing something new is the essence of product innovation. Since this process necessarily involves early risk identification and management are required in innovative firms. Therefore, this paper aims to explore methods for managing risk in the diffusion of innovation. At the same time, the proposed method for managing risk in a prespecified innovation will be further explained. Risk is inherent to the activities of innovation companies; managing such risks represents an opportunity for companies to improve their capability to achieve their goals. The market of innovation development has been increasing, year by year, encompassing a greater and greater share of the economy. It is different from other industries because it consists of many small companies (Lowman et al., 2012). Together with other countries with more developed economies, the UAE has conducted a great deal of research related to this topic. In contrast, the number of such studies in developing countries has been limited (Nagano et al., 2014).

1.1 Research Questions

This systematic review has focused on the relationship between risk management culture and diffusion of innovation and has studied the factors and variables that affect this relationship. More precisely, this review performed its analysis by answering the research questions below:

RQ1: What are the primary research purposes of the studies selected?
RQ2: What are the main research methods of the studies selected?
RQ3: What are the participating countries in the context of the studies selected?
RQ4: What is the context of the studies selected?
RQ5: What is the study distribution by publication year regarding RM and DOINV?

1.2 Research Objectives

This systematic review has focused on developing many skills for new DBA students, such as:

1. Using different databases to develop research skills and techniques.
2. Learning the systematic review process.
3. Expanding knowledge concerning the search topic.
4. Discovering the factors affecting the relationship between RM and DOINV.
5. Creating ideas about future studies concerning the same topic.

1.3 Research Importance

Many firms have used RM as a competitive advantage. If risks are managed correctly between all parties in an organisation, everyone will act positively to achieve the organisation's goals and objectives. This study will help researchers see what other researchers have already achieved in this field, build from where others have stopped, and understand the various issues related to this topic: RM and DOINV—in addition to exploring the factors that affect the relationship between RM and DOINV. Finally, learning how to conduct a systematic review.

2 Literature Review

2.1 Risk Management

For companies to launch new products speedily and successfully, taking risks is essential. The ability to identify and manage risk is vitally important in risky innovation.

Definition

There has not been a single, universally accepted definition of the word risk (Green and Serbein, 1983). Its definition has changed as it has become interwoven with innovation and the rapidly globalising world. Companies that wish to survive need to innovate at a previously unparalleled rates and within a framework of greater uncertainty. This situation means their risks are deepening (Taplin, 2005). In more technical and specialised literature, as Kalvet and Lember (2010) pointed out, the word risk implies the measurement of the chance of an outcome, the size of the outcome, or a combination of both. According to the standard definition of risk, it is "the combination of the frequency or probability of occurrence and the consequence of a specified hazardous event"(Edwards et al., 2005). Some former writers in this field have distinguished between uncertainty and risk.

A risk situation is defined as a probability distribution for consequences is made on a meaningful basis, agreed upon by a set of relevant experts, and therefore it is 'known'. Uncertain situations arise when an agreement among experts cannot be gained, so there will be an undefined probability distribution on the set of outcomes (Vargas-Hernández, 2011).

Sources of Risk

Any factor affecting project performance can cause risk, and when this effect is both significant and uncertain on project performance, risk arises (Chapman & Ward, 1997). Fort-Rioche and Ackermann (2013) argued that categorising risk in a simple manner could be very unhelpful since such categories could be viewed independently. Thus, when considering a wider range of risk categories, it is important to consider

more than just the risks themselves and their impact on one another. Risk should be considered systemic to represent the different aspects of risk accurately. According to their research, categorisation comprised; political, partner and supplier, customer, people, reputation, financial and market.

Following Vargas-Hernández (2011), an enterprise's risk aspects may be placed under the following major categories: property and personnel, marketing, finance, personnel and production and environment. Therefore, by considering the different sources of risk and the purpose of this paper, the best risk categorisation for this research work was as follows:

- Environment (exchange rates, availability of skilled labour, government policy, culture, weather).
- Technical (materials, new methods, technologies).
- Resources (materials, staff, finance).
- Integration (old and new systems, software modules).
- Management (experience, multiple parties, use of project management techniques, product transition management, set tight goals, HRM, organisation behaviour, organisation structure).
- Marketing (competitors, customers).
- Strategy.

Risk Management System

Risk management is acknowledged as 'the process of understanding the nature of uncertain future events and making positive plans to mitigate them where they present a threat or take advantage of them where they present opportunities' (Taplin, 2005). Considering that one of the main features of innovation is 'risk', risk management should facilitate innovation rather than stifle it (Taplin, 2005). Systematic risk management enhances an organisation's ability to manage risks. Risk management aims to improve project performance using; systematic identification, appraisal, and management of project-related risk (Chapman & Ward, 1997).Systematic risk management encourages decision-making inside an organisation that is more controlled, consistent, and flexible (Edwards et al., 2005). Following Edwards et al. (2005), it can be said that good risk management for a project should encompass these processes:

- Establishing appropriate context(s).
- Recognising project risk that faced by a stakeholder organisation.
- Analysing identified risks.
- Developing risk responses.
- Supervising and monitoring risks throughout a project.
- Permitting post-project collection of risk knowledge.

2.2 Innovation Diffusion

According to Mokyr (2002), innovation is the main source of economic growth, a key source of new employment opportunities, and has the potential to realise environmental benefits (Foxon et al., 2005). It is widely argued that in the current global economy, economic actions can be more cheaply conducted in low-wage economies, such as China. Therefore the main way in which other economies can compete and survive is for them to discover new and improved processes and products, in other words, they must innovate (Salaman & Storey, 2005).

Definition

The Oxford Dictionary of Economics states that innovation refers to the economic application of a new idea. Product innovation involves a modified or new product; process innovation involves a modified or new process of making a product (Black et al., 2006). Afuah (2003) stated that innovation involves the employment of new knowledge to provide a new product or service that the customers want; in other words, it is invention plus commercialisation. Van de Ven (1986) designated innovation as a new idea, which may be; a recombination of old ideas, a plan that challenges the present order, a formula, or an exclusive method that is perceived as new by individuals involved.

Different Innovation Types

The existing literature provides different innovation categories classified by; competence, degree, type, ownership and impact (Narvekar & Jain, 2006). Innovation can be considered in service and manufacturing sectors of different sizes (large, medium, and small). Although these two sectors differ, the general definition and innovation process is the same. The services sector has different characteristics from manufacturing. For instance, services are; perishable, intangible and heterogeneous (Salaman & Storey, 2005; Alshurideh et al., 2012; Alshurideh et al., 2021; Alshurideh, 2022).

Tidd and Hull (2006) stated that innovation was not just about opening new markets; it can also present new ways of serving older and established ones. He classified innovation into four groups (Product, Process, Position, and Paradigm), where each can happen along an axis, running from incremental through radical change. Incremental product innovation entails introducing an improved product, which, compared with its predecessor, has at least one additional desirable characteristic or is more efficient with the same characteristics. In contrast, radical or fundamental product innovation occurs when a new market has opened up, and the innovator begins to satisfy a hidden demand (Arundel et al., 2019).

3 Methods

This assessment used a systematic review of risk management and innovation. The research went through many stages, including; defining exclusion and inclusion criteria, selecting data sources and the search strategy, a quality assessment process, and data coding and analysis. These stages are detailed further in the subsequent subsections.

3.1 Exclusion/Inclusion Criteria

The exclusion and inclusion criteria were set up to support conducting this research. Firstly, the searched articles needed to involve risk management and innovation for the inclusion criteria. Secondly, the reviewed articles were required to show the relationship between RM and innovation. Thirdly the included articles needed to have been published between 2007 and 2020. Fourthly the articles needed to be written in the English language. Finally, the included articles should not include sector indicators.

Regarding the exclusion criteria, firstly, articles with technical backgrounds were excluded. Secondly, older articles published before 2007 concerning risk management and innovation were excluded. Finally, articles not written in English were excluded. Table 1 presents the exclusion and inclusion criteria used by this research work.

3.2 Research Strategies and Data Sources

Several databases and research engines were used to conduct this systematic literature review, such as; ProQuest, Emerald, Google Scholar, IEEE, Scopus, and ScienceDirect. The Search terms used were "risk management and innovation. In the identification stage, the results presented 1361 articles from the mentioned search engines and databases. In the screening stage, the results were filtered, and any duplicated articles were removed; most of the duplicates came from Google Scholar. The results were

Table 1 Exclusion and inclusion criteria

Inclusion criteria	Exclusion criteria
• Should involve risk management and innovation • Should show the relationship between innovation and RM • No sector indicators • Published between 2007 and 2020 • Must use the English language	• Articles with technical backgrounds • Non-English language • Articles published before 2007

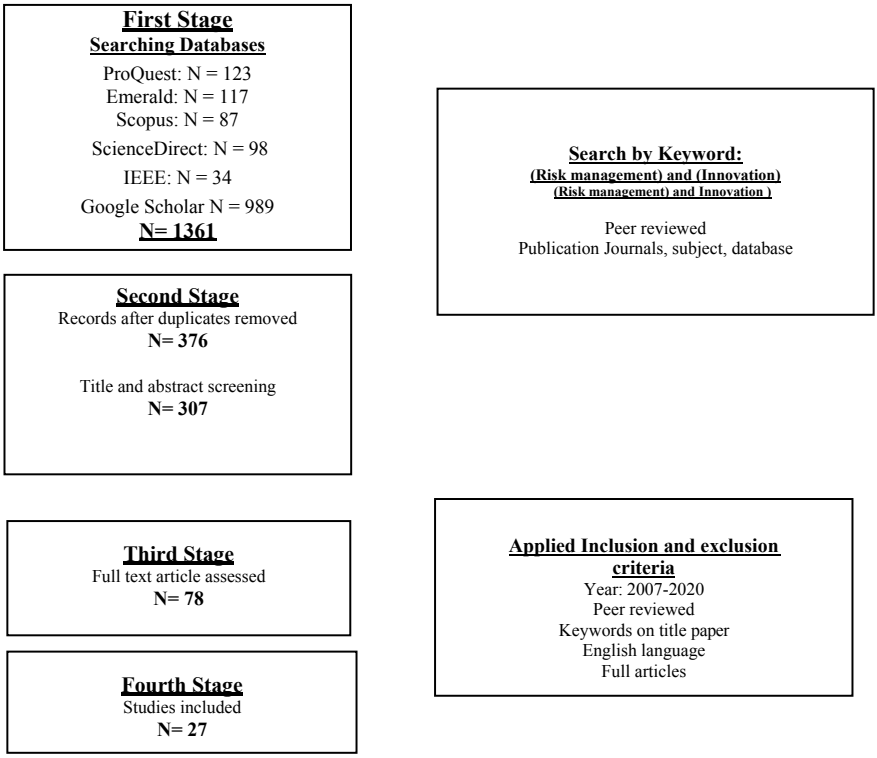

Fig. 1 Flowchart for the selected studies

limited to only show peer-reviewed articles published from 2007 to 2020; the result comprised 376 articles. Following that, the titles and abstracts of all articles were checked, reducing to 307 the number of shown articles. Then the full articles and keywords included in the title were requested, which reduced the resulting articles to 78 in the eligibility stage. The exclusion and inclusion criteria were next applied for all articles, which reduced the shown articles to 27 in the final stage. The flowchart of the selected study is illustrated in Fig. 1 (Tables 2, 3, 4, 5, 6, 7, and 8).

3.3 Quality Assessment

To check the quality of the research studies in this research, "Quality assessment." was used similarly to how Da Silva Etges and Cortimiglia (2019) used it in his paper "A systematic review of Risk Management in Innovation-oriented Firms" as it's easy to use and gave an excellent way to evaluate the articles. The quality assessment contained nine questions to investigate the quality of the selected articles. There

Licensed to (putm@utm.my)

Table 2 Data sources and databases

#	Search engine/database	Total articles 1st stage	Total articles 2nd stage	Total articles 3rd stage	Total articles 4th stage
1	ProQuest	123	89	24	6
2	Emerald	117	42	5	3
3	ScienceDirect	98	71	11	2
4	Scopus	87	63	14	5
5	IEEE	34	9	5	4
6	Google Scholar	989	102	19	7
	Total	**1361**	**376**	**78**	**27**

was a three-point scale. YES was worth one point, NO was worth zero points, and particularly was worth 0.5 points. Each study was scored between 0 and 9.

3.4 Analysis and Data Coding

This research's methodology quality was coded including; 1: research purpose 2: methods. 3: country. 4: context. 5: year of publication as other studied such as (Aisha Alshamsi et al., 2020; Al Mehrez et al., 2020; Assad & Alshurideh, 2020; Al Suwaidi et al., 2020; Ahmad et al., 2021; Ahmed et al., 2021; Almazrouei et al., 2021; Al Khayyal et al., 2021; Alshamsi et al., 2021; AlShehhi et al., 2021) did. The answers from this group of questions provided a precise representation of the paper's quality. A researcher can, at this point, include many articles by answering the five following questions:

RQ1: What are the primary research purposes of the studies selected?
RQ2: What are the main research methods of the studies selected?
RQ3: What are the participating countries in the context of the studies selected?
RQ4: What is the context of the studies selected?
RQ5: In terms of RM and innovation, what is the study distribution by year of publication?

Based on the selected 27 research articles concerning risk management and diffusion of innovation from 2007 to 2020. The systematic review results were analysed related to the answers to the above five questions.

RQ1: Research purpose distribution

The country of origin was developed as a crucial indicator to analyse the articles in this systematic review. This procedure helped to analyse the articles according to their purpose.

Table 3 Analysis of included research articles

No.	Authors	Year	Place	Context	Data collection methods	Sample size
S1	Da Silva Etges and Cortimiglia (2019)	2019	Brazil	Innovation oriented firms	Systematic review and empirical study	115 works
S2	Jin and Navare (2010)	2010	UK	Liverpool Victoria	Case study approach	One organisation
S3	Kwak et al. (2018)	2018	South Korea	Manufacturers and logistics intermediaries	Quantitative approach	
S4	Borgelt and Falk (2007)	2007	Australia	Three large organisations	Qualitative and case study methodology	60 leaders and managers
S5	Andersen (2009)	2009	Denmark	Different manufacturing industries	Quantitative approach	896 companies
S6	Chiambaretto et al. (2020)	2020	Sweden	Swedish firms	Quantitative approach	786 innovative Swedish firms with 50 to 1000 employees
S7	Wehn and Evers (2015)	2015	Netherlands	Citizen observations	Case study approach	2 Case Studies
S8	Migliori et al. (2020)	2020	Italy	Small and medium-sized family firms	Quantitative approach	1093 Italian small and medium-sized family firms
S9	Koru et al. (2018)	2018	United States	Home health agencies (HHAs)	Qualitative analysis	347 reports entered by HHA clinicians
S10	Games and Rendi (2019)	2019	Indonesia	Small and medium enterprises (SMEs)	Quantitative approach	165 small business owners in creative industries
S11	Ab Rahman et al. (2015)	2015	Malaysia	AIM participants	Quantitative approach	10 participant companies

S22	Gurd and Helliar (2017)	2017	Australia	Zeta and Eta companies	Case study approach	Two case studies
S23	Vargas-Hernandez and Garcia-Santillan, (2011)	2011	Mexico	Innovation projects in lightweight medical	Case study and qualitative approach	One case
S24	Hölttä-Otto et al. (2015)	2015	United States	Kickstarter and Indiegogo customers	Quantitative Approach	127 consumers
S25	Berglund (2007)	2007	Sweden	Large corporations	Case study approach	Two cases
S26	O'Connor et al. (2008)	2008	USA	Large firms	Literature sharing and meetings with the IRI membership. Two longitudinal cross-case qualitative studies	85 high-level individuals
S27	Kalvet and Lember (2010)	2010	Estonia	Public procurement	Case study approach	Five case studies

Table 4 Articles included in this study with purpose, findings, and limitations

No.	Third term	Purpose	Finding	Limitations
S1	Ffinancial impact	The proposed framework was the first necessary state for future development. this study identified that innovation-oriented firms would provide a first empirical test of the interpretative framework of risk events, particularly regarding the comprehensive completeness of the proposed framework as perceived by practitioners	The main contribution of this paper was the proposal of a synthesising interpretative framework of risk events that could support the future development of payment ERM models for innovation-oriented firms. Additionally,	The empirical study signalled which risk events were more relevant in the Brazilian context, limited to discussing specific aspects of operational implementation
S2	Global sustainability (GS)	Determining the relationship between risk and innovative adoptive behaviour was examined to guide managers on managing risk and uncertainty under the different circumstances of their innovative practices	The study developed a conceptual framework, which consisted of; risk behaviour, environmental conditions, and innovation. Two key elements determined the performance of such behaviour	The research was only exploratory and used a single case study to illustrate the applicability of the REAI model The boundary and conditions of such applications were not specified. Therefore, there remains a need to test the REAI model using a large representative sample. Given that it takes a relatively long period to observe environmental turbulence and organisational behaviour changes, it is also essential to carry out such a study from a longitudinal perspective
S3	Supply chain	This paper proposed and validated a theoretical model to investigate whether supply chain (SC) innovation positively affected risk management capabilities, such as robustness and resilience in global SC operations. It also examined how these capabilities may improve competitive advantage	It was found that innovative SCs had a discernible positive influence on all dimensions of risk management capability, which in turn had a significant impact on enhancing competitive advantage Therefore, this research provided evidence on SC innovation and risk management capabilities in supporting competitive advantage	This research did not use objective data to measure the firm's competitive advantage but employed the respondents' perceptions of their competitive advantage. The impact of risk management capability on competitive advantage might take a long time. Data were collected from a single country, South Korea

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S4	Leadership	This paper presented a data-driven discussion concerning whether effective leadership and innovation were being stifled in contemporary organisational environments of continuous change	The key finding was that the accurate application of interaction between leadership and management released social capital and related identity and knowledge resources, helping address tension between risk management and innovation	This paper only reported on one component of the original study. The findings and implications reported here are regarded as tentative
S5	Capital structure	This paper argued that strategic responsiveness was of paramount importance for effective risk management outcomes and demonstrated this by introducing an empirical study	The study revealed that risk management effectiveness combined the ability to exploit opportunities and avoid adverse economic impacts and had a significant positive relationship with performance. This effect was moderated favourably by investment in innovation and lower financial leverage	The analysis was based on a sample of large firms, which may have affected the generalisability of the results. Nonetheless, the study showed that effective RM capabilities differentiated firms and determined success and failure. It further underscored the importance of combined innovation policy and capital structure decisions as firms deal effectively with risk and uncertainty
S6	Small and large firms	This research investigated the extent to which small, and large firms differed when assessing the benefits and risks provided by competitors as partners in innovation	This paper's results confirmed that small and large firms valued the benefits and risks associated with competitors differently. It showed that small firms were less reluctant to compete than large firms, especially if the competition allowed them to reduce their costs and learn from their competitor. In contrast, it showed that large firms' agreed to cooperate with their competitors to enable them to reduce their time-to-market	The method used did not allow the researchers to investigate other attributes that might be equally or even more important. Second, the participants were forced to select a competitor for innovation based on only a few limited attributes, which were limited by the number of respondents
S7	Flood risk management	This paper analysed the social innovation potential of ICT-enabled citizen observations to increase e-participation in local flood risk management	This study analysed the social innovation potential of ICT-enabled citizen observations to increase e-participation in local flood risk management	The limitation of this research was its focus on only two cases. Further investigation is required to confirm the findings based on more cases

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S8	Family management	This paper investigated the relationship between family management and innovation investment propensity in family firms by analysing the effect of two innovation impulses: demand-pull and technology-push. Extending the technology-push/demand-pull framework in the context of family firms, and adopting a direct measure of firms' innovation investment propensity	The findings suggested to practitioners and policymakers that family firm innovation impulses were important contingencies that needed to be considered when making innovation investment decisions. Other findings suggested that the effect of FTMT on INN_PRO was statistically significant. Additionally, the findings suggested that the TP impulse was less decisive than the DP impulse	First, the investigation was focused on Italian family firms. Second, the study adopted a cross-sectional analysis given that the dataset covered the period 2007–2009. Third, the study measured the DP and TP variables following some prior studies. Fourth, the sample and the family business definition was adopted. Finally, the focus was on family SMEs rather than medium or large firms
S9	Technology	The study performed a detailed examination of fall and near-fall incidents in an HHA to identify potential IT-based innovations that could be used in process improvement to achieve better fall risk management during home care	The results provided data about fall risk management during home care. The results suggested methods that could positively respond to the challenges and opportunities identified in the current study to impact fall risk management during home care positively	The perspectives of patients and caregivers related to fall incidents were not captured
S10	Financial performance	This study examined the effects of knowledge management and risk-taking on financial performance where negative innovation outcomes were chosen as a mediator variable	The study results indicated the importance of knowledge management and risk-taking to reduce negative innovation outcomes. Further, it was found that negative innovation outcomes did not mediate the links between knowledge management, risk-taking, and SMEs' financial performance	The study offered some insights from Indonesia as an emerging market economy, which may have had different characteristics from other contexts. Secondly, most respondents were newly in business and perhaps saw business innovation imperative in creative industries. Thirdly, it may also not be sufficient to see the result of the implementation of risk management. Fourthly, this research did not include positive innovation outcomes as a mediator variable. This study saw negative innovation outcomes as sufficient to see the impact of knowledge management and risk-taking

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S11	Sustainability of microfinance	This study clarified issues around whether measures had a positive effect on different aspects of innovation and best practices	The study findings showed that performance measurement positively affected innovation and best practice issues. The measurements for several aspects of innovation and best practices had good potential in the microfinance industry	The study's main limitation descended from its exploratory nature because the objective was to gain theoretical clarification regarding the product innovation process and best practices. The findings were generalised, which limited the study
S12	Disaster management	This paper identified three key issues that could help overcome the following barriers: networking, eco-production of knowledge, and a stronger role played by academia	This paper clearly showed that innovations were not required to be completely new or high-tech products, as approaches and frameworks could lead to changes and influence people's thinking and behaviour	It was necessary to consider both innovative products and approaches in DRR strategies when working to develop them further and make them more effective and useful. CBDRR was still a relatively new approach, even among governments
S13	Health care	This study proposed a conceptual ERM framework specifically designed for health care organisations. The study explored how hospitals in the United States and Brazil structured and implemented ERM processes within their management structures	The study confirmed that adopting ERM for health care organisations had gained momentum and become a priority. The demand for risk economic assessment orientation was common among health care risk managers	Given the complexity of the variables affecting health care organisations in other countries: political, financial, and environmental, the results of this study may not be generalisable
S14	Board of directors	This study explored the role of the board of directors in the relationship between integrated risk management and product innovation. The study focused on the board's direct involvement in risk oversight and its use of external audits in risk oversight. It also examined their moderating effects on the relationship between integrated risk management and product innovation	The finding demonstrated that a board's risk involvement and its use of external audits in risk oversight negatively moderated that relationship. A board's direct involvement in risk oversight negatively moderated the positive relationship between integrated risk management and product innovation success. The use of external audits in risk oversight similarly weakened the relationship	First, this study examined only the relationship between IRM and product innovation. It would perhaps be fruitful to extend the theoretical framework to other innovative activities, such as process innovation or organisational innovation. Furthermore, it would be interesting to break down product innovation into radical and incremental innovations and examine any differences in the relationship with IRM and board involvement. Since the entire sample was from China, future research needs to validate the applicability of these findings elsewhere. Finally, this analysis used time-lagged variables to address this issue

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S15	Strategic choices	This study developed a fuzzy evaluation model that provided managers at different responsibility levels in pharmaceutical laboratories with a rich picture of their innovation risk and that of competitors. This situation helped them make better decisions about managing their present and future portfolio of clinical trials in an uncertain environment	The main finding of this work was the development of an innovative fuzzy evaluation model that was useful for analysing the innovation risk characteristics of large pharmaceutical laboratories given their strategic choices	Small pharmaceutical laboratories are a relevant part of the pharmaceutical industry but were not covered in this paper. Other restrictions imposed in this work could be relaxed, allowing each expert to evaluate the model's variables by proposing their independently of the rest of the evaluators
S16	Resistance to change	This paper investigated why different individuals struggled to achieve a shared understanding of innovation projects. The primary focus was on the individuals' functional backgrounds as the cause of systematic differences in assessing innovativeness, neglecting dispositional traits. So the paper investigated how a decision's context and an individual's resistance to change influenced the assessment of an innovation project's risk and innovativeness	The paper showed that an individual's resistance to change moderated the positive relationship between an innovation project's innovativeness and its perceived risk. It also indicated that; department orientation, mental models, or thought worlds caused systematic differences when individuals evaluated innovation projects	First, the experimental design sought to clarify the specific relationship between the constructs, limiting it in terms of complexity. Second, it reduced complexity and neglected to include recent research avenues during innovation portfolio management. Third, recent research has not been able to clarify the influence of innovation project portfolio's innovativeness on agility. Finally, testing the generalisability of the findings with an investigation of practitioner behaviours could offer further novel insights
S17	Logistics management	This study determined the impact of the risk of implementing digital technologies for logistics management	The literature review proved that this issue still had a research gap in management theory, including in logistics. Analysis of the research results showed that the implementation and use of digital technologies implied changes in logistics management. However, this impact was diversified, depending on the digital technology type	The limitations of this study were that the implementation and use of digital technologies implied changes in logistics management. However, this impact was diversified, depending on the digital technology type. Therefore, it could be assumed that not all digital technologies arouse equal interest among logistics specialists, bringing with them the yet unknown effects of the risk of implementing digital technologies

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S18	Cloud-based business	This study uncovered the myriad challenges managers confront as they seek to leverage cloud technology in the ongoing transformation of their organisation's service offerings. Combining this systematic literature analysis with relevant theory also helps managers identify their organisation's general risk profile and links that profile to a specific configuration of resolution	This study synthesised an integrated model for managing risk during the innovation of cloud-based business services. The model identified three types of risks (services, technology, and process risks) and four types of resolutions (stakeholder engagement, technology development, innovation planning, and innovation control)	One area for future research is to explore whether the risk-strategy model works differently for public, private, and hybrid cloud environments. The research did not differentiate between these categories; hence, further insights may be gained from investigating the differences and commonalities across these contexts. is how cloud-based business services providers might deal with the risks of transitioning all or some of their services to the cloud
S19	Knowledge management	This study examined the impact of internal and external KM capabilities on BMI and how risk-taking tolerance moderated these effects	The results from this study indicated that external KM capabilities stimulated BMI. This relationship was strengthened for firms with a high risk-taking tolerance. Internal knowledge was only effective for firms with a low risk-taking tolerance	It was important to consider the nature of the data basis for empirical analysis when interpreting the data. The study relied on key informants in each organisation. Multiple informants in each organisation might be preferable to capture different facets of BMI. Although this issue was lower for SMEs, future studies are encouraged to collect data with respondents at different levels in a firm. The study only focused on external and internal KM capabilities from a theoretical perspective
S20	Enterprise management	This paper showed that it was possible to measure the risks that an innovation company faces and that such risks can be managed with the support of a company strategy. An economic analysis was applied based on MCS and an indicator of CFaR to measure innovation risks. A strategic performance model for innovation companies was proposed, and the benefit of implementing risk management practices in innovation organisations was validated	The main findings indicated the link between analysing the risks to which a company was exposed, its origin, and their relationship to decision making to manage the company strategically. In brief, the probabilistic analysis of the risks indicated the variables that caused the greatest financial impact	The region limited this research. The case study was from Brazil and cannot be assumed as a global conclusion. Similarly, by only examining one case, the findings were specific to one company and its business sector

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S21	Project management	This paper helped fill the knowledge gap based on a practical basis for designing the most appropriate form of risk management in different innovation-based industries. It also highlighted the possibilities for better integration of the theories of innovation and project risk management	The main finding of this paper was to provide a framework that diverse companies could appreciate. The framework offers a basis for discussing the most appropriate form of risk management in different innovation-based industries	It would be useful to extend this research by examining more case studies from other countries and industries
S22	Management control systems	This study used the concept of institutional leadership to explore how leaders balanced creativity and product innovation against administrative arrangements, such as risk management and management control	Using two case companies, distinct contrasts to this balance were produced. Neither showed the ambidexterity needed to 'secure the value of innovation and exploration and developed risk management and control systems for exploitative activities	A limitation of this study was that both enterprises were highly focused on engineering and dominated by engineers
S23	Project management	This research identified the sources of risk in innovation projects and determined whether they could be managed better	This research attempted to provide a system for managing the risk in innovation projects. It also created a method for prioritising different risks factors and managing the most important ones in the second stage of this risk management system for innovation	The proposed method for analysing the risk in risk the management system will be applied for one case
S24	Crowdfunding	This paper filled the research gap of understanding the innovation and risk balance strategy for new product development (NPD) at small companies. It also explored innovation versus risk for small companies using crowdfunding products as a proxy for analysis	The main result suggested a preliminary innovation and risk balance framework for crowdfunding NPD success. A statistical model was developed to correlate the amount of crowdfunding raised with 64% predictability. These results may contribute to better understanding and balancing risk and innovation in crowdfunding and small company contexts	The limitations are worth mentioning. The adapted RWW metric might require further refinement before being applied to a wider selection of products and crowdfunding platforms. Also, the current rating process was relatively slow to generate a large dataset for analysis. The results from this paper could be used to generate experience to design better machine learning tools for a faster and more rigorous data collection and analysis. Finally, the implications from this paper were constrained to the context of crowdfunding. Caution shall be taken before interpreting the results for other areas

(continued)

Table 4 (continued)

No.	Third term	Purpose	Finding	Limitations
S25	Risk conception	This paper explored the risk conceptions of innovators in two large corporations and identified three themes that illuminated the relationship between risk and innovation in the corporate setting	There were three main findings. The first related risk to the issues of boundaries and control over parts of the innovation process. The second showed how risk was primarily related to innovation as a process and not an output. The third showed how a flexible view of business models could manage risk in corporate innovation	The two units came from different industries and differed in corporate history and performed work. Second, there was a tendency to discuss both innovation risks and the concept of quality about processes instead of outputs. Finally, given the small sample size, the results were not generalisable in a statistical sense
S26	Learning	The study investigated a subset of management practices that might have contributed to the success of radical innovation efforts by large established firms. The study focused on that subset of practices concerned with learning-oriented approaches to risk management	The study found that the development of dynamic capabilities for managing highly uncertain phenomena, such as radical innovation, included a risk management-by learning capability. Further research is necessary to replicate the findings and extend them to other high uncertainty venues	The limitations were that the interaction between industry clock speed and harvesting strategy negatively affected activity and output, suggesting that a strategy of harvesting early and often was more valuable for firms operating in less dynamic environments. Thus, the interaction between the use of experimental processes and industry clock speed did not significantly correlate with any of the RI success measures
S27	Public procurement	This study provided the public sector with what was necessary to deal with different kinds of process risks. The study took an exploratory approach in determining the state of practice regarding risk management in public procurement for innovation at the local level	The study found that cities were, for the most part, actively engaged in risk identification; the risks were being met mainly with mixed solutions in contracting strategies rather than comprehensive risk-management tools	There were no signs of addressing these risks via comprehensive risk management strategies aimed at reducing providers' technology or innovation-related risks. Further studies are needed to document how the public sector meets the risks when using public procurement to promote innovation. Also, further research is needed for building coherent theoretical models addressing this issue

Articles from China:

There were five articles from China. The first article highlighted the research's purpose to mediate the role of decision quality in the relationship between risk management and firm performance (Tidd & Hull, 2006) The second article examined the impact of risk management strategies on high technology firms in China (Yang, 2008). While Zheng et al. (2010) conducted his study by examining the mediation role on risk management and organization Innovation culture, structure, strategy, and effectiveness. The fourth article asserted the relationship between risk management orientation, organisation innovation, and organisational performance (Darroch, 2005). The last article from China focused on the fit between risk management strategies and intellectual capital and their impacts on firm performance (Hsu & Sabherwal, 2012) .

Articles from Spain:

In this study, three articles from Spain were covered. The first article showed a model of strategic human resource practices as a catalytic mechanism influencing the effectiveness of risk management (Inkinen et al., 2015). The second paper aimed to evaluate structural and relational capital's roles as the conclusions of codification and personalisation of risk management strategies in renewal capital and innovation in low- and high-tech companies (Buenechea-Elberdin et al., 2018) . The third article showed the relationship between SMEs' R&D internationalisation and innovation outcomes (Ren et al., 2015). Edwards et al. (2005) defined his research paper

Table 7 Checklist for quality assessment

#	Question
1	Were the research aims specified clearly?
2	Did the study design achieve these aims?
3	Were the variables considered in the study specified clearly?
4	Was the study context/discipline specified clearly?
5	Were the data collection methods detailed adequately?
6	Did the study explain the validity/reliability of the measures?
7	Were the statistical techniques used to analyse the data described adequately?
8	Did the results add to the literature?
9	Did the study add to your understanding or knowledge?

by assessing the impact of risk management RM strategies on a firm's corporate performance and innovation.

Articles from India:

Three articles from India were covered. The first article evaluated organisational learning, firm performance, and risk management (Fort-Rioche & Ackermann, 2013) The second article proposed a conceptual model comprising six knowledge management and two performance constructs (Joshi & Chawla, 2019). Narvekar and Jain (2006) studied the influence of efficient risk management practices on firm performance.

Articles from Iran:

There were four articles from Iran. The first one evaluated risk management value and organisational innovation (Salaman & Storey, 2005). Wehn and Evers (2015) defined his research to determine relationships between; organisational learning, transformational leadership, organisational innovation, knowledge management, and organisational performance. The third article studied the influence of organisational innovation and risk management practices in SMEs using structural equation modelling SEM (Calvo-Mora et al., 2016). The last study presented a universal approach to evaluating RM practices on FP (Douthwaite & Ward, 2005).

Articles from Taiwan and Japan:

Gurd and Helliar (2017) examined the relationship between RM strategy and FP performance. While Tseng and Lee (2014) showed how enterprises could effectively apply their risk management capabilities and develop uniquely dynamic capabilities. The article from Japan assessed explicit and implicit risk's role in translating management innovation into firm performance in Japanese companies (Van de Ven, 1986).

Table 8 Quality assessment results

Articles from the US and Brazil:

Bowers and Khorakian (2014) in his research tested the relationship between strategic intent, including; the goals, vision and mission of intellectual capital (i.e., structural capital, relational capital, human capital), risk management, and. While Vargas-Hernandez and Garcia-Santillan (2011) reviewed a conceptual view of the relationship between; business innovation and risk management, supply chain technology investments, and overall firm performance. The author from Brazil classified the type and intensity of relationships between; organisational performance, innovation performance, and strategic knowledge management (SKM) practices (Afuah, 2003).

Articles from Bahrain and Egypt:

The Bahraini article evaluated a comprehensive model comprising various relationships between; risk management (RM) processes, transformational and transactional leadership, and organisational performance (Birasnav, 2014). While Jin and Navare (2010) from Egypt, in his study, highlighted the role of risk management to enhance organisational performance and, consequently, developed an integrated risk management capabilities framework for assessing organisational innovation.

Articles from Malaysia and Indonesia:

Three articles were from Malaysia, where the first author examined the indirect relationships between Soft TQM factors and risk management with firm performance (Etges et al., 2017). The second author evaluated the relationship between organisation performance and risk management capabilities (Berglund, 2007). The last author highlighted the critical role of the risk creation process in demonstrating the risk management enabler's T-shaped skill to create creativity in the organisation, which wand, thus, firm performance (Azmi et al., 2018). There were two articles from Indonesia. The first investigated the environmental hostility contingencies on the relationship between firm innovation and risk management strategy (Ambad & Wahab, 2013). The second article, Hock-Doepgen et al. (2021), studied the application of risk management and intellectual capital as variables and tested their effect on firm performance.

Articles from Finland, the UK, Italy, Slovenia, and Serbia:

The author from Finland covered the relationship between risk management and intellectual capital and firm performance (Hock-Doepgen et al., 2021). While Hölttä-Otto et al. (2015) researched to show the effect of the company performance on risk management with information technology support. The author from Italy assessed the link between; problem-solving processes, knowledge management practices, and organisational innovation (Giampaoli et al., 2017). The Slovenian article showed that through; creating, collecting, organising, and utilising knowledge, that organisations could enhance organisational performance (Rasula et al., 2012). The article from Serbia focused on the effect of risk management on organisational performance and innovation in Serbia's economy (Dwyer et al., 2016).

RQ2: Distribution of research methods

Regarding the study distribution by research method used, the chart below shows that numerous research papers depended on the case study approach in their studies as it was the most prevalent method for collecting data. Several other studies used interview methods. The framework, quantitative and qualitative, literature review, mail survey, and conceptual study methods were also used in the examined studies (Fig. 2).

Licensed to (putm@utm.my)

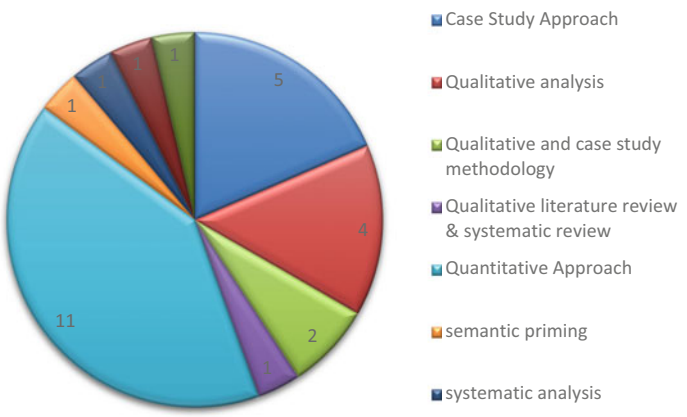

Fig. 2 Study distribution by research method

RQ3: Country distribution of research studies

The chart below shows that the USA produced the most research articles concerning risk management and innovation in the examined studies. This situation may be because the USA is a leading industrial country globally. Brazil ranked in second place with three articles. The UK, Germany, Sweden, and Australia were ranked third with two articles. The rest of the countries each had one article, as shown in Fig. 3.

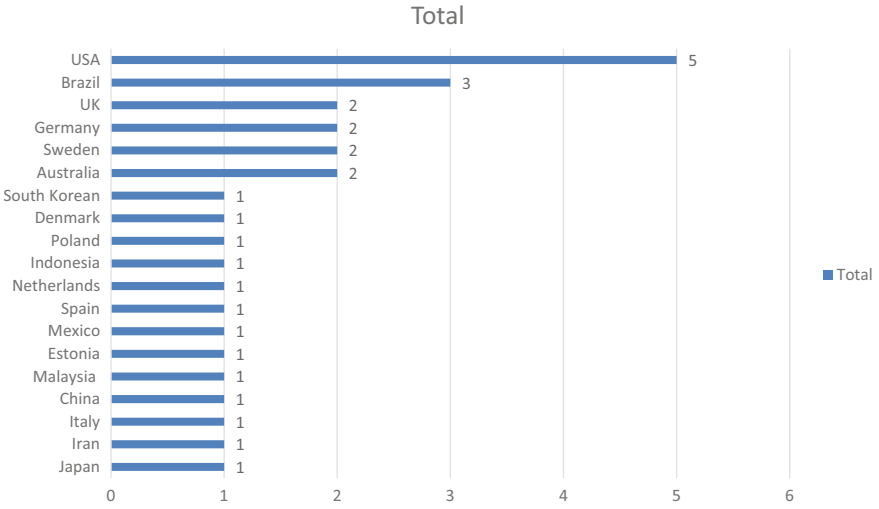

Fig. 3 Number of research studies by country

RQ4: Distribution of research context

This systematic review covered many contexts: investment, large firms, academia, government, NGOs, the private sector, different manufacturing industries, hospitals, innovation projects, high technology firms, electronic and electric firms, hospitality services, domestic companies, and manufacturing organisations. Firms, SMEs, technology and IT cross-sectional industries, textile industries, family businesses, PLU-SMEs, engineering firms, and firms adopted the risk management system. The chart below illustrates that large firms were ranked highest with eight articles, small-medium enterprises had three articles, and manufacturing firms came next in the context of this research. Technology and IT firms came after innovation projects (Fig. 4).

RQ5: Distribution of studies by year of publication

Listed by the year of publication, Fig. 5 presents the distribution of the examined studies investigating risk management and innovation from 2007 to 2020. The number of research papers covered in this research totalled 27. It can be seen that there was one article in 2008, 2009, 2011, 2013, 2014, and 2016, respectively. There were two articles in 2007, 2010, and 2018. There were three articles in 2015 and four articles in 2017. In 2019 the number of articles totalled eight.

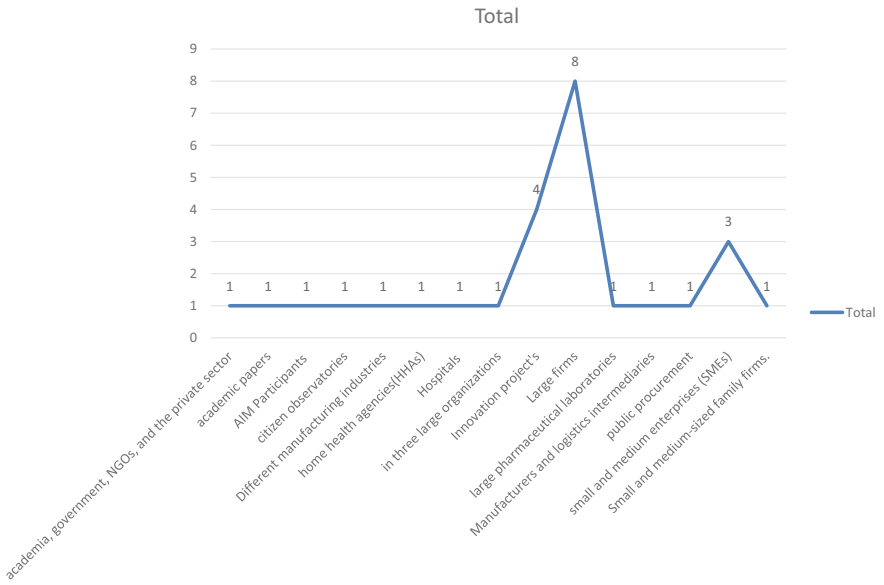

Fig. 4 Distribution of studies by context/discipline

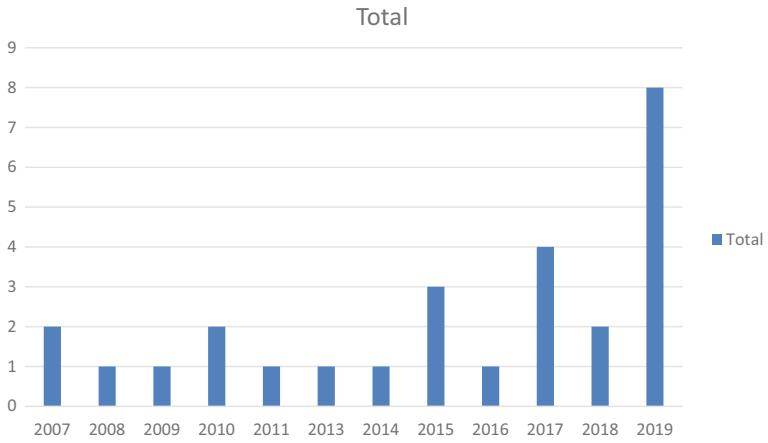

Fig. 5 Number of articles by year

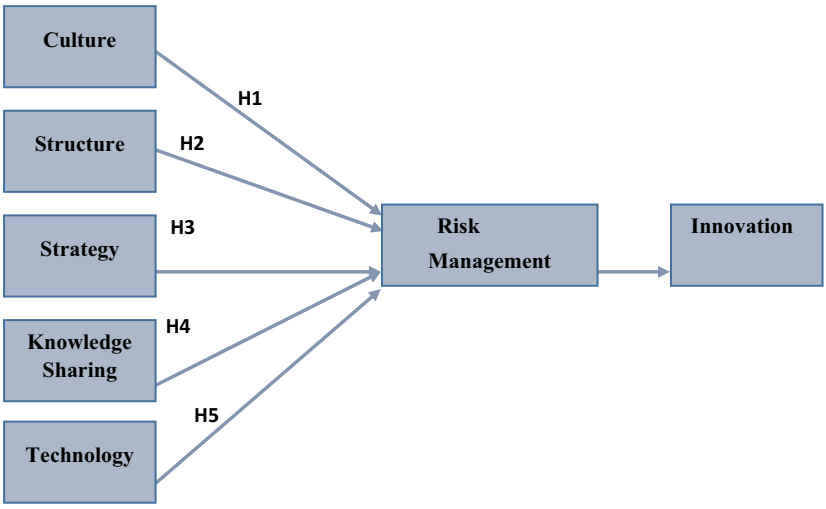
4 Discussion

The primary goal of this study was to systematically review and synthesise the existing published studies concerning risk management and diffusion of innovation. Organisation learning, teamwork and collaboration, performance management, freedom and autonomy, recognition and reward, and achievement orientation were positive predictors of the different dimensions of innovation and RM practices. Firms characterised by high levels of intellectual capital and the high-level implementation of RM practices are more likely to overtake the firms with low overall levels of intellectual capital and RM practices. There was support for the complementarity viewpoint by showing that codification and human capital RM capabilities interacted to influence customer service outcomes (Da Silva Etges et al., 2018; Games & Rendi, 2019; Koru et al., 2018). The research studies concerning risk management and innovation highlighted the need to study the technological sections of firms as a contingency variable affecting the intellectual capital and innovation relationship. Koru et al. (2018) research highlighted the importance of setting a risk management strategy before anything else. Most of the articles indicated that management and innovation were positively related. Many mediators were mentioned that affected the relationship between RM and DOINV, such as; human resources, knowledge, potential, trust, rewarding policy, corporate culture, structure and strategy.

Figure 2 shows the study distribution by research method. The results show that 41% of the studies used case studies for their data collection. This outcome reflected that quantitative research was more common research than qualitative research. According to Figure 3, most of the examined studies came from the USA, comprising 12% of the research articles, as the USA is one of the leading manufacturing countries. Brazil came second with 9.7% of the research articles. Figure 5 shows the research studies in terms of the context. 14 % of the research articles were from the

context of large firms, 9.7% from manufacturing firms, 7.2% from SMEs, and 2.4% from IT and technology firms. Figure 5 illustrates the year of publication.

After checking the dependent and independent factors, it could be seen that the most frequent factors were (culture, structure, technology, intellectual capital, and leadership)**.** This comprehensive research highlights paths for future studies concerning the internal drivers that affect risk management and diffusion of innovation. The research model is shown below: culture, structure, strategy, knowledge sharing, and technology were used as internal factors that affect risk management and diffusion of innovation. The model shown below was drawn based on the hypotheses of the paper (Fig. 6).



H1: Culture positively impacts risk management

H2: Organisation structure negatively impacts risk management

H3: Great organisation strategy positively impacts risk management

H4: Knowledge sharing positivel impacts risk management

H5:A higher degree of technology has a positive impact on risk management.

H6: Risk management has a positive impact on firm performance

H7: Risk management mediates the relationship between culture and organisation performance

Fig. 6 Research model

5 Conclusion

Many findings can be drawn from this systematic review concerning risk management and diffusion of innovation. In this research, several factors reoccurred, such as; culture, structure, strategy, technology, intellectual capital, leadership, process, and rewards. The majority of the repeated elements were located within firms and organisations. This outcome will lead any future studies regarding the internal drivers affecting RM and DOINV. Secondly, the majority of the articles indicated a positive relationship between risk management and diffusion of innovation. An increasing relationship between RM and DOINV was discovered. Thus, if a firm possesses excellent risk management, there will also be high diffusion of innovation. Thirdly, the primary data collection method in most examined research was through surveys; around 78% of the examined works used surveys. Fourthly, positive research outcomes were found in 87.8% of the articles, 7.9% had negative outcomes, and 4.3% were N/A.

There were several limitations related to this systematic review. First, numerous articles highlighted limitations in their conceptual and theoretical models, which required additional constructs. Second, many articles examined specific countries and contexts, making it difficult to generalise the studies. The third limitation was small sample sizes, which indicated low reliability in many examined articles. The fourth limitation was that some studies have not considered other possible moderators and mediators, such as; trust, policy, rewards, etc. Finally, bias was indicated in many articles.

The Impact of the Quality of Medical Information Systems on Job Performance in Private Hospitals in Jordan

Nida'a Al-Husban, Sulieman Ibraheem Shelash Al-Hawary, Doa'a Ahmad Odeh Al-Husban, Riad Ahmad Mohammed Abazeed, Bayan Anwar Al-Azzam, Ibrahim Rashed Soliaman AlTaweel, Mohammad Fathi Almaaitah, Ayat Mohammad, and Muhammad Turki Alshurideh

Abstract The study aims to identify the impact the quality of medical information systems on the job performance in Private Hospitals in Jordan. The study population consisted of all employees with job titles (doctor, nurse, pharmacist, laboratory technician) in private hospitals in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample via email. A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Statistical program AMOSv24 was used to test the study hypotheses. The results showed that the highest impact was for ease of use, followed by ease of learning, then flexibility, then reliability, and finally the lowest impact was for responsiveness. Based on the results of the study, researchers recommend managers

1 Introduction

The phenomenon of globalization has emerged, which has entered the pyramid of the new world system, which calls for a shift from the local market to the global market, and from the concept of time to the concept of synchronization, where the person in his place has become running his business and marketing his product in another place (Aldaihani & Ali, 2018; Allahow et al., 2018; Mohammad et al., 2013). Hence, commercial markets and administrative work have shifted from multiple markets to a single market, and from the unified management to the system of multiple advanced technological managements that work as one body to carry out the knowledge and cultural exchange of information under an important concept (business), this concept plays a major role in the success of any project whatsoever (Al-Hawary & Hadad, 2016; Al-Hawary et al., 2010).

The business system faces many challenges, problems and obstacles that forced it to have a clear strategic approach in light of its managerial work towards achieving its desired goals and interests, and then ensuring that this approach remains safe and away from the complexity, entanglement and challenges (Aldaihani et al., 2020; Al-Hawary & Al-Hamwan, 2017; Al-Hawary & Ismael, 2010). Hence, information systems have an important role, as this system represents (the heart in relation to the body) if it is disturbed, the whole body is disturbed, and if it is safe, it helps in the success of the managerial system (Altamony et al., 2012; Alzoubi et al., 2021a, 2021b; Svoboda et al., 2021).

Modern organizations focus their efforts to continuously improve the level of their performance and the performance of their employees and allocate a lot of their budgets to find ways to raise performance and achieve high levels of productivity (Alshura et al., 2016). The concept of performance is related to the behavior of the

Department of Management, College of Business, University of Sharjah, 27272 Sharjah, United Arab Emirates

individual and the organization, and it occupies a special place within any organization as the final product of the outcome of all its activities (Al-Hawary & Shdefat, 2016; Al-Lozi et al., 2017; Al-Lozi et al., 2018). Human behavior is the determinant of job performance, which is the outcome of the interaction between the nature of the individual, his upbringing and the situation in which he is located, and performance does not appear as a result of forces or pressures stemming from within the individual himself, but as a result of the process of interaction and compatibility between the internal forces of the individual and the external forces surrounding him (Al-Nady et al., 2013; Altarifi et al., 2015; Al-Hawary & Mohammed, 2017; Alshurideh et al., 2022).

Information systems and cognitive technology have developed in recent times, and it has become necessary to have a contemporary and advanced medical information system to compete with the challenges and problems it faces (Alhalalmeh et al., 2020; Al-Hawary & AlDafiri, 2017; Aldaihani & Ali, 2018; Aldaihani et al., 2020; Ghazal et al., 2021). Hence the importance of this research by providing a broad understanding of the issue of the quality of health information systems, as the quality of information systems has become evolving and has practical importance in business management; the health information system is a central force to achieve the desired goal of work (Aburayya et al., 2020b, c; Al-Maroof et al., 2021). Thus, this study comes to fill the literary gap in this field, and the concept of employee performance and its implications on the performance of the organization and the performance of the economy as a whole, which increased the importance of this study, so this study came to clarify the impact of the quality of information systems on the job performance in private hospitals.

2 Theoretical Framework and Hypotheses Development

2.1 Medical Information Systems

The information and communications revolution and its advanced and renewable applications in the third decade of the third millennium, of the twenty-first century, brought about a managerial reality different from what it was in previous decades, and the manifestations of the new reality are manifested in the decline of many intellectual concepts and systems on which previous managerial studies relied, which making modern administrative methods almost irrelevant to the reality of managerial thought and its applications in the past decades (Aldaihani & Ali, 2018; Aldaihani et al., 2020; Taryam et al., 2020).

The information revolution is the tool of globalization for the new global system. These technologies are undergoing radical and profound transformations that have increased the speed of the communication process, so that technical obstacles, political considerations and geographical boundaries are no longer an obstacle to the

developmental tide of this service (Al-Lozi et al., 2018; Aburayya et al., 2020a; Al-Hawary & Al-Syasneh, 2020). The information revolution, with its enormous power and ability, has become the main nerve for all possible changes in various aspects of life in this era (Al- Quran et al., 2020). Information systems are considered one of the most important requirements of this era in all its fields, and its various theoretical and practical aspects, and at all levels and activities related to the performance of organizations, and a major resource of the organization and an important source of its success (Ahmed et al., 2020; Alshurideh, 2022; Tariq et al., 2022).

The rapid development in the medical field and medical services in recent decades has increased the demand for appropriate medical information to make medical and managerial decisions, as health managers and policy-makers need appropriate and accurate information to measure the program's effectiveness and follow-up progress to achieve the desired goals, so the investment in medical information systems will be justified because it helps in improving performance and making decisions regarding the detection and control of medical problems (Abu Qaaud et al., 2011; Al-Hawary & Al-Namlan, 2018; Alolayyan et al., 2018; Mohammad et al., 2014, 2020).

The World Health Organization defines medical information systems as "integrated efforts to collect and process medical data and transform it into information and knowledge for use in decision-making and policy implementation at all levels of medical services to improve its efficiency and effectiveness". Lippeveld (2000) Defined medical information systems as "a set of elements, components and procedures for an organization that aims to obtain information" that supports managerial and medical decisions at all levels of the medical system. Medical information systems are defined as "a group of special computer systems, which are used to provide medical information" Patients and auditors in particular, and the hospital in general, regards to a set of functions that enable investors to enter, maintain and review information, and issue statistics and reports that help in making medical, therapeutic and managerial decisions.

The joint commission on accreditation of hospitals (JCAH) defines it as the degree of adherence to generally recognized contemporary standards of good practice and expected outcomes for a specific service, diagnosis, or medical problem. Good medical services are those that follow the standards and foundations that were followed and taught by the founding leaders of the medical profession in society. Quality of medical care may be defined; as an accessible, safe, responsible and fair medical care. This means that the service provider provides the right care for the right condition at the right time in the right way. Patients easily get care at the right time in an accurate manner, and they have to have full information about the risks in order to avoid unsafe procedures and full information about the benefits of the care they receive, respect the rights of both patients and providers (Al-Hawary & Abu-Laimon, 2013; Al-Hawary et al., 2011). The quality of the medical service is measured by the availability of the five dimensions that Berry et al. reached in the medical service provided by the hospital, and these dimensions are:

Quality of medical information systems are those systems that aim to provide medical information for patients, auditors and the hospital itself, which helps to

make, develop and improve the level of effective medical, treatment and managerial decisions. The quality of medical information systems is the systems with good and specific specifications and characteristics, easy to use and at a high level of accuracy. Good medical information systems are the systems that are able to raise the level of the organization's performance and achieve its goals with the least effort and time (Al-Hawary, 2012; Alzoubi et al., 2020; Zu'bi et al., 2012).

Ease of use: The ability of systems to be used easily in order to achieve a specific goal, and usability also means how efficient those systems, clarity in design, and human interaction with them (Al-Hawary & Al-Smeran, 2017; Alshurideh et al., 2020).

Response time: The time it takes for a system or functional unit to respond to a specific input or is the total time it takes to respond to a service request, which is the sum of the service time and waiting time, which is the time it takes to do the work you requested.

Flexibility: It expresses the extent to which the systems are able and responsive to changes, or it is the ability of the system to absorb disturbances, reorganize, and continue to perform functions with the same efficiency as before.

Ease of learning: The extent to which systems are able to understand, use, deal with, and use them in the correct ways (Al-Hawary & Hussien, 2017).

Reliability: The ability of the systems to perform the required tasks (completely free from technical errors); It is a measure of the period during which the systems can perform their agreed function without interruption. The term reliability can also be used to indicate the extent to which a particular process or function is likely to achieve the outputs required (Al-Hawary & Metabis, 2012).

2.2 Job Performance

There is an increasing interest in the issue of job performance, and the effectiveness and efficiency of organizations in carrying out their functions and achieving the goals for which they were established, whether these are profit or service organizations (AlShehhi et al., 2020; Alsuwaidi et al., 2020). Hence the focus on human resources management and the exploitation of available opportunities and available energies, in order to provide services quickly and with high quality, so that organizations can respond to the needs and expectations of customers, in a way that guarantees them reaching their goals by raising the level of performance to ensure their continuity, growth and development (Zwick, 2006; AlHamad et al., 2022; Shamout et al., 2022).

Job performance is the main axis around which the efforts of organizations focus as it constitutes their most important goals. Organizations expect human resources to perform the functions assigned to them efficiently and effectively. Performance refers to the degree of achievement and completion of the tasks that constitute the job of

the working individual, and it reflects how the individual achieves the requirements of the job, and often there is confusion and overlap between performance and effort, effort refers to the energy expended, while performance is measured on the basis of the results achieved by the individual (Al-Nady et al., 2013; Mohammad, 2020; Al Kurdi et al., 2020). Huang et al. (2015) defines job performance as the achievements of an organization through the goals set and includes the outputs that are achieved or achieved through the contribution of individuals or the team in achieving the strategic goals of the organization.

Willcocks and Smith (1995) defined Job performance as "a continuous process of defining, measuring and developing performance in an organization by linking each individual's job performance and goals with the organization's tasks and objectives in full." We believe that performance is the levels of business achievement, which expresses the extent to which individuals or organizations carry out their responsibilities and tasks using the available capabilities and resources in the best possible way. In other words, it is the outputs and goals that the organization seeks to achieve through its employees, and therefore it is a concept that reflects both the goals and the means necessary to achieve them, that is, it is a concept that links the aspects of activity and the goals that organizations seek to achieve through the tasks and duties performed by the workers in those organizations. They are embodied in the form of useful products and services.

2.3 Medical Information Systems and Job Performance

Al-Gharabawi study (2014) found a positive relationship between computerized health information systems and job performance in UNRWA health centers in the Gaza Strip. Abugabah et al. found an impact of computerized information systems on user performance depends on 4 influencing factors: system quality, information quality, technological components, and human characteristics. This study presented most of the previous evaluation models with an explanation of the similarities and differences between them and the model under development, where the researchers considered that there is a need to develop this model to be a comprehensive model that facilitates the process of understanding the impact of the use of information systems on user performance. Based on the above, the hypothesis of the study can be formulated. as follows:

There is a statistically significant effect of the quality of health information systems on job performance in private hospitals in Jordan.

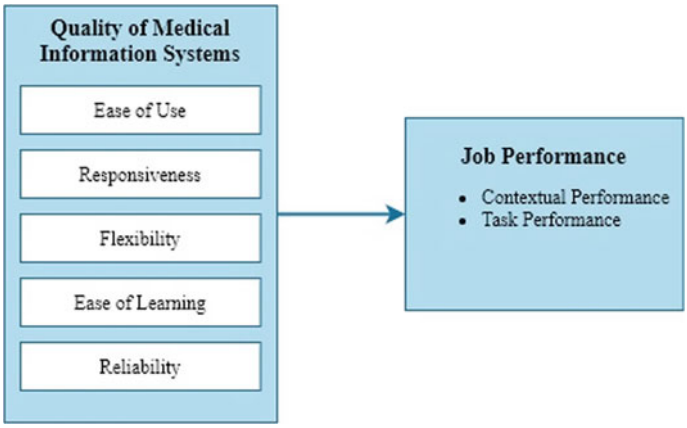

Fig. 1 Conceptual model

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of quality of medical systems on job performance. The study population consisted of all employees with job titles (doctor, nurse, pharmacist, laboratory technician) in private hospitals in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample via email. In total, (205) responses were received including (14) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (191) responses suitable to analysis requirements, where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (23) items to measure quality of medical systems based on (Alshurideh et al., 2017). These questions were distributed into dimensions as follows: five items dedicated for measuring ease of use, four items dedicated for measuring responsiveness, five items dedicated for measuring flexibility, five items for ease of learning, and four items dedicated for measuring reliability. Whereas the second section included eight items developed to measure job performance according to what was pointed by (Al-Hawary & Metabis, 2012).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.615–0.866), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. EU	**0.758**						
2. RP	0.497	**0.725**					
3. FL	0.533	0.538	**0.741**				
4. EL	0.567	0.477	0.443	**0.755**

7. TP	0.702	0.715	0.712	0.699	0.695	0.645	**0.753**
VIF	2.384	1.885	2.642	2.539	1.286	–	–
Loadings range	0.615–0.866	0.692–0.758	0.653–0.791	0.681–0.806	0.724–0.813	0.652–0.816	0.705–0.824
AVE	0.575	0.526	0.549	0.571	0.585	0.543	0.566
MSV	0.506	0.468	0.513	0.498	0.508	0.482	0.510
Internal consistency	0.865	0.815	0.856	0.868	0.845	0.823	0.837
Composite reliability	0.869	0.816	0.858	0.869	0.849	0.825	0.839

Note EU: ease of use, RP: responsiveness, FL: flexibility, EL: ease of learn, RL: reliability, CP: contextual performance, TP: task performance, Bold fonts indicate to square root of average variance extracted

in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 *Structural Model*

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Figs. 1 and 2.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.975, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.046, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study

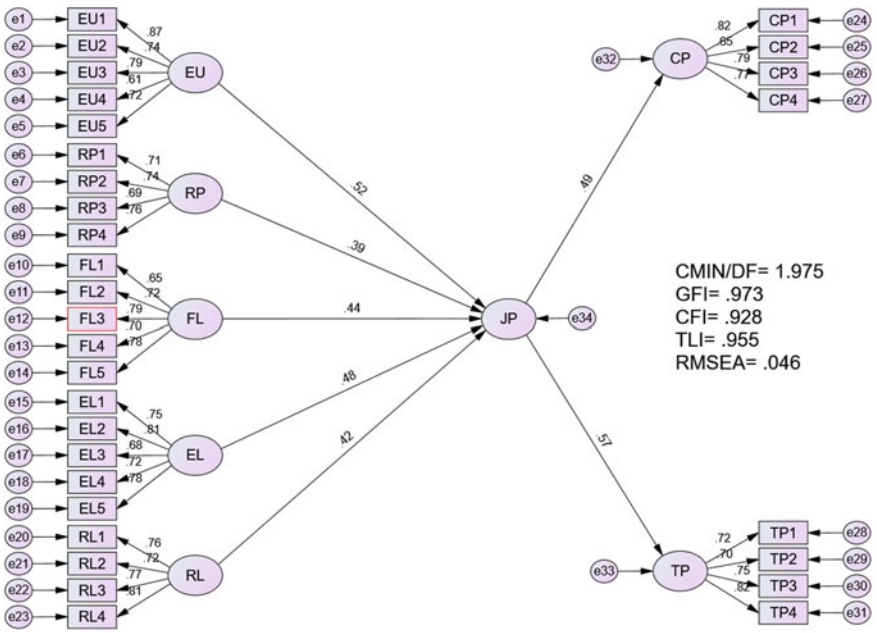

Fig. 2 SEM results of the quality of medical systems effect on job performance

Table 2 Hypothesis testing

Relation	Standard Beta	*t* value	*p* value
EU → JP	0.521	22.68***	0.000
RP → JP	0.394	15.06*	0.03
FL → JP	0.438	18.29**	0.004
EL → JP	0.480	21.74***	0.000
RL → JP	0.423	17.03**	0.002

Note EU: ease of use, RP: responsiveness, FL: flexibility, EL: ease of learn, RL: reliability, JP: job performance, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that the highest impact was for ease of use ($\beta = 0.521$, $t = 22.68$, $p = 0.000$), followed by ease of learn ($\beta = 0.480$, $t = 21.74$, $p = 0.000$), then flexibility ($\beta = 0.438$, $t = 18.29$, $p = 0.004$), then reliability($\beta = 0.423$, $t = 17.03$, $p = 0.002$), and finally the lowest impact was for responsiveness ($\beta = 0.394$, $t = 15.06$, $p = 0.03$). Thus, all research hypotheses were supported based on these results.

6 Discussion

The results showed that the level of quality of medical information systems; Medium, and this indicates that private hospitals are keen to have modern medical information systems with high efficiency, due to their awareness of the importance and effectiveness of the quality of medical information systems. This has a significant and positive impact on the quality of services provided as a whole within the hospital. It was also found that the level of job performance in private hospitals in Jordan is average, attributing this to the stability and job security that hospitals provide to their employees, in addition to the high quality of working life compared to other hospitals working in the same field in the public sector, which increased the level of performance.

The results show that there is an impact of the quality of medical information systems on the job performance in private hospitals in Jordan, and this result can be justified by the fact that most of the work carried out by hospital employees depends mainly on the various applications of the medical information system, as the more varied the information systems used and the higher their efficiency in the implementation of the work, this led to the development of performance and speed of completion. Meaning that the higher the efficiency of the quality of medical information systems, the higher the level of functionality.

The results show that there is an impact of ease of use on the job performance in private hospitals in Jordan. It is evident from the above that a high percentage

of employees consider themselves qualified to deal with the modern system used in the hospital, and this indicates that they have high capabilities in dealing with information, which increases work efficiency and improves job level. It was also found that there is an impact of response time on the job performance in private hospitals in Jordan, and this result is attributed to the use of the various applications of the medical information system inside the hospital, and there is a comprehensive system that computerizes and links all departments and specializations, and it is relied on daily treatment as a form for the sick. The relevance and modernity of the software used serves to meet the user's information needs in a timely manner, which has a significant impact on the completion of tasks and functions and thus improves job performance.

The results show that there is an impact of flexibility on the job performance in private hospitals in Jordan, and the researchers attribute this result to the fact that the information provided by the medical system is commensurate with the needs of the job, and this indicates the follow-up of the senior management and the specialized technical team to the workflow based on the use of the medical system and with periodic feedback in order to develop the system, increase its effectiveness, and make it more compatible with work requirements, thus, job performance is improved. It was also found that there is an effect of ease of learning on the job performance in private hospitals in Jordan, and the researchers attribute this result to the conditions of employment followed by private hospitals, such as subjecting the employee to an exam to measure his computer skills and taking this into account when deciding to hire. Employees possess good levels of computer use as a result of the employment policy inside the hospital that requires tests to measure computer skills, in addition to the good relations linking employees with the specialized technical department, which facilitates understanding the users' needs of the system and addressing the problems they face during their use.

The results show that there is an impact of reliability on the job performance in private hospitals in Jordan, and this result is attributed to the good level of information provided by the medical system, which is commensurate with the needs of the job, in addition to the follow-up of the higher management of the workflow based on the use of the medical system and its effective management, and its implementation and management. More compatible with the work requirements and the flexibility of the hospital's organizational structure, which allows the flow of information easily, and all this has led to an improvement in the job performance.

7 Recommendations

Based on the results of the study, researchers recommend managers and decision-makers in private hospitals in Jordan to hold training courses in the field of using medical information systems for all employees in private hospitals, and to focus on maintaining these courses, and raising their levels in line with continuous technological developments and changes. Implementation of awareness campaigns

targeting employees in the medical fields on the importance of medical information systems in raising the level of job performance and the performance of hospitals in general. Helping the hospital to improve the quality of services provided to patients by increasing staff productivity, speeding up the completion of administrative and medical transactions, facilitating procedures, improving decision-making and reducing errors.

Impact of Human Resources Management Strategies on Organizational Learning of Islamic Banks in Jordan

Ibrahim Rashed Soliaman AlTaweel, Riad Ahmad Mohammed Abazeed, Mohammad Fathi Almaaitah, Dheifallah Ibrahim Mohammad, Doa'a Ahmad Odeh Al-Husban, Sulieman Ibraheem Shelash Al-Hawary, Faraj Mazyed Faraj Aldaihani, Anber Abraheem Shlash Mohammad, and Ayat Mohammad

Abstract The major aim of the study was to examine the impact of Human Resources Management strategies on Organizational Learning. Therefore, it focused on Islamic banks operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of managers via email. The statistical program AMOSv24 was used to test the study hypotheses and achieve objectives. The study results demonstrated that Human Resources Management strategies have a positive impact relationship on Organizational Learning of Islamic banks operating in Jordan. Based on the study

1 Introduction

In light of the great technological advances witnessed by the business world in recent decades, organizations are operating in an environment of intense competition and uncertainty conditions, which in turn led these organizations to research more in ways to deal with these conditions, and to identify the competitors' capabilities and the need of markets (Al-Hawary & Al-Hamwan, 2017; Al-Hawary & Hadad, 2016; Al-Hawary & Ismael, 2010). Organizational learning has become a prerequisite for business organizations to keep themselves updated with technological and competitive developments, Organizational learning involves the ability of an organization to adapt to emerging circumstances in its business environment and its ability to keep up with or compete with its competitors (Al-Hawary & Al-Namlan, 2018; Al-Hawary & Al-Syasneh, 2020). It is necessary to have a system that serves as an early warning for these organizations to predict future changes in their business environment, making the functions, activities and functions of human resources management in business organizations more complex and sophisticated, and need a large amount of data and information that help organizations to make decisions in a manner that supports and achieve its objectives through the management of their resources in an optimal way.

Organizations need to increase the pace of organizational learning to be able to cope with the dramatic changes in the contemporary business environment, and to achieve this; they need to be more open and receive new ideas and concepts (Al-Hawary et al., 2020). They need to innovate products and modern methods, train human resources and encourage innovation and creativity while doing business (Al-Hawary et al., 2018; Alameeri et al., 2021; Nuseir et al., 2021; Alzoubi et al., 2022). Organizations are treating human resources as intellectual energy, a source of information and knowledge, and innovations. They have also increased attention to

these resources and created a healthy environment (Al-Hawary & Aldaihani, 2016; Al-Hawary & Alwan, 2016; AlHamad et al., 2022; Alshurideh et al., 2022). It has also increased attention to these resources and created a healthy environment work (Alameeri et al., 2020; Alshurideh et al., 2019). Despite the increasing importance of the study of organizational learning, and its role in achieving the goals of the organization, the concept of organizational learning has become one of the basic concepts that managers, researchers and practitioners have been interested in enhancing job satisfaction.

Human resources management is one of the most important functions of the organizations, where it performs many tasks, activities and functions that will provide efficient and qualified human resources suitable for the current and future needs of the organization, which should be able to contribute to the achievement of its objectives efficiently and effectively (Al Kurdi et al., 2021; Al-Hawary, 2011, 2015; Shamout et al., 2022). Past and current studies in strategic human resources management have indicated that human resources management already has an impact on the organizational outputs, and several studies have indicated that there is a relationship between human resources management and organizational performance (Huselid, 1995; Arthur 1994 Youndt. et al., 1996; Alkalha et al., 2012). Human resources management practice considered as an important source of competitive advantage (Wright et al., 2001).

2 Theoretical Framework and Hypotheses Development

2.1 Strategic Human Resources Management

The concept of strategic human resources management has played an important and leading role in management research for the past three decades (Boxall & Purcell, 2011). Continuous analysis in the field of strategic human resources management shows how this field has achieved added strategic value and contributed to organizational success. Human resources represent the critical and necessary resources in the performance of the organizations. The integration of human resources management with the organization's strategy results in more organizational effectiveness improves organizational performance and enhances business continuity, improvement and efficiency (Holbeche, 2001; Metabis & Al-Hawary, 2013; Zu'bi et al., 2012).

HRM is defined as a strategic and coherent approach to the management of individuals contributing to the achievement of organizational goals. This term was introduced as an alternative to the concept of people management. Human resources management has taken into consideration the focus on the strategic dimension of human resources management in the organizations, and in order to focus more on the concept of human resources management, the strategic dimension is added to refer

Licensed to (putm@utm.my)

to human resources management as a strategic function not only for building and activating organizations but also for seeking and creating sustainable competitive advantage (Holbeche, 2001; Obeidat et al., 2021), which means that the strategic dimension of human resources management requires to set long-term goals for these organizations, and take plans to allocate their resources for the achievement of long-term goals (Altamony et al., 2012).

Human resource management practices represent an intermediary factor between HRM strategies and HRM outputs (Al-Hawary & Nusair, 2017; Al-Hawary & Shdefat, 2016). Sheppeck and Militello (2000) divided the HRM strategy into four divisions: business skills and policies, supportive work environment, measurement and promotion of performance, and market organization. Guest (1997) divided them into three categories: differentiation through innovation, focus on quality, and decreasing cost. Stavrou-Costea (2005) concluded that effective human resource management may be a necessary factor in the success of the organization, and Lee and Lee's (2007) referred that HRM practices including: Training, teams, compensation and incentives, human resources planning, performance appraisal, and job stability, improve the organizational performance.

Strategic HRM represents a great insight into the integration of HRM functions with both strategic planning and operations in organizations, especially in circumstances where consumers and employees are constantly interacting and communicating. Strategic human resources management can be described as a strategy of an integrated organizational strategy that includes an effective environmental survey that works to achieve the organization's objectives (Nankervis et al., 2005; Schuler & Jackson, 1999). The strategic approach to human resources management requires from the manager of human resources to be responsive to the changes that may occur in the organization and the environment in which the organization operates (Devanna et al., 1981). Wilton (2006) found that large organizations adopt higher levels of HR practices than small organizations.

Strategic human resource management focuses on individuals as means to develop competitive advantage (Barber et al., 1999; Becker & Huselid, 1999). The human resources manager plays an important and critical role in the development of business plans, and strategies to serve the objectives of the Organization (Artis et al., 1999). Highly effective communication and information-sharing between managers and their subordinates reinforces them to engage in strategy formulation and implementation (Barber et al., 1999; Becker & Huselid, 2006). Strategic HRM requires integration of HR practices, and address of these practices as a whole rather than focusing on individual HRM practices (Al-Hawary & Metabis, 2012; Becker & Huselid, 2006; Combs et al., 2006). Integration of human resource practices leads the organization to achieve sustainable competitive advantage, because they are complex, unique, specific, accurate and difficult to imitate by other competitors (Al-Hawary et al., 2013; Pfeffer, 2005; Wright et al., 2003). This study adopts five strategies, which represent three basic functions of human resources management. These strategies are as follows:

Strategy for human resources formation: This strategy is concerned with ensuring timely access to human resources, and retention of the workforce to achieve synergies between performance requirements and organizational conditions of the environment. This strategy is designed in the light of the general human resources strategy with the aim of acquiring a workforce that meets the specifications of personal characteristics, skills and knowledge as well as possessing the ability of career advancement and future professional development. The HR formation strategy consists of a number of sub-activities that are interrelated in an integrated that enables organization to meet the human resources needs according to specific characteristics and traits to fill specific functions, the most important of these functions is the recruitment of human resources and then the selection and appointment of human resources, and these functions are one of the main activities in this strategy. Armstrong (2006: 154) noted that the human resource formation strategy works to provide the Organization with qualified human resource in the right quantity and quality, while sustaining these human resources and in harmony with the culture of the Organization.

Strategy of training and development: Training and development is a cornerstone in the advancement and success of organizations, so training is one of the supporting activities in the organization (Al-Hawary & Abu-Laimon, 2013; Alshraideh et al., 2017). The training activity is responsible for upgrading cognitive skills; this is in addition to the need to pay attention to the external environment and the need to diversify training programs in line with the environment in which the organization operates (Al-Hawary & Al-Kumait, 2017). Training and development department must have a strategic role in the organization, and in the design of the training process to achieve efficiency and efficiency in the completion of the work carried out by the organization in its field. The development and training function represents the next job of the recruitment function, and aims to teach the selected workers during the recruitment process the skills and knowledge necessary to perform the jobs. Training is known as planned efforts. Through development, skills and knowledge are expanded, and in order to achieve the goal of training and development. The skills and knowledge acquired during training must be transferred to practical application while performing tasks and duties (Mondy et al., 2012). The subject of training is one of the most important topics, as the training aims to give the trainees knowledge, skills and attitudes in order to develop their performance and professional development.

Work Quality Strategy: The quality of work life is represented by increasing the participation of employees in the decisions made by managers and reflected in the form of improving productivity through the optimal use of individuals more than money, in addition to improving security and job health, return and job satisfaction and reduce the turnover rate (Moroccan, 2007; Al-Hawajreh et al., 2011). Al-Salem believes that the quality of work life is represented in the positive aspects of the work environment from the perspective of employees. Whenever the management of the organization has overcome the difficulties in achieving the work of its employees, and provides an appropriate organizational environment and climate and respect of the employees, the result of this is the enhancement of the conviction of the employees

and the spirit of loyalty and belonging to the organization, which enhances job satisfaction, and reduces the work turnover in the organization.

Performance appraisal Strategy: This is a function that measures and evaluates the results of employees' performance, which identifies their opportunities for promotion and career path (Al-Hawary& Alajmi, 2017; Al-Lozi et al., 2018a, b; AlShehhi et al., 2020; Mohammad et al., 2020). This function is an incentive for further learning and development to keep pace with requirements and provides feedback on how employees benefit from the training and development they have received. And their need for other training and development programs (Byars, 2006; Alshurideh, 2019; Al Kurdi et al., 2020; Alsuwaidi et al., 2020; Kurdi et al., 2020).

Incentive and Remuneration Strategy: This strategy includes all the financial payments, bonuses and non-financial benefits provided by the organization to the employees for carrying out their work and activities, in order to attract qualified human resources, and maintain what is available in the organization, compensation is one of the most important factors that affect the motivation of individuals to grow, develop and continue Learning. Motivation is a critcal tool for greater productivity and improves the performance of the entire organization and achieves its goals (Al-Lozi et al., 2017; Casio, 2013).

2.2 Organizational Learning

Thomas and Allen define organizational learning as "the process that leads to continuous learning of the organization." Sun and Scott points out that organizational learning expresses "the learning process used in the organization, dealing with the question of how individuals learn within the organization." Hodgkinson argues that organizational learning occurs as a result of individuals' continuous interaction with each other during the learning process, resulting in their acquisition of experience. Farago refers to organizational learning as "all systems, mechanisms and processes used to continuously improve the capabilities of individuals, to achieve specific objectives concerning individuals and the organization." From the above definitions, it is noted that organizational learning reflects a process with specific components and mechanisms. This process is ongoing, as well as the need for interaction to improve the capacity of all members of the organization.

Finger and Brand argues that organizational learning is an activity and the process by which an organization can reach the stage of learning. This process generates new and useful ways of thinking to teach individuals how to work together. As a result of organizational learning, the organization reaches out to what is known as the Learning Organization. Organizational learning may be defined as: the continuous life cycle of the organization and the shared and planned vision to remain within the organizational community through a systematic effort and growing awareness stemming from the knowledge and experience of the leadership of the organization, and its competitive culture and strategy to bring about continuous change through

monitoring information constantly, and to benefit from its expertise and experience and solve its problems to bring it and its personnel to the level that ensures the achievement of its policy, and management goals with the highest degree of efficiency and competition, and take sound decisions and improve Organizational performance.

The real development of the organizational learning concept in the early 1990s by Senge, who introduced the idea of adaptive learning and generative learning (Al-Hawary & Obiadat, 2021). Adaptive learning focuses on adapting to what happens in an organizational environment, this type of learning helps the organization to survive, but does not provide organizational learning. Sun and Scott notes that this type of learning does not require much time and cost. Generative learning builds new capabilities and deliberately discards previous working methods. Generative learning is necessary in the operational aspect of an organization operating in a highly changing environment. This type of learning has high costs. Wijnhoven points out that what distinguishes adaptive learning from generative learning is that adaptive learning relates to simple change that relates to the first stage of the learning process, whereas generative learning relates to the advanced and complementary phase of adaptive learning, which improves the organization's ability to discover abilities to modify behavior and create new knowledge and experience. Organizational learning consists of two dimensions:

Adaptive Learning: This relates to the subordinates' learning of the skills needed to accomplish new business, and the business processes that lead to gradual development in order to ensure that these companies survive and continue.

Generative Learning: It relates to learning in which subordinates are interested in trying to imagine the future of the work that concerns them and try to design, and requires that subordinates have a high degree of autonomy to try good methods.

3 Study Model

See Fig. 1.

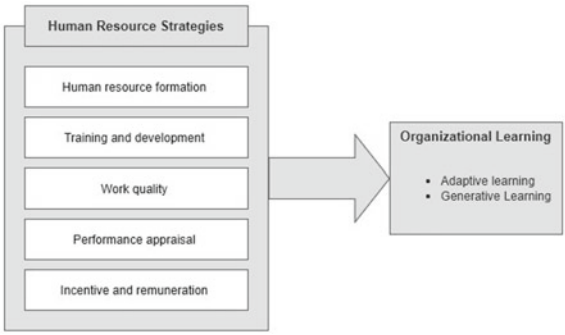

Fig. 1 Research model

H1: There is a statistically significant impact of Human Resources Management strategies on Organizational Learning of Islamic banks in Jordan.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of HRMS on OL. Therefore, it focused on Islamic banks operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of managers via email. In total, (284) responses were received including (9) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (275) responses suitable to analysis requirements, where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (23) items to measure human resource management strategies based on (Al-Hawary & Metabis, 2012; Becker & Huselid, 2006; Combs et al., 2006). These items were distributed into dimensions as follows: items (HRF1-HRF5) were used to measure human resource formation strategy, (TDS1-TDS5) were dedicated for measuring training and development strategy, (WQS1WQS4) were used to measurework quality strategy, (PAS1-PAS4) were dedicated for measuring performance appraisal strategy, and (IRS1-IRS5) were dedicated for measuring incentive and remuneration strategy. Whereas the second section included eightitems developed to measure organizational learning according to what was pointed by Wijnhoven. OL was divided into two main dimensions: adaptive learning (ADL1-ADL4) and generative learning (GEL1-GEL4).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.592–0.881), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018a, b; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (de Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in Fig. 1 (Fig. 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.454, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90.

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. HRF	**0.743**						
2. TDS	0.458	**0.759**					
3. WQS	0.385	0.496	**0.745**				
4. PAS	0.492	0.538	0.513	**0.737**			
5. IRS	0.538	0.506	0.497	0.528	**0.726**		
6. ADL	0.671	0.695	0.711	0.662	0.682	**0.765**	
7. GEL	0.702	0.655	0.680	0.635	0.675	0.698	**0.781**
VIF	3.591	2.663	2.067	3.359	1.938	–	–
LR	0.627–0.833	0.682–0.821	0.607–0.861	0.592–0.837	0.674–0.761	0.702–0.830	0.706–0.881
AVE	0.552	0.577	0.555	0.544	0.527	0.585	0.610
MSV	0.468	0.503	0.394	0.510	0.437	0.462	0.507
α	0.856	0.868	0.829	0.822	0.845	0.848	0.858
ω	0.859	0.871	0.831	0.824	0.847	0.849	0.861

Note VIF: variance inflation factor, LR: loading ranges, AVE: average variance extracted, MSV: maximum shared variance, α: Cronbach's alpha, ω: MacDonald's omega, Bold font refer to $\sqrt{AVE}$

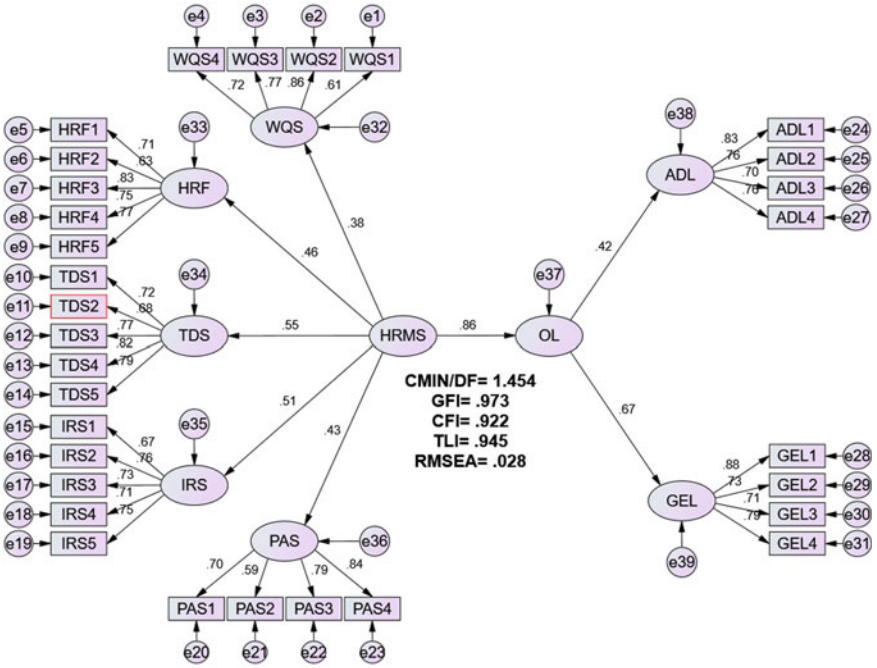

Fig. 2 SEM results of the HRMS effect on OL

Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.028, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019).To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.These results demonstrated that HRMS has a positive impact relationship on OL ($\beta = 0.858$, $t = 41.86$, $p = 0.000$), which justifies support for the study's major hypothesis.

Table 2 Hypothesis testing

Relation	Standard Beta	*t* value	*p* value
HRMS → OL	0.858	41.86***	0.000

Note HRMS: human resource management strategies, OL: organizational learning, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

6 Conclusion and Recommendations

The researcher concludes that companies, through their management, seek to focus on human resources management strategies in order to improve their performance of tasks and achieve their objectives, but they need to make a greater effort in this area, management is convinced of the importance of human resources strategies through working on the formation of human resources (recruitment, selection and appointment), because of its impact on the conduct of its operation, This result is a reflection of the employees' view of the importance of attracting distinguished human resources through evaluation of applicants before choosing to work and then appoint them, as the management is aware of the capabilities of every individual, helping management to identify actions that can be assigned to them. Due to the variety of tasks, the management is keen to select workers with diverse experience.

HR strategies contribute to enhance organizational learning. The function of training and development contributes to the building of organizational learning significantly, which requires strengthening the relationship between training and the development of human resources, because; training includes broad approaches to reshape all human resources management strategies. The results of the study indicate that there is an interest in learning, and the sources of obtaining it from the point that it collects information and data from the departments, and give warning signals about everything that happens in the external environment, and try to deal with it positively, and works to achieve the principle of participation among employees in the expertise and experience they possess, these operations are based on the formal structure owned by organization, and enhance the flow of knowledge through it, in addition to the application, and activation of work teams in most of the operations.

The results of the study showed an impact of human resources strategies (training and development, quality of work life, incentives and rewards) on organizational learning. The results show that there is an impact of training and development strategies, quality of work life, incentives and rewards and no impact of human resources formation and performance evaluation strategies on organizational learning. This result indicates that organizational learning processes need a long time and to be reinforced through incentives and rewards. It also needs a good organizational climate mechanism that leads to the consolidation and validation of information through training and knowledge programs. The result of the study agreed with Al-Kasasbeh et al., Momeni and Pourdsaid and Kumar and Idris (2006).

Based on the study results, researchers recommend managers of Islamic banks in Jordan to develop mechanisms that reward employees for learning new things, in a way that enhances adaptive and generative learning processes, and enhances confidence building among employees which allowing organizational learning processes of both adaptive and generative types. In addition; emphasizing the need to give workers the opportunity to freely choose when carrying out work duties, in a way that achieves competence and flexibility in carrying out work and enhances their satisfaction. Also departments management have to collect information and ideas

from their practical experience in a way that enhances the enrichment of adaptive and generative organizational learning processes, and transfers them to other workers in various departments.

The Impact of Organizational Structure Characteristic on Administrative Communication Efficiency: Evidence from Telecommunication Companies in Jordan

Mohammad Fathi Almaaitah, Doa'a Ahmad Odeh Al-Husban, Riad Ahmad Mohammed Abazeed, Ibrahim Rashed Soliaman AlTaweel, Nida'a Al-Husban, Muhammad Turki Alshurideh, Sulieman Ibraheem Shelash Al-Hawary, Ayat Mohammad, and Anber Abraheem Shlash Mohammad

Abstract The major aim of the study was to examine the impact of organizational structure characteristic on administrative communication efficiency. Therefore, it focused on telecommunication companies operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of managers at different levels via email.

Structural equation modeling (SEM) was used to test hypotheses. The study results showed that organizational structure characteristic has a positive impact on administrative communication efficiency. Based on the results of the study, the researchers recommend managers and decision makers to pay more attention to the dimensions related to the characteristics of the organizational structure (specialization and flexibility) that will affect the enhancement of the level of effectiveness of administrative communication.

Keywords Organizational Structure Characteristic · Administrative Communication Efficiency · Telecommunication companies · Jordan

1 Introduction

Human organization has existed and developed since the dawn of history. Man, by nature, cannot live in isolation from others, so human groups emerged, and these groups did not find a way to organize except by choosing a leader for this group who addresses its problems, settles its affairs and achieves harmony among its members. With the passage of time, organizations appeared that soon played a major role in our daily lives, whether at the level of individual life or on the level of society as a whole or the scope of the economy (Al-Hawary, 2011; Al-Hawary & Al-Hamwan, 2017; Al-Nady et al., 2016). It is difficult to imagine modern societies without these organizations that have spread rapidly to provide goods and services to the public, which calls for studying these organizations, and their structural construction to provide the appropriate conditions for their survival, growth and continuity and creativity, and providing goods and services to the beneficiaries (Al-Hawary, 2015; Al-Hawary & Aldaihani, 2016; Alsharari & Alshurideh, 2020; Bebba et al., 2017). Also, good communication means the blood that runs in the veins of organizations, and lack of effective communication is often the problem of organizations and one of their important obstacles (Aljumah et al., 2021; Alshurideh et al., 2014; Alyammahi et al., 2020). Both sides of the communication process have different desires, trends and needs, and this represents an important obstacle to the success of this process (Alshurideh et al., 2019; Alameeri et al., 2020; Alshurideh, 2022).

Communication can be defined as a social process by which an individual communicates with others to achieve common interests or benefits through cooperation, or conflicts and incompatibility in the event of competition and conflict as a method of dealing (Al-Hawary & Batayneh, 2010). It can also be said that the process of communication, as defined by the Oxford Dictionary, is "the transfer of ideas and information and their communication or exchange by words, writing or sign." Information or ideas are exchanged between a sender and a receiver or a sender and two receivers. When we speak, we want someone to hear us. When we write, we want someone to read us, when we use gestures and smiles, we want someone to receive and respond to them with similar gestures. The importance of the organizational structure in the life and continuity of organizations, whether governmental or private, highlights its interest in dividing and distributing work among individuals and its role in unifying efforts in order to achieve the goals of the organization, preventing overlapping of powers and reducing conflicts over competencies, and its role is also in the optimal use of human competencies in terms of distributing job roles, defining activities and facilitating the process of managerial communication between managerial levels (Al-Hawary et al., 2011; Nuseir et al., 2021; AlHamad et al., 2022; Alshurideh et al., 2022; Shamout et al., 2022). The current study comes to identify the impact of the characteristics of the organizational structure on the effectiveness of administrative communication.

2 Theoretical Framework and Hypotheses Development

2.1 Organizational Structure Characteristics

The issue of the organizational structure has occupied and continues to be an important space in administrative and organizational thought, and it is still receiving increasing attention by thinkers, consultants and managers; this is because it is a vital way to help organizations accomplish their work and achieve their goals efficiently and effectively (Al-Hawary, 2009; Al-Hawary et al., 2012; Agha et al., 2021). Because it is a major variable that affects many variables and organizational aspects of any organization. The attention of thinkers and researchers focused on determining the dimensions of the organizational structure and their relationship to the organizational performance, its efficiency, effectiveness, flexibility, adaptability, and other criteria for the success of organizations that were mentioned in many studies related to measuring the performance and success of organizations (Alhalalmeh et al., 2020; Al-Hawary & Mohammed, 2017; Mohammad et al., 2020; Al-Hawary & AlDafiri, 2017; Kabrilyants et al., 2021). The managerial literature indicated that there is no general agreement on one comprehensive definition of the organizational structure, as the views and concepts they presented varied in terms of comprehensiveness and depth, but they see that the organizational structure is only a means and a tool to

achieve the goals of the organization (Al-Hawajreh et al., 2011; Aburayya et al., 2020).

Robbins defines the organizational structure as "the way in which tasks are organized and the main roles of employees are defined, and the information exchange system is identified and the coordination mechanisms and interaction patterns necessary between the different departments and their employees are identified." Hall believes that the idea of the organizational structure can be similar to the structure of the building that has pillars, walls, ceilings and cabins, and it is this structure that determines the movements and activities of the individuals who are inside it. Daft (1986) defines the organizational structure as a reflection of the organizational map, which is a clear representation of all activities and operations in organizations.

Organizational structure is a complex concept and it cannot be considered as a single element. Some writers link the organizational structure to the chain of authority, the scope of supervision, the division of labor, and so on (Ahmad et al., 2021; Alameeri et al., 2021). As is the difference in defining the definition of the organizational structure, there is a difference in defining its characteristics. Robbins refers to that difference that the organizational structure consists of complex, formal, and centralization. As for the team of researchers from Aston School, they see that the organizational structure consists of formality, specialization and centralization, formality and profiling. In view of the lack of consensus on the main characteristics of the organizational structure, and the opinion of most researchers about the main characteristics of the organizational structure revolved around: (complexity, formality, centralization, flexibility, and specialization), the study will adopt these characteristics as dimensions of the organizational structure, which are as follows.

Complexity: It refers to "the amount and volume of work that reflects lines of authority, verticality, geographical dimension of organizational units, and difficulty of coordination". The organizational structure also represents the number of activities, jobs and departments within the organization, the degree of specialization, division of work, managerial levels, and geographical locations (Al-Hawary & Al-Syasneh, 2020; Mohammad, 2020). The more these elements increase, the more complex the organizational structure. The importance of complexity arises in that when the degree of complexity of the organizational structure increases, the organization's need for communication, coordination and control increases. This places an increasing burden on management towards more communication and better control (Al Kurdi et al., 2020; Alshura et al., 2016).

Formalization: The term formality refers to the extent to which the organization relies on laws, regulations, rules, and directives to pressure the behavior of individuals during work, and the degree of formality may change significantly between organizations and within a single organization, as there are certain businesses that do not need high formality. Formality varies according to the standard of craftsmanship, or the degree of skill, and it also varies according to the managerial levels (Mohammad et al., 2020; Al-Hawary & Shdefat, 2016; Mohammad et al., 2014; Allahow et al., 2018). The nature of work in the management owned by the manager increases as he rises to the top in the organizational structure of the organization.

Centralization: It refers to the degree of distribution of decision-making power in the organization at any level, and the more the decision-making right is limited to the higher levels of the organization, the more this indicates a high degree of centralization in the organization and vice versa (Ahmed et al., 2020; Al-Tarawneh et al, 2012; Harahsheh et al., 2021).

Specialization: It means "the degree of dividing the organization's tasks into separate sub-works from each other. If the specialization is accurate, we will find that each of the workers performs limited tasks, but if the specialization is inaccurate, we find each worker performs a wide range of tasks."

Flexibility: It refers to the ability of the organizational structure to self-change, and it depends on the degree of response in the structure to the processes of change resulting from the internal and external developments and influences imposed by its self-capacity for expansion and absorption (Al-Lozi et al., 2017; Al-Hawary & Al-Syasneh, 2020; Alkitbi et al., 2020).

2.2 Administrative Communication

Studies and research indicate that communication in public organizations represents the lifeblood of these organizations, and the backbone on which they depend to provide their services to all beneficiaries. In this regard, it should be noted that public organizations, in their essence and orientations, are institutions that work for the common good, and not for the benefit of a particular group or party at the expense of others. Therefore, the basis for its survival depends on its ability to communicate with the broad segments of people who find in the services of these institutions a safe and sure haven away from the cases of attrition and waste that result from the behavior of some business organizations (Al-Hawary et al., 2020; Al-Nady et al., 2013; Metabis & Al-Hawary, 2013). Also, public organizations is a term that refers to all institutions that provide goods, services and ideas and provide advice and guidance to citizens based on their orientation to the citizen and their adoption of methods that would advance the society and its members. On this basis, the organizations' orientations are often societal and ethical.

Daft defined communication as: "the use of words, letters or any similar means to share information about a topic or an event." Effective communication means "the occurrence of a perfect match between the meaning sent by the sender and the meaning understood by the receiver. Whereas, efficient communication means that communication takes place at the lowest possible cost, and communication in order to be successful must be efficient and effective at the same time." (Al-Hawary & Metabis, 2012; Al-Hawary & Nusair, 2017; Al-Hawary & Obiadat, 2021). The efficiency of the communication process depends on the extent to which the two parties to the communication (the sender and receiver) understand each other. Some management scholars, in defining the effectiveness of communication, tend to determine the return on behavior that is issued by an individual after the communication, without

paying attention to the individual from whom that behavior originates. Therefore, effectiveness is defined as "a characteristic of the behavior in which you expend energy and have a financial impact."

2.3 The Organizational Structure and the Effectiveness of Administrative Communication

The organizational structure is a mechanism to achieve the goals that organizations seek to achieve, as the organization has been found to achieve certain goals. A good organizational structure helps to focus efforts to link activities with the goals to be achieved, clarify how work flows, and avoid duplication of work and conflict in tasks. The organizational structure serves the organization by enabling it to make optimal use of the available resources, whether financial or human, which leads to an increase in the organization's ability to implement its goals easily and smoothly, facilitating and avoiding overlap and duplication between the various administrative processes and activities, defining the roles of individuals working in the organization, and reducing pressures Work, and contributes to increasing the ability of organizations to deal with internal and external variables that the organization may be exposed to, and helps avoid work differences.

The success of the organization in building a successful organizational structure depends on its ability to work to find an appropriate work environment and its ability to achieve a high degree of adaptation, congruence and harmonization between its organizational structure and its objectives, as well as the efficiency of the human element, and its material resources, this shows the importance of the organizational structure of the organization. Without a good appropriate organizational structure, the organizational processes go in a chaotic manner that is not based on a solid practical basis, as the organization flounders and deviates from its path and its goals, becoming useless and heading for decline, in addition to wasting human and material resources. An inappropriate organizational structure has negative effects in terms of low Morale and motivation of employees, improper decision-making, increased organizational and job conflicts, decreased ambition and creativity, and increased expenditures. Based on the above, the hypothesis of the study can be formulated as follows.

There is an effect of the characteristics of the organizational structure on the effectiveness of administrative communication.

3 Study Model

See Fig. 1.

Licensed to (putm@utm.my)

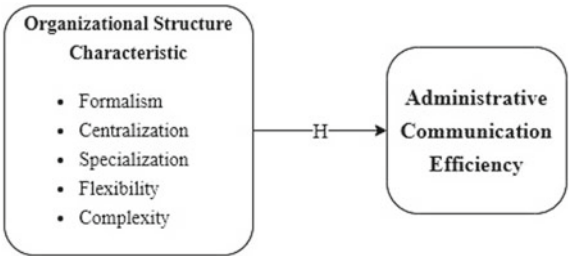

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of organizational structure characteristic on administrative communication efficiency. Therefore, it focused on telecommunication companies operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of managers at different levels via email. In total, (173) responses were received including (18) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (155) responses suitable to analysis requirements, where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (21) items to measure organizational structure based on (Daft, 1986). These items were distributed into dimensions as follows: four items dedicated for measuring formalism (FO1-FO4), four items dedicated for measuring centralization (CE1-CE4), five items dedicated for measuring specialization (SP1-SP5), four items dedicated for measuring flexibility (FL1-FL4), and four items dedicated for measuring complexity (CO1-CO4). Whereas the second section included six items developed to measure administrative communication efficiency (ACE1-ACE6) according to what was pointed by (Al-Hawary & Batayneh, 2010).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.641–0.864), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6
1. FO	**0.769**					
2. CE	0.514	**0.779**				
3. SP	0.442	0.439	**0.756**			
4. FL	0.527	0.495	0.552	**0.774**		
5. CO	0.439	0.537	0.506	0.486	**0.776**	
6. ACE	0.698	0.715	0.708	0.725	0.702	**0.754**
VIF	1.647	1.254	2.778	2.366	2.013	–
Loadings range	0.691–0.884	0.653–0.846	0.642–0.822	0.711–0.824	0.675–0.836	0.641–0.864
AVE	0.591	0.607	0.571	0.598	0.602	0.568
MSV	0.517	0.531	0.492	0.503	0.524	0.484
Internal consistency	0.848	0.854	0.866	0.855	0.854	0.883
Composite reliability	0.851	0.860	0.868	0.856	0.857	0.886

Note Bold fonts refer to square root of average variance extracted

rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in Fig. 2.

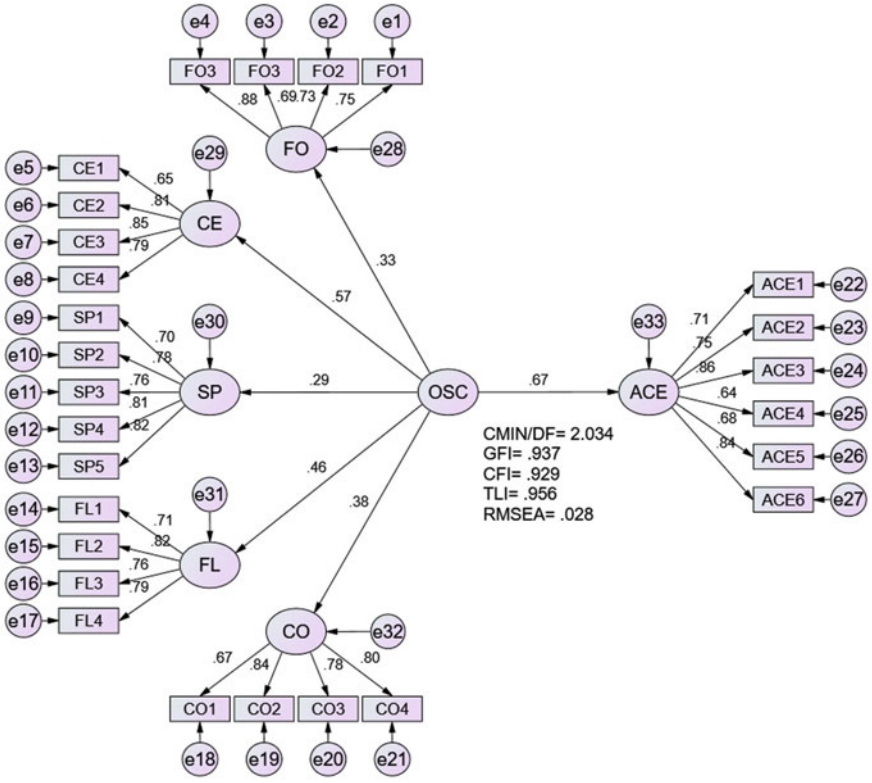

Fig. 2 SEM results of the organizational structure characteristic effect on administrative communication efficiency

Table 2 Hypothesis testing

Relation	Standard Beta	*t* value	*p* value
OSC → ACE	0.675	27.59***	0.000

Note OSC: organizational structure characteristic, ACE: administrative communication efficiency,* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.034, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.028, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019).To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that organizational structure characteristic has a positive impact relationship on administrative communication efficiency ($\beta = 0.675$, $t = 27.59$, $p = 0.000$), which justifies support for the study's major hypothesis.

6 Conclusion and Discussion

The study aimed to identify the effect of the organizational structure characteristics on the effectiveness of administrative communications. The results of the study showed the confirmation of these characteristics, particularly centralization and complexity, as components of the organizational structure, and they represent one of its characteristics. The results of the study indicated that the effectiveness of administrative communication was affected by factors and variables other than the dimensions of the characteristics of the organizational structure. The researchers attribute this result to the fact that there are other factors that may have an impact, including the case of informal structures, or that there are informal groups that play an important role in guiding the communication system.

The results showed that the formal dimension had an effect on the effectiveness of administrative communications. The researchers attribute the reason for this to the fact that the formality applied in the private sector is less compared to the public sector, since business organizations follow the approach to achieving profit, which requires open relations between the parties, which makes formality less effective in influencing the effectiveness of administrative communications. The results showed that the centralization dimension has an impact on the effectiveness of administrative communication. The researcher can explain this on the grounds that organizational

structures in business organizations follow a horizontal communication pattern that allows a kind of delegation to act in situations that do not require the intervention of senior management. This appears through the activities and processes carried out by the middle and lower departments of reporting and defining the duties entrusted to managers. It is clear from the results that the dimension of specialization has an impact on the effectiveness of administrative communication. The researchers attribute this result to the fragmentation of business that characterizes the organizational structure, in addition to the decrease in the number of working departments, in order to reduce the costs involved, as the private sector announces the principle of efficiency and effectiveness and not the principle of social goals.

The results indicated that the flexibility dimension has an effect on the effectiveness of administrative communication. From the researcher's point of view, this result is due to the fact that business organizations operate in an unstable environment, which makes the response to the environment highly dynamic, in addition to keeping pace with technological developments. The results indicated that the dimension of formality has an impact on the effectiveness of administrative communications, which means that the lines of communication between the various departments and departments affiliated to it are somewhat unclear to a high degree due to the interference of stakeholders in many activities and operations. It is clear that the complexity dimension has an impact on the effectiveness of administrative communication. This indicates that the organizational structure does not have a large number of administrative levels, which means that the vertical differentiation in the organizational structure does not exist, as well as that the horizontal departments are not a large number, which means that the horizontal differentiation is one of the components of the organizational structure.

7 Recommendations

Based on the results of the study, the researchers recommend managers and decision makers to pay more attention to the dimensions related to the characteristics of the organizational structure (specialization and flexibility) that will affect the enhancement of the level of effectiveness of administrative communication, and to try to pay attention to the dimensions related to the effectiveness of administrative communication and study them at the individual level and at the organizational level as a tool to measure the extent to which the administrative communication system has been verified and its effectiveness to achieve the set goals, In addition to raising awareness and the participation of managers in decision-making, especially with regard to the administrative communication system to increase its effectiveness through the selection of the communication system, lines of communication and effective means of communication, and preparing managers to improve the communication system as an administrative approach. And finally, designing the organizational structure in a way that achieves the effectiveness of administrative communication and facilitates

the process of administrative communication between the president and subordinates in all directions.

Develop a Causal Model for the Impact of Critical Success Factors of the Strategic Information System in Promoting Human Resources Management Strategies in the Social Security Corporation

Kamel Mohammad Al-hawajreh, Muhammad Bajes Al-Majali, Menahi Mosallam Alqahtani, Basem Yousef Ahmad Barqawi, Sulieman Ibraheem Shelash Al-Hawary, Enas Ahmad Alshuqairat, Ayat Mohammad, Muhammad Turki Alshurideh, and Anber Abraheem Shlash Mohammad

Abstract This study aimed to analyze the impact of critical success factors of strategic information system on the strengthening human resources management strategies in the Social Security Corporation. The study population was made up of 120 members of the directors and chiefs of sections of the Social Security Corporation. Structural equation modeling (SEM) was conducted to test hypotheses. The study found a statistically significant impact of the critical factors of the strategic information system on the human resources management strategies of the Social Security Corporation. The study recommended that attention should be given to

strengthening top management support for its important role in strengthening human resources management strategies and the strategic information system.

Keywords Strategic Information Systems · Human Resources Management Strategies · Social Security Corporation · Jordan

1 Introduction

Information is a basic pillar for the effectiveness of decisions in the organization, and for the success of the strategic information system, it is necessary to identify the critical success factors for the strategic information system, which is one of the important and necessary means for the development and distinction of organizations, which in turn constitutes a basic process for the success or failure of the strategic information system, which must be adhered to and taken into consideration (AlTaweel & Al-Hawary, 2021; Al-Hawary & Al-Syasneh, 2020; Al-Quran et al., 2020; Al-Hawary et al., 2020; Al-Hawary & Obiadat, 2021; Allahow et al., 2018; Al-Hawary & Alhajri, 2020; Altarifi et al., 2015; Al-Hawary & Hussien, 2017; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Ismael, 2010).

Since the human resource is considered one of the main and necessary resources for any organization, and this resource is the first responsible for the implementation of all functions and activities related to the organization, therefore, this resource is the main nerve for organizations (Alhalalmeh et al., 2020; Hijjawi & Mohammad, 2019; Al-Hawary, 2015; Al-Lozi et al., 2017; Al-Hawary & Mohammed, 2017; Al-Hawary et al., 2012; Al-Hawary, 2009), and in order for these human resources to accomplish their various activities, they urgently need to find strategies to manage human resources and support them through a strategic information system capable of processing data and information and supporting the decision maker in achieving and completing various activities in organizations in general and the Social Security Corporation especially (Abu Zayyad et al., 2021; Alaali et al., 2021). Therefore, there is a link between the completion of the tasks and activities of the management of the organization and its various activities, especially the strategy and the strategic information system in the organization, where the information system and human resources are an integral part of the strategies that organizations must care about and interact with to achieve the vision and objectives of the organization, it plays an

important and essential role in achieving the success and distinction of organizations (Al-Dmour et al., 2021; Alzoubi et al., 2022).

Human resource management strategies are indispensable in all business organizations, as they need to provide comprehensive strategic information, and this information is a capital resource for organizations, which in turn leads to an increase in the effectiveness of human resource management outputs, to achieve this, an efficient and effective strategic information system must be harnessed through commitment by the organization to identify the critical success factors for this system (Alameeri et al., 2021; Al-Hawary & Al-Namlan, 2018; Alshurideh et al., 2019a, b). Human resources are considered a very important main element and they play an important and essential role in achieving the success and distinction of organizations, and the effectiveness of human resources management strategies greatly contribute to this, so it is necessary to pay attention to these strategies by the organization to ensure the achievement of excellence and provide high levels of performance (Alkalha et al., 2012; AlHamad et al., 2022; Alshurideh et al., 2022).

The effectiveness of human resource management strategies is determined by understanding the organization's internal and external environment, its requirements and basic variables (Al Kurdi et al., 2021; Shamout et al., 2022). To achieve this, a strategic information system must be harnessed and work to identify the critical success factors for this system. Given the social and economic importance of the Social Security Corporation, this importance has raised in the mind of the researcher the importance of having an effective system for human resource management as it represents the cornerstone in all the activities carried out by this national institution, and from this point of view, and to determine the effectiveness of the management strategies Human resources applied in the Social Security Corporation. The researchers conducted a number of interviews with a number of department heads at the various administrative levels in the Social Security Corporation and it was found that there is a lack of awareness among managers of the concept and application of a number of human resource management strategies, in addition to a lack of awareness of the importance of critical success factors for the strategic information system applied in the institution. This study seeks to identify the role of critical success factors for the strategic information system in enhancing human resource management strategies in the Social Security Corporation (Al-Dmour et al., 2021; Ashal et al., 2021; Ben-Abdallah et al., 2022).

2 Theoretical Framework and Hypotheses Development

2.1 Critical Success Factors of a Strategic Information System

The critical success factors are among the necessary topics in management literature in general, and information systems literature in particular. With regard to applications in the field of information systems, it should be noted that strategic information systems are in themselves one of the most important critical success factors in the life of organizations (Al-Taie and Al-Khafaji, 2009; Altamony et al., 2012).

Critical success factors play an important role in the failure or success of the information system and the organization, as they contribute significantly to helping business organizations identify information systems that need to be developed, and they also serve as a planning tool for information systems and help direct the efforts of business organizations towards developing and using strategic plans In identifying the critical issues accompanying the implementation of plans and directing the resources that are under the authority of managers towards important areas (Al-Zoubi, 2005; Alzoubi et al., 2021a).

Information system refers to a system for converting inputs or data from internal and external sources into information and communicating this information to managers at all organizational levels, and at all functions to enable and support managers in making successful and effective decisions in a timely manner to plan, direct and control the activities for which they are responsible (Esmeray, 2016; Svoboda et al., 2021).

Researchers and those interested in the field of strategic information systems agreed that this system represents the most important and main source for improving business competitiveness in an era when information and knowledge has become the most important, basic and decisive economic resource to ensure growth, survival and prosperity in the business environment, and understanding the competitive environment with its variables, dimensions and movement is the main premise and the basis for building, developing, enhancing and sustaining competitive advantage.

The strategic information system makes a substantial contribution to achieving this goal only when this system achieves strategic harmony and integration with other business resources, specifically the organization's strategy and infrastructure (Alzoubi et al., 2021b; Tariq et al., 2022). Obviously, the importance of any information system is determined by its output level, meaning the level of use, benefits, results, or achievements that result from, from this point of view, the importance of strategic information systems stems from the role of its outputs (strategic information) that the organization's strategic management needs to carry out its activities and activities efficiently and effectively, this information is of a special nature as that information necessary for making strategic decisions at the level of the organization (Masrek et al., 2009).

Researchers differed in defining a specific and agreed concept of critical success factors, as a result of differing opinions and viewpoints in addition to the difference

in the cognitive orientations of researchers, as (Syed et al., 2018) indicated that organizations that are interested in identifying critical success factors, this gives them the ability to develop its business, improving its competitive position, and achieving its planned organizational goals, since these factors represent important areas of focus, in addition to the fact that understanding these factors helps organizations to effectively confront risk situations, and thus enhances their ability to invest available opportunities in the future, and focus on identifying strengths and weaknesses in job.

Olszak and Ziemba (2012) believes that the critical success factors represent the processes, systems, and policies that organizations meticulously pursue to achieve a high and distinctive competitive position in the market and to adopt a certain type of mechanisms and methods that achieve success, growth and development for the organization as a competitive strategy and strategic position. Ranong and Phuenngam (2009) defined the critical success factors as the sum of results and the elements that help the organization to obtain effective and successful competitive performance, as there is a certain sequence of steps that must be followed to achieve the effectiveness and success of the organization, if the organization reaches unsatisfactory results, this indicates that there is a failure in the efforts made by the organization.

One of the main objectives achieved by the critical success factors is to adequately ensure the effectiveness and success of any organization, and to maintain a distinguished level of performance to implement its operations. Al-Abadi and Al-Atabi (2014) pointed out that the critical success factors are those vital factors and elements identified by the senior management for the success of the organization's strategic plan and the achievement of its goals, mission and distinction in the organization's internal and external environment.

Among the most prominent dimensions of the critical success factors for a strategic information system: **The commitment of senior management to support the strategic information system**, it has been described as representing the level of importance that management places on the successful completion of the information system, and in general, the commitment of senior management to support the strategic information system refers to the emotional or psychological commitment shown by senior management towards the information system. **Interaction between the beneficiaries of the strategic information system and its specialists**, It is represented in the level of coordination, communication, partnership and teamwork between the beneficiaries and specialists in the information system in terms of the amount and quality of communications and the exchange of ideas between them and the nature of the activities carried out by them. The beneficiaries and specialists must focus on the main objective of having a sound and effective strategic information system in order to interact appropriately. **The level of readiness of workers in the system**, it refers to the organization's ability through its employees to achieve successful adoption, use and benefit from information technology and systems (Fathian et al., 2018). **Users understand system requirements**, it is represented by the extent to which users understand the objectives, tasks and outputs of operations related to the information system, i.e. knowledge and comprehensive and integrated understanding in the field of information systems**.**

2.2 Human Resource Management Strategies

The idea of human resource management strategies in nomenclature and content was formed at the beginning of the nineties of the last century, basing its existence on the ideas that came from the Human Resources Management School; it did not cancel the previous ideas, but tried to add to it what could enhance its work at the present time. The directions of this new label for human resource management can be understood in the human resource management strategy by asking the following question: "How can coordination between human resource management activities and the organization's strategy?" (Al-Hawary & Alajmi, 2017).

Human resource management strategies are one of the most important elements of the success of the organization's strategies. It is not possible to find a strategy for an organization without including the human resource strategy, as goals can only be achieved through the human element as leaders or as subordinates in the organization (Jleida & Samir, 2018; Al-Hawary & Al-Hamwan, 2017; Al-Nady et al., 2013, 2016; Al-Hawary & Hadad, 2016). The strategy is defined as a set of procedures or behaviors that show how the organization will move from the activity in which it is currently working to the activity in which it hopes to work in the future, bearing in mind external opportunities and threats, and internal strengths and weaknesses (Dessler, 2015). From another point of view, the strategy is defined as a long-term plan taken by the organization as a base for making decisions based on its identification of its current and future mission. It is based on defining the range of products and markets it deals with, the uses of the resources available, the competitive advantage it enjoys, and the impact of compatibility between its various administrative functions and business activities, in order to achieve the organization's internal cohesion and enable it to move freely and adapt to what links it to its external environment and to reach its basic goals and objectives in a balanced manner (Alameeri et al., 2020; Alshurideh et al., 2019a, b; Schrager & Madansky, 2013).

The strategies of human resource management gain great importance through its contribution to the preparation and implementation of the organization's strategy, such as attracting experienced and competent workers, training and developing employees, motivating them and mobilizing their energies towards making more efforts and creativity to achieve the organization's goals and increasing its ability to gain opportunities and avoid environmental threats, as well as its ability to make optimal use of the organization's financial and material resources in line with the general strategic directions of the organization (Matei, 2013; Shah et al., 2020, 2021). The main objective of human resource management strategies is to attract creative human talents with experience and efficiency and try to take care of these talents and preserve them through their development, training, development, motivation and protection of their interests in order to achieve the ambitions and goals of the organization efficiently and effectively.

The researchers' viewpoints varied regarding the number of strategies that make up the human resource management strategy, as well as their nomenclature. Accordingly, the researcher decided to address the following strategies, which he looked at

in terms of their importance in the organization in which the study was applied and were as follows: **The recruitment strategy** is considered the most important among the human resource management strategies, as the construction and implementation of this strategy and the quality of the human resources employed result in the rest of the organization's functions, and thus the quality of the organization's performance as a whole (Al-Hawary & Nusair, 2017; Lee et al., 2022a, b). **Training and development strategy** refers to the administrative and organizational efforts related to the state of continuity aimed at making a modification in skills, behavior and knowledge within the current or future characteristics of the employee in order to be able to meet the requirements of his work or to better develop his practical performance in order to achieve the goals of the organization (Al-Hawary, 2011; Alshraideh et al., 2017). The **performance evaluation strategy** is defined as the organized description of the strengths and weaknesses associated with the job, whether collectively or individually, and serves two main purposes in the organization: providing managers and workers with the information necessary for decision-making, and improving and developing the performance of employees, which is positively reflected on the performance of the organization (Al-Hawary & Abu-Laimon, 2013; Al-Hawary et al., 2013; Lim et al, 2017). **Compensation strategy** is a system related to wages, rewards, incentives, and benefits that the organization provides to employees within certain bases in return for the employees' completion of their job tasks so that the compensation system is characterized by justice and equity and aims to attract human competencies and preserve human talents within the organization (Metabis & Al-Hawary, 2013; Mohammad et al., 2020).

2.3 Strategic Information Systems and Human Resource Management Strategies

Hammadi (2020) concluded that there is a relationship between human resource management strategies and strategic success in organizations, and that the information technology component of strategic information systems has a significant impact on competitive advantage. Holding training courses for new employees to qualify them in the field of practices related to the application of software because of their role in improving their efficiency and effectiveness. Al-Tayyar and Al-Nama (2018) emphasized that the inputs of strategic information systems and the sources of obtaining them, whether internal or external, are considered the main source of information used in making important decisions in the organization, as well as trying to reduce the difficulties facing the decision maker by using the strategic information system to provide the appropriate information to the decision maker when making strategic decisions, as well as using software to support the strategic decision (Youssef & Yahia, 2018).

That senior management adopts effective policies and vision in highlighting the role of critical success factors for information systems to achieve sustainable competitive advantage with the presence of environmental sensing. Al-Samarrai believes that there is a need for the company's management to invest in the strong positive relationship between the commitment of senior management to support the strategic information system and the effectiveness of the strategic decision to achieve more of this effectiveness and to make it more competitive. There is strong evidence that strategic information systems support and enhance the company's ability and flexibility to find competitive strategies in response to external environmental changes and that the effects of strategic information systems on the company's performance vary based on the competitive strategy. Accordingly, the study hypothesis can be formulated as follows.

There is a statistically significant effect of the critical success factors of the strategic information system in enhancing the strategies of human resources management in the Social Security Corporation.

3 Study Model

See Fig. 1.

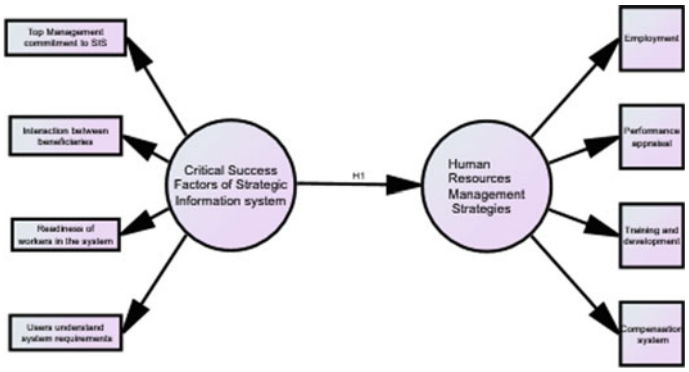

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A quantitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of critical success factors of strategic information system on reinforcement of human resources management strategies in the Social Security Corporation. Data were primarily gathered through the questionnaires created by researchers which were distributed to a random sample of (165) respondent. In total, (145) responses were received including (25) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (120) responses suitable to analysis requirements that were formed a response rate of (82.76%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (22) items to critical success factors of the strategic information system based on. These questions were distributed into dimensions as follows: five items dedicated for measuring Senior management commitment to support the strategic information system, six items dedicated for measuring Interaction between beneficiaries, five items dedicated for measuring readiness of workers in the system, and six items dedicated for measuring users understand system requirements. Whereas the second section included (20) items developed to measure human resource management strategies according to what was pointed by (Lim et al., 2017). This variable was divided into four dimensions: employment that was measured through five items, performance appraisal which measured by five items, training and development was measured using five items, and compensation systems that was measured by five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv26. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.573–0.654), these values greater than the minimum retention of the elements based on their standard loads (Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (de Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1 (Fig. 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.133, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90.

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7	8

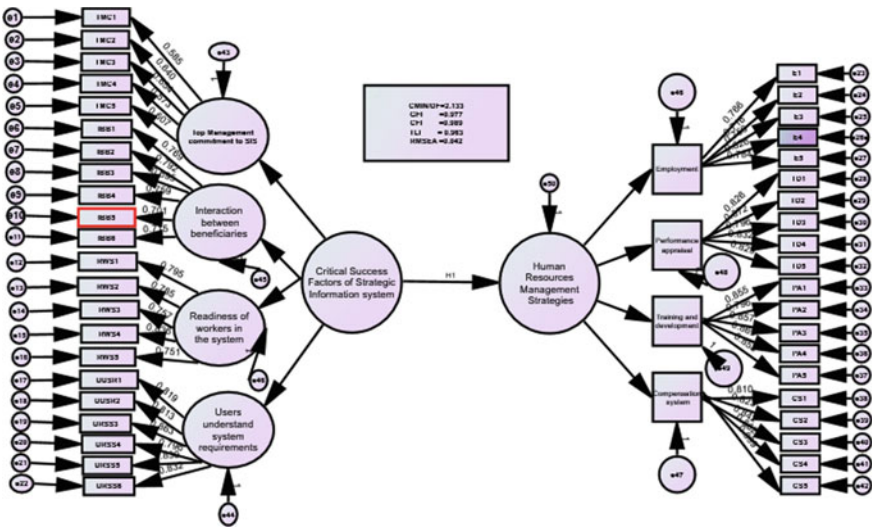

Fig. 2 SEM results of the digital marketing effect on mental image

Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.049, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all critical success factors of the strategic information system dimensions have a positive impact relationship on human resources management strategies except Top management commitment to

Table 2 Hypothesis testing

Hypothesis	Relation	Standard Beta	*t* value	*p* value
H1	Top management commitment to support the strategic information system → human resources management strategies	0.084	1.041	0.300
H2	Interaction between the beneficiaries of the strategic information system → human resources management strategies	0.246	3.260	0.001
H3	The level of readiness of workers in the system → human resources management strategies	0.272	3.411	0.001
H4	Users understand system requirements → human resources management strategies	0.352	3.921	0.000

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

support the strategic information system which has no impact on human resources management strategies ($\beta = 0.084$, $t = 1.041$, $p = 0.300$). However, the results indicated that the highest impact was for combination ($\beta = 0.352$, $t = 3.921$, $p = 0.000$), followed by socialization ($\beta = 0.272$, $t = 3.411$, $p = 0.001$), and finally the lowest impact was for internalization ($\beta = 0.246$, $t = 3.260$, $p = 0.001$).

6 Discussion

The results concluded that the Social Security Corporation adopts the critical success factors of the strategic information system, which are the interaction between the beneficiaries of the strategic information system and its specialists, the level of readiness of workers in the system, and the users' understanding of the system's requirements, it enhances the organization's management's interest in these factors because of their impact on the management of the organization's business from the strategic side, especially in the aspects of interaction between users and users' understanding of the aspects and operations of the information system, as well as the level of readiness of workers in the system to work. The critical success factors of the strategic information system enable the Social Security Corporation to practice recruitment activities (recruitment and appointment) in the various departments of the Human Resources Department and in a manner that enhances the possibility of creating databases that serve these activities and in a manner that enhances the possibility of obtaining the highest competencies and in order to achieve the strategic objectives of the Social Security Corporation**.**

The results confirmed that the management of the Social Security Corporation considers the interaction activities between the beneficiaries of the strategic information system and its specialists, and the level of readiness of the workers in the system from the normal routine activities in the institution and not from the strategic activities at the level of the Social Security Corporation. In addition, the Social Security Corporation exercises its internal tasks and operations with the aspects related to the performance evaluation strategy and related to the keenness of these leaders to give the process of evaluating the performance of workers great importance as it contributes to spreading the spirit of competition among workers and uses the results of performance evaluation to determine the training needs in the Social Security Corporation and to determine promotions And bonuses, and follow-up on the performance of employees by comparing the previous performance with the current performance at the level of departments and sections in the Social Security Corporation.

The results showed that the Social Security Corporation exercises its internal functions and operations in the aspects related to the compensation systems strategy in a tight manner through information systems and linking it to the performance evaluation and training strategy related to the keenness of these leaders to give the compensation systems strategy great importance as it contributes to formulating and

determining the strategy of wages, rewards and compensation that achieves satisfaction**,** and the use of this strategy in determining the levels of workers' achievement of their tasks in a way that qualifies them to determine the type of reward, in addition to the Social Security Corporation's reliance on the information provided by the performance appraisal system to determine the rewards and incentives that outstanding workers deserve, in addition to the Social Security Corporation conducting continuous wage surveys And salaries for the purpose of linking them to the cost of living.

7 Recommendations

Based on the previous results, the researchers recommend the need for the management of the General Organization for Social Security to pay attention to the commitment of the senior management to support the strategic information system, as it represents one of the critical success factors for the strategic information system. The study recommends that leaders in the organization strengthen the performance evaluation strategy because of its impact on enhancing many activities related to human resource management and linking them to strategic information systems to benefit from them in activating electronically and increasing the speed in making strategic decisions, and the need for the institution to pay attention to the recruitment strategy because of its reflection in attracting and employing competencies from human resources and working to link them electronically in terms of recruitment and models, leading to appointment in vacant positions in the institution.

Factors Affecting Local Employees Sectorial Choice (Public vs Private), the Case of Abu Dhabi, UAE

Mohammad Mousa Eldahamsheh, Main Naser Alolayyan, Hanan Mohammad Almomani, Ali Zakariya Al-Quran, Fuad N. Al-Shaikh, Mohammed Saleem Khlif Alshura, Menahi Mosallam Alqahtani, Sulieman Ibraheem Shelash Al-Hawary, and Anber Abraheem Shlash Mohammad

Abstract The purpose of this research study was to explore the factors that affect emirates employee sectorial choice (public vs private). And, to examine if there is a difference between these factors related to local employees working in the public sector and the private sector. A quantitative approach was deployed in this study to determine the most important factors that affect local employees' career choice

toward the private sector. The population of this study was the work force in the state of Abu Dhabi, those whom are employed in the public sector and in the private sector. Simple random sampling technique used to choose appropriate sample from this population. From each sector a random sample has been chosen from different industry that falls under the public sector and the same procedure has been followed for the private sector. The statistical tool used for the purpose of this study was Chi-square. Chi-square analysis is used to check for differences in the categories between the two samples. This study reveals the difference between public sector employees and private sector employees and their job characteristics. The public sector employees experience more autonomy and feedback than their colleague in the private sector. The study provided practical and theoretical recommendations.

Keywords Local employees · Sectorial choice · Abu Dhabi · UAE

1 Introduction

Career choice is considered the most important decision job seekers face. Choosing a career is not an easy decision, as this decision will affect their satisfaction, motivation, turnover, earnings, and productivity (Gagné & Deci, 2005; Alameeri et al., 2020; Allozi et al., 2022). In contrast, choosing the right career will increase productivity, and reduce turnover, and job burnout (Al Kurdi et al., 2020a, b). In this regard many theories were established to explain how people make their career choice. For example, Holland theory of vocational types, Super's developmental self-concept theory, Roe's personality theory of career choice (Osipow & Fitzgerald, 1996), social cognitive career theory (Brown, 2002), and the theory of planned behavior (Ajzen, 1991) provide an explanations of how people chose their career from different perspectives (sociological, personality, self-concept…etc.).

Switching between careers is sometimes considered an easy decision to make, but sometimes it is a difficult decision, especially when the opportunity to find another job is limited and competitive (Al Kurdi et al., 2021; Hansen, 2012; Hayajneh et al., 2021). In the Middle East area in general, and in the Gulf region specifically, job seekers prefer to work for the government (Al-Waqfi & Forstenlechner, 2012). United Arab Emirates is one such country in the Gulf region with employment rates that reveal high rates of people who prefer to work for government. According to Aldhaheri et al. (2017) in the United Arab Emiratis the employment rate in the government for locals is 89%, while only 11% are working in the private sector. Many factors affect employee's career choice. A number of studies have shown that many factors affect employee preferences for career and sector (private or public), factors such as job motivations, job characteristics, social influence (Albugamy, 2014; AlShehhi et al., 2020) and employer branding (Moroko & Uncles, 2008).

The private sector in the United Arab Emirate is currently suffering a shortage of Emiratis employees (Al-Waqfi & Forstenlechner, 2012). The majority of Emiratis target public sector as their preferred employment destination (Aldhaheriet al., 2017).

Licensed to (putm@utm.my)

Local job seekers in this country prefer to stay in unemployment pool for years to get a job in the public sector rather than starting immediate job in the private sector. The future policy of the country is to minimize dependence on oil as the main source of income, and finding other sources of income, such as depend on the service and production sectors.

This study is considered the first quantitative large-scale testing research for Emirates employment sectorial choice and the factors affecting their career choice preferences toward the private sector versus the public sector. Al-Waqfi and Forstenlechner (2012) in their research paper highlighted the need for quantitative research on local's job seekers in United Arab Emirates. Research also needed to explore external factors for job seekers career choice (Aldhaheri et al., 2017). The research added to the body of knowledge in career choice by examining job motivations, job characteristics, employer branding, and social influence. In addition, this study fills the gap in the literature that largely ignored the differences between the public sector employees and the private sector employees regarding their sectorial choice.

2 Theoretical Framework and Hypotheses Development

2.1 Career Choice

Career choice is considered a very critical and complex decision for each human being (Alshurideh, 2016; Alshurideh et al., 2015a). The stage in person's life in which he/she will transfer from dependent to independent person, where people think about their future and what they want to be (Alshurideh, 2019; Alshurideh et al., 2015b). A number of studies have shown that many factors affect employee preferences for career and sector (private or public), factors such as job motivations, job characteristics, social influence (Albugamy, 2014; Almazrouei et al., 2020; Alshurideh et al., 2019) and employer branding (Moroko & Uncles, 2008).

2.2 Factors Affect Employee Preferences for Career and Sector

Job Motivations: Motivations are considered an important factor for employees; when employee gets motivated, he/she will be able to do his job in more efficient and in effective manner. Job motivation (Al-bawaia et al., 2022; Alshurideh, 2022; Ammari et al., 2017). According to George and Jones (2012, p. 157) "can be defined as the psychological forces within a person that determine the direction of that person's behavior in an organization, effort level, and persistence in the face of obstacles". The differences in motivation between public and private sector employees have been discussed in many research articles (Al Shebli et al., 2021; Al-Hawary, 2015;

Al-Hawary & Abu-Laimon, 2013; Al-Hawary et al., 2020). Many of these studies focused on two different types of motivations, intrinsic and extrinsic motivations (Al-Hawary & Al-Namlan, 2018; Al-Hawary et al., 2013; Bettayeb et al., 2020; Metabis & Al-Hawary, 2013; Rashid & Rashid, 2012). According to Rayn and Deci (2000, p. 55) " *intrinsic motivations*, which refers to doing something because it is inherently interesting and enjoyable, and *extrinsic motivations,* which refers to doing something because it leads to a separable outcome". Thomas (2009) in his book indicated four types of intrinsic rewards or motivation; the four main intrinsic rewards are: sense of meaningfulness, a sense of choice, a sense of competence, and a sense of progress. Other studies indicated different types of extrinsic motivations, such as financial rewards (Al-Hawary, 2011; Al-Hawary & Nusair, 2017; Ng et al., 2016) prestige (Ng et al., 2016), pay (Lewis & Frank, 2002; Al-Lozi et al., 2018; Al-Hawary & Alajmi, 2017; Al-Hawary et al., 2020; Mohammad et al., 2020). Similar to Ng et al. (2016) and Dur and Zoutenbier (2015) found out that intrinsic motivations for public sector employees are stronger than private sector employees. However, Dur and Zoutenbier (2015) stated that altruism and laziness are more prevalent in the behavior of public sector employees. Extrinsic and intrinsic motivations were considered very important for both employees (public and private sectors); still, public employees' value extrinsic motivations more than private sector employees (Maidani, 1991).

DeSantis and Durst (1996) and Alsuwaidi et al. (2020) found out that pay is considered very important factor for choosing between public and private sector, especially between young employees, which prefer the private sector. Dan (2015) found out that there are no differences between employee benefits and the sectorial choice. Public sector employees were less concerned about financial rewards than private sector employees (Alshurideh et al., 2014; Rashid & Rashid, 2012). In contrast, Lewis and Frank (2002) argued that employees prefer the public sector because of the high security. Based on the above literature, the study hypotheses can be formulated as:

H1: There is a difference between extrinsic motivations and employee sectorial choice (Public vs Private).

H2: There is a difference between intrinsic motivations and employee sectorial choice (Public vs Private).

Job Characteristics: A job characteristic is considered a very important factor as it has many effects on work related outcomes. The job characteristics theory (JCT) developed by Hackman and Oldham (Faturochman, 2016) is widely used as a framework to study how particular job characteristics impact job outcomes, including job satisfaction. According to (Faturochman, 2016, p. 9) "job characteristics theory describes the relationship between job characteristics and individual response to work". The theory states that there is five core job characteristics: (a) skill variety, (b) task identity, (c) task significance, (d) autonomy, and (e) job feedback (Faturochman, 2016). Many studies linked job characteristic with organization performance, but few studies focused on the relationship between job characteristics and the employment sector.

DeSantis and Durst (1996) found out that employees in both sectors are concerned with a pleasant work atmosphere, friendly work environment, and job that are important for them and for the society. Solomon (1986) argued that some job characteristics that promote efficiency were more prevalent for the private sector employees. Lewis and Frank (2002) found out that job security considered very important characteristics, and employees who value job security will be more likely to work for the public sector. Based on the above literature, the study hypotheses can be formulated as:

H3: There is a difference between job characteristic and employee sectorial choice (Public vs Private).

Social Influence on Career Choice: Social influence plays a major role for job seekers in their decision for the career path. Studies indicted many social factors that affect job seekers career chose, factors such as, family, friends, and peers (AlHamad et al., 2022; Alkalha et al., 2012; Alshurideh et al., 2022; Alzoubi et al., 2020). Kulkarni and Nithyanand (2013) examined why social influence is considered a key factors in job choice decision for young job seekers. Kulkarni and Nithyanand indicated that there are two reasons on how social influence affects the decision of job seekers. The First reason was the pressure from their family. The second reason was to show their worth for their peer group, they want to be seen equal to their peers at work not want to be looked down upon.

In addition, Mishkin et al. (2016) studied career choice among women from the perspective of the theory of planned behavior. Based upon the theory of planned behavior, the researchers studied the effect of attitudes, subjective norms, and perceived behavioral control and their impact on career choice. Mishkin et al. stated that subjective norms; which are considered a social factor that explain how a person changes his/her behavior based upon the social pressure, was the most significant factor that affect women's career choice.

Further, Mishkin et al. (2016) investigated the role of role model on student's career choice. Both of these factors (subjective norms and role model) were positively affected students career choice (Mishkin et al., 2016). In similar study, (Korkmaz, 2015) investigated the social factors affecting student's career choice in science and technology. Korkmaz indicated that there was strong impact for father and mother on student career choice. In the same manner, Law and Arthur (2003) investigated the factors affecting school student career choice toward nursing as profession. Law and Arthur found out that parents, social career masters, and friends significantly affected their career choice. Based on the above literature, the study hypotheses can be formulated as:

H4: There is a difference between social influence and employee sectorial choice (Public vs Private).

Employer Branding and Job Seekers Career Choice: Private organizations conduct their business in a competitive environment. Competition between organizations has many forms. There is a competition on resources, technology, suppliers, human capital…etc. Attracting the most talent human capital is primary concern of the employer. This will enhance the fit between organization and people, which will

contribute to the strategic goals of organizations (Wallace et al., 2014). According to Wallace et al. (2014) employer branding can be defined as "the package of functional, economic, and psychological benefits provided by employment, and identified with the employing company" (p. 21). Moroko and Uncles (2008) attempt to provide characteristics of successful employer brand. There are two characteristics of successful employer brand. First, attractiveness and accuracy, which mean, that employee can assure an employer to be attractive if he supports awareness, differentiation, and relevance. Secondly, employees consider the employer brand successful if he supports consistency; in which there are a consistency between employer brand and employer experience, and organization culture and value (Moroko & Uncles, 2008).

Looking to employer brand from the perspective of potential employee, Jain and Bhatt (2015) pointed out the importance of understanding potential employees' perspective about employer brand. Jain and Bhatt declared that potential employees are willing to work for the employer if they perceived his brand to support company stability, work-life balance, and job security. Based on the above literature, the study hypotheses can be formulated as:

H5: There is a difference between employer branding and employee sectorial choice (Public vs Private).

3 Study Model

See Fig. 1.

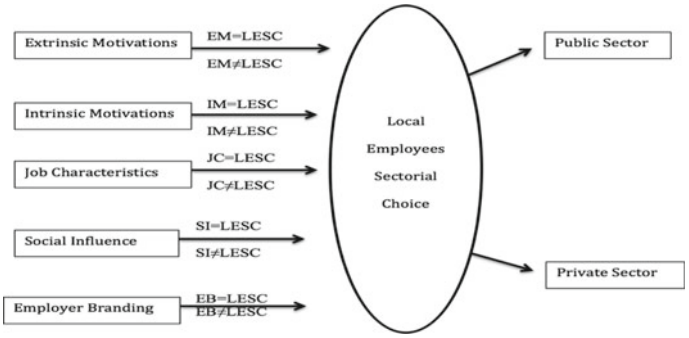

Fig. 1 Career choice conceptual model

4 Research Methodology

This is an exploratory study in which, it investigated and explored the factors that affect local employees career choice. A quantitative approach was deployed in this study to determine the most important factors that affect local employees career choice toward the private sector. The statistical tool used for the purpose of this study was Chi-square. Chi-square analysis is used to check for differences in the categories between the two samples.

4.1 Data Collection

The population of this study were the work force in the state of Abu Dhabi, those whom are employed in the public sector and in the private sector. Simple random sampling technique used to choose appropriate sample from this population. From each sector a random sample has been chosen from different industry that falls under the public sector and the same procedure has been followed for the private sector. Two samples were selected from both sectors (public and private), and a comparison between these two samples were conducted. The researcher deployed questionnaire to collect data from selected respondents, and five-point Likert Scale has been used to measure the variables.

4.2 Population

The population that concerns this study was the local employees working in United Arab Emirates, in specific, the state of Abu Dhabi. Employees working in the public and the private sector in the state of Abu Dhabi were considered the population of this study. Information about this population was gathered from Statistics Centre—Abu Dhabi (SCAD) and the Ministry of Human Resource and Emiratization (MHRE).

4.3 Sampling Frame and Sample

The method of simple random sampling was used to develop the sample of the research under discussion. This type of sampling is preferred when we are looking for a representative sample, it also allows for using statistical tests in data analysis (Neuman, 2006). Randomization in the sample helps the researcher in generalizing the results on the population, as it is free from bias and prejudice and it is a representative of the population. The researcher selects one sample from each sector (Public

Table 1 Questionnaire items obtained from the review of related literature

Construct	Author/s
Motivations (intrinsic and extrinsic)	Rashid and Rashid (2012), Dan (2015), Park and Word (2012), Lee and Wilkins (2011), Ko and Jun (2015)
Job characteristics	Johari and Yahya (2016), Faturochman (2016), Kim (2016)
Social influence	Pavel (2015), Eesley and Wang (2017), Al subait et al., (2017)
Employer branding	Jain and Bhatt (2015), Saini et al., (2015)

and Private), from different organization. Mostly, the industry under the investigation was from the service industry. The overall sample size was 344 respondents, 350 respondents from the public sector and 150 from the private sector.

4.4 Instrumentation

The questionnaire was developed upon reviewing the literature related to this dissertation. Table 1 represents the research constructs and the questionnaire items obtained from review of related literature by the researcher.

4.5 Validity

To assure the content validity the questions to be asked for the respondents supposed to cover all parts of the construct under investigation. Content validity should measure all elements of the construct and it involves three steps; identify of the content from the construct definition, from all the definitions chose a sample, and developing indicators that hit all of the parts of the construct definition (Neuman, 2006).

4.6 Reliability

For intrinsic and extrinsic work motivation, this part the researcher borrowed some questions from the work extrinsic and intrinsic motivation scale (WEIMS) developed by Deci and Ryan (Tremblay et al., 2009). The part of job characteristics was borrowed from Job characteristics inventory, developed by Hackman and Oldman (Faturochman, 2016). For employer branding the researcher borrowed some questions from the work of Tanwar and Prasad (Tanwar & Prasad, 2017). Finally, for

social influence scale the researcher borrowed some questions from the career influence inventory (Pavel, 2015). After conducting the pilot study, the Cronbach Alpha scores was 0.848 which indicates a strong reliability of the instrument.

5 Data Analysis

The aim of this research was to explore the differences between the public and the private sector employees in selecting their career sector. The statistical techniques employed to achieve this aim was Chi Square using SPSS (Statistical Package for Social Sciences). According to (Cooper & Schindler, 2014, p. 653) "chi-square ($\chi 2$) test is a test of significance used for nominal and ordinal measurements". Chi-square (χ 2) goodness-of-fit test to determine how closely observed frequencies or probabilities match expected frequencies or probabilities. It can be calculated for nominal, ordinal, interval, or ratio data (Leedy & Ormrod, 2013). This test used to determine whether a relationship observed in a contingency table is statistically significant (Christensen et al., 2011).

Hypothesis (1) was tested by five items (salary, working in prestigious organization, opportunity for career advancement, benefits, and job security). As it can be shown from Table 2, the table shows that all P-values for Chi-Square test are 0.001, and that is less than the established significant 0.05. Also, Table 1 shows that all Spearman Correlation are negative which indicate that the private sector employees are less extrinsically motivated than the public sector employees.

Overall, total extrinsic motivations combined have P-values for Chi-Square test is 0.001 and that is less than the established significant 0.05. Therefore, the hypothesis (H1) is supported. Correlation value equal (−0.608) this indicates strong negative relationship. We conclude that There is a significant difference between the public and the private sector employees regarding extrinsic motivation in favor to the public sector.

Table 2 Chi-square and Spearman correlation tests for extrinsic motivations

#	Item	Chi-square value	P-value	Spearman correlation
1	Salary	208.437	0.001	−0.753
2	Work in a prestigious organization	173.322	0.001	−0.640
3	Opportunity for career advancement (promotion)	32.916	0.001	−0.212
4	Benefits (health insurance, car, housing, bonus, leaves, etc.)	130.225	0.001	−0.593
5	Job security	218.865	0.001	−0.723
Total	Extrinsic motivations	654.404	0.001	−0.608

Table 3 Chi-square and Spearman correlation tests for intrinsic motivations

#	Item	Chi-square value	P-value	Spearman correlation
1	Interesting and challenging work	60.028	0.001	−0.368
2	Opportunity for personal growth and development (training, skills, languages, etc.)	30.296	0.001	−0.243
3	Sense of achievement	47.995	0.001	−0.349
4	Opportunity to serve the society	47.573	0.001	−0.337
5	I want to be a useful to the society	52.318	0.001	−0.344
Total	Intrinsic motivations	224.622	0.001	−0.308

This hypothesis (2) was tested by five items (interesting and challenging work, opportunity for personal growth and development, sense of achievement, opportunity to serve the society, useful to the society). Table 3 shows that all P-values for Chi-Square test are 0.001, and that is less than the established significant 0.05. Also, Table 3 shows that all Spearman Correlation are negative which indicate that the private sector employees are less intrinsically motivated than the public sector employees. Overall, total intrinsic motivations combined have P-values for Chi-Square test is 0.001 and that is less than the established significant 0.05. Therefore, the hypothesis (H2) is supported. Correlation value equal (−0.308) this indicates weak negative relationship. We conclude that there is a significant difference between the public and the private sector employees regarding extrinsic motivation in favor to the public sector.

Hypothesis (3) was tested by five items (the job requires a lot of cooperative work with other people, the job denies me any chance to use my personal initiative or judgment in carrying out the work, the job gives me considerable opportunity for independence and freedom in how I do the work, the supervisor and co-workers on this job almost never give me any feedback about how well I am doing in the work, supervisor often let me know how well they think I am performing the job, the job itself provides very few clues about whether or not I am performing well). Table 4 shows that all P-values for Chi-Square test are less than 0.05, and that is less than the established significant 0.05. Also, Table 4 shows that all Spearman Correlation except for item 2 are negative. The positive correlation for item 2 means that the private sector employees have more independent in performing their jobs.

Overall, total job characteristics combined have P-values for Chi-Square test is 0.001 and that is less than the established significant 0.05. Therefore, the hypothesis (H3) is supported. Correlation value equal (−0.037) this indicates very weak negative relationship. We conclude that there is a significant difference between the public and the private sector employees regarding job characteristics.

Hypothesis 4 was tested by five items (family, friends, and peers have a great impact on my decision, I believe on myself and he know what I want). As it can be

Table 4 Chi-square and Spearman correlation tests for job characteristics

#	Item	Chi-square value	P-value	Spearman correlation
1	The job requires a lot of cooperative work with other people	10.624	0.031	−0.162
2	The job denies me any chance to use my personal initiative or judgment in carrying out the work	54.135	0.001	0.220
3	The job gives me considerable opportunity for independence and freedom in how I do the work	104.587	0.001	−0.471
4	The supervisor and co-workers on this job almost never give me any feedback about how well I am doing in my work	20.383	0.001	−0.223
5	The job itself provides very few clues about whether or not I am performing well	15.804	0.001	−0.039
Total	Job characteristics	11.937	0.018	−0.037

shown from Table 5, the table shows that all P-values for Chi-Squair test are less than 0.05, and that is less than the established significant 0.05. Also, Table 5 shows that all Spearman Correlation are negative which indicate that the private sector employees are less affected by social influence than the public sector employees.

Overall, total social influence combined have P-values for Chi-Square test is 0.001 and that is less than the established significant 0.05 (see Appendices4). Therefore,

Table 5 Chi-square and Spearman correlation tests for social influence

#	Item	Chi-square value	P-value	Spearman correlation
1	My family has great impact on my decision (parents, spouse, siblings, children)	22.774	0.001	−0.243
2	My friends have great impact on my decision	18.212	0.001	−0.132
3	Peers have a great impact on my decision	12.489	0.014	−0.179
4	Professors and teachers in my university and school have great impact on my decision	23.989	0.001	−0.240
5	I believe on myself and I know what I want	13.840	0.008	−0.179
Total	Social Influence	66.052	0.00 1	−0.140

Table 6 Chi-square and Spearman correlation tests for employer branding

#	Item	Chi-square value	P-value	Spearman correlation
1	An employer reputation in the market for looking after and valuing employees	99.786	0.001	−0.450
2	Understanding the important of family or life outside the work	11.528	0.009	−0.181
3	Definitive and strong company values	56.045	0.001	−0.349
4	Flexible work hours	29.114	0.001	−0.187
5	Ethical practices	61.627	0.001	−0.405
Total	Employer brand	182.562	0.001	−0.309

the hypothesis (H4) is supported. Correlation value equal (−0.140) this indicates very week negative relationship. We conclude that there is a significant difference between the public and the private sector employees regarding social influence in favor to the public sector.

Hypothesis 5 was tested by five items (an employer reputation in the market for looking after and valuing employees, understanding the important of family or life outside the work, definitive and strong company values, flexible work hours, ethical practice). As it can be shown from Table 6, the table shows that all P-values for Chi-Square test are 0.001, and that is less than the established significant 0.05. Also, Table 6 shows that all Spearman Correlation are negative which indicate that the private sector employees have less employer brand practices than the public sector employees. Overall, total employer brand combined have P-values for Chi-Square test is 0.001 and that is less than the established significant 0.05. Therefore, the hypothesis (H5) is supported. Correlation value equal (−0.309) this indicates weak negative relationship. We conclude that There is a significant difference between the public and the private sector employees regarding employer branding in favor to the public sector.

6 Conclusions

The result of the study shows that there is a difference between public and private employees and sectorial choice (public vs private) for all hypothesis. The first variable in this study was extrinsic motivations. The first item measure extrinsic motivations was salary. In terms of salaries the public sector employees were very motivated by salary and they considered salary as the reason they choose this sector, in contrast private sector employees were not motivated by salaries and they did not considered salary as the reason they choose this sector. This result contradicts with previous studies (Rexhaj, 2011). The reason behind this contradiction is the salary gap between

Licensed to (putm@utm.my)

the public sector and the private sector, the gap can reach 5 times between the two sectors in favor for the public sector. As for work in prestigious organization the public sector employees see their organization as prestigious ones, and it was the reason they choose this sector. While, the employees in the private sector did not think this is the reason they choose this sector. This is due to the cultural perspective which connect salaries with prestige. The third item for measuring extrinsic motivation is opportunity for career advancement (promotion). The public sector employees were considering this item very important for them and affect their decision. In contrast, the private sector employees do not consider this item the reason behind their sectorial choice. This finding is not consistent with previous studies (Lee & Wilkins, 2011). The reason behind this result is that the private sector employees consider their job as a temporary one, and this will give them the experience to find a job in the public sector. Added to that, finally, the competition between locals on public jobs, especially with the increasing numbers of locals whom hold bachelor's degrees.

As for the benefits (health insurance, car, housing, bonus, leaves, etc.) and job security, both were considered very important for the public sector. The public sector employees considered these factors very important and affect their sectorial choice. In the contrary, the private sector employees did not consider these factors in their interest when it comes to sectorial choice. These finding contradicted with previous studies (Lee & Wilkins, 2011). The interpretation of why private sector employees feels unsecure and did not have benefits as their counterparts in the public sector is the hiring and firing policies practices followed by the private sector, and the absences of benefits in the private sector and the threat of expatriates. As stated by (Daleure, 2016), the researcher found out that job seekers prefer working in the public sector in UAE because they believe that the public sector had high salaries, better benefits and working conditions.

The second variable measured the difference between employee's sectorial choice was intrinsic motivations. For interesting and challenging work, public sector employees considered their work interesting and challenging while the private sector employees did not agree that their work is challenging and interesting. The reason behind this result is that the hiring polices imposed on the private sector and the employees themselves. Opportunity for personal growth and development shows a difference between employees in the public sector and employees in the private sector. This item was very important for public sector employees. In contrast the private sector employees did not consider this factor as a reason to work in the private sector. As discussed in the previous section private sector employees considered working in this sector as a temporary job, as soon as they get a job in the public sector they will leave immediately.

The third variable that measures sectorial choice between local employees in the public sector and employees in the private sector was job characteristics. For the purpose of this study, this variable measure job autonomy and job feedback, and it shows differences between employees' sectorial choice. The public sector employees have more job autonomy and receive feedback about their performance. In the contrary, the private sector employees have less autonomy in their job and receive

lees feedback about their performance. These finding is supported with previous study (Kim, 2016).

The fourth variable that measures sectorial choice between employees in the public sector and the private sector is social influence. All the factors that measure social influence are family, friends, peers, professors, and believe on oneself. For the public employees; family, friends, and believing in themselves, have strong impact on their decision toward the public sector. The same can be said for the private sector employees but with less impact. These finding confirmed with previous research (Mishkin et al., 2016, Workman, 2015; Ng, Burke, & Fiksenbaum, 2008). The finding can be explained due to the type of relationship between people and the culture of the Arab countries. Arab countries are considered a collectivistic societies base upon Hofstede cultural dimensions, individuals are embedded in groups with strong ties and loyalties and are expected to place collective interests over personal interests (Klasing, 2013).

The last variable that measures sectorial choice between the public and the private sector employees was employer brand. The results indicate differences between the two sectors regarding this variable. Public sector organizations are characterized by looking after and valuing their employees more than the private sector organizations. Also, organizations in both sectors appears to have an understanding of the important of life outside the work in favor to the public sector companies. Moreover, the public sector organizations have stronger company values than the private sector organizations (Daleure, 2016).

7 Implication

This study is considered the first point, this study is considered the first quantitative large-scale testing research for Emirates employment sectorial choice and the factors affecting their career choice preferences toward the private sector versus the public sector. The research added to the body of knowledge in career choice by examining job motivations, job characteristics, employer branding, and social influence. The second point of this study was to fill the gap in the literature that largely ignored the differences between the public sector employees and the private sector employees regarding their sectorial choice.

Two types of motivation were discussed in this study, extrinsic motivations and intrinsic motivations. The finding and conclusions of this study approved that there is a difference in the type of motivations that affect local employees decisions regarding sectorial choice. In general, prior studies showed that public sector employees are intrinsically motivated while private sector employees are extrinsically motivated.

The finding of this study somewhat surprising with prior studies, public sector employees considered both types of motives were the reason behind their sectorial choice decision. In contrast, private sector employees did not consider these factors as important as their counterpart in the public sector regarding their sectorial choice decision. This finding has important impactions for increasing the number of locals

in the private sector, by understanding their motives toward the private sector. Also, a review for the national program to encourage the employment of UAE nationals is needed. This program facilitates the employment of UAE nationals within specified occupations across the private sector.

In addition, this study reveals the difference between public sector employees and private sector employees and their job characteristics. The public sector employees experience more autonomy and feedback than their colleague in the private sector. An implication of this result is the possibility of the role of the human resources practice in these sectors. Furthermore, this study showed the impact of family and friends on employees sectorial choice decision. This finding may help us in understand the role played by the family and friends on the decision process. It also explains the weak role played by the educational system to deploy more locals in the private sector. Finally, one of the issues that emerged in this study was the difference between the two sectors in regard to employer branding. This finding has an important implication related to the private companies. These companies must shed the light on their image, and how to enhance this image to be more attractive for the locals as their desire sectorial choice.

8 Limitations

This study achieved its aim and its objective; however, it is not without limitations. It is difficult to generalize the finding of this study due to the industry that were willing to participate in this study (service industry only), and only three companies were participated in this study. Added to that, the study only covers one state from seven states in UAE (the state of Abu Dhabi).

Another limitation was the bureaucracy procedures to get the approval for collecting data from the government organizations. Even if the researcher inquired into general information that is supposed to be available to the public, the procedures were time consuming and the researcher's request was often rejected. Finally, as English is the second language for the researcher the process of developing this study was challenging for the researcher. In addition, the researcher did not have any idea about the academic writing style, it was challenging for the researcher.

9 Recommendations

This study provided practical and theoretical recommendations, the practical recommendations concern the leaders and decision makers about how to address this problem based on the results of this study. The theoretical recommendations concern the researchers and what further studies can be conducted based on the results of this study. Leaders and decision makers must focus on job security and the benefits that the private sector offer to the locals working in this sector. The study reveals a

fear from the locals working in the private sector regarding the continuity of their jobs and the fair benefits they deserve. Locals face a competition from expatriates, expatriates are willing to work more for less. Leaders and Decision makers must start to develop a pension and retirement plan that guarantee the rights of locals, to make the local feels more secure and protected from any prejudiced action from their companies. Leaders and decision makers must focus on the human resource practice and performance assessment in the private sector. The result of the study disclose that local employees have little autonomy and did not receive significant a feedback from their supervisors. As mentioned in the finding section, private companies must hire a specific number of locals in their companies.

The Impact of Job Insecurity on Employees Job Performance Among Employees Working at Save the Children in Jordan

Yahia Salim Melhem, Isra Ali Hamad BanyHani, Fatima Lahcen Yachou Aityassine, Abdullah Matar Al-Adamat, Main Naser Alolayyan, Sulieman Ibraheem Shelash Al-Hawary, Ayat Mohammad, Menahi Mosallam Alqahtani, and Muhammad Turki Alshurideh

Abstract This study aims to investigate the impact of job insecurity on job performance among employees of Save the Children Jordan. The population of this study is 254 employees of which 153 employees are the recommended sample size for Save the Children Jordan. In total (254) questionnaires were distributed to the target sample, of which (248) questionnaires were retrieved. The final number of valid questionnaires for analysis was (160). This study used a quantitative, descriptive statistics and other tools to test the study model. SEM analysis using PLS considering that present study has a sample of a small size relatively, therefore, it's vital to validate the garnered results using such SEM type. The findings in the study illustrated that job insecurity is negatively related to job performance. Base on the study results; Save the Children management is advised to provide more attention to Job insecurity issue among its employees and to find suitable means and apply adequate interventions to cope with this phenomenon and its consequences that expected to last for relatively a long period of time.

Keywords Job insecurity · Job performance · Save the children · Jordan

1 Introduction

In response to the devastating Syrian crisis and refugee's emergency situation, humanitarian work and relief has been booming recently in Jordan and the region where too many local and international Non-Governmental Organizations (NGOs) were established (Musa et al., 2014). One major focus of these NGOs is how to prepare their staff to respond to refugee needs with high quality services. However, since these NGOs are operationally based on donors' funding of certain projects, most of their staff gets recruited on project base, which means that by the end of the fund and the project duration the employees' contract is ended, and this creates a feeling of job insecurity which might negatively impact job performance.

Save the Children Jordan is one of those big NGOs operating in Jordan, especially when a merger took place between Save the Children Jordan office and international office to generate a big member with more than 300 staff and 600 volunteers. The merger includes a physical relocation, asset transfer, organizational restructuring and strategy refinement. These huge organizational changes expected to impact employees job insecurity level and thus their job performance at many local and international NGOs and specifically the case at Save the Children in Jordan.

Recently, job insecurity has become a very hot topic for researchers, being one of the most important stressors in working life (De Cuyper et al., 2008; Al Kurdi et al., 2020; Allozi et al., 2022) especially in the last 15 years, job insecurity researches has grown significantly (Lee et al., 2018). Due to the rivalry and market globalization, many organizations tend to achieve more adaptation to the market changes therefore

more mergers, acquisitions and other organizational changes appear (AlTaweel & Al-Hawary, 2021, Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Al-Hamwan, 2017; Hirsch & De Soucey, 2006), which are expected to put those organization's employees in doubt about their future careers. Job insecurity emerged as one of the most critical and alarming issues in contemporary organization, and has been studied among scholars and researchers (Sverke & Hellgren, 2002; Sverke et al., 2002).

Organizations try to improve the employees' performance adopting different approaches and measures (Allahow et al., 2018; Al-Nady et al., 2013; Mohammad et al., 2020; Alhalalmeh et al., 2020; Alolayyan et al., 2018; Alshurideh et al., 2017; Al-Hawary & Al-Kumait, 2017; Al-Hawary et al., 2011, 2013). However, few organizations including NGOs pay enough attention to the feeling of job insecurity among their employees and its impact on organizational outcomes, such as employees' satisfaction, turnover, productivity and overall performance. This might create subtle unwanted consequences including low levels of employee performance where employees' performance is vital and critical to the organizations' success and overall performance (Al Kurdi et al., 2021; Alameeri et al., 2020; Hayajneh et al., 2021). Managers and researchers have not fully realized the impact between these two important constructs. The present study aims to contribute to the understanding of the job insecurity–job performance relationship by contributing with additional perspective to the researchers' debate in the literature that claims different views for the relationship (AlShehhi et al., 2020; Alsuwaidi et al., 2020). Hence, most research on the effect of job insecurity on performance has so far reported mixed results (Al Shebliet al., 2021). This research contributes to support one view over the other. Since several studies covered the relationship between job insecurity and other variables, the researcher couldn't find big focus on the Job performance as a major dependent variable in the literature and it has received relatively little empirical attention in the literature as a consequence of job insecurity construct (Rosen et al., 2010; Al-bawaia et al., 2022). Even recent researchers, where tackling job performance among other outcomes with no focus on the direct Job Insecurity-Job performance relationship (Jiang & Lavayss, 2018). This can be considered as a second major contribution for this research. Therefore this study aims to investigate the impact of job insecurity on job performance.

2 Theoretical Framework and Hypotheses Development

2.1 Job Insecurity

Job security has been defined in the literature as the probability of an employee to keep his/her job. On the contrary, job insecurity is defined as the perception of a potential threat to continuity in his or her current job (De Witte, 2000; Probst, 2003). In growing societies, where companies need to keep up with the technological changes and the continuous demand, it is common to experience job security. In periods of

economic growth or expansion, organizations experience more demands and this in turn increases the amount of jobs available, and the probabilities of maintaining the actual employment thus job security will be prevalence. In contrast, when organizations experience loss of demand, they are forced to downsize thus job insecurity will be prevalence (Jimenez & Didona, 2017). On counterpart, some researchers argue that job insecurity is a common organizational phenomenon that does not necessarily comprise organizational changes, such as restructuring or downsizing, they reported in their studies that even in the same environment, employees could experience different levels of job insecurities (Huang et al., 2017).

Other researchers agreed that the global definition is best fit and has been most applied for organizations passed thru a crisis or change (De Witte, 1999). Whereas scholars who treat job insecurity as a multidimensional construct instead address not just job loss but also the loss of desired job features, certain dimensions or privileges in the job itself; such as opportunities for promotion, pay or other areas (Kurdi et al., 2020; Lee et al., 2006; Mauno et al., 2005). Researchers who adopt this multi-dimensional definition argue that job insecurity refers not only to the degree of uncertainty, but also to the components of job insecurity including: the severity of the threat concerning job continuity, the importance of the job feature to the individual, the perceived threat of the occurrence of a total negative effect on the job situation, the total importance of the changes and powerlessness and inability of the individuals to control the above mentioned factors.

2.2 Job Performance

Employees' performance defined as the quantity, quality, and timeliness to deliver an output with efficiency and effectiveness according to a pre-defined measure set by the supervisor or the organization (Al-Hawary & AlDafiri, 2017; Mathis & Jackson, 2009). Another definition Aguinis (2009) described performance as an employee perception on his behavior and to what extent it contributes to the organizational success rather than the real outcomes of their work. Quality and quantity of performance was defined as "a measure of how well the job was done" and "ratings of the quantity or volume of work produced," respectively (Viswesvaran et al., 1996). Primary studies often reported performance information from multiple sources, including objective assessment, supervisor ratings, and self-ratings.

2.3 Job Insecurity and Job Performance

As job insecurity may disturb performance at work, it becomes important for organizations to know the factors that might buffer the negative effects of job insecurity (Probst et al., 2018), being a potential moderator in the job insecurity-performance relationship (Sverke et al., 2006; Alshurideh, 2022). And since several studies

covered the relationship between job insecurity and other variables, the researcher couldn't find any focus on the Job performance as the major dependent variable in the literature (Jiang & Lavaysse, 2018).

The performance of employee will also get affected to the extent of feeling job insecurity (Alshraideh et al., 2017; Al-Dhuhouri et al., 2020; Ashal et al., 2021). Literature shows that there is an association between job insecurity and self-related performance (AlMehrzi et al., 2020). Moreover, studies also reveal that employees being afraid of job insecurity perform more to become valuable, in order to confirm their stay with organization. Other studies show negative relationship between job insecurity and well-being of employees, their attitudes, job involvement and trust over management (Alaali et al., 2021; Shoss, 2017; Sverke, et al., 2002).

It was clear in the literature that numerous studies have found negative relationship between job insecurity and job satisfaction, describing that an increase of job insecurity is associated to a decrease in job satisfaction (Reisel et al., 2010; Jiang & Probst, 2019). What is less clear in the literature is the relationship between job insecurity and performance, there is an evidence that job insecurity in some instances may leads to either increased or decreased levels of productivity or performance. Thus, a debate between researchers about job insecurity and job performance relationship raged. Although some researchers claimed that job insecurity negatively impact the job attitudes and then the performance, with the majority of studies considered that job insecure employees perform worse than job secure employees (Cheng & Chan, 2008). However, the counterpart researchers argued that job insecure employees are motivated to do necessary actions and extra effort to alter the risk of losing their jobs, as employees think that higher performing individuals are unlikely to be laid off, which implies the positive relationship between job insecurity and performance (Hartley et al., 1990). To investigate whether job insecurity might be a double effect factor or not, a recent research by (Lam et al., 2015) studied the relationship between job insecurity and organizational citizenship behavior (OCB). In his study he finds that as job insecurity increases from low to medium, OCB decreases and people deteriorate their social exchanges, and once job insecurity continues to increase, the employees become interested in OCB to impress their management thus enhance their chances of survival. Similar effects between job insecurity and self-reported job performance have also been reported by Selenko et al. Hence, these recent studies also suggest the need to continue examining potential moderators that might contribute to job insecurity and its associated performance. Based on the above literature the study hypotheses may be formulated as".

H1: Job insecurity will be a negative predictor for job performance among employees of Save the Children Jordan.

3 Methodology

This study used a quantitative, descriptive statistics and other tools to test a model that examined the effect of job insecurity on job performance among employees working at Save the Children in Jordan. Data were collected using self-administered questionnaire in regards to two main variables; job insecurity (the independent variable), job performance (the dependent variable) from employees working at Save the Children Jordan.

3.1 Population and Sampling

The population of this study is 254 employees of which 153 employees are the recommended sample size for Save the Children Jordan according to Sekaran (2003). However, due to the small population size it is preferable in this study to consider total population sampling to examine all Save the Children employees and avoid sample selection. This ensures that all concerns of this study will be better captured by the respondents. According to the above, 254 questioners is distributed to survey Job Insecurity especially after the unification, targeting different levels, positions, experiences, ages, genders, educational levels, salaries, etc. and focusing on certain geographical working areas where save the Children operating in (e.i. Zaatari camp, Azraq camp; and host communities in Amman, Irbid, Mafraq, Karak and Maan).

In total (254) questionnaires were distributed to the target sample, of which (248) questionnaires were retrieved. Hence, the response rate was (97%). Following that, validity of the questionnaire was checked for statistical analysis purposes, (88) questionnaires were deemed impropriate for further analysis due to inconsistent answers or consistent pattern through the entire questionnaire (either a low or high value on Likert scale). A number of reverse questions were added to enhance the robustness of the analysis and the findings. The exclusion rate of a 35% is perhaps due to participants' reluctance to provide factual data in judging the management behavior and decisions regarding downsizing and job security. Hence, the final number of valid questionnaires for analysis were (160). SPSS v.25 was used for data coding, using frequencies and means. The sample characteristics is summarized as:

Half of the sample were females (n = 79, 49.4%), this indicates good diversity in the sample gender. Majority of the sample were Jordanians (n = 148, 92.5%). The majority of the sample were relatively young and had aged less than 40 years (n = 119, 74%), with bachelor or higher education qualification (n = 114, 71%) among the sample, which is expected as Jordan classified with having one of the highest ratios of literacy among Middle East countries. Majority of the sample, had more than 5 years working in the humanitarian sector (n = 96, 60%), this is expected to allow for better understanding for the questionnaire items. Majority of the sample worked less than 5 years in Save the Children Jordan (n = 145, 69%) a sound of job insecurity is evident with a possibility of a high employees' turnover rate, thus the renewed contracts

seems to be conditioned with full commitment and high performance which fits the study design and concerns. In terms of the basic salary, about 40% of the workers in this organization are getting paid above 1,000 JOD which reflects the very good salary scale and the good packages this organization offer compared to other local organizations, especially during the difficult Jordanian economic situation. Majority of the sample were from Programs department (n = 92, 57.5%) which is in alignment with the organizational human capital distribution ratio (35% Support Departments; 65% Programs Department) and aligned with the Non-Governmental Organizations (NGOs) human capital normal distribution as these organizations scope of work is mainly based on programs implementation in the areas of deprivation. Hence, Job location reported that the majority of the sample were field based (n = 125, 78.1%) as some support jobs like: HR, Safety and Security, IT and logistics are also based in the to provide the programs with the necessary support.

3.2 Questionnaire Design

A survey questionnaire is used as an instrument with certain statistical tools to measure two variables, those designated to be used in this study. Through an extensive review of studies that used these variables, the researchers assessed reliability, validity, number of items, and the feasibility of each variable. These variables are:

1. **Job insecurity:** Job insecurity was measured in its global concept using De Witte (2000) scale which is a four items scale (2 items for cognitive job insecurity and 2 items for affective job insecurity). This scale was fruitfully employed in previous cross-cultural studies, exhibiting excellent validity and reliability of which it was the most used scale for job insecurity since 2003 (Lee et al., 2018). "Chances are, I will soon lose my job", "I am sure I can keep my job" (reverse coded), "I feel insecure about the future of my job", and "I think I might lose my job in the near future". Respondents were asked to rate these items on a 5-point Likert type scale, ranging from 1 ("strongly disagree") to 5 ("strongly agree"). It's worth mentioning that all previously mentioned different conceptualization of job insecurity in the literature have generated various measurement instruments for job insecurity (Huang et al., 2010). In a review for many empirical studies more than 10 different measures were adopted for job insecurity. Some studies use a single-item measure, asking if respondents perceive their jobs as insecure (e.g. Debus et al., 2012; Jiang & Probst, 2019); other studies rely on self-developed scales. Still the most frequently adopted measures are De Witte's (2000) four item scale, which appears in 46 studies conducted in Europe and Asia (Chiu et al., 2015). In the case of Save the Children Jordan, De Witte's (2000) Job Insecurity four item scale will be adopted as it is frequently used in studies on job insecurity and has a reasonably high reliability across different studies.
2. **Job Performance:** Job performance was measured using 29 items and as per a recent scale of which this particular one was developed in order to be useful in any

job-related context with a high probability of applicability worldwide (Carlos & Rodrigues, 2016). In Carlos & Rodrigues article they developed a job performance measure that was applicable across jobs and cultures after an extensive literature review and based on studies that were developed in different cultural and job-related contexts to end up with two main dimensions (task performance and contextual performance) and eight sub dimensions: job knowledge, organizational skills, efficiency, persistent effort, cooperation, organizational consciousness, personal characteristics and interpersonal and relational skills. Confirmatory factorial analysis was used in order to test their relevance. The dimensions 'personal characteristics' and 'persistent effort' were merged. The resulting 29 item scale presents appropriate psychometric properties. This scale has been selected for this research for its appropriateness and comprehensiveness for Job performance measurement. Both task performance and contextual performance has been measured as the follows: For Task Performance, 3 main items have been employed: 4 items in Job Knowledge, 5 items in Organizational skills, and 3 items under the efficiency. For Contextual Performance, 4 main items have been used: 5 items for Persistent effort, 3 items for the Cooperation, 5 items for Organizational conscientiousness and 4 items for Interpersonal and relational skills.

3.3 Data Normality

Skewness and Kurtosis values were examined to confirm normal distribution of the data. Kurtosis measure the extent to which data-tail is heavy or light in compare to normal distribution, and Skewness measure the extent to which data distribution differ from the normal distribution as suggested by (Sposito et al., 1983) who also suggested that Skewness and Kurtosis values should be within (+2) and (−2) range to confirm normality for SEM analysis purposes. Table 1 confirmed normality for study variables as Skewness recorded (−1.377) (−0.726) for job insecurity and job performance respectively, whereas Kurtosis recorded (1.719) and (−1.096) for job insecurity and job performance respectively.

Table 1 Skewness and kurtosis values for study variables (N = 160)

Construct	Skewness	Kurtosis
Job insecurity	−1.377	1.719
Job performance	−0.726	−1.096

Table 2 Summary of model fit indices

Indices	Cutoff criteria	Estimate	Interpretation
Chi-Square	–	387.818	–
NFI	>0.90	0.904	**Confirmed**
SRMR	<0.08	0.036	**Confirmed**

4 SEM Analysis Using SMART PLS

Recently, SMART PLS has emerged as a method of choice in different social sciences arena due its high capabilities in assessing complex models using regression-based ordinary least squares (OLS) estimation method with the goal of explaining the latent constructs variance by minimizing the error terms and maximizing the R^2 values of the endogenous constructs particularly with samples of small size (Hair et al., 2017), therefore, highlights SEM analysis using PLS considering that present study has a sample of a small size relatively, therefore, its vital to validate the garnered results using such SEM type.

4.1 SEM Analysis

Anderson and Gerbing (1988) suggested the use of two steps to complete SEM analysis, testing the measurement model using CFA and structural model testing.

Step 1: Measurement model & CFA:

The initial running of CFA reported poor model fit as (Hair et al., 2017) recommended values for model fit indices in variance structure analysis including Normed Fit Index (NFI) and Standardized Root Mean Residual (SRMR) to achieve good model fit. Therefore, number of items with low loading deleted from the model, as (Hair et al., 2017) recommended that items loading should exceed (0.70) to achieve good model fit. Following that (14) items were deleted from job performance construct and (1) item from job insecurity, and a sound of good model fit was achieved as summarized in Table 2. Table 3 summarizes deleted items.

After identifying final measurement model, statistical validity and reliability of the model need to be confirmed before proceeding with testing structural model.

4.2 Model Reliability

Reliability of the model was confirmed through Composite Reliability [CR] and Cronbach's α as suggested by Sekaran and Bougie (2016) and Hair et al. (2017). The recommended values for both criteria need to exceed (0.70) which was confirmed for present study variables as presented in Table 4.

Table 3 Deleted items from measurement model

Variable	Item
Job performance	Task_Perf_Knowledge_2
	Task_Perf_Knowledge_3
	Task_Perf_Skills_1
	Task_Perf_Skills_5
	Task_Perf_Efficiency_1
	Task_Perf_Efficiency_3
	Contex_Perf_1
	Contex_Perf_5
	Task_Perf_Cooperation_1
	Task_Perf_Cooperation_3
	Task_Perf_Conscient_2
	Task_Perf_Conscient_4
	Task_Perf_Interpersonal_3
	Task_Perf_Interpersonal_4
Job insecurity	Job_Insecurity_3

Table 4 Values of Cronbach α and Composite Reliability

Variable	Cronbach's α	CR
Job insecurity	0.805	0.807
Job performance	0.974	0.974

4.3 Model Validity

1. **Convergent validity:**

The majority of the model items load exceeded the recommended level (0.70) and significant at (0.05) level as (T) statistics of significance exceeded (1.96) as depicted in previous figure, therefore convergent validity was confirmed. Table 5 summarize final measurement model items loading and significance.

The second criterion to confirm convergent validity is the Average Variance Extracted (AVE), as Hair et al. (2017) suggested that AVE values should exceed (0.50) to confirm convergent validity of the model, which was confirmed in present study as summarizes in Table 6.

2. **Discriminant validity:**

PLS provides Fornell–Larcker criterion to confirm discriminant validity, which was confirmed for present study as presented in Table 7.

The final measurement model was confirmed, therefore its suitable to proceed with testing structural model.

Table 5 Loading and significance for final measurement model items

Variable	Item	Loading	(T)
Job insecurity	Job_Insecurity_1	0.863	20.452
	Job_Insecurity_2	0.867	15.019
	Job_Insecurity_4	0.813	13.349
Job performance	Task_Perf_Knowledge_1	0.893	65.212
	Task_Perf_Knowledge_4	0.854	40.488
	Task_Perf_Skills_2	0.866	49.486
	Task_Perf_Skills_3	0.883	50.365
	Task_Perf_Skills_4	0.835	32.420
	Task_Perf_Efficiency_2	0.852	32.869
	Contex_Perf_2	0.866	44.477
	Contex_Perf_3	0.847	32.926
	Contex_Perf_4	0.868	40.473
	Task_Perf_Cooperation_2	0.831	31.507
	Task_Perf_Conscient_1	0.782	20.009
	Task_Perf_Conscient_3	0.859	37.944
	Task_Perf_Conscient_5	0.832	27.231
	Task_Perf_Interpersonal_1	0.899	66.059
	Task_Perf_Interpersonal_2	0.859	38.323

Table 6 Values of AVE

Variable	AVE
Job insecurity	0.584
Job performance	0.713

Table 7 Fornell–Larcker discriminant validity

Variable	Job insecurity	Job performance	Locus of control
Job insecurity	**0.764**		
Job performance	−0.325	**0.844**	

Step 2: Structural model:

To test the proposed hypotheses, structural model needs to be tested. Testing structural model requires path testing through examining coefficient of determination (R^2) which represent the amount of variance that independent variable explain in the dependent variable, and path coefficient (β) that represent the influence of the variable and finally the significance of each path coefficient at (0.05) level through (T) statistics as suggested by Hair et al. (2017). Structural model that examine the

influence of job insecurity on job performance was tested, and result reported that job insecurity explained ($R^2 = 11\%$) of the variance in job performance, which indicate low variance, moreover, the influence was seen to be negative as ($\beta = -0.331$) and significant as ($T = 4.851$) which is evidently exceeding (1.96), therefore confirming the first hypothesis. See Figs. 1 and 2.

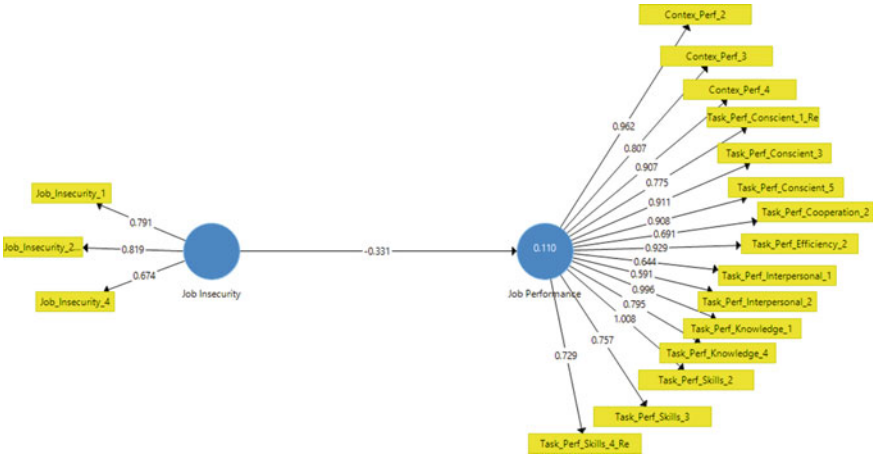

Fig. 1 Path testing for job insecurity as a predictor for job performance

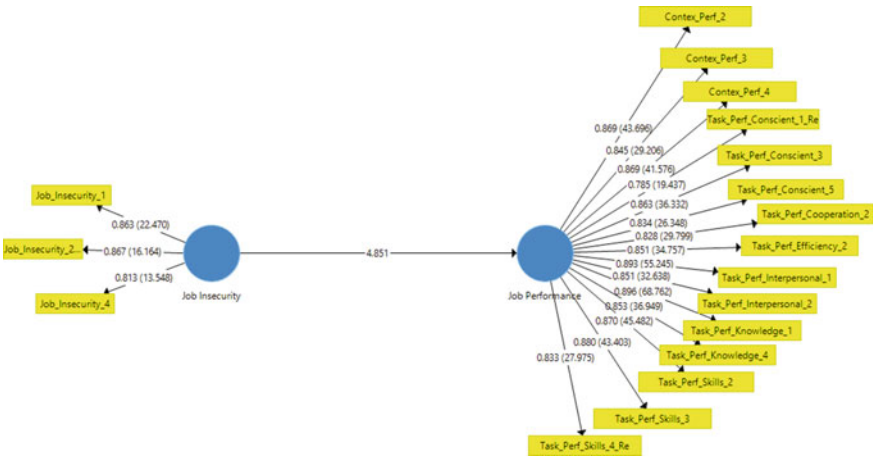

Fig. 2 Path significance for job insecurity as a predictor for job performance

5 Discussion

The researchers intended to understand the relationship and the prediction power of job insecurity on job performance. The findings in the study illustrated that job insecurity is negatively related to job performance. According to the literature, most studies on job insecurity and job performance agreed to have a negative relationship between Job insecurity and Job Performance indicate that this finding is logical and expected. The conclusion of these studies is that individuals who experience high levels of job insecurity generally perform worse when compared with individuals who experience low levels of job insecurity (Cheng & Chan, 2008; Schreurs et al., 2012; James, 2012; Awan & Salam, 2014; Wang et al., 2015). Moreover, an interesting weekly diary study conducted in 2012 on the buffering role of social support in the relationship between Job Insecurity and Employee Performance showed that during weeks in which individuals felt insecure about their job, they performed worse in terms of meeting organizational objectives and fulfilling the requirements of their job. However, they found that this negative relationship is less pronounced when employees feel supported by their supervisor (moderator) (Schreurset al., 2012). Moreover, a recent study conducted in the Sultanate of Oman, concluded that there is a significant negative effect of job insecurity on employee performance (Sanyal et al., 2018). In such instance, all the above studies and findings support the view that job insecurity has a negative relationship with performance which is the case in this study.

However, the result in this study contradicts with some researchers who argued there is no significant negative association observed between job insecurity and performance. Berth stressed in his study that employees do not increase or decrease their discretionary efforts when experiencing job insecurity and he claimed that employees' motivation was a main reason to be unaffected by the external threat of organizational restructuring. Moreover, some other studies showed a positive and significant relationship between job insecurity and job performance or a positive but not significant relationship (Probst et al., 2007; Staufenbiel & König, 2010). Moreover, some other studies showed a positive and significant relationship between job insecurity and job performance or a positive but not significant relationship (Probst et al., 2007; Staufenbiel & König, 2010). According to the above, this study revealed the negative relationship between Job insecurity and Job Performance to contribute with one more vote to the side of the researchers stressed on the negative relationship between job insecurity and job performance among all the literature's argument.

6 Limitations of the Study and Direction for Future Research

Using self-administered survey which may allow for subjectivity although it is the most appropriate method that matches the study design. The study conducted for Save the Children Jordan office, thus considered as a case study with limitation for the generalizability of the findings and the results. Therefore Future research is needed to expand the population and to consider other NGOs in Jordan, for further validation, expanding acceptability, generalizability and applicability of this model. The conceptualization of job insecurity might be considered as a limitation. As we assessed only the core perception of job insecurity as the probability of losing the current job. Although using a reliable scale is an advantage however, some job insecurity measures are more differentiated and include additional aspects like the probability of losing valued job features, so it would be interesting to see whether these aspects have a similar correlational pattern or not. Future research is needed to investigate which individual factors (i.e. other personality traits) could have either a stronger or weaker moderation effect compared to LOC on the relationship between job insecurity and job performance in the presence of high job insecurity.

This study focuses on individual aspects in job insecurity and job performance, and did not include organizational aspects. However, organizational aspects such as organizational culture might influence the relationship between job insecurity and performance. Future research could also explore the generalizability to other cultures and countries. Such intercultural research should also try to explain the effect that studies from English speaking countries found relationships between job insecurity and performance that are double as high as in non-English speaking countries this could refer to the laws and regulations in every country as in some countries firing people could be legally difficult such as Germany. Future research could study how organizational factors such as culture, justice, commitment, etc. could affect the relationship between job insecurity and job performance.

7 Managerial Implications

Despite that this study revealed that Save the Children employees have a high level of performance, this high performance is expected to be a short term status as those employees are expected to leave the organization whenever they secure a better stable job which could impact the organization negatively with high turnover rate, loss of institutional memory, losing competent staff, high cost of recruitment and training, beside other implications. According to the literature, Save the Children management is advised to provide more attention to Job insecurity issue among its employees and to find suitable means and apply adequate interventions to cope with this phenomenon and its consequences that expected to last for relatively a long period of time. Management needs to listen to employees' concerns, increase

their participation in change-related decision making, and spend more time clearly explaining the aim of the changes using accurate and unbiased procedures. More focus on employees' long term contracts instead of the short term contracts to improve staff stability and job security. Human Resources Management in Save the Children need to ensure that new comers orientation program matches the skills needed in the workplace and may need to expand to areas that teach about moderating stressors at work environment such as job insecurity and having the abilities to achieve work goals, too.

The Impact of Strategic Thinking on Performance of Non-Governmental Organizations in Jordan

Fuad N. Al-Shaikh, Yahia Salim Melhem, Ola Mashriqi, Ziad Mohd Ali Smadi, Mohammed Saleem Khlif Alshura, Ali Zakariya Al-Quran, Hanan Mohammad Almomani, Sulieman Ibraheem Shelash Al-Hawary, and Ayat Mohammad

Abstract This study aimed to address the issue of strategic thinking at non-governmental organizations in Jordan & investigate whether strategic thinking has any impact on the performance of these organizations. It also aimed at finding out whether the top manager's demographic characteristics have moderating effects on the relationship between strategic thinking and organization performance. The study sample consisted of (262) top managers of non-governmental organizations in Jordan. The primary data of the study collected by questionnaire. SPSS, AMOS, and Smart PLS software utilized to conduct the statistical analysis process. The results show a positive impact of strategic thinking on the on performance. Furthermore, the

study will hopefully be beneficial for policymakers & all organizations interested in boosting the role of NGOs. This research recommends the organizations to promote and support the adoption of strategic thinking factors for NGO managers and related institutions to improve the level of performance and quality of services provided such as developing training programs specialized in strategic thinking topics and organizing training workshops to discuss the real cases and companies' experiences inside and outside Jordan.

Keywords Strategic thinking · Organization performance · Non-governmental organization

1 Introduction

Strategic thinking (ST) is a critical component in the strategic management literature (Altamony et al., 2012; Al-Hawary & Hadad, 2016). A combination of careful blending of alternative strategic approaches and the impact of different decisions on an organization's value-creating process is essential. ST entails maintaining perspective on an organization's overall approach and coordinating the multiple dimensions of a combination of strategy (Pisapia, 2009). Most organizations operate under extreme pressure to attain efficiency and effectiveness (AlTaweel & Al-Hawary, 2021; Al-Hawary & Al-Syasneh, 2020; Allahow et al., 2018; Al-Nady et al., 2013). Hence, strategic thinking is needed to show direction and adapt to the ever-evolving environmental challenges (Alshraideh et al., 2017; Alaali et al., 2021). Managers with strategic thinking acumen who can scan the salient ecological trends and events with maximum predictability must be of paramount importance to the successful change process that positively impacts organizational performance (Harzing & Ruysseveldt, 2004; Al-Dmour et al., 2021; Lee et al., 2022a, b).

Strategic management and strategic thinking involve a series of decisions that companies could make strategically in the process of developing an effective and long-lasting business strategy to succeed and compete well at the internal levels (Alhalalmeh et al., 2020; Al-Hawary et al., 2020; Alyammahi et al., 2020). A company often adopts strategic planning process through business documentation, team management, time management and effective utilization of HR resources to achieve their desired levels of productivity and business growth in comparison to their competitors (Al-Hawary & Al-Namlan, 2018; Al-Hawary et al., 2013a, ¾b; Al-Lozi et al., 2017, 2018). Companies strive hard to create a strategic thinking environment within the internal business culture to make creativity and innovation through strategic decision making in year around processes (Hamadneh et al., 2021; Odeh et al., 2021). Strategic thinking enhances the ability of the companies to think strategically and differently than routine business processes and to get competitive edge over their competitors by identifying emerging business opportunities (Kitonga et al., 2016).

Non-governmental organizations (NGOs) have grown enormously to the point where they are now involved with every aspect of humanitarian work and relief. One primary focus of NGOs is how to prepare their staff to respond to the needs of the beneficiaries from their services. According to AlNasser (2016), Jordan now has many NGOs that act on an international scale through communication, coordination, training, fund-raising, and project implementation. They work with different local and international organizations such as environmental communities, community centers, women's groups, cultural foundations, and IT circles, all in the common purpose of empowering women and youth as well as improving their chances in the future.

The research work on the importance of strategic thinking in the process of strategic planning through which companies can achieve desired business growth and success. It provides necessary direction and guidelines to the management of a company to think strategically about limited business resources and time and people who are important for a success of a business. Strategic thinking enhances the ability of a business to effectively utilize available resources and advance the company towards its business goals and objectives. The research indicates that strategic thinking has become essential for companies to adapt their business processes and operations according to changing business environment and market conditions. With the lack of research related to NGOs in Jordan and growing interest in strategic thinking, it is necessary to shed more light on this area. So, the present study aims to address the issue of strategic thinking at NGOs in Jordan and investigate whether strategic thinking has any impact on the performance of these organizations.

2 Theoretical Framework and Hypotheses Development

2.1 Strategic Thinking

Strategic thinking is seen as the generation and application of unique business ideas intended to create a competitive advantage for a firm or business (Hamel & Prahalad, 1994). According to Mahdavian et al. (2014), ST is a way of thinking that has an essential place in the modern world and plays an essential role in significant issues at different organizational levels. Several researchers of strategic management emphasize that ST is one of the capabilities of high- performing leaders and enables thinkers to discover opportunities & understanding of the past, present, and future of the organization in order to survive, grow and achieve competitive advantage (Obeidat et al., 2021; Shamout et al., 2022; Shirvani & Shojaie, 2011). Bonn (2005) emphasizes that ST provides thinking and future vision that can change the competing rules of organizations and stresses that strategic thinking has been identified by a panel of experts as one of the ten most critical areas for future management research. Leadership and strategy theorists also noted that strategic thinking is required at

multiple organizational levels; the need for thinking skills moves deeper at all levels of organizations (Ahmad et al., 2021; Alzoubi et al., 2022; Goldman & Casey, 2010).

Strategic thinking has many concepts. Porter (1991) states that ST is the glue that holds together the many systems and initiatives within the company, Mintzberg notes many practitioners and theorists have wrongly assumed that strategic planning, ST, and strategy making are all synonymous, at least in best practice. It is a matter of common sense to realize the existence and importance of strategic thinking as a concept. According to Horne and Wooton (2000), ST involves gathering information, formulating ideas, and planning action. Keelin and Arnold (2002) consider that the critical ability to be a strategic thinker is to have a strategic perspective and the ability to create clarity out of complex and disconnected details. Bonn (2005) defines ST as a way of solving strategic problems that combines a rational and convergent approach with creative and divergent thought processes. He argued that ST at the individual level consists of three main elements: systems thinking, creativity, and future vision. It can be seen from the above discussion that strategic thinking is conceptualized in different ways by different researchers. The present study adopts Bonn's (2005) definition, which includes three dimensions: systems thinking, creativity, and future vision.

Different models were proposed by strategic management thinkers to conceptualize ST. Bonn (2005) scrutinizes strategic thinking in three levels individual, group, and organization. On an individual level identifies three dimensions of ST: systems thinking, creativity, and future vision. He also concludes that competent decision-makers in strategic thinking have obtained more diverse conceptual systems than those who lack this capacity. Bonn believes that the role of strategic thinking is to try to innovate and envision a different future for the organization, which may lead to the redefinition of the company's primary or industrial strategies. Mintzberg (1998) argues that strategic thinking is a combination of looking backward, outlook, looking around, and completing it because he thinks that a real strategic thinker is the one who can connect all perspectives and visualize their cooperation in his mind. Kaufman et al. (2003) views Strategic thinking as a response to everyday problems. He argues that strategic thinking focuses on creating a better future by making the future and also on increasing value goals in society by obtaining profitable results. Kaufman et al. (2003) outlines six critical factors as success factors that chart strategic thinking. These factors are changing existing models and defining new broad lines of thinking, planning, activity, evaluation, and continuous improvement.

Many scholars seem to agree that the main dimensions of strategic thinking are Systems thinking, creativity, and having a future vision (Morrisey, 2004; Mintzberg, 1998; Kaufman et al., 2003; Bonn, 2005; Ashal et al., 2021). The present research also uses the same dimensions for strategic thinking. A brief description of each of these dimensions is provided in the following sections.

Systems thinking: Systems thinking is a way to see holistically. In other words, system thinking creates a conceptual framework to represent clearer models and makes clear how they are changed effectively, and it is formed based on a system viewpoint. A strategic thinker should always have a complete model of value creation factors and understand their collaboration well (Alameeri et al., 2020; Liedtka, 1998;

Licensed to (putm@utm.my)

Marquardt, 1996). System thinking sees a problem or an opportunity as a part of the whole situation or system (Senge, 1990; Liedtka, 1998; Bonn, 2005; Alzoubi et al., 2021).

Creativity: Creativity is another essential element of ST. In a rapidly changing competitive business world, strategy and creativity are not random phenomena. Many organizations are looking for ways to find new perspectives and think about products, markets, challenges, and opponents. It is necessary to combine creativity with a strategic thinking process that allows employees and organizations to utilize more effectively and leverage the power of their minds in the best way (Alsharari & Alshurideh, 2020; Bonn, 2005; Mintzberg, 1998). According to Amabile (2013) creativity disciplined work style and skills in generating ideas. These cognitive processes include the ability to use wide, flexible categories for synthesizing information and the ability to break out of perceptual and performance "scripts." The personality processes include self-discipline and a tolerance for ambiguity.

Future vision: The third element of ST has a future vision. The latest theories in the world of leadership emphasize the roles of leaders in arranging view choosing its content (Bonn, 2005). The view of an organization defines its way and direction, which helps the organization heightens its success. Some believe that the view is created while others believe that it exists but should be discovered. In any case, the organizational view consists of the process of creation (Collins & Porras, 1989; Nuseir et al., 2021). ST must be accompanied by a strong understanding of the ultimate goal and a positive vision of the future of the organization.

2.2 Organizational Performance

According to Zheng et al. (2010) organizational performance stimulation has always been a priority in all sectors since it is directly associated with the value creation of the entity. Organizations are continually striving for better results, influence, and competitive advantage. Evaluating the performance of the organization has always been of interest to management teams and researchers (Al Kurdi et al., 2020; Al-Hawary, 2011, 2015; Al-Hawary & Abu-Laimon, 2013; Al-Hawary et al., 2013a, 2013b). In this regard, some researchers focused on determining definitions and how to measure organizational performance. The term performance is used extensively in the field of business management, and it varies according to organization objective. According to Hamon (2003), performance is a set of appropriate standards that enable to provide judgment on activities results. Borman and Motowidlo (1997) identified two types of employee behavior that are necessary for organizational effectiveness: task performance and contextual performance. Task performance refers to behaviors that are directly involved in producing goods or services or activities that provide indirect support for the organization's core technical processes. On the other hand, contextual performance is defined as individual efforts that are not directly related to their primary task functions. However, these behaviors are essential because they

formulate the organizational, social, and psychological contexts (Wang et al., 2015; AlShehhi et al., 2020).

In the first decade of the twenty-first century, according to Robbins (2000) and Mouzas (2006), each of effectiveness and efficiency have their distinct meaning. Effectiveness focuses on achieving mission, goals, and vision, whereas efficiency relates to the optimal use of resources to achieve the desired output. Al-Hawary and Al-Syasneh (2020), argues that organizational performance should focus on the capability and ability of an organization to efficiently utilize the available resources to achieve accomplishments consistent with the set objectives of the company. Effectiveness oriented companies are concerned with output, quality, creation of value-added, innovation, and cost reduction. It measures the degree to which a business achieves its goals or the way outputs interact with the economic and social environment. Usually, effectiveness determines the policy objectives of the organization or the degree to which an organization realizes its own goals (Zheng et al., 2010; Al-Hawary, 2009; Al-Hawary & Mohammed, 2017; Al-Hawary & Nusair, 2017). Meyer and Herscovitch (2001) analyzed organizational effectiveness through organizational commitment. The workplace may take various forms, such as the relationship between leaders and staff, employee's identification with the organization, involvement in the decision-making process, psychological attachment felt by an individual.

According to Al-Hawary (2009), organizational effectiveness helps to assess the progress towards mission fulfillment and goal achievement. To improve organizational effectiveness, management should strive for better communication, interaction, leadership, direction, adaptability, and a positive environment. Pinprayong & Siengthai (2012) distinguishes between business efficiency & organizational efficiency. Business efficiency reveals the performance of input and output ratio, while organizational efficiency reflects the improvement of internal processes of the organization, such as organizational structure, culture, and community. Excellent organizational efficiency could improve entities' performance in terms of management, productivity, quality, and profitability. Therefore, management must ensure success in both areas.

In summary, effectiveness and efficiency are two essential dimensions of organizational performance. According to the researcher's best knowledge and based on the nature of the study population (non-profit organizations), effectiveness and efficiency are more suitable for the present research to measure organizational performance. In the other hand, strategic thinking associated with creativity and innovation to improve business performance and competitiveness of business; ST identified and revealed different strategic management approaches such as open-minded idea creation by mangers and enhanced learning within internal culture of the organizations. So, the organizations could success in developing a learning business environment within their business structure to succeed in the processes of strategic thinking to enhance innovation and creativity and uniqueness of ideas within the organization.

2.3 Strategic Thinking and Performance

Bonn (2005) showed that the development of strategies at the individual, community, and organization levels helps to develop the strategic thinking of organizations, which in turn helps to achieve organizational objectives. Jelenc and Swiercz (2010) explored the relationship between leader cognitive models of ST and the performance of Croatian firms. The results showed a positive relationship between leader cognitive models of ST and firm performance. Al-Qatamin and Esam (2018) addressed the effect of ST on the achievement of a competitive advantage. The Results showed that ST skills have a significant effect on competitive advantage. Moghadam et al. (2018) studied the impact of ST on innovation performance in Sistan and Baluchistan province customs administrations in Afghanistan. Results showed that all ST dimensions significantly influence innovation performance. Based on the literature review above studies, the study hypotheses can be formulated as:

There is a positive impact of strategic thinking on NGOs performance in Jordan

3 Research Model

As can be seen from the research model in Fig. 1, strategic thinking is the independent variable, and its dimensions are systems thinking, creativity, and future vision. These dimensions were adopted by well-known researchers in the field of strategic management (Morrisey, 2004; Mintzberg, 1998; Kaufman et al., 2003; Bonn, 2005). These dimensions/variables are hypothesized to affect the dependent variable (i.e., efficiency and effectiveness).

The model below represents the predicted association and relationships between strategic thinking represented by system thinking, creativity and future vision. Hence, strategic thinking is expected to impact organizational performance. Organization performance can be measured by two significant variables: efficiency and effectiveness.

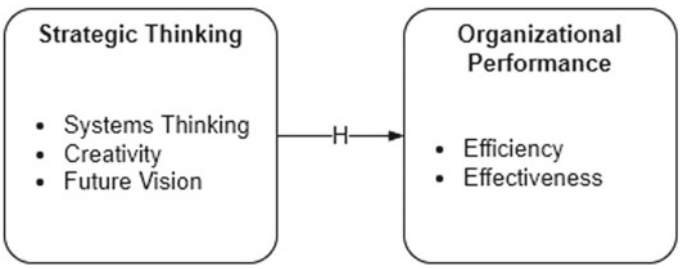

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of strategic thinking on organizational performance. Therefore, it focused on non-governmental organizations (NGOs) operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to (275) senior managers via email. In total, (263) responses were received including (6) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (257) responses suitable to analysis requirements that were formed a response rate of (93.45%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (14) items to measure strategic thinking based on (Alomari, 2020; Dixit et al., 2021). These questions were distributed into dimensions as follows: four items dedicated for measuring systems thinking, five items dedicated for measuring creativity, and five items dedicated for measuring future vision. Whereas the second section included nine items developed to measure organizational performance according to what was pointed by (Jami Pour & Asarian, 2019; Ling, 2019). These items divided into two dimensions: five items for measuring efficiency and four items for effectiveness.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5
1. Systems thinking	**0.760**				
2. Creativity	0.428	**0.775**			
3. Future vision	0.337	0.384	**0.756**		
4. Efficiency	0.674	0.682	0.471	**0.779**	
5. Effectiveness	0.584	0.665	0.387	0.628	**0.745**
VIF	1.054	1.784	1.674	– -	– -
Loadings range	0.688–0.847	0.658–0.839	0.674–0.822	0.652–0.894	0.681–0.852
AVE	0.578	0.600	0.571	0.606	0.555
MSV	0.497	0.502	0.488	0.436	0.510
Internal consistency	0.842	0.880	0.865	0.854	0.858
Composite reliability	0.845	0.882	0.869	0.859	0.861

Note Bold fonts demonstrate the values of $\sqrt{}$AVE

analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.652–0.894), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

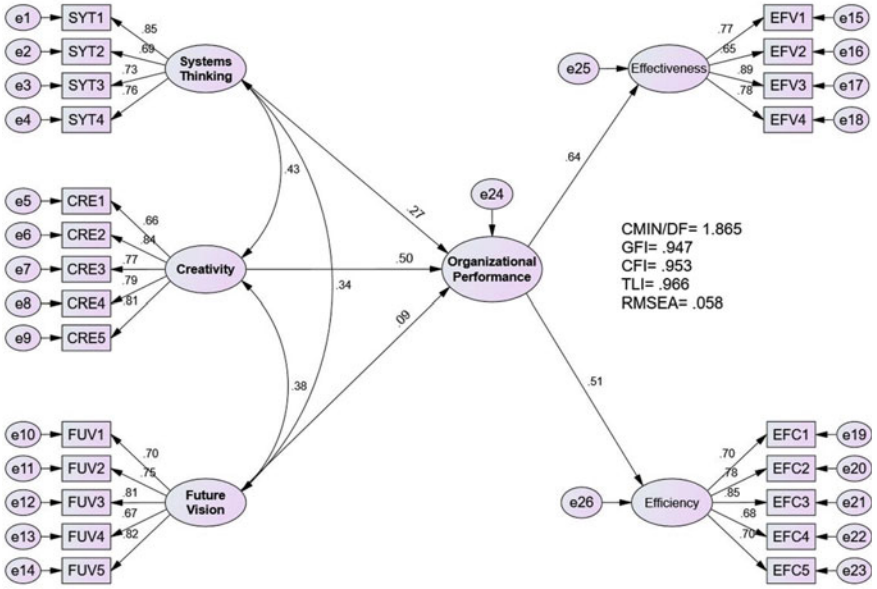

Fig. 2 SEM results of the strategic thinking effect on organizational performance

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 2.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.865, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.058, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that the highest impact was for creativity ($\beta = 0.504$, $t = 3.489$, $p = 0.001$) followed by systems thinking ($\beta = 0.275$, $t = 2.974$, $p = 0.003$), while future vision ($\beta = 0.088$, $t = 0.978$, $p = 0.849$) had not impact on organizational performance.

Table 2 Hypothesis testing

Hypothesis	Relation	Standard Beta	*t* value	*p* value
H1	Systems Thinking → Organizational Performance	0.275	2.974**	0.003
H2	Creativity → Organizational Performance	0.504	3.489**	0.001
H3	Future Vision →; Organizational Performance	0.088	0.978	0.849

Note *$p < 0.05$, **$p < 0.01$, *** $p < 0.001$

6 Discussion

Understanding the linkage between thinking strategically and organizations performance sets the stage for exploring how managers exploit managerial activities and value creation. Based on the findings and hypotheses presented in this research, the result of the first hypothesis showed that the level of strategic thinking in NGOs in Jordan is moderate, with a mean of (3.49).

There is a positive impact of strategic thinking on performance of NGOs in Jordan; structural testing reported that strategic thinking through its three dimensions namely, systems thinking, creativity and future vision achieved moderate variance in organization performance in term of Effectiveness (R2 = 38%) and achieved low variance in Organization Performance in terms of Efficiency as (R2 = 7%). ST at NGOs in Jordan had a little impact on performance especially in efficiency side. These findings are Inconsistent with previous studies (Jelenc & Swiercz, 2010; Al-Qatamin & Esam, 2018; Moghadam et al.,;2018). At the same time the results showed a high level of organizations efficiency (4.35), this indicates the elements of strategic thinking are not directed towards achieving the goal and there are other factors that affect on performance efficiency. So, the researcher recommends for future studies to know the influencing factors that have achieved the success of the organizations and greatly affect in their efficiency and continuity.

7 Managerial Implications

The researcher suggests some recommendation to promote and support the adoption of strategic thinking factors for NGO managers to build a model of value creation, understand their collaboration well and sees a problem or an opportunity as a part of the whole situation or system and combine creativity with a strategic thinking process that allows employees and organizations to utilize more effectively and leverage the power of their minds in the best way which corresponds with (Bonn, 2005; Liedtka, 1998; Mintzberg, 1998; Senge, 1990).

Strategic thinking is a necessity to address the problems facing organizations in creative ways that allow them to succeed and to provide what is new in their field through the exploitation of resources, knowledge, and skills. So, the organizations need to develop managerial awareness of the importance of strategic thinking and be more flexible to meet unexpected circumstances and adapt quickly to sudden changes to achieve organization objectives and developing their internal resources that in turn enable them to address future problems. The award scheme is an appropriate way to encourage managers and employees to think strategically because this process can motivate them to collaborate. Such an award plan can be presented Influencing members, which leads to important results in management decisions and strategies. It is necessary to encourage initiative and innovation among employees and managers to create a regulatory environment in which everyone motivates innovation in line with Strategic thinking.

8 Limitations and Direction for Future Work

The limitation of this study is based on self-reported data, causal relationships among the independent and dependent variables may be affected by other factors that cannot be controlled. A longitudinal study is needed in order to build a solid ground for the causal direction of relationships. This study using a quantitative approach, so, in order to gain a more in-depth knowledge of the impact of strategic thinking on NGOs' performance, there is a need for a more qualitative approach to research needs to take place. It would be essential for future research to focus on a smaller population to enable a qualitative approach to be used. The researcher believes that this will enable more critical questions to be asked in an interview process.

The Influence of Electronic Human Resource Management on Intention to Leave: An Empirical Study of International NGOs in Jordan

Menahi Mosallam Alqahtani, Hanan Mohammad Almomani, Sulieman Ibraheem Shelash Al-Hawary, Kamel Mohammad Al-Hawajreh, Ayat Mohammad, Mohammad Issa Ghafel Alkhawaldeh, Yahia Salim Melhem, Muhammad Turki Alshurideh, and Shoroq Haidar Al-Qudah

Abstract The aim of the study was to examine the impact of electronic human resource management on intention to leave. Therefore, it focused on international non-governmental organizations (NGOs) operating in the humanitarian sector. Data were primarily gathered through self-reported questionnaires created by Google

Forms which were distributed to a random sample of (620) employees. Structural equation modeling (SEM) was conducted to test hypotheses. The results showed that electronic human resource management had a negative impact on intention to leave. Moreover, the results indicated that the highest impact was for e-performance evaluation. Based on the study results, the researcher recommends organizations to involve employees in databases that enable them to follow the electronic human resources management practices, which is to follow up on the performance appraisal and how it works.

Keywords Electronic human resource management · Intention to leave · International NGOs · Jordan

1 Introduction

Technological development and electronic tools have contributed to the various sciences development such as management, where today employees have a greater awareness than employees in the past, and new technologies have created a new employee's generation and a change in the organizational structure (Al-Hawary & Alhajri, 2020; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Hussien, 2017). Where the changes are organized in such a way that the organizations absence on the global communication network means the loss of huge capital resources, business organizations are nowadays facing many challenges such as globalization, competitive value chain and technological changes (Al-Hawary & Ismael, 2010; Al-Nady et al., 2013; Altarifi et al., 2015; Allahow et al., 2018; Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Obiadat, 2021; AlTaweel & Al-Hawary, 2021). The rapid information and communication technology and its ability to apply it in various organizational fields led to the information technology penetration into human resource processes and systems, which led to a new approach to human resource management called "electronic human resource management" (Al-Hawary et al., 2020; Al-Hawary & Al-Namlan, 2018).Where electronic human resources management is one of the latest topics in the human resources management science as it aims to improve procedures to speed up the human resources functions operations, reduce costs and free managers from administrative restrictions to perform strategic roles (Alkalha et al., 2012; AlHamad et al., 2022; Alshurideh et al., 2022). In addition, increasing efficiency and benefiting from the different dimensions of technology, the rapid development of systems that provide electronic human resources services to employees and managers has allowed more information in a more convenient way that enables them to benefit from this information in the organization resources, so it automates human resources tasks and practices and transforms them from traditional and paper-based activities to electronic activities, allowing organizations to anticipate and transform environmental changes to create the necessary competitive advantage (Al Kurdi et al., 2021; Almaazmi et al., 2020; Harahsheh et al., 2021; Shamout et al., 2022).

What concerns us about the leave work intention is monitoring changes taking place in the workforce size, and there is no doubt that the organization's management is striving to reduce this phenomenon, because the high intention to leave work means that there is a large exit and entry situation to and from the organization (Alhalalmeh et al., 2020; Al-Hawary et al., 2013a, 2013b; Mohammad et al., 2020). This means that the efficiency degree of its workforce will be relatively low due to modernity and lack of experience, which makes the organization face many negative situations (Ahmed et al., 2020; Ahmad et al., 2021a, b; Odeh et al., 2021). As aspiring organizations today seek to achieve excellence and competitiveness, stay in the business world, retain their employees, and reduce the leave work intention by increasing job loyalty levels and achieving high job satisfaction levels, which helps to achieve goals (Abu Qaaud et al., 2011; Metabis & Al-Hawary, 2013; Al-Hawary et al., 2013a, 2013b; Al-Hawary & Harahsheh, 2014; Al-Nady et al., 2016; Al-Lozi et al., 2017; Alshurideh et al., 2017; Alolayyan et al., 2018; Al-Hawary & Al-Khazaleh, 2020). This study provides a scientific explanation to the impact of electronic human resources management on the intention to leave work. Hence the study idea came to identify the impact and importance of the effectiveness of electronic human resources management practices in the intention to leave work, through which it contributes to putting the organization on the right track.

2 Literature Review and Hypotheses Development

2.1 Electronic HR Management Practices

The human resource management department in many organizations focuses on human capital development and advocates human resource planning, performance management, recruitment and employee selection, as human resource management (HRM) scholars have sought to understand the ways in which the efficiency of human resource (HR) practices relates to their employees' attitude (Al-Hawary, 2015; Al-Hawary & Abu-Laimon, 2013). The human resource department is responsible for increasing human resources effectiveness in the organization in order to achieve the individual and society goals (Al-Hawary, 2011; Al-Hawary & Alajmi, 2017). There are many views of human resource management practices concept, which are defined as "a set of functions, activities and programs related to the human resources management affairs in the organization, and aiming to achieve the individuals, organization and society goals (Al-Hawary & Nusair, 2017; Al-Hawary & Mohammed, 2017). These functions, activities and programs include developing human resources strategy, analyzing organization jobs, planning human resources, evaluating employees performance, training and developing them, determining their salaries, wages and additional benefits, motivating them, activating them and addressing their problems to coordinate their goals and needs with the organization needs in which they work, all within the framework of specific organizational

and societal context" (al-Bari Dora and Al-Sabbagh, 2010). Al-Hawary and Nusair (2017) explained that it is a group of administrative activities and efforts that seek to obtain the organization's needs of human resources, develop, motivate and maintain them in order to achieve organizational goals with the highest efficiency and effectiveness level. Akinyemi (2011) defined that it is the organization formal structure which responsible for all decisions, strategies, principles, processes and practices in addition to the total functions, activities and methods related to the management of employees. The researchers dealt with human resource practices differed about its practices, depending on the study community or its nature. Muhammad et al. sees that human resource management practices are represented by (motivation, selection and appointment, training), while Al-Hawary (2015) sees that the practices are represented by (Recruitment and selection, human resource planning, training and development, compensation), while) expanded the practices related to human resource management, which were represented by (human resource planning, recruitment and selection, training and development, job analysis and design, motivation, performance evaluation, Participation in decision-making).One of the technology various dimensions is improving efficiency as it has enabled human resource managers to hire fewer employees who play a more important role in the organization. There are also many viewpoints of the concept of e-HRM practices as) explained as an umbrella term describing the integration of information technology and HR services to automate and facilitate service delivery. The researchers addressed electronic human resource management practices from multiple points of view, but they agreed on the mechanism by which the practices are applied, as the human resource management practices represented by: recruitment, selection, training, performance evaluation and compensation, aim to ensure that employees possess the necessary attributes for effective organizational performance, and to provide a behavioral indicator and appropriate reinforcement to guide and motivate desired behaviors. This can be done via using the main electronic human resource management practices which are (e-recruitment, e-selection, e-training) (Al-Hawary & Nusair, 2017; AlMehrzi et al., 2020; Alshurideh et al., 2021).) believe that the practices are (e-learning, electronic recruitment, selection and appointment, e-training). While Swaroop (2012) sees that electronic human resources management practices are (electronic profile, electronic recruitment, electronic selection, e-learning, e-training, e-compensation, e-leave).When reviewing the literature related to electronic human resources management practices, which were addressed by researchers from different cultural destinations and in different environmental conditions, the researcher believes that electronic human resources management practices represented in (electronic recruitment, electronic learning, electronic performance evaluation, electronic compensation) can be addressed in the current study and may be appropriate for the study community. **Electronic Recruitment**, the mechanism of electronic recruitment works by posting vacancies on the organizations' websites or an online recruitment site. Recruitment refers to the overall process of attracting, selecting, and appointing suitable candidates for jobs. The recruitment process includes analyzing job requirements, attracting employees to work, screening and selecting applicants, and integrating the new employee into the organization-learning: **E-training** is seen as the preferred

learning channel because it can be accessed from different parts of the world with a mouse click on the Internet, and e-training can happen anywhere. The researchers also revealed in the literature on training that the main objective of e-training is to enhance job performance and the extent of satisfaction that the trainee feels. **Electronic performance appraisal**: Macwan and Sajja (2013) define performance appraisal as a formal management procedure that provides an assessment of an individual's performance quality in an organization. As Swaroop (2012) stated that electronic performance appraisal means the company's website use to conduct an online assessment of employees' skills, knowledge and performance over the Internet. **Electronic compensation** is an effective reward and incentives system to enable organizations to respond quickly to changes in the environment, as the rewards and incentives system has become a tool for organizational effectiveness, as the electronic compensation system allows all organization employees to apply electronically in terms of reducing human resources management burden (Al-Khayyal et al., 2021; Alshurideh, 2019, 2022).

2.2 Intention to Leave Work

Human capital is one of the most important organizational assets and it is the most important pillars for maintaining organizational stability, growth stability and market control. Without the human element presence, organizations would not continue to work, and this is observed in major organizations and the rewards, training and loans they provide to their employees (Alshraideh et al., 2017; Al Suwaidi et al., 2020; Nuseir et al., 2021). Where the organizations owners always strive to strengthen the employees' loyalty and spirit, which contributes to the increasing productivity process and continuing to work (Alsuwaidi et al., 2020; Al Shebli et al., 2021). Thus intent to leave is a behavior directed toward leaving the organization, such as looking for a new job and quitting. In this regard, it is important to meet employee's needs and demands towards organizational support (Ammari et al., 2017; Al-bawaia et al., 2022). It is known that the intention to leave work has a negative impact on organizational efficiency and job satisfaction, as this phenomenon causes the organization to bear additional costs as a result of replacing an employee with another. If the employee is not satisfied with his work, this will reflect on his performance, and therefore the quality of service provided by this organization will decrease (Al-Dhuhouri et al., 2020; Al Mehrez et al., 2020). When the employee feels that organization does not fulfill his desires and needs; he will have the idea of leaving work and looking for the nearest presented opportunity (Alameeri et al., 2020; AlShehhi et al., 2020). In this case, the organization will have significant costs, whether direct costs (replacement, recruitment and selection, temporary staff) or indirect costs (morale, pressure on remaining staff, new staff learning) which are perhaps more important than direct costs. Intention to leave the job is the employee's plan to forget the current job and look for another in the near future. Amora (2014) defined the intention to leave work as the general framework for planning the behavior resulting from the

worker's intention and the worker's determination to leave work. Mohammad et al. also defined it as the employee's intention to voluntarily end the work relationship that binds him to the institution in which he works. There are many things that lead to the intention of leaving work, including the imbalance between work and life that employee may suffers, whether managers or employees, which may be represented by several situations, including that there is extra work, or a lack of compatibility with the organization's schedule, as these situations and work pressure can lead to conflicts between work and family (Al Kurdi et al., 2020a, b; Allozi et al., 2022). Thus, the stress that the employee feels without an increase in wages, promotions or vacations, this stress hinders the employee's performance and he may think with the intention of leaving work.

2.3 Electronic HR Management Practices and Intent to Leave

The researchers concluded that there are different relationships between electronic human resources management practices in the intention to leave work. Ali and Khalifa (2013) indicated that there is no direct statistically significant relationship between human resources management practices represented in performance evaluation and the intention to leave work, while the incentives were linked to the performance evaluation results in order to give the employee an incentive to improve his performance. When human resources department managers in organizations undertake the selecting workers process, weights and criteria are set for this process in order to ensure the human elements provision that tend to voluntary practices from the beginning of their integration into employment. Al-Hawary and Alajmi (2017) also indicated that employee's moral factors have an impact on the intention to leave work and the importance of maintaining the positive aspects of these factors in order to avoid reaching negative results, which may eventually lead to the employee leaving his work. While Issam indicated that there is a statistically significant effect of human resources strategies on employees' intention to leave work, the results also showed a statistically significant effect of the perceived organizational support on the employees' intention to leave work While Al-Hawary et al., (2013a, 2013b) indicated that there is a statistically significant effect of human resources strategies on employees' intention to leave work, the results also showed a statistically significant effect of the perceived organizational support on the employees' intention to leave work. Mohammad et al. (2020) indicated that employees job performance is greatly affected by modern human resource management process, and the greatest impact was for job analysis and design, followed by the workers participation in decision-making and performance evaluation, and that all practices positively affect workers performance, the better the application of these practices, the better the performance of workers. Based on above literature, the study hypotheses may be formulated as:

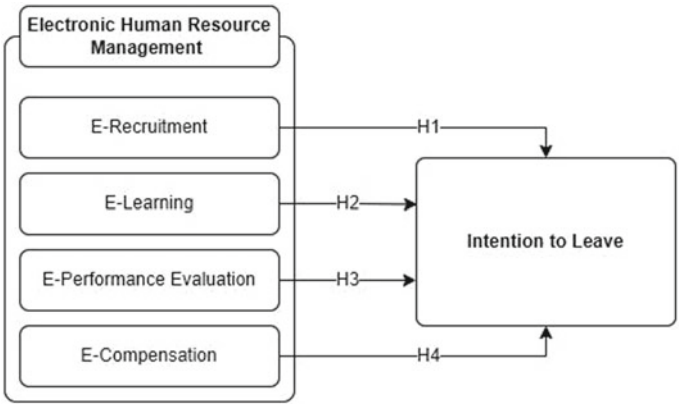

Fig. 1 Research model

There is a significant effect of human resource management practices on intention to leave.

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of electronic human resource management on intention to leave. Therefore, it focused on international Non-Governmental Organizations (NGOs) operating in the humanitarian sector. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a random sample of (620) employees via email. In total, (568) responses were received including (16) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (552) responses suitable to analysis requirements that were formed a response rate of (89.03%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure electronic human resource management based on (). These questions were distributed into dimensions as follows: five items dedicated for measuring e-recruitment, five items dedicated for measuring e-learning, five items dedicated for measuring e-performance evaluation, and five items dedicated for measuring e-compensation. Whereas the second section included seven items developed to measure intention to leave according to what was pointed by (Mohammad et al., 2020).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.531–0.864), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approaches based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table

Licensed to (putm@utm.my)

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5
1. E-Recruitment	**0.740**				
2. E-Learning	0.425	**0.753**			
3. E-Performance Evaluation	0.364	0.348	**0.761**		
4. E-Compensation	0.333	0.452	0.425	**0.766**	
5. Intention to Leave	0.625	0.604	0.633	0.597	**0.761**
VIF	2.064	1.778	1.649	1.947	– -
Loadings range	0.642–0.811	0.681–0.834	0.703–0.812	0.655–0.864	0.531–0.860
AVE	0.548	0.566	0.579	0.587	0.580
MSV	0.371	0.438	0.505	0.425	0.511
Internal consistency	0.854	0.866	0.870	0.874	0.900
Composite reliability	0.857	0.867	0.873	0.876	0.904

Note Bold fonts in the table indicate to square root of average variance extracted

1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 2.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.644, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.026, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the intention to leave and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

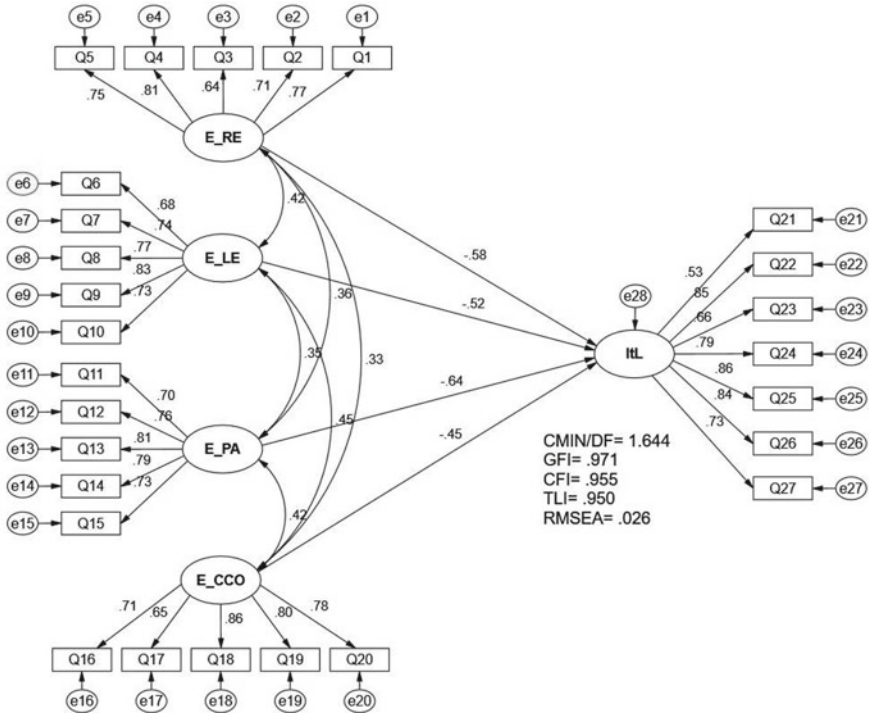

Fig. 2 SEM results of the E-HRM effect on intention to leave

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	E-Recruitment → Intention to Leave	−0.584***	18.611	0.000
H2	E-Learning → Intention to Leave	−0.522***	16.302	0.000
H3	E-Performance Evaluation → Intention to Leave	−0.641***	22.597	0.000
H4	E-Compensation → Intention to Leave	−0.451**	12.095	0.002

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

The results demonstrated in Table 2 show that electronic human resource management had a negative impact on intention to leave. Moreover, the results indicated that the highest impact was for e-performance evaluation ($\beta = 0.641$, $t = 22.597$, $p = 0.000$), followed by e-recruitment ($\beta = 0.584$, $t = 18.611$, $p = 0.000$), then e-learning ($\beta = 0.522$, $t = 16.597$, $p = 0.000$), and finally the lowest impact was for e-compensation ($\beta = 0.451$, $t = 12.095$, $p = 0.002$).

6 Discussions

The results showed the presence of a statistically insignificant effect of the electronic recruitment variable on the intention to leave work. Perhaps the reason behind this is that the electronic recruitment process is considered modern and not applied in all organizations, even if it is applied, the process of sorting applications and matching them with standards is not completely electronic, which in turn affects the employee and makes him think leave work. The results also showed a statistically significant effect of the e-learning variable in the intention to leave work, and the reason is that the process of teaching new employees the skills required to perform work tasks is based on the use of electronic systems in an average manner, as well as the case for determining training needs and evaluating the training process results. There was also a statistically significant impact of the electronic performance evaluation variable in the intention to leave work, which is a logical result in light of the partial reliance on employee performance evaluation through the use of the Internet and the presence of fixed standards based on evaluating employees performance by electronic tools that limit human intervention. In addition to the decisions related to employee's promotion, are still below the required level, as the performance evaluation results are obtained in a traditional way, not completely electronically. As it gives the employee the opportunity to get rid of negative reasons such as unfairness in performance appraisal. Finally, the results showed that there is an impact of the electronic compensation variable on the intention to leave work, and this means that informing employees of incentives through electronic methods is still below the required level, and that the use of electronic systems is partially applied in determining rewards through electronic programs, and the adoption of these programs is still weak in determining the relative jobs value.

7 Recommendations

Based on the study results, the researcher recommends organizations to involve employees in databases that enables them to follow the electronic human resources management practices, which is to follow up on the performance appraisal and how it works, which is done electronically, as well as identifying granting incentives mechanism and following up on training programs provided by the organization through modern technology tools. The researcher also recommends involving employees in paid training courses to raise their satisfaction and efficiency with work, in addition to providing an appropriate work environment for employees to reduce leaving work idea. The study also recommends that the electronic performance evaluation criteria should be clear to all employees and that they be familiar with their performance evaluation results, as this increases the employee's belief in the electronic evaluation fairness and integrity.

hospital. To collect the primary data questionnaire survey was distributed to (200) working women and (144) questionnaires were returned. The study uses ordinary least square (OLS) technique to run simple regression and test hypothesis where the work life balance is used as independent variable and intention to leave as dependent variable, for mediating effect the study used the organization commitment variable. After analysis, study found that affective commitment has fully mediated the relationship between work life balance and intention to leave. While normative commitment has partially mediated the relationship between work life balance and intention to leave among working women in King Abdullah University Hospital. In light of previous findings, the researchers recommends adoption of work life balance program in Jordanian hospitals, to improve the motivation and commitment of women employees for better organizational performance.

Keywords Work life balance · Organizational commitment · Intention to leave · King Abdullah university hospital · Jordan

1 Introduction

Today Arab women occupy an important position in modern societies and contribute effectively in advancing and developing their countries economy. Women have become a key partner in success of their organization (Aburayya et al., 2020; Kabrilyants et al., 2021). However, they face extra demand due of their roles in work and home; they should do their best at work and take care their families when baking home. The main factor that leads to the success of women in their work is the ability of achieving balance between family obligations and work demands. Therefore, the failure to achieve this balance will negatively influence their duties towards home and work, that leading to the occurrence of physical and psychological problems and consequently, reducing her life satisfaction (Al Khayyal et al., 2020; Nuseir et al., 2021).

Women working in the Middle East are not an exception to the rule, the perfect balance between work and personal life remains the most important challenge faced by women in Middle East as they are first responsible for the welfare of their families and care for their children (Abu et al., 2012). And while, she made strides to have a more flexible treatment in the workplace in terms of working hours and the establishment of units for the care of children in the workplace and work-sharing arrangements; she still face social pressure to comply with standards that force them to be ideal mother and ideal employee and so on a daily basis.

The conflict between work and family is considered as an important issue for organizations and individuals due to its association with negative results (Lyness &

Licensed to (putm@utm.my)

Judiesch, 2008). For example, the conflict between work role and family life role is associated with increased absenteeism and labor force turnover, low performance in the work place, and poor physical and mental health (Agha et al., 2021; Mohammad et al., 2020). One of negative consequences of work life balance is intention to leave, which is costly for organization. The cost of Replacing one hospital nurse has been estimated to be around $42,000 in Canada (Strachotaet al, 2003). Current studies in the Health Industry are paying attention to how to address the high cost of labor turnover and staff shortage (Chaaban, 2006). Although the significant of work life balance, little attention is paid to this issue in Arab word. The best of researcher knowledge no studies have been conducted in Arab countries (include Jordan) to investigate the effect of work life balance on intention to leave among working women. Therefore, the current study is carried out to fill the gap in literature by investigate the mediating effect of organizational commitment on the relationship between work life balance and intention to leave.

2 Theoretical Framework and Hypotheses Development

2.1 Work Life Balance

The work life balance of employees has come to focus during second half of the twentieth century (Naithani, 2010). The research on working mother has started during 1960 (Lewis et al., 2007). However, before 1970, the work life and family life were treated separately (Blunsdo et al., 2006). After 1970, various research articles were published regarding this issue. In 1977, when some research was conducted on interdependence between work life and family life (Pleck, 1977).

There are only quite general and no homogenous definitions of the term work-life balance. There has been a wealth of earlier revisions trying to deliver a theoretical definition of the concept of work-life balance. For example, Fleetwood (1977) defined work-life balance as “the relationship between cultural and institutional spaces and times of work and non-work in civilizations where income is primarily created and distributed through labor markets”. Greenblatt (2002) characterizes work-life balance by "the absence of unacceptable levels of conflict between work and non-work demands". And Voydanoff (2005) defines work-family-balance as “a global assessment that work and family resources are sufficient to meet work and family demands such that participation is effective in both domains”. This definition serves as a basic concept for this thesis as it shed lights elements that entail work family-balance and thus are in the center of interest. Another Definition of the work-life balance was introduced by the Rigby & O’Brien (2010) that work-life balance is a split of time between the work and personal life based on the priorities. In this definition, there is clear indication between the time management for both lives, one is personal life and other is official life. Priorities of the people may be different based on their perceptions, but the main thing is the consideration of both lives rather just

focusing on the single one. Because if the focus is shifted to the single side of the life only, then it is likely that balance would go out and effectiveness of the life may be compromised (Irene, 2014).

2.2 *Organizational Commitment*

The theoretical concept of the organizational commitment is elaborated along with the definitions of the organization commitment. The concept of the organizational commitment has taken a considerable importance over the years and become an essential feature of the researches that are connected with the employees and the organizations (Alhalalmeh et al., 2020; Al-Hawary & Alajmi, 2017; Al-Hawary et al., 2020; Alketbi et al., 2020; Metabis & Al-Hawary, 2013) It has been defined as a psychological state that combine an employee to an organization, that lead to reduce the turnover of employee (Allen, 2000). There are several definitions being introduced by the researchers about the organizational commitment (Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Al-Namlan, 2018; Al-Hawary et al., 2013; Al-Lozi et al., 2018). One definition of the organizational commitment is, "it is a multidimensional approach in nature which intends to analyze the attitude of the employee for the achievement of the organizational goals in addition to the membership willingness" (Al-Hawary, 2015; Al-Lozi et al., 2017; Meyer & Herscovitch, 2001). This definition is clearly based on two points where one is targeting the intention of the employee to be part of the organization and the other is merely based on the working attitude of the employee because both these things indicate the commitment of the employee with the organization. The definition is, "Organizational commitment is basically a person's attachment with the organization with the intention to stay with it along with the identification of the organizational goals so that extra effort can also be put in the consideration of achieving this" (Meyer et al, 2002). As per the analysis of all these definitions presented above, it shows that there are several things which are common among these definitions and these are termed to be part of the organizational commitment. One important factor, which is common in most of the definitions, is the commitment of the employee to stay in the organization for a longer period of time by providing a quality work with continuity (Al Kurdi et al., 2020a, b; Alameeri et al., 2020). The other thing, which is being focused on the definitions, is the goal of the organization and goal congruence. Organizational goals are simple that these are the aims of the organizations but the goal congruence is basically the unity of goals, goal of the employee and of the organization (Al-Hawary & Al-Syasneh, 2020; Allozi et al., 2022). This means that employees act in such a way that their goals are also attached with the goals of the organizations.

There are basically three models of the organizational commitment which are also known as commitment models. Meyer et al. (1993) explain that an employee's commitment reflected a need, desire and obligation to maintain membership in an organization. So the models of organization commitment can be outlined as

follows: ***Continuance Commitment*** occurs when an employee remains in organization because there are largely out of need, as lack of alternatives or costs associated with leaving, such as lost income, or an inability to transfer skills and education to another organization are the primary antecedents of continuance commitment (Meyer et al, 2002). ***Affective Commitment*** has been linked to positive work-related behaviors like organizational citizenship behavior (Meyer et al., 2002). Affective commitment model is linked with the wish of the employee to stay in the organization due to multiple reasons perceived by the employee himself. it is associated positively with organizational citizenship behaviors and negatively with turnover cognitions. ***Normative Commitment*** is more emotional and sense of liability-based model as compared to the other than two models discussed above. The basis of this model is different from the other two models and results in a more positive way for the organization. The employee feeling of moral obligation to stay in the organization because he feels that the organization has spent a lot of the resources in the grooming and the teachings of the employee.

2.3 Intention to Leave

Intention to leave is one of the measurements of performance (Abu Qaaud et al., 2011; Al-Nady et al., 2013; Al-Nady et al., 2016; Alshurideh et al., 2017; Alolayyan et al., 2018; Allahow et al., 2018; Al-Quran et al., 2020; AlTaweel & Al-Hawary, 2021; Altarifi et al., 2015; Al-Hawary & Alhajri, 2020; Al-Hawary & Obiadat, 2021). Intention to leave is defined as the planning of an employee to leave the current job and search for another job in near future time (AlShehhi et al., 2020; Alsuwaidi et al., 2020; Alshurideh, 2022). It is the willingness of the employees to leave the organization. There are several definitions being introduced of the intention to leave. According to the definition given by the Chaaban (2006) it is being defined as the intention of turnover whereas the definition given by Barak and Nissly (2001) it means that a serious consideration of leaving the job at present. However, the definition given by the (Chan & Morrison, 2000) is a little bit changed from the above two definitions. They said that intention to leave is about having a deliberate desire to leave the current employment. Aiken et al. (2002) defined this as a prediction of the future behavior because the intent is linked with the future action, which is based on the behavior, so it is very much integrated definition. It is clear that there have been similarities in the definitions being proposed by the plenty of writers. This "Employee Retention" is one of the major problems that are faced by present organizations (Ammari et al., 2017; Al-bawaia et al., 2022; Al Shebli et al., 2021). To maintain their workforce and to reduce the rate of erosion the organizations deliver visions into staff retention strategies, techniques and measures. In order to retain valuable employees, every employee should be given a proper attention.

2.4 Organizational Commitment, Work Life Balance and Intention to Leave

The research aims to investigate the work life policies and their effect on organizational commitment and intention to leave the organization of female employees in Jordan. Arab Muslim female has to perform more responsibilities in family than women in developed countries do. Hence, a work life balance is more difficult for them, which may lead to leave the organization. Effective work-life balance policies can solve this issue, which is the focus of this research. Kim (2014) concluded that there is a direct relationship between work-life balance with affective commitment but not with in-role performance. However, affective commitment can affect the in-role performance and hence, there is an indirect relationship between work-life balance and in-role performance. Tummers et al. (2013), concluded that development and career opportunities as well as work atmosphere are most influential factor that affect the turnover intention. Lee et al. (2013) found that individual related features such as marital status, education level etc. and work related features such as Work unit and teaching hospital are correlated with nurses' intention to leave their organization. Seven indicators were used to measure the quality of work life. Among them four (supportive milieu with job security and professional recognition, work arrangement and workload, work or home life balance, and nursing staffing and patient care) are correlated with nurses' intention to leave their organization. Nwagbara and Akanji (2012) found that women face more work life imbalances than men do. Women have more responsibilities, which pressurize themselves and reduce their motivation and commitment. Sakthivel and Jayakrishnan (2012) thought that working load interfere with their family greatly, but their family do not interfere with working significantly. The study also found that there is a positive relationship between work life balance and organizational commitment. Noor (2011) found that there is a negative correlation between perceived work life balance satisfaction and intentions to leave the organizations. The result of the study also indicated that job satisfaction and organizational commitment can act as partial mediator to define the relationship between work life balance and intentions to leave the organizations. Malone (2010) identified some factors, which causes dissatisfaction of the employees such as attitudes of the owner and/or managers, fairness, equality etc. These issues cannot be solved by work life balance policies as they are related to personal attitude. Kamel (2013) concluded that Affective Commitment can fully mediate the relationship between Quality of Work Life and Intention to Leave. Work life balance, organization commitment and intention to leave the organization: all are important factors for better human resource management and overall performance of the organization. From above studies, it is clear that these three are related to each other. Based on the literature above, the study hypotheses may be formulated as:

Organizational commitment mediates the relationship between work life balance and intention to leave among working women in King Abdullah University Hospital.

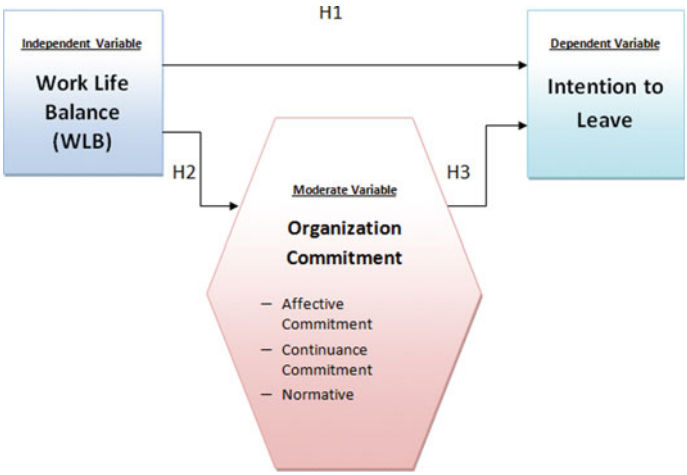

Fig. 1 The research model based on theoretical framework

3 Model and Variable of the Study

Based on previous literature the researcher prepared the following model in Fig. 1 that contains independent variable (work life balance) that measure their effect on dependent variable (intention to leave) through the mediating variable (organization commitment).

4 Research Methodology

4.1 Population and Sample

The female employees in king Abdullah University Hospital were the target population of the study with approximately (800) female employees. The sample frame comprised of working women in King Abdullah University Hospital at all degree levels, single and married with at least one year of experience of being employed with KAUH, the sample of the current study consist of 200 employees, which represent 25 percent of the study population. A sample population consisting of working women in King Abdullah University Hospital to achieve the goal of this study.

4.2 Instruments and Reliability

Based on previous studies and empirical review, a questionnaire was developed to explore the relationship between the work life balance, organizational commitment and how affect the intention to leave of female employees in King Abdullah University Hospital. The data gathering instruments used in this study were previously used instrument and measured the three variables. The general model is basically divided into three parts. Part one consists of three items of work life balance based on the work of (Hayman, 2005). Part two consists of organization commitment based on the work of (Meyer et al., 1993), Part three consists of intention to leave based on the work (Lee et al., 2013).

4.3 Validity and Reliability

Validity refers to the instrument should contain items related to the study variables, and it measures them accurately and clearly. To examine the validity of the survey and to ensure no biases with multiple interpretations or inappropriate and unclear wording, the tool of this study questionnaire was in English, but it was translated from English to Arabic by the researcher, then evaluated, the questionnaire had been sent to a number of specialist in business administration field.Their comments and recommendations were taken into consideration to improve some of the questionnaire items in a manner that fits the study variables measurements.

Reliability an indication of stability and internal consistency. It was established by calculating Cronbachs' Alpha coefficient which is an evidence indicating how well the questions are positively correlated to one another. Obtaining (Alpha ≥ 0.60) considered in practice for management science and Humanities is acceptable in general (Sekaran, 2003). Reliability coefficient for the main content of the questionnaire values ranged between (0.69) and (0.87), Hence it is acceptance values for the purposes of our analysis and test hypothesis, and the following Table 1 shows the results of Cronbach s Alpha for each dimension.

5 Analysis

H1.1: Affective Commitment mediates the relationship between work life balance and intention to leave among working women in King Abdullah University Hospital**.** The following model illustrates the nature of relationship between dependent, independent and mediator variables (Fig. 2).

To test this hypothesis, we used path analysis using regression technique results, the results are presented in Table 2, as illustrated in the below table, we noticed B and t turn out to be insignificant; this means that Affective Commitment fully

Table 1 Scales reliability

Variable measured	Dimensions	Number of items	Cronbach's Alpha
Work Life Balance	Work interference with personal life (WIPL)	7	0.87
	Personal life interference with work (PLIW)	4	0.71
Organization commitment	Affective commitment	6	0.80
	Continuance commitment	6	0.78
	Normative commitment	6	0.79
Intention to leave		6	0.69

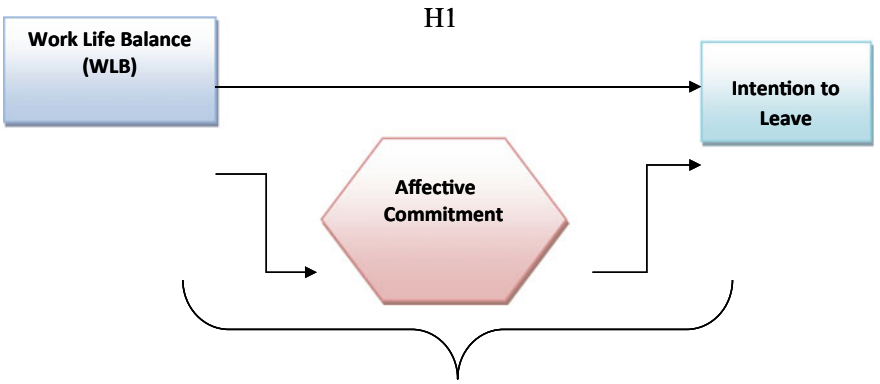

Fig. 2 First mediate model

mediates relationship between Work Life Balance (WLB) and Intention to leave. So, Hypothesis 1 is supported (Accepted). This explanation supported by previous research like (Kamel, 2013).

H1.2: Normative Commitment mediates the relationship between work life balance and intention to leave among working women in King Abdullah University Hospital**.**

Table 2 Path analysis for the mediating effect of affective commitment between WLB and intention to leave

Predictors	dependent variable	B	t	Sign. t	R^2	F	Sign. F
WLB	**Affective Commit.**	−0.705	−8.468	**0.000**	0.336	71.714	0.000
WLB	**Intention to Leave**	0.355	4.298	**0.000**	0.115	18.477	0.000
WLB + AC	**Intention to Leave**	0.179	1.82	**0.071**	0.171	14.553	0.000

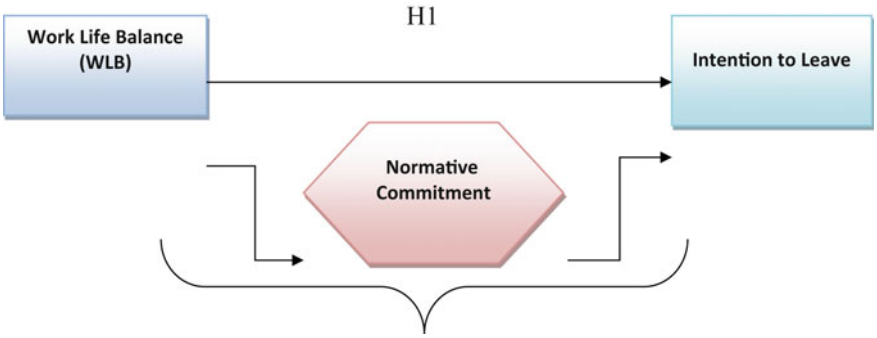

Fig. 3 Second mediate model

Table 3 Path analysis for the mediating effect of normative commitment (NC) between WLB and intention to leave

Predictors	Dependent variable	B	t	Sign. t	R^2	F	Sign. F
WLB	**Normative Commit.**	−0.194	−2.044	**0.043**	0.029	4.176	0.043
WLB	**Intention to Leave**	0.355	4.298	**0.000**	0.115	18.477	0.000
WLB + NC	**Intention to Leave**	0.325	3.934	**0.000**	0.141	11.62	0.000

The following model illustrates the nature of relationship between dependent, independent and moderator variables (Fig. 3).

To test this hypothesis, we used path analysis using regression technique results, the results are presented in Table 3, as illustrated in the below table, we noticed B and t remained significant; this means that Normative Commitment (NC) partially mediates relationship between Work Life Balance (WLB) and Intention to leave. So, Hypothesis 1.2 is supported (Accepted).

6 Conclusion and Discussion

The balance between the work and life is essential for a healthy land happy life because extra time spends on the work leads to work stress and extra time spends at home leads to the unsuccessful life. A high turnover is not considered a good sign for a corporate organization. If too many employees leave a particular organization, other experts or professional will think that there is a problem in the organization for which the employees left. Therefore, they will not be willing to join the organization (Davis & Kalleberg, 2006). Thus, intention to leave of the employees creates adverse

effect on organizations. However, women in organization are increasing, they have dual roles at work and at home, this put extra pressure on women, they struggle than men to balance between demand of work and life. Organizational commitment is further being explained as the employee's commitment to continue to stay in the organization and the integration of the self-goals with the goals of the organization because it is the way to pay for the affiliation with organization.

The aim of the study is to examine the mediate effect of the Organizational commitment on the relationship between work life balance and intention to leave among working women in King Abdullah University Hospital. The study found that affective commitment has fully mediated the relationship between work life balance and intention to leave. While normative commitment has partially mediated the relationship between work life balance and intention to leave among working women in King Abdullah University, the results of the study are consistent with Kim (2014), he concluded that there is a direct relationship between work-life balances with affective commitment, and Nwagbara and Akanji (2012) found that women face more work life imbalances than men do. Women have more responsibilities, which pressurize themselves and reduce their motivation and commitment. And Kamel (2013) concluded that Affective Commitment can fully mediate the relationship between Quality of Work Life and Intention to Leave. Work life balance, organization commitment and intention to leave the organization. The research conducted by Clutterbuck (2003) showed that the employees having been provided with work life opportunities believed more in commitment to the work and to the organization.

So, there must be some flexibilities for women during their working hours in order to have an ability to create the balance between the work and life such as compressed hours, short time and flexible timings, those are very effective policies for women. The theories of the work life balance are applied differently to women because their perception and the attitude are different from those of men. For more illustration, let's take this example: it is about a mother, who has plenty tasks to perform and these tasks cannot be done by a man like feeding the child, taking care of the child at home and also handling the routine tasks like house cleaning and cooking (Clutterbuck, 2003). These factors clearly show that women require more time to spend at home, but this would create the lack of balance between the work and life at home; so basically, if a little flexibility is given to women, they will easily maintain the balance. So, these are basically the major differences between men and women, these differences have caused more emphasizing on the work life balance for women contradictory to the less importance given to men.

The employees of the organizations with work life opportunities are more satisfied with the organization and have more willingness to work for the organization. This helps organization in retention of staff. (Booth & Jan, 2008). Work pressure is one of the causes of the high turnover. This is a state where the employee finds himself stuck in the work and has the specified deadline coming which puts an immense pressure on the tissues that it becomes harder for him to concentrate. Employee facing such situation may suffer from physiological and physical problems, so they may think about leaving organization (Obeidat et al., 2019; Kristensen, 2000; Alshurideh et al., 2022).

7 Recommendations

Based on the study results, the researchers recommend managers and decision makers to adopt work life balance program, to improve the motivation and commitment of women employees for better organizational performance. The recommended programs as safety, reward, promotion, flexible hour, training, payment, childcare support, parental leave, and to provide work life balance program is necessary for woman in Jordanian hospitals to increase job satisfaction that lead to enhance commitment for organization and reduce intention to leave. The organizations must enhance the participation of employee in decision making and locus of control to improved organization commitment. Finally, organization should give special attention to commitment its vision and goals in such a way that is consistent with the employee values to enhance affective commitment.

Electronic HR Practices as a Critical Factor of Employee Satisfaction in Private Hospitals in Jordan

Main Naser Alolayyan, Reham Zuhier Qasim Almomani, Shoroq Haidar Al-Qudah, Sulieman Ibraheem Shelash Al-Hawary, Anber Abraheem Shlash Mohammad, Kamel Mohammad Al-hawajreh, Raed Ismael Ababneh, Muhammad Turki Alshurideh, and Abdullah Ibrahim Mohammad

Abstract The aim of the study was to examine the impact of e-human resource management on employee satisfaction. Therefore, it focused on the private hospitals in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of (320) physicians.

In total, (285) responses were received including (11) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (274) responses. Structural equation modeling (SEM) was conducted to test hypotheses. The results showed that E-human resource practices had a positive impact on employee satisfaction except e-compensation. They also indicated that the highest impact was for e-development. According to the study's findings, managers and decision-makers should follow the contract's implementation of all employee rights, as well as the employee's commitment to carry out all of the duties entrusted to him, ensure the employee's job stability, and work to ensure that an organization offers advanced technologies based on employee performance evaluation.

Keywords Electronic HR practices · Employee satisfaction · Private Hospitals · Jordan

1 Introduction

In today's information-based economy, an electronic human resources management system is a must to deal with the challenges of human resources in the twenty-first century (Al-Hawary et al., 2020; AlHamad et al., 2022). Web-based human resource management solutions, often known as an electronic human resource management system, are becoming increasingly popular in businesses (Al-Hawary & Al-Namlan, 2018; Swaroop, 2012). As surveys of human resources consultants' show, the number of organizations adopting the electronic human resource management system (E-HRM) and the depth of applications within organizations is constantly increasing, the rapid development of the Internet over the last decade has led to an improvement in the implementation and application of electronic human resource management. Academic interest in electronic human resources management has risen as a result of the publication of numerous issues of journals devoted to human resources and the existence of a group of empirical studies in the field (E-HRM). HRIS is known as E-HRM, according to Stone and Dulebohn, because organizations have enabled online HR transactions. Because it automates human resources tasks and practices and transforms them from traditional and paper-based activities to electronic activities, the rapid development of systems for providing electronic human resources services to employees and managers helps them obtain additional information in a more convenient way so that they can benefit from the information in organizational resources (Alkalha et al., 2012; Alshurideh et al., 2022).

Satisfaction is a term that refers to a mix of psychological, functional, and environmental variables that contribute to an employee's happiness at work (Al-Hawary & Obiadat, 2021; Alhalalmeh et al., 2020; Al-Hawary & Alhajri, 2020; Al-Hawary & Al-Khazaleh, 2020; Alolayyan et al., 2018; Alshurideh et al., 2017; Al-Hawary & Al-Menhaly, 2016; Al-Nady et al., 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary et al., 2017; Al-Hawary & Harahsheh, 2014; Altarifi et al., 2015; Al-Hawary & Hussien, 2017; Al-Hawary, 2013; Al-Hawary et al., 2013a, b). Furthermore, it is

an understanding of the difference between what a person expects from his job and what he actually gets (Al Kurdi et al., 2021). Positive feedback on the extent to which the job satisfies the employee's aims and objectives is included in job satisfaction. Employees typically attempt to attain their goals and fulfill their wishes by giving the appropriate performance, as well as the employee's knowledge of specific changes and conditions that may affect him while at work (Alsuwaidi et al., 2020; Al-bawaia et al., 2022). Organizations are interested in the topic of job satisfaction because a higher degree of job satisfaction correlates with a lower percentage of employee absenteeism, implying that there is a link between job satisfaction and workplace productivity (Alameeri et al., 2020; Kurdi et al., 2020). Employee satisfaction is one of the issues that must be examined from time to time owing to variances in human nature as a result of current improvements in our world, and it is still a research topic (Al Kurdi et al., 2020; AlShehhi et al., 2020). The purpose of the study was to see how electronic human resource management affected employee satisfaction.

2 Theoretical Framework

2.1 Electronic HR Management Practices

Because the human resources department focuses on the human aspect, it is one of the most crucial administrative roles on which any corporation is built (Al-Hawary, 2009; Al-Hawary et al., 2012; Al-Hawary & Mohammed, 2017). Organizational success or failure is determined by the efficiency and effectiveness of human resource management techniques. Human resource management is defined as the department in charge of increasing the effectiveness of human resources in the organization in order to achieve individual and societal goals, and it is thus the department in charge of enabling the organization to build, maintain, and develop its strategic advantages (Al-Hawary & Nusair, 2017).

Human resource management, according to Al-Hawary (2011), is the total of functions within an organization, including hiring the right personnel and managing labors relations, as well as both the strategic and operational perspective of the firm's needs. They are identified procedures and activities that support common institutional goals by combining the demands of the organization and the needs of the individuals who work for it, according to Keshway (2008). Electronic human resources management (E-HRM) is described by Parry and Tyson as the use of technology in human resource management functions and communication via technology directed through networks between the organization and its personnel.

Electronic human resource management is defined by Schramm (2006) as a method of implementing human resource management strategies, processes, and policies in an organization through direct and conscious directed support based on various online technologies. According to AlTaweel and Al-Hawary (2021), it is a technology that allows human resources functions to establish new areas

of contribution to company performance. Electronic human resource management strives to provide a comprehensive, thorough, and continuous information system for employees and occupations at a fair cost, as well as support future planning and policy formulation. Automate personnel information and make human resource demand and supply discrepancies easier to track.

Researchers measured a set of techniques for electronic human resource management, and their opinions on the procedures vary. For example, Mohammad et al. (2020) see electronic human resource management practices in (work analysis and design, recruitment, selection, compensation and benefits), whereas) see electronic human resource management practices in (work analysis and design, recruitment, selection, compensation and benefits) (electronic polarization, electronic selection, electronic training, electronic compensation, electronic performance evaluation, and electronic communication). The researcher believes that the practices of electronic human resources management represented in (electronic recruitment and selection, electronic development, electronic performance evaluation, electronic compensation, and electronic communication) can be addressed after reviewing studies related to the practices of electronic human resources management that were addressed by researchers from various cultural destinations.

It may be appropriate for the current study's population. **Electronic recruitment:** E-recruitment, according to Swaroop (2012), is the use of a company's website to attract prospects and receive electronic applications. E-recruitment has a number of advantages, including 24/7 access to online opportunities, the comfort of job examination without the physical stress of an interview, and the ability for applicants to obtain a thorough grasp of the business and its culture before joining it. **Electronic development:** Organizations have resorted to developing training and integrating it with technology in order to effectively trains their employees. As a result, organizations have begun to use a new term called e-training, whose main goal is to improve job performance and the extent of satisfaction that the trainee feels, as well as to create a productive workforce. E-training, according to Al-Hawary and Alajmi (2017), is "skills training using modern computer technologies." **Electronic performance appraisal**: This practice is based on evaluating human resource performance via the Internet, which means that managers can provide performance information directly to the human resources department via electronic forms, reducing the use of paper for supervisor and control, as well as the time and cost of the strike for resource management. Managers can also use human self-service tools to enter performance appraisal management outcomes in real time. **Electronic Compensation:** Electronic compensation is one way to a compensation toolkit that allows a company to gather, store, analyze, and use compensation data and information. The use of a company's website to arrange employee remuneration is defined by Swaroop (2012) as an organization's pay strategy should be able to attract the right kind of personnel, keep them, and ensure that they are treated fairly. **Electronic communication**: The ability to communicate solely through electronic means, removing the need for physical contact and allowing for geographical dispersion of organization members, as well

as online collaboration via e-mail, discussion boards, and chats, as well as telephone and fax communications, promises to eliminate time and space constraints (Lee & Kim, 2009).

2.2 Employee Satisfaction

Job satisfaction is one of the most important factors in determining the efficiency and effectiveness of business organizations (Alshurideh, 2022; Hayajneh et al., 2021). Employees are an important part of the process of achieving the company's mission and vision, so they must meet the organization's performance standards to ensure the quality of their work (Alzoubi et al., 2022). We considered a number of negative consequences of job unhappiness, including disloyalty, greater authoritarianism, and a rise in the number of accidents. Employees require a working environment that allows them to operate freely without being hindered from achieving their full potential (Alshraideh et al., 2017; Alzoubi & Inairat, 2020). Job satisfaction is a complicated and varied notion that can mean different things to different people (Aburayya et al., 2020; Alshurideh et al., 2012). For example, what satisfies one employee may not satisfy another. For all employees, there is no single measure of job satisfaction. As a result of exposure to a group of psychological, social, professional, and material elements, it describes the psychological or emotional state that the employee achieves at the degree of certain satisfaction.

Job satisfaction and motivation are linked, although the basis of this correlation is unclear. Job satisfaction, according to Al-Lozi et al. (2017), is described as a feeling of inner loyalty and pride experienced when performing a specific task. Employees' typical feelings and feelings about their work are referred to as job satisfaction (Al-Dmour et al., 2021; Allozi et al., 2022). Positive attitudes toward the workplace indicate job satisfaction, whereas negative attitudes toward the job indicate job discontent (Al-Khayyal et al., 2020; Armstrong, 2006). According to George and Jones (2008), job satisfaction is a set of feelings and beliefs that people have about their current job. Job satisfaction levels can range from extreme satisfaction to complete dissatisfaction. In addition to attitudes about their jobs as a whole, people can have attitudes about different aspects of their careers such as the type of work they do, coworkers, supervisors, or developers, and their pay.

Job satisfaction, according to Hoppock is "any combination of psychological, biological, and environmental variables that leads a person to honestly state that I am content with my job". Job satisfaction is the sum of a worker's positive and negative feelings about their work. Job circumstances were discovered by Metabis and Al-Hawary (2013). It is a significant factor for job satisfaction for workers who work in challenging working conditions; as a result, employees in these situations are dissatisfied with their jobs, and it was required for management to improve working conditions in order to promote employee happiness. As a result, their overall work performance will improve (Alketbi et al., 2020; Sultan et al., 2021).

2.3 E-HR Management Practices and Employee Satisfaction

Employee satisfaction and computerized human resource management approaches have varied correlations, according to the researchers. According to Wadi (2018), there is a favorable link between the benefits of an electronic human resources management (E-HRM) in terms of streamlining work procedures, decreasing the load and efficacy of communications, and transparency between satisfaction and satisfaction. Employees gave feedback on how to utilize the system, the ease with which it could be used, its suitability for work, and the level to which technical capabilities were available. In addition to Al-Shakhanbeh (2015), who referred to the identification of the role of electronic human resources management in the quality of job performance, the study's findings revealed that there is a statistically significant effect of human cadres in the quality of job performance, as well as the presence of a statistically significant effect of human cadres and electronic human resources management software in continuous improvement in Orange Company.

Through the mediating function of employee satisfaction, Khan et al. (2019) investigated the impact of human resource management methods (selection and appointment, training and development, performance evaluation, and compensation) on employee performance in six Pakistani public institutions. And it came up with a set of conclusions, the most important of which are: Human resource practices have a significant impact on faculty members' job performance, with job satisfaction serving as a mediating factor; in addition, human resource management practices have a positive impact on job satisfaction; and job satisfaction has a positive impact on improving faculty members' performance in these universities.

Madanat and Khasawneh (2018) investigated the effectiveness of human resource management practices (manpower planning, selection and appointment, training and development, compensation, and performance evaluation) and their impact on employee satisfaction in 15 commercial and Islamic banks. It came to a set of conclusions, the most important of which is that the banking sector uses human resource management practices at a high level, with the exception of compensation, which is at a medium level, employee satisfaction is at a medium level, and there is a strong and positive statistical relationship between human resource management practices and job satisfaction. Based on above literature review, the study hypotheses may be formulated as:

E-HR management practices have a significant impact on employee satisfaction

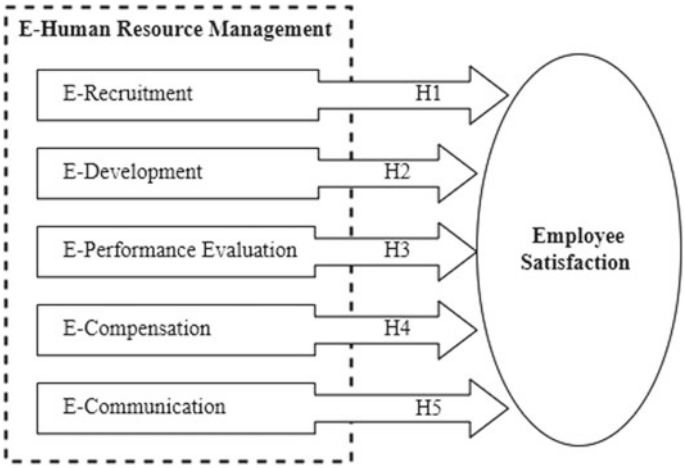

Fig. 1 Research model

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of e-human resource management on employee satisfaction. Therefore, it focused on the private hospitals in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of (320) physicians via email. In total, (285) responses were received including (11) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (274) responses suitable to analysis requirements that were formed a response rate of (85.6%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (24) items to measure e-human resource management based on (). These questions were distributed into dimensions as follows: four items dedicated for measuring e-recruitment, five items dedicated for measuring e-development, five items dedicated for measuring e-performance evaluation, five items dedicated for measuring e-compensation, and five items dedicated for measuring e-communication. Whereas the second section included eight items developed to measure employee satisfaction according to what was pointed by (Al-Hawary et al., 2013b).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021; Al-Hawary & Al-Syasneh, 2020; Al-Adamat et al., 2020; Al-Gasawneh & Al-Adamat, 2020). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.572–0.911), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6
1. e-recruitment (ERC)	**0.757**					
2. e-development (EDV)	0.351	**0.737**				
3. e-performance evaluation (EPE)	0.375	0.355	**0.764**			
4. e-compensation (ECP)	0.418	0.468	0.458	**0.769**		
5. e-communication (ECM)	0.436	0.455	0.528	0.392	**0.774**	
6. employee satisfaction (ESA)	0.628	0.602	0.671	0.652	0.660	**0.771**
VIF	2.544	1.825	1.671	2.237	2.060	–
Loadings range	0.572–0.855	0.694–0.782	0.703–0.821	0.743–0.815	0.675–0.831	0.643–0.911
AVE	0.572	0.543	0.583	0.592	0.599	0.594
MSV	0.458	0.338	0.420	0.497	0.503	0.514
Internal consistency	0.836	0.854	0.871	0.877	0.879	0.918
Composite reliability	0.840	0.856	0.875	0.879	0.881	0.921

coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 2.

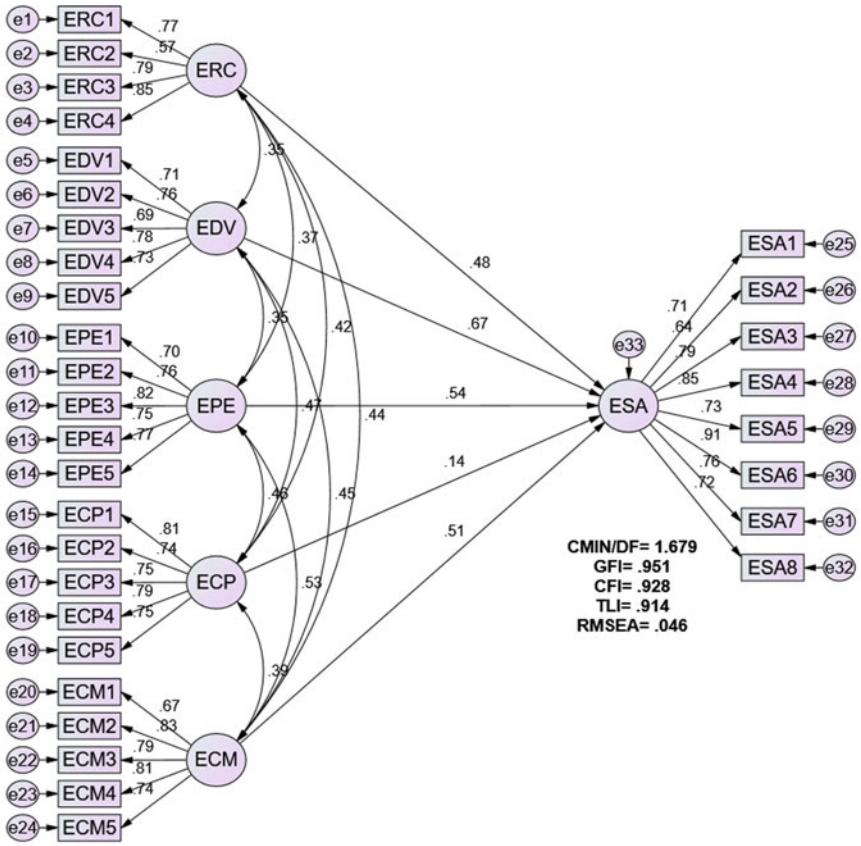

Fig. 2 SEM results of the e-human resource management effect on employee satisfaction

Table 2 Hypothesis testing

Hyp	Relation	Standard beta	t value	p value
H1	e-recruitment→employee satisfaction	0.485*	8.847	0.03
H2	e-development→employee satisfaction	0.671***	14.873	0.000
H3	e-performance evaluation→employee satisfaction	0.542**	10.597	0.002
H4	e-compensation→employee satisfaction	0.137	0.897	0.188
H5	e-communication→employee satisfaction	0.615***	13.042	0.000

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.679, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.046, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the employee satisfaction and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that e-human resource management dimensions had a positive impact on employee satisfaction except e-compensation ($\beta = 0.137, t = 0.897, p = 0.188$). They also indicated that the highest impact was for e-development ($\beta = 0.671$, $t = 14.873$, $p = 0.000$), followed by e-communication ($\beta = 0.615$, $t = 13.042$, $p = 0.000$), then e-performance evaluation ($\beta = 0.542$, $t = 10.597$, $p = 0.002$), and finally the lowest impact was for e-recruitment ($\beta = 0.485$, $t = 8.847$, $p = 0.03$).

6 Results Discussion

The study concluded that electronic human resource management practices (selection and appointment, development, compensation and incentives, performance evaluation, communication) have a statistically significant impact on achieving employee satisfaction, which agreed with the findings of Khan et al. (2019), who found an impact of human resource management practices (selection and appointment, training and development, performance evaluation, communication) on achieving employee satisfaction. Employee satisfaction was also found to have a statistically significant effect on the electronic human resources management variable in the study. The reason for this could be that the systems that underpin electronic human resource management, such as electronic performance appraisal, protect the worker's right to be free from manipulation by others. This finding is in line with Atyani and Abu

Salmi's research (2014). In addition, the variables of polarization and computerized selection have a statistically significant effect on employee satisfaction. Electronic systems are utilized in the sorting of job applications in this activity, and advanced applications are sifted and applications that meet the standards and conditions are picked using electronically operated systems, because these systems are so vital in increasing employee satisfaction. Finally, the electronic training and development variable has a statistically significant effect on employee satisfaction. Electronic systems are used to teach new employees the skills they need to accomplish their jobs and to provide them with appropriate training based on their needs being closely monitored. Employee satisfaction is increased as the results of training programs are evaluated utilizing specific technological technologies. This finding is consistent with Ruël et al. (2004), who found that using computerized human resource management in the training process can help finish the training and development process at the lowest feasible cost.

The electronic performance evaluation has a statistically significant effect on employee satisfaction. Employee performance is reviewed using the Internet, and data on employee performance is collected using computerized systems in order to make judgments about promotions or determine training needs. This practice has the most impact compared to others. Because of the transparency that electronic performance appraisal systems provide. The benefit of electronic human resources management, according to Stone et al. (2006), contributes to the dissemination of information about employees and access by managers, the human resources department, and employees themselves, as well as the identification of job opportunities and performance feedback (Al-Dhuhouri et al., 2020; Odeh et al., 2021).

The electronic compensation variable has a statistically significant effect on employee satisfaction. Electronic programs determine the relative and compensating value of occupations, and employees are alerted about incentives electronically, demonstrating transparency among employees and so leading to employee satisfaction. Employee satisfaction is influenced by the electronic communication variable because each employee receives a personalized email from the company, which is intended to keep employees informed about changes to the company's rules and procedures. Employee happiness is a result of working hours that are determined by a prior agreement between them.

7 Recommendations

According to the study's findings, managers and decision-makers should follow the contract's implementation of all employee rights, as well as the employee's commitment to carry out all of the duties entrusted to him, ensure the employee's job stability, and work to ensure that an organization offers advanced technologies

based on employee performance evaluation, by making the most significant investment in contemporary technologies imaginable. Finally, electronic compensation mechanisms must be improved. Pay close attention to electronic human resource procedures, and place a strong emphasis on employee satisfaction, since this will help them work better.

Employee Empowerment and Intention to Quit: The Mediating Role of Work Engagement: Evidence from the Information Technology Sector in Jordan

Yahia Salim Melhem, Fuad N. Al-Shaikh, Shatha Mamoun Fayez, Sulieman Ibraheem Shelash Al-Hawary, Muhammad Turki Alshurideh, Ayat Mohammad, Kamel Mohammad Al-hawajreh, Anber Abraheem Shlash Mohammad, and Barween H. Al Kurdi

Abstract The objective of this study to understands the role of work engagement as a mediator in the relationship between employee empowerment and intention to quit. A quantitative approach was adopted in order to achieve this study aim: 318 responses were collected via an e-questionnaire from the respondents belonging to IT sector employees in Jordan, one of the most significant Jordanian sectors. The Statistical Analysis Package for Social Science (SPSS) was used for data analysis, and the Sobel test was further used to assess the mediating impact of work engagement on the relationship between employee empowerment and employees' intentions to quit. Findings indicated that that work engagement has a mediating effect between employee empowerment and employees' intention to quit. In light of the

findings of this research, the most important recommendations include that information technology companies should focus on enhancing employee empowerment within organizations so that the employee becomes more affiliated and engaged in the organization in which they work. More future studies on empowerment, intention to quit and work engagement could be conducted in other organizations.

Keywords Work engagement · Intention to quit · Employee empowerment · Information technology · Jordan

1 Introduction

Empowering employees is one of the modern administrative trends in the growth of human resources, which is responsible for enhancing capability and competitiveness in organizations and enhancing quality and sustainability (Alshurideh et al., 2019; Al Khayyal et al., 2020). Empowered employees are in better position to make appropriate choices to solve particular problems on their own (Alhalalmeh et al., 2020; Al-Hawary et al., 2020; Andrew & Sofian, 2012; Mohammad et al., 2020). So, individuals who feel more efficient in their ability to perform the work successfully would be more satisfied in their work (Al-Lozi et al., 2018; Saks, 2006), be more committed and have less desire to leave their job (Al-Hawary & Alajmi, 2017; Shuck et al., 2011)., and show positive performance in their work, more than those individuals who have lower levels of empowerment (Al-Lozi et al., 2017; Meyerson & Kline, 2008).

Work engagement has become a very common concept and a topic of significant concern in management and psychology over the last 20 years. Getting an engaged workforce is a strategic advantage for organizations, as it is strongly associated with desirable organizational outcomes (Han, 2015; Yin, 2018). Organizations with high levels of work engagement increased earnings per share by 3.9 times more than those with low levels of work engagement (Alameeri et al., 2020; Gallup, 2010). Disengaged employees, on the other hand, cost organizations because they are less productive (Alyammahi et al., 2020; Richman, 2006). As a result, having engaged employees is regarded as the fourth most important management challenge facing business organizations (Al-Hawary & Al-Namlan, 2018; Aselstine & Alletson, 2006).

In the modern era, organizations strive to maintain talent and explore potential ways to enhance work engagement with their employees and teams (Al-Hawary,

e-mail: barween@hu.edu.jo

2015; Al-Hawary & Abu-Laimon, 2013). Hence, workforce stability is a powerful competitive strategy that is expected to become increasingly important in the future, and employees' intention to quit continues to be a topic of interest among management researchers (Al-Hawary et al., 2013; Metabis & Al-Hawary, 2013; Nuseir et al., 2021). Alfes et al. (2013) indicated that engaged employees tend to have less intention to leave their organizations.

"Employees' intention to quit," according to Fugate et al. (2012), is a very costly issue, especially when it is accompanied by cognitive withdrawal. The term "occupational stability" contrasts with the term "intention to quit" and means the survival and continuation of individuals in the same job for a long period (Agha et al., 2021; Whitebook & Sakai, 2003). Studying, in the Jordanian context, the impact of employee empowerment on employees' intention to quit is considered a necessary input to the process of promoting sustainable job opportunities, while reports received from individuals and organizations indicate that the rate of employees' intention to quit has a significant impact on organizational performance (AlShehhi et al., 2020; Kurdi et al., 2020). The rate of job turnover is a challenge to the workflow, given the time and effort needed by human resources employees to maintain employment levels and productivity in organizations (Abu Jadayil, 2011; Al Kurdi et al., 2020). From the review above, it can be concluded that, in spite of the volume of research on employee empowerment, intentions to quit, and work engagement, most such effort is still conceptual at best, confined to a limited, scope or lacks empirical testing (Alsuwaidi et al., 2020; Al Shebli et al., 2021; Al-bawaia et al., 2022). Hence, this research study aims to explore the impact of employee empowerment on intentions to quit, and to identify the role of work engagement as a mediator, in the rather unexplored context and.

2 Literature Review and Hypotheses Development

2.1 Employee Empowerment

Employee empowerment, according to Selvi and Maheswari (2020), is a process in which an organization's employees are given authority, power, responsibility, resources and liberty to make decisions and complete job responsibilities. It also grants employees control and allows for the distribution of responsibilities and control at all levels (Ammari et al., 2017). There is no doubt that attention to the concept of empowering employees constitutes an essential and decisive element for organizations in Jordan, especially in light of the trend towards adopting and applying modern administrative concepts, such as total quality management, re-engineering management processes and comprehensive performance planning (Alshurideh et al., 2015, 2020) Empowerment leads the individual to a sense of belonging to the organization, which in turn leaves positive effects on the employee's psyche and sense of importance and appreciation in the organization. Empowerment is seen as a way to

involve employees in the decision-making process, enrich their skills and experience, and establish a sense of their importance at work (Al-Hawary & Al-Syasneh, 2020; Moye & Henkin, 2006).

Employee empowerment contributes to changing the individual's perception and attitude towards their organization or their job (Ghaniyoun et al., 2017). Empowerment has been considered a vital subject in management recently. There is common support to grant employees adequate scope of freedom in their work meaning and responsibilities to enable them to apply this scope towards achieving the overall aims of the organization (Al-Dhuhouri et al., 2020; AlTaweel & Al-Hawary, 2021).

Due to the many dimensions of empowerment, and because of a dynamic process in a dynamic environment, and many elements involved in various steps of this process, empowerment is very complex to define (Al Mehrez et al., 2020; Al-Hawary & Alwan, 2016; Robbins et al., 2002). Conger and Kanungo (1988) defined empowerment as the motivating principle of self-efficacy, According to Khalili et al. (2016), empowerment is an administrative approach in which managers and other organizing members participate in influencing decision-making (i.e., decision-making cooperation). This definition is in line with that of Baird and Wang (2010, p. 577), who defined employee empowerment as "the delegation of power and responsibility from higher levels in the organizational hierarchy to lower level employees, particularly decision-making power."

Previous studies present many dimensions that can be used to measure empowerment within organizations. To achieve the purpose of our study, competence, impact, self-determination and meaning were used as dimensions to measure employee empowerment. These four perceptions together reflect a positive attitude towards work, and from that, empowerment is a motivating component that supports individuals and qualifies them to possess independent capabilities that enable them to make decisions commensurate with the goals of the organization (Al Suwaidi et al., 2020; Alaali et al., 2021). These dimensions are; **Meaning**, is related to the individual's sense of the importance of his/her work on a personal level and within the work environment (Zhang & Bartol, 2010). **Competence**, it is the individual's ability to perform tasks successfully and this refers to self-efficacy. **Self-Determination,** it has also been described as a feeling of control, freedom of choice, and self-determination to initiate action (Salman, 2015). **Impact**, it represents the degree to which the individual sees that his/her behaviour at work makes a difference in results (Zhang & Bartol, 2010).

2.2 Intention to Quit

Individual employees' plans to leave their jobs can be referred to as intentions to quit (Al-Hawary & Aldaihani, 2016; Al-Hawary & Nusair, 2017; Al-Hawary & Mohammed, 2017; Williams & Hazer, 1986); such intentions to quit can be either voluntary or involuntary. The biggest predictor of actual turnover is employees' intention to quit (Joseph et al., 2007) and the study of Williams and Hazer (1986)

indicates that there is a strong correlation between the employee's intention to quit work and the actual behaviour of quitting. We conclude from the foregoing that employees' intention to quit is defined as the individual's unwillingness to continue working, and decision to think carefully and seriously about leaving the job and trying to search for new job opportunities. intention to quit is one of the phenomena that have a high cost to the organization, and it crystallizes in two directions; the first is the decision to leave the work, which incurs large losses to the organization, and the second is the loss of morale among workers who decide to stay in the organization in the presence of these intentions (Odeh et al., 2021; Lee et al., 2022a, b). Based on the above, the study of intention to quit becomes one of the constants that the organization must study in order to avoid many material and moral costs.

2.3 Work Engagement

Successful organizations consider engagement to be important, and it is one of the hot topics highlighted in human resource management insights today. Some researchers refer to it as employee engagement, while others refer to it as work engagement. Even so, there is no difference between the two terms when it comes to explaining employee engagement. Employee engagement is a solution that managers can recommend when dealing with employees' motivation issues (Oehler & Adair, 2019; Alshurideh, 2019, 2022). Engagement was interpreted by Kwon and Park (2019) as an individual's mental, emotional, and cognitive condition that leads to the achievement of organizational goals. Hence, in occupational health psychology, work engagement is one of the most common outcomes (Lesener et al., 2020). Therefore, the issue of work engagement has become a topic that has captured the interest of many researchers and practitioners in the field of management and organizational behaviour, as it is a basic and decisive element in the success of business organizations (Garg & Singh, 2019).

Recent research showed high levels of disengagement from work, a situation that continues to cause problems for leaders around the world. Massive employee disengagement has recently been reported (Hewitt, 2013). According to Baron (2013), employee engagement is beneficial; engaged employees work harder, perform better, and provide better customer service, believe in the values of the organization, search and explore opportunities to improve organizational performance, can be relied upon and perform job requirements to the fullest, all of which led to improvement in the bottom line. Work engagement is described as involvement, commitment, enthusiasm, optimism, and energy, which stem from each employee's attitudes and behaviours in carrying out his or her responsibilities (Na-Nan et al., 2020).

Most researchers have dealt with work engagement as a three-dimensional construction, comprising: first, **vigour**, characterized by high levels of energy, mental resilience at work, investment in the performance of the tasks of the job, and perseverance in the face of difficulties; second, **dedication,** including the ability to solve work problems and awareness of work events and challenges (Chirkowska-Smolak,

2012); third, **absorption**, which refers to being fully focused, taking pleasure in being preoccupied with work and feeling the passage of time quickly (Cole et al., 2012).

2.4 Work Engagement as a Mediator

Work engagement has long been a source of interest for managers and researchers, who have discovered that it has a strong link to a variety of positive consequences, e.g., job satisfaction, financial returns, better productivity, lower intention to quit and employee innovation and creativity (Anderson, 2017; Polo-Vargas et al., 2019). Organizations depend heavily on the abilities and skills of their employees in a rapidly changing business environment. Where the competitive business environment is very high, engaged employees are essential for successful organizations that want to remain competitive; this requires individuals with dedication, absorption, energies and ambition; employees who are engaged have a plethora of "resources" to invest in their jobs (Karatepe et al., 2020). They are passionate about their job, completely immersed in their work activities, and tenacious when faced with obstacles. Work engagement is a crucial indicator of job effectiveness and organizational performance, according to several reports that distilled the average impact observed in hundreds of studies. Furthermore, recent research has shown that employee engagement contributes to key organizational outcomes, such as creativity and innovation, customer satisfaction, improved financial performance, and decreased turnover rate (Bakker & Leiter, 2017).

Work engagement and psychological empowerment are critical in coping with work-related deviations and improving organizational effectiveness (Ugwu et al., 2014). Stander and Rothmann (2010) analyzed the relationship between psychological empowerment, work engagement and job insecurity among employees working in a government and manufacturing organization. The findings show that job security, psychological empowerment, and work engagement all have significant connections between them. On the other hand, the study also revealed four dimensions of psychological empowerment (self-determination, competence, meaning, impact) that predict engagement (vigour, dedication and absorption) of the employee.

In the information technology (IT) sector, organizations get to be more powerful and stronger by increasing the employees' experience. Turnover, on the other hand, poses a threat to successful organizations since it results in the loss of skilled employees. It is also an additional expense for the organizations. As a result, the managers attempt to keep turnover to a minimum (Alshurideh, 2019; Alshurideh et al., 2012). However, the turnover intention must be handled in order to keep turnover under control. This is a difficult undertaking because there are so many factors that affect turnover intentions (Özkan, 2021). Based on the above literature review, the study hypotheses may be formulated as:

Work engagement of IT companies in Jordan significantly mediates the relationship between employee empowerment and employees' intention to quit.

3 Research Model

The systematic treatment of the research problem in light of its theoretical framework and field implications requires designing a hypothetical scheme that indicates the logical relationship between the research variables. First, the model assumes that a four-variable construct, consisting of meaning, impact, competence, and self-determination, represents employee empowerment. This model further asserts a directional relationship between the empowerment of workers and this construct. Second, the model assumes that work engagement is a compound of Vigour, dedication, and absorption of three variable constructs. In addition, this model states a directional correlation between work engagement and this construct. Third, the model assumes that (Employee empowerment) and work engagement have a directional relationship. In Fig. 1, the hypothesized ten variables are described in this model.

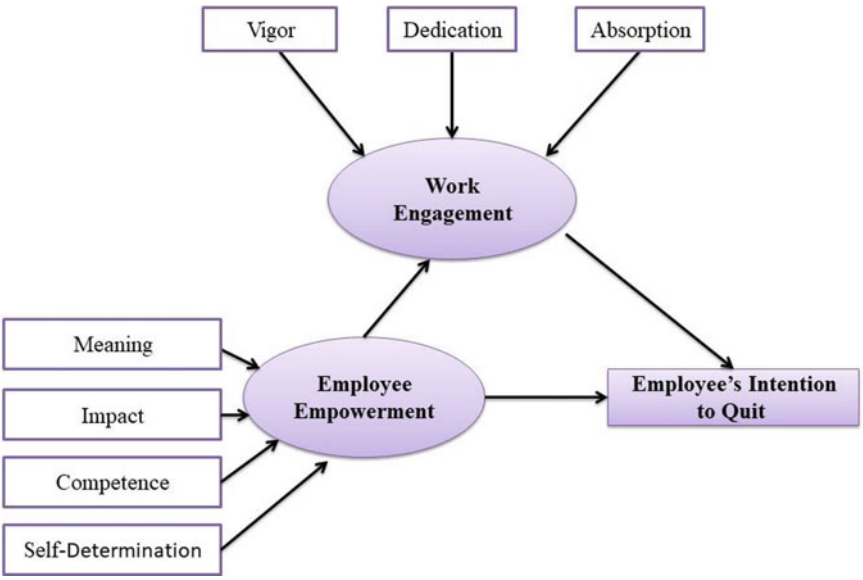

Fig. 1 Research model

4 Methodology

4.1 Population and Sample

The population in this study consisted of all IT employees working in IT companies that participated in this study, in Amman and the North of Jordan, with a total number of 1568. For the study sample, convenience sampling was used, which is a sort of non-probability sampling. Convenience sampling is a way of collecting research data from a conveniently available number of respondents who are easily accessible. An e-questionnaire was distributed, to which the response rate was 20%, with 318 questionnaires returned, while 312 questionnaires were valid for analysis.

4.2 Questionnaire Design

The researchers developed a questionnaire that covered all parts of the study variables. The questionnaire was based on previous studies in order to improve this study instrument; previously used statements were used in several studies (Dysvik & Kuvaas, 2010; Gim & Ramayah, 2020; Low & Spong, 2021), and thus their validity has been previously verified because they were used and achieved the desired results. The questionnaire was used as a basic instrument for collecting the necessary data to complete the study. The study tool was developed after reviewing the literature and studies related to the topic of employee empowerment, work engagement and intention to quit.

The study instrument consisted of four parts: Part One, Demographic data related to the study sample, including age, gender, educational level, years of experience, average weekly working hours, career level. Part Two, this is related to the independent variable represented by employee empowerment, which was measured in four dimensions (Meaning, Impact, Competence, Self-Determination), following Spreitzer (1995). Part Three, this relates to the mediating variable represented by work engagement, which was measured in three dimensions (Vigour, Dedication, Absorption), based on a scale from Schaufeli et al. (2002). Part Four, this relates to the dependent variable represented by the intention to quit (ITQ), which was measured based on a scale from Begley and Czajka (1993). A Likert scale method was employed from 1 (Strongly agree) to 5 (Strongly disagree) to measure all variables, except demographic variables.

Table 1 Cronbach's α values

Factors	Cronbach's alpha	Number of items
Employee empowerment	0.904	18
Competence	0.669	4
Impact	0.640	3
Meaning	0.715	4
Self determination	0.761	7
Work engagement	0.949	13
Absorption	0.818	4
Dedication	0.912	4
Vigour	0.879	5
Employees' intention to quit	0.839	9

4.3 Validity and Reliability

Content validity

The researcher also tested the validity of the questionnaire in order to identify the links to the questions and their relevance to the variables of the study, and to ensure the consistency of the answers of the sample members, in achieving the objectives of the study and answering its questions. The questionnaire was also reviewed by academic experts in the field from Yarmouk University; it took two weeks to complete the validity phase. After completing the face and content validity phase with academics, the researcher took corrections based on the recommendations of these scholars. The questionnaire after the content validity check. The questionnaire was then adjusted and revised according to their comments.

Instrument reliability

The reliability of the study tool was verified using the Cronbach's alpha reliability coefficient. The recommended reliability coefficient exceeds 0.70 according to Sekaran and Bougie (2016), while other researchers accept 0.60 as a cut-off point (Sekaran & Bougie, 2013; Al-Adamat et al., 2020; Al-Gasawneh & Al-Adamat, 2020). Cronbach's alpha was employed in this study to determine the research tool's reliability, as well as the consistency of the items with each other and with all items in general. This is illustrated in Table 1.

5 Analysis

The researcher employed the Sobel Test to examine whether work engagement mediates the relation between empowerment and intention to quit. Figure 2 indicates that

Licensed to (putm@utm.my)

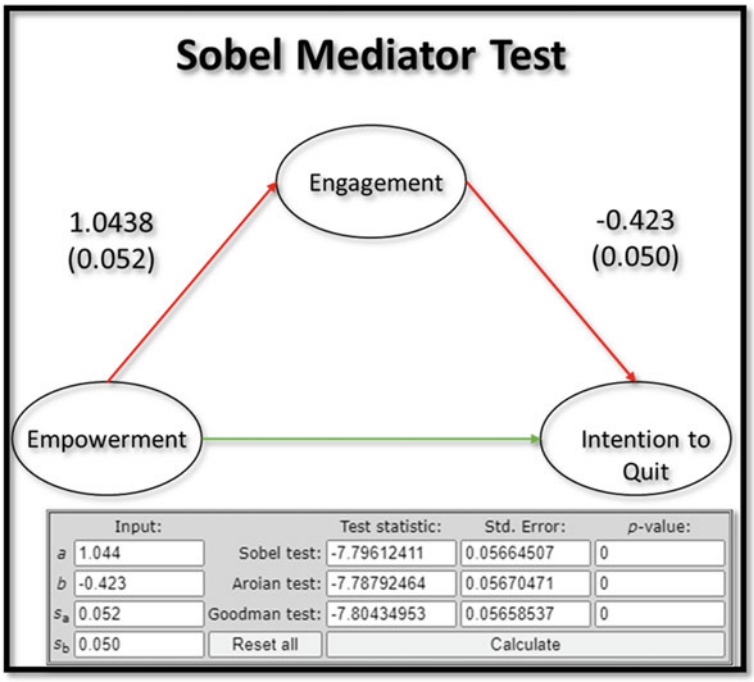

Fig. 2 Sobel mediator test

the indirect effect of empowerment on employees' intention to quit after work engagement is included in the model estimate is: Test statistic −7.79612411 and Std. Error 0.05664507; this result is significant, since the *p*-value is 0.000, which is less than 0.05. Thus, we accept the hypothesis that work engagement has a significant impact on mediating the relationship between empowerment and intention to quit at $\alpha \leq 0.05$.

6 Discussion

The purpose of this study is to determine the mediating role of work engagement on the relationship between the independent variable and the dependent variable. The information technology sector contributes significantly to national economies and employment (Thomas & Lucas, 2019). The researcher concludes that all participants have responded positively to all dimensions of the employee empowerment scale. This can be explained by highlighting the employees' awareness of the importance of their work and their confidence in performing their job tasks efficiently, as they possess all the skills and capabilities that qualify them to do so. Nevertheless, they do not feel a high level of self-determination in the job they do in their surrounding

environment. The researcher employed the Sobel Test to examine whether work engagement mediates the relation between empowerment and intention to quit. The study results showed the indirect effect of empowerment on employees' intention to quit after work engagement is included in the model estimate is Test statistic − 7.79612411 and Std. Error 0.05664507; this result is significant, since the *p*-value is 0.000, which is less than 0.05. To test the hypothesis that engagement mediates the relationship between empowerment and intention to quit, the Sobel test was used. The results show this hypothesis is validated and work engagement has a mediating effect between employee empowerment and intention to quit according to the Sobel test.

7 Recommendations and Direction for Future Research

In light of the results, the researcher makes some recommendations that she believes may contribute to enhancing and improving employee empowerment and work engagement in organizations in general and in information technology companies in particular: it is required from the Information technology companies to focus on enhancing the employee empowerment within organizations so that the employee becomes more affiliated and engaged in the organization in which he/she works, through working to enhance the dimensions of empowerment among employees, because of the positive impact of empowerment on improving work engagement, and to notifying the employee of the importance of the work they do and providing incentives and material and moral rewards to them in appreciation of their efforts, because of the importance of finding meaning in one's work and its positive impact on improving work engagement. Finally, to focus on developing the competence of employees by designing training programs that increase their skills and ability to do work, because of the importance of the dimension of competence and its positive impact on work engagement.

The current study examined the relationship between empowerment and the intention to quit work through the mediating variable of work engagement, and thus paves the way towards conducting more studies on empowerment and its relationship with other variables, such as creativity, employee well-being and work stress. And examining the relationship between empowerment and the intention to quit in other organizational contexts, such as the industrial sector and the health sector. Future studies can examine the relationship between work engagement and other variables, such as leadership, good citizenship behaviours, performance, and organizational justice. The researcher recommends conducting studies on different sectors for the same dimensions of this study and using different quantitative and qualitative methodologies to come up with results that can be generalized with greater confidence.

Impact of Manufacturing Flexibility on Response to Customer Requirements of Manufacturing Companies in King Abdullah II Ibn Al Hussein Industrial City in Jordan

Ziad Mohd Ali Smadi, Eyass Ahmad AL-Qaisi, Main Naser Alolayyan, Ali Zakariya Al-Quran, Abdullah Matar Al-Adamat, Anber Abraheem Shlash Mohammad, Muhammad Turki Alshurideh, Sulieman Ibraheem Shelash Al-Hawary, and D. Barween Al Kurdi

Abstract This study aims to examine the impact of manufacturing flexibility on the response to customer requirements which is the dependent variable. This study was applied on 210 random samples of 458 manufacturing companies in King Abdullah II Ibn Al Hussein Industrial City. The researcher used the questionnaire tool to collect the primary data from the units of observation. The data was analyzed by using SPSS program. The study findings showed the impact of manufacturing flexibility

on response to customer requirements. The study recommends increasing of job rotations of employees among company's activities to amend labor flexibility.

Keywords Manufacturing flexibility · Response to customer requirements · King Abdullah II Ibn Al Hussein · Industrial city · Jordan

1 Introduction

In light of the rapid development that the world is witnessing in all life aspects and the increasing in the products and services diversity that did not exist in the past, the pressure on business organizations has increased in their race to meet this diversity as much as possible in a way that reflects positively on the business organization and preserves it from decline (Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Obiadat, 2021; Al-Nady et al., 2013; AlTaweel & Al-Hawary, 2021). Therefore, many business organizations are making rapid and continuous changes in order to respond to developing or changing products and diversifying them to adapt to the world new situation and to enhance their competitive position, this leads organizations to activating a competitive weapon that depends on their ability to deal with variables, which is manufacturing flexibility (Al-Nady et al., 2016; Allahow et al., 2018; Al Kurdi et al., 2020a, b).

The most important thing for business organizations today is their ability to meet customer's requirements, and one of the means to achieve this is by providing high product diversity in the least amount of time while maintaining or improving quality and reducing costs (Al-Hawary, 2013; Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Harahsheh, 2014; Al-Hawary & Hussien, 2017; Al-Hawary et al., 2013, 2017; Alolayyan et al., 2018; Alshurideh et al., 2017; Metabis & Al-Hawary, 2013). Therefore, manufacturing flexibility represented by (machines flexibility, product mix flexibility, new product flexibility, labor flexibility, operations flexibility, process flexibility) is a weapon with which organizations face changes in customer requirements. As for Jordan, which has adopted the economic openness option, Jordanian business organizations today find themselves forced to keep pace with the development they have made in order to continue in the market and maintain their market position.

The study importance comes from the importance of responding to customers' requirements by industrial companies because of their essential role in developing, improving and preserving the company from failure if it cannot meet these requirements in a timely manner (Ahmed et al., 2020; Ahmad et al., 2021a, b; Odeh et al., 2021). In addition to manufacturing flexibility importance in meeting the change in products according to circumstances, times and places, especially with the increase

D. B. Al Kurdi
Department of Marketing, Faculty of Economics and Administrative Sciences, The Hashemite University, Zarqa, Jordan
e-mail: barween@hu.edu.jo

of requirements changes in recent times, the most recent of which was during the Corona Virus (COVID-19) crisis, which impact has become clear on all life aspects, including industrial companies (Alameeri et al., 2021; Nuseir et al., 2021; Taryam et al., 2020). It should be noted here that some companies responded quickly to the changes accompanying this crisis, which reflected positively on their position and market share (Alshurideh et al., 2021a, b, c; Khasawneh et al., 2021a, b; Leo et al., 2021).

The application of this study to the companies of King Abdullah II Ibn Al-Hussein Industrial City is of special importance, as it is considered the oldest industrial city in Jordan, as it was built in 1984 and is considered the largest industrial gathering in the Kingdom, where companies number reached 458 industrial companies, according to the Industrial Cities Company Jordanian website, this reflects its influential role in developing the Jordan economy. It was found by the study literature reviewing that there is a lack of studies that dealt with the relationship between manufacturing flexibility and its variables and its impact on the speed, flexibility and reliability of responding to customer requirements. And after the spread of Corona virus globally and the subsequent changes in consumer behavior and the sudden change in the humans' requirements in general, this is a strong test of the extent to which the manufacturing flexibility in companies affects the speed response to the sudden change in demands.

Responding to customers requirements and needs is a familiar slogan for many companies and one of the most important things that companies do by following them in order to continue their development and success in their work (Al-Hawary & Alhajri, 2020; Altarifi et al., 2015; Mohammad et al., 2020; Williamson, 1991). Manufacturing flexibility is becoming an increasingly important ability to design and operate manufacturing systems, as these systems operate in highly variable and unpredictable environments (Ghannajeh et al., 2015; Al-Dhuhouri et al., 2020; Alsuwaidi et al., 2020). When looking at previous studies on the issue of manufacturing flexibility, we find that most of them dealt with the impact of manufacturing flexibility on production, cost or performance, as in the study of Alsada and Allawi (2017) and (Kumar et al., 2017), and did not link manufacturing flexibility with responding to customers' requirements (Alkitbi et al., 2020; Alshamsi et al., 2020; Sweiss et al., 2021). This study came to find the effect of manufacturing flexibility with responding to customer's requirements.

2 Literature Review and Hypotheses Development

2.1 Manufacturing Flexibility

Continuous developments in manufacturing systems technology have made operations more capable, efficient and flexible to meet changing requirements and this has been particularly evident in the automotive industry. Operations are not longer

Licensed to (putm@utm.my)

limited to the production of a single product but can continually adapt to a range of products and demands. Flexibility of the production process has become an inevitable necessity imposed by the competition that characterizes the contemporary business environment, as a prerequisite for achieving business strategic goals of survival and growth. In light of the modern technology use, this aims to reduce unused energy by using automation, as the use of flexibility in manufacturing works to exploit idle energy. As for manufacturing flexibility concept, it was defined by Zhang et al. (2003) as the organization's ability to manage production resources and cases of meeting different customer demands uncertainty.

Daoud and Jawad (2016), defined manufacturing flexibility as the organization's ability to respond or adapt to the environment changes, and it can enhance the company's competitive performance by providing a variety of products that meet customers different tastes quickly while maintaining the production system performance. Ojstersek and Buchmeister (2020) defined it as the ability of a manufacturing system to respond effectively and efficiently to uncertain surrounding changes (manufacturing system and global demand). Accordingly, manufacturing flexibility can be defined as the organization's ability to interact with external or internal changes that occur suddenly or can be predicted, through the use of available resources quickly and using the least effort and expenses possible to meet customers demand (Al Mehrez et al., 2020; Alshurideh, 2019, 2022; Alzoubi et al., 2022; Tariq et al., 2022a, b).

Several researchers dealt with different manufacturing flexibility dimensions, where Gregory et al. (2019) took eight dimensions of manufacturing flexibility, while Daoud and Jawad (2016) addressed four dimensions of manufacturing flexibility, and Upton (1994) identified fifteen dimensions of manufacturing flexibility, which are: Production path flexibility, product flexibility, mix flexibility, activity flexibility, status flexibility, scale flexibility, program flexibility, long-run and short-run flexibility, stretch flexibility, machine flexibility, labor flexibility, design change flexibility, operational flexibility, and process flexibility. As for Benjaafar and Ramakrishman (1996), they differentiate between the different types of flexibility as they are divided into product flexibility and process flexibility; the first refers to a variety of factory options for a particular product. While process flexibility, is defined as one of the characteristics of an industrial process to work under various dynamic operating conditions. The researcher has chosen six dimensions of manufacturing flexibility from the dimensions identified by (Upton), which are the most appropriate to the researched companies' nature, and they are as follows: **Machine Flexibility**: Machine flexibility is one of the most fundamental and important dimensions of manufacturing flexibility that many researchers have discussed. It has been defined as the ability to make changes to the machine system with minimal interference in production (Gregory et al., 2019). **Labor Flexibility** which is the ability to multitask a labor, operator, or human resource within the manufacturing system without affecting efficiency (Kumar et al., 2017). **New Product Flexibility**: which is the company's ability to bring new parts and products to market in response to a changing business environment (Alamro, 2014). **Product Mix Flexibility**: This means that the mix of items delivered to the market can be changed quickly while maintaining cost-effectiveness, which achieved when product and process flexibility achieved together.

Process Flexibility: which is the ability to change the steps required to complete a required task, allowing the system to complete many tasks (Gregory et al., 2019). Process flexibility in a manufacturing system is related to the range of parts types that the system can produce without major preparation processes. **Operation Flexibility**: is a property of the part, and it means that the part can be produced with alternative process plans, where the process plan means a series of operations required to produce the part.

2.2 Responding to Customer Requirements

A customer is that person who buys something, whether goods or services, and is thus a customer of a company that sells products for making a profit purpose. As for customer requirements according to the researcher, is the characteristics or specifications that must be available in the product or service in order to receive approval from customers (Alshurideh et al., 2012; Alzoubi et al., 2020; Al-Dmour et al., 2021b; Abuhashesh et al., 2021). It is divided into two types: Service requirements: These are the intangible aspects of the purchased product that the customer expects to occur, such as delivery on time, good dealing with the seller when purchasing, ease of payment, and so on (Al-Dmour et al., 2021a; Alshurideh et al., 2021a, b, c). Final good requirements: which are the tangible characteristics, features, or specifications that the consumer expects to find in the product or service.

As for responding to customer requirements, it is often seen as a flexible response, but the response must be characterized by reliability and speed. Responsiveness is defined as encompassing the full range of values related to timely product development and delivery, as well as reliable scheduling and flexible performance (Heizer et al., 2017). Flexible responsiveness may be seen as the ability to adapt to changes in a market where design innovations and volumes fluctuate wildly. Heizer et al. (2017) defined response speed as speed in product development, speed in production, and speed in delivery. speed response to the customers' requirements and needs can be raised by reducing the time to deliver products to the market, reducing the time of the product manufacturing cycle, reducing the customer cycle time, and reducing the time of operations conversion or change.

2.3 Manufacturing Flexibility and Responding to Customer Requirements

Many managers see flexibility not as the end but as a means to many ends. As managers view flexibility as a tool for improving manufacturing as it is an essential component of the production process, it must be developed until the best production is reached. Daoud and Jawad (2016) studied the impact of manufacturing flexibility

in achieving competitive advantage and found that the level of manufacturing flexibility positively affects the competitive advantage, and the company's abilities to achieve competitive advantage represented by increasing interest and developing manufacturing flexibility. Zhang et al. (2003) explain Strong, positive, and direct relationships between flexible manufacturing efficiency and volume flexibility, and flexible manufacturing efficiency and mix elasticity. Size Flexibility and product mix flexibility have strong, positive, and direct relationships with customer satisfaction. As customers want a quick response and a variety of updated products and competitors achieve higher performance levels than were considered possible a few years ago, manufacturing flexibility, above all other measures of manufacturing performance, is cited as a solution. More flexibility in manufacturing processes means more ability to move with customer needs, respond to competitive pressures and move closer to the market (Slack, 2005). Accordingly, the research hypothesis can be formulated as follows:

There is a statistically significant impact of manufacturing flexibility on responding to customers' requirements in industrial companies in King Abdullah II Ibn Al Hussein Industrial City.

3 Study Model

See Fig. 1.

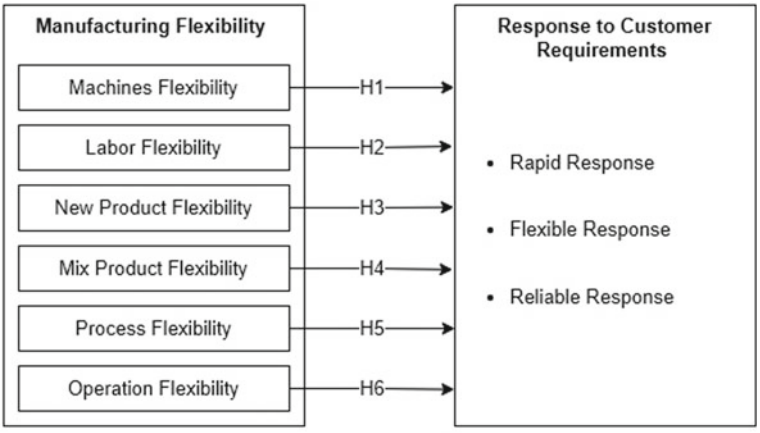

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of manufacturing flexibility on response to customer requirements. Therefore, it focused on manufacturing companies in King Abdullah II Ibn Al Hussein industrial city in Amman. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a random sample of (250) respondents via email. In total, (210) responses were received including (22) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (188) responses suitable to analysis requirements that were formed a response rate of (89.5%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (31) items to measure manufacturing flexibility based on (Upton, 1994). These questions were distributed into dimensions as follows: five items dedicated for measuring machines flexibility, six items dedicated for measuring labor flexibility, five items dedicated for measuring new product flexibility, six items dedicated for measuring mix product flexibility, four items dedicated for measuring process flexibility, and five items dedicated for measuring operation flexibility. Whereas the second section included (12) items developed to measure response to customer requirements according to what was pointed by (Al-Hawary & Hussien, 2017). This variable was a second-order construct divided into three first-order constructs. Rapid response measured by four items, flexible response measured through four items, and reliable response measured using four items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.664–0.8871), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.716, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker–Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated

Note MAF: machines flexibility, LAF: labor flexibility, NPF: new product flexibility, MPF: mix product flexibility, PRF: process flexibility, OPF: operation flexibility, RAR: rapid response, FLR: flexible response, RER: reliable response, I.C: internal consistency, C.R: composite reliability

to value 0.056, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the response to customer requirements and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that manufacturing flexibility dimensions, which were new product flexibility ($\beta = 0.368, t = 4.305, p = 0.000$), machines flexibility ($\beta = 0.202$, $t = 2.469$, $p = 0.014$), and operation flexibility ($\beta = 0.177$, $t = 2.146$, $p = 0.033$) had impact on response to customer requirements. Despite, the results indicated that labor flexibility ($\beta = 0.088$, $t = 1.240$, $p = 0.216$), mix product flexibility ($\beta = 0.047$, $t = 0.530$, $p = 0.597$), and process flexibility ($\beta = 0.006$, $t = 0.064$, $p = 0.949$) had no impact on response to customer requirements.

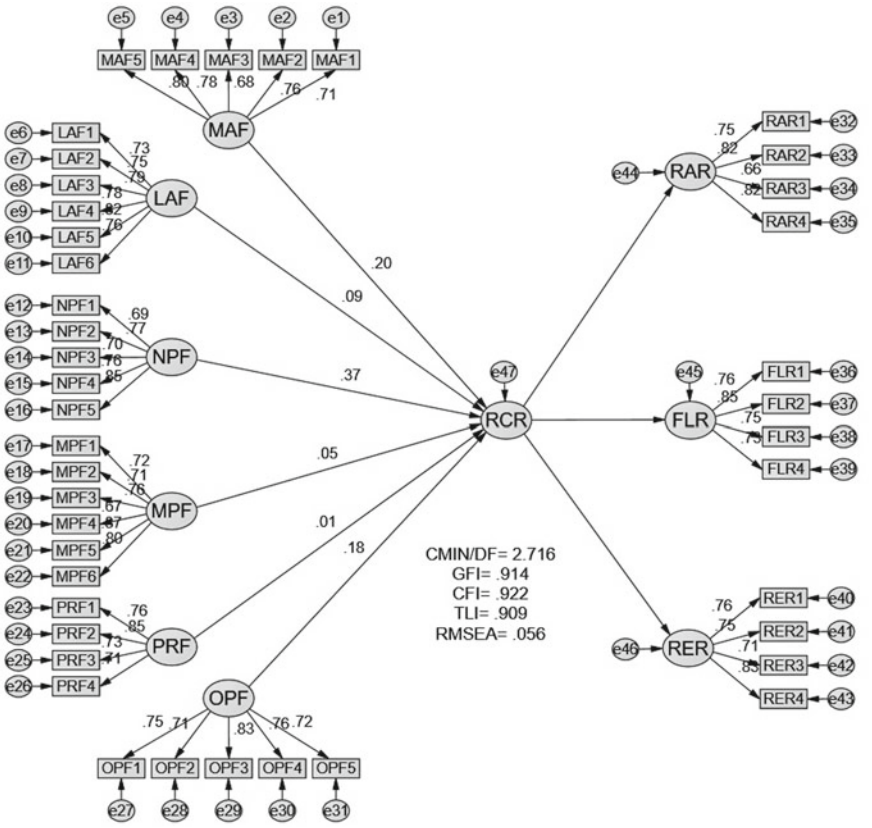

Fig. 2 SEM results of the manufacturing flexibility effect on response to customer requirements

Table 2 Hypothesis testing

6 Discussion

The study results showed that the nature of the used machines in the researched companies is characterized by ease of preparation and configuration as a result of the extensive use of advanced technology in manufacturing, which in turn helps in the goods production in appropriate quantities that correspond to the customers' demand quantity. Also, the machines used in manufacturing can be operated in certain mechanisms, which contribute to increasing production, while reducing the time needed to modify the process on the machine, and this indicates those machines flexibility and their ability to produce well in addition to saving worker time and effort.

Study results revealed the multiplicity of skills and experiences possessed by workers in King Abdullah II Ibn Al Hussein Industrial City, their experience levels, and their obtaining the appropriate academic qualifications that qualify them to perform various tasks at low costs and within the company's capabilities. The company's various needs also require its production lines to move employees from one site to another according to the company's production need, production type, or required expertise type, to remain and compete in the market, and to provide employees with diverse skills and experiences. This is in line with Bernardes and Hanna (2008) study which showed that systems allow change within predetermined parameters and response usually refers to system behavior that involves purposeful change in time.

Study results show the companies' desire to go in line with the market demand, and to cover that demand in light of the necessary machinery and equipment availability, as well as the participation of their employees and their concerted efforts in order to reach good production levels, and diversification in products to achieve success in introducing different products types to the market, and satisfy consumers' desires and needs as well. Results also indicated the companies' desire to maintain production and competition with products and the desire to improve performance, and this result could also be due to the availability of many experiences and workers scientific qualifications in those companies, which can determine the ability to perform many

operations on the same production line, as well as the desire through the workers in these companies to interact and achieve higher production levels, and all these factors help in increasing the production levels.

The study results also show the workers ability to maintain the production processes level, and this is also due to the nature of the machines and equipment used, and their accuracy in work and production, and also for drawing plans in production processes an important role in maintaining the products' types, and maintaining the cost as well. The study also revealed the companies' desire for competition and continuity in the markets, and to work on the development and modernization of products issued by industrial companies operating in King Abdullah II Ibn Al Hussein Industrial City. Also, companies must take into account all customers' requirements in their main objectives. The reason for the high response level among companies may be attributed to raising the competition level they have with other companies, and raising the trust level between companies and customers, which is beneficial to companies' sustainability and continuity, maintaining their level, and employing the largest possible number of working employees, who are the ones who help provide market and customer requirements.

Study results were clear, showing the existence of an impact of manufacturing flexibility application in its dimensions (machine flexibility, new product flexibility, and operating flexibility) in responding to customer requirements in industrial companies in King Abdullah II Ibn Al Hussein Industrial City. The reason for this may be the companies' high professionalism work and their follow-up to the development and used equipment and machines modernization, and also due to the companies providing new products to the markets on a permanent basis, which covers the changed consumer's need, This is also due to enabling companies to produce many multiple products at the same time to cover all consumers tastes and desires, and the reason for the effect may also be due to carrying out many operations on the same production line, and the possibility of changing the steps and processes necessary to produce a particular product easily, and within the specified time With the provision of efforts in light of providing many workers capabilities and experiences, as well as the clear impact of operating flexibility by setting manufacturing plans and goals, and intensively ensuring coverage of market requirements with all its elements, as traders and consumers, this results agreed with the results of Daoud and Jawad (2016), study which confirmed the existence of an impact of manufacturing flexibility in achieving competitive advantage.

The study also showed that there is no impact on the dimensions of manufacturing flexibility (labor flexibility, product mix flexibility, and process flexibility) in responding to customers' requirements. It is worth noting that it is noted that the relationship between the flexibility of the product mix and the response to customer requirements, although it did not reach the statistical significance level, but it is inverse, and this may be due to the fact that some of the measures taken in one of the dimensions of manufacturing flexibility may negatively affect other dimensions.

7 Recommendations

In light of the results and their discussion, the study recommends reducing the time spent when switching from one process to another on the same machines. And the increase in the employee's turnover rate within the company's various activities, which ensures an increase in the employment flexibility, and work to organize and speed up time, to introduce new products to the market. The study also recommends training workers to raise their skills to move from producing a specific product to producing another product quickly, and training workers to change the process on the same machine quickly and in a short time, taking care of developing several operations plans for each manufacturing process, so that the course of operations can be changed to produce a product when a machine malfunctions or is unable to operate it for any reason.

Impact of Strategic Vigilance on Competitive Capabilities in Jordanian Insurance Companies

Refd Safi Jamil Al-Khasswneh, Ayat Mohammad, Fuad N. Al-Shaikh, Yahia Salim Melhem, Majed Kamel Ali Al-Azzam, Main Naser Alolayyan, Abdullah Matar Al-Adamat, and Sulieman Ibraheem Shelash Al-Hawary

Abstract The study aimed to identify the effect of strategic vigilance on competitive capabilities in Jordanian insurance companies. The study population included (288) individuals, who are the managers of the upper and middle level at the Jordanian insurance companies, which are (24) companies. The study sample is chosen from study population and this sample was chosen by equal stratified random method, which is estimated at (167) respondent according to the sample selection schedule. The questionnaire was used as a tool for the study, the final sample was consisted of

(138) individual. Two statistical analysis programs (IBM SPSS 24) (SMARTPLS, v. 3.2.6) to analyze the study data and test its hypotheses. The study showed a statistically significant impact of the strategic vigilance on competitive capabilities in Jordan insurance companies. According to the results, the study recommended the need to enhance interest strategic vigilance information in Jordanian insurance companies through the establishment of units and departments for the strategic vigilance in them, as they are important as strategic information resource.

Keywords Strategic vigilance · Competitive capabilities · Insurance companies · Jordan

1 Introduction

Business organizations are currently witnessing large and rapid developments, because they operate within their external environment, as they are affected and affected by them, and as a result, organizations must keep pace with these developments on an ongoing basis to ensure their continuity and survival (Al-Nady et al., 2016; Allahow et al., 2018; Al-Hawary & Obiadat, 2021; AlTaweel & Al-Hawary, 2021). The concept of strategic vigilance with its various dimensions (environmental, technological, competitive, and marketing) has played a major role in this field because it provides the organization with a strategic ability to ensure its survival within the successful business system. And because organizations are naturally working to achieve profits and enhance their marketing and competitive capabilities, this has had a significant impact by linking the strategic vigilance process to creating a state of enhancing their competitive capabilities, which in turn achieves organization overall goals (Alaali et al., 2021; Al-Hawary & Al-Hamwan, 2017; Al-Hawary & Al-Syasneh, 2020). It enhances its competitive capabilities in its various dimensions, it has become imperative for organizations to create and adopt competitive capabilities that are unique from their competing organizations (Altamony et al., 2012; Ahmad et al., 2021; Shamout et al., 2022; Tariq et al., 2022), and these capabilities and mechanisms for exploiting and applying may differ from one organization to another, and because this era is the information age, many organizations have adopted the idea of information searching proactively to develop their competitive capabilities, and because Information is the main source that enables organizations to stay in the field of competition and thus continuity (Al-Nady et al., 2013; Al-Hawary & Alwan, 2016; Alzoubi et al., 2021; Kabrilyants et al., 2021). Business organizations are looking for information in their internal and external environments to reach a high level of competitiveness and create added value for their products and services (Alshurideh, 2022; Alzoubi et al., 2022; Svoboda et al., 2021). The study importance appears in the fact that it deals with two important variables of management, strategic vigilance plays the role of a stimulus to ensure the organization survival in conducting business and competition, while competitive capabilities may contribute

to organization market share raising by exploiting the available market opportunities and avoiding threats and thus raising profitability levels.

The studied insurance companies in Jordan face intense competition, as each company seeks to attract the customer, meet his needs, and achieve his desires and aspirations, for this reason, Jordanian insurance companies must strengthen attention to strategic vigilance in order to develop competitive capabilities, considering that it is one of the mainstays to establish the competition rules, thus giving it a competitive position that makes it able to overcome the competitors threats. Through this study, the researcher tries to identify competitive capabilities and highlight their important role in creating an added value for the organization, which would guarantee it an advanced position among business organizations (Al Kurdi et al., 2020a, b; Alshurideh et al., 2020; Alzoubi et al., 2020; Al-Dmour et al., 2021; Ghazal et al., 2021; Alshurideh et al., 2022).

2 Literature Review and Hypotheses Development

2.1 Strategic Vigilance

The idea of building and integrating vigilance with strategy came as an extension of several previous concepts such as strategy first and then strategic planning to strategic management and finally the idea of smart organizations. Where strategic vigilance is one of the means that enables organizations to reach the strategic intelligence, organizations with the great developments taking place in the technical and technological sector have become interested in reaching a high stage of administrative and strategic intelligence, as strategic intelligence depends largely on the strategic vigilance process out puts. It is represented in monitoring the environment and collecting proactive information about it in order to use it to achieve the organization strategic objectives of the organization (Al-Hawary & Ismael, 2010; Mouloud, 2014; Al-Hawary & Hadad, 2016). Thus, the strategic vigilance concept came to enhance these axes in a smarter way by not being satisfied with information that is easy to notice, but rather searching for information in a proactive and conscious manner to remove ambiguity from the organization's work environment and, in turn, build a safe future for its continued performance in an effective manner (Zu'bi et al., 2012; Al-Hawary et al., 2013; Morabiti & Ben Tafat, 2016; Aburayya et al., 2020a, b).

Based on the foregoing, strategic vigilance is defined as the organizations race to obtain information through which organizations can listen to their external environment in order to open the appropriate opportunities to exploit them, and to monitor and avoid risks to reduce their effects, this process includes the collection, analysis and dissemination of strategic information with the aim of feeding strategic decisions, which, in turn, contributes to making strategic decisions for the organization (Sahnoun, 2018), On the other hand, Hajar (2018, 27) defined it as an organization that seeks to know the business environment and anticipate changes. It is an

informational process through which organizations listen to their environment in order to be able to make decisions. This process is classified within the information systems group that allow managers to lead in difficult times, and the strategic vigilance process can be considered as a system consisting of sub-systems affected by information flows coming from its overall environment. Decision makers must keep pace with changes and adapt to them, and this can only be done through several activities, including strategic vigilance. Competitiveness is no longer based only on reducing costs, but on the speed of response and adaptation to the large and rapid changes taking place in the dynamic work environment of organizations, in addition to the fact that the proper and proactive analysis of environmental signals avoids the organization from any upcoming danger and leads it towards exploiting the opportunities coming from its external environment (Alhalalmeh et al., 2020; Al-Lozi et al., 2017, 2018). Through vigilance concept, many different types and concepts of vigilance emerge. Researchers have differed about the classifications of strategic vigilance according to the purpose for which this strategic system is to be applied (Zhou et al., 2019; Alshurideh et al., 2019; Alameeri et al., 2020).

Marketing vigilance: The concept of marketing (commercial) vigilance is considered one of the modern and advanced concepts in the field of strategic management and in the field of marketing alike. Rapid technological developments and environmental challenges facing business organizations, organizations must be keen to realize, follow up, monitor and confront these changes and conflicts occurring in their environment. Marketing, as organizations must create a database of the marketing environment in order to take the necessary measures and take precautions and caution.

Competitive vigilance: Also known as competitive inquiry, it is the process through which the organization identifies its current and potential competitors, as it studies the environment in which competing organizations live by collecting and analyzing information and then extracting the results and applying them in making decisions. It also allows the organization to build a solid information base that enables it to study competitors deeply.

Technological vigilance: Technological vigilance has been defined as the organized effort by the organization to monitor, receive, analyze, re-publish and retrieve accurate and comprehensive information about certain events, as it contributes to the appropriate and accurate distribution of information within the organization for the purpose of using it in decision-making. As it helps to face rapid technological changes and monitor technological change in a proactive and orderly manner, which contributes to the organization's survival on the safe side of any rapid technological threat that may threaten its survival.

Environmental vigilance: Environmental vigilance is concerned with the remaining factors of the organization external environment that were not addressed by the previous types of vigilance, and of course they are no less important than the previous types, and from the types of environmental vigilance (social vigilance, economic vigilance, and political and legislative vigilance). Environmental vigilance has been defined as monitoring all developments that could affect the organization's activity and that were not taken into account in the previous types.

2.2 Competitive Capabilities

Competitive advantage is one of the organizational performance measurements (Al-Hawary, 2011, 2013; Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Al-Namlan, 2018). It is the organization's ability to provide products and services more efficiently and effectively compared to other competing organizations, thus achieving what is known as competitive advantage. Therefore, the advantage is not achieved for organizations without access to competitive capabilities, because the competitive advantage depends in essence on internal and external factors. The external factors are political, technological and cultural factors, while the internal factors are the organization's ability to possess resources and capabilities that are not available to its competitors (Metabis & Al-Hawary, 2013; Alshurideh et al., 2017; Alolayyan et al., 2018; Al-Hawary et al., 2020; Al-Quran et al., 2020; Mohammad et al., 2020; AlHamad et al., 2022). The importance of competitive capabilities lies in providing the opportunity for organizations to overcome the narrowness of the local market, as it helps to provide a competitive environment that ensures organizations efficiency in production. If the organization competitive ability is available, this will help the organization to reach an effective method and approach to ensure economic efficiency and promote economic growth in addition to developing creativity and innovation skills in the organization (Al-Hawary & Hadad, 2016; Alsharari & Alshurideh, 2020; AlShehhi et al., 2020; Alsuwaidi et al., 2020).

Cost leadership capabilities: Cost leadership capabilities require the organization to have the ability to offer products with low costs and an acceptable quality, by seeking to reduce costs in various ways, and that the organization pays high attention to cost control and employee performance monitoring to ensure optimal utilization of resources. As the industry becomes more mature and costs decrease, this will increase organization market share and thus increase sales amount, which means an increase in profits.

Flexibility capabilities: Flexibility is defined as the organizations ability to effect change from one product to another, from one market to another, or from one customer to another, at the lowest possible costs and time, in addition to quickly adapting to changes, disturbances and complexities in the markets and in production volume, where flexibility is one of the most prominent trends with critical importance of the organization's competitive and strategic capabilities, as it is considered a mainstay in the organizations success (Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Hussien, 2017; Al-Hawary et al., 2017; Alolayyan et al., 2018).

Speed response capabilities: This priority refers to the organization's ability to provide products and services according to the schedule agreed upon between them and consumers, as many international companies such as FedEx have adopted this competitiveness as they considered it one of their most important competitive priorities within their framework.

2.3 Strategic Vigilance and Competitive Capabilities

A study conducted by Haroun and Hamo (2019) showed that there is a statistically significant relationship between strategic vigilance and competitive capabilities, and that the use of strategic vigilance functions enhances the organization competitive capabilities. Mesbah and Boukhamkham (2019) found that the organization relies in formulating its competitive strategies on the information that vigilance provides about competitors and everything that would affect its competitive position. Whereas, Sanaz and Yaghub (2019) study, which was conducted with the aim of identifying the factors affecting competitive advantages, showed that the organization needs to be strategically agile to reach competitiveness and achieve competitive advantages, this was agreed by the study (Arokodare et al., 2019), which found that strategic agility enhances the company performance, thus achieving competitive capabilities and access to global markets. From the foregoing, we conclude that strategic vigilance increases the organization competitiveness by providing information that contributes to making decisions related to improving competitive capabilities, which the researcher previously concluded is directly related to customers. And the researcher defined it as the organization ability to create and discover the aspirations, desires and needs of customers and analyze them in order to adapt their production capabilities to simulate and apply those aspirations in a proactive manner that guarantees the organization's singularity with this product or service. It works to ensure the organizations competitive advantages continuity and sustainability. The research hypothesis can be formulated as follows.

There is a statistically significant effect of strategic vigilance on competitive capabilities in Jordanian insurance companies.

3 Study Model

See Fig. 1.

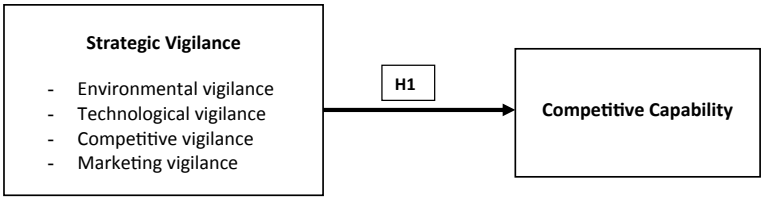

Fig. 1 Research model

Licensed to (putm@utm.my)

4 Methodology

4.1 Study Population

The study population, which is the Jordanian insurance companies, operates under the umbrella of the Jordanian Federation of Insurance Companies, a union that was established in (1989) and includes in its membership all the 24 Jordanian insurance companies (www.joif.org), where insurance companies work is based on several Pivotal aspects include life insurance, car insurance, fire insurance, and marine insurance. Since the union establishment, the insurance sector has witnessed a relative increase in the intensity of competition, especially in the past five years. The researcher found the need to study this sector, especially after the increase in employees' numbers in it in the past decade, where employees' numbers in insurance companies reached (2017)—the last approved statistic—(3124) employees, including employees of the union, in addition to employees of insurance companies (except for sales people) and the insurance administration. The study population consisted of workers in the upper and middle management of these companies, where the managers was (288) from various specializations.

4.2 Study Sample

The study relied on an equal stratified random sample consisting of (167) individuals from the upper and middle management level in the Jordanian insurance companies. The appropriate sample size is (167) individuals. The reason for choosing (167) individuals as a sample for the study is due to the fact that the study population consists of (288) individuals, and according to (Sekaran & Bougie, 2016, 295), the appropriate sample size is (167).

4.3 Study Tool

The study tool includes 32 item to measure the study variables, 20 items were to measure the independent variable, strategic vigilance with its dimensions (environmental vigilance, technological vigilance, competitive vigilance, marketing vigilance) based on the following previous studies: (Haroun & Hamo, 2019), (Zhou et al., 2019) as follows: Items (5-1) measure environmental vigilance, items (10-6) measure technological vigilance, items (15-11) measure competitive vigilance, and items (10-6) measure competitive vigilance. (16-16) marketing vigilance. (12) items were to measure the dependent variable (competitive capabilities) based on the

following previous studies. As follows: items (24-21) measure cost leadership capabilities, items (28-25) measure flexibility capabilities, and items (32-29) measure responsiveness capabilities.

4.4 Measurement Model Analysis

SmartPLS 3.2.9 software was used to test the model with latent variables and to perform measurement model tests. First, this study found no outliers that exceeded the permissible limit therefore the outliers number remain as it is, after that the measurement model was examined to examine the reliability and validity of the instruments (Hair et al., 2011; Al-Adamat et al., 2020; Al-Gasawneh & Al-Adamat, 2020). Sekaran and Bougie (2016) pronounced reliability as the way an instrument measures the concept it is meant to measure consistently, while validity was defined as the ability of the instrument to measure the concept it is intended to measure.

The PLS measurement model analysis comprised reliability and validity (internal consistency and convergent and discriminate validity). The measurement model measures are as follows: all the item loadings should be more than 0.7 or 0.6 (Hair et al., 2017; Tan et al., 2017). The composite reliability (CR) value ought to be 0.7 or greater; and the average variance extracted (AVE) should be at least 0.5 (Hair et al., 2010, 2017). Further. for validity testing, the convergent validity reflects whether a specific item estimates a latent variable that it is expected to measure (Tan et al., 2017; Urbach & Ahlemann, 2010), while the AVE assesses the measure of change that a build catches from its contrasting markers and the sum because of the estimation mistake (Fornell & Larcker, 1981; Ringle et al., 2015; Tan et al., 2017). Table 1 presents the latest reliable as well as valid measurement model conducted using Smart PLS version 3.2.9.

Table 1 shows the results of the reliability and validity assessments of the measurement model. As Table 1 which shows that all items were above 0.6. The results also depict that the CR of all constructs exceeded the threshold value of 0.7, ranging from 0.839 to 0.906. This illustrates that the measurement model of this study is reliable (Hair et al., 2017). Additionally, the validity was examined based on its convergent and discriminate validity for the measurement model. The convergent validity of the measures was accepted, with AVE values greater than the recommended level of 0.5, ranging from 0.592 to 0.763 (Hair et al., 2017).

Discriminate validity is confirmed when item loading should load more highly on own construct than on other constructs. Hence, researchers assessed discriminate validity by differentiating the square root of the AVE value of each construct with all the other constructs to be larger than the correlations between two factors (Barclay et al., 1995; Fornell & Larcker, 1981). Thus, Table 2 reveals that the correlation scores between each construct with itself is greater than all other constructs. This indicates that the discriminant validity was met by all constructs and it is acceptable. Therefore, it can be concluded that the measurement model is reliable and valid. Based on this, the data' reliability and validity of the instrument were confirmed.

Table 1 Results of reflective measurements model—a summary

Constructs	Indicators	Internal consistency reliability			
		Loading	(AVE)	Composite reliability	Crombach's alpha
		>0.60	>0.50	0.70–0.90	0.60–0.90
Strategic vigilance					
Environmental vigilance	Q1	0.700	0.67	0.92	0.90

Table 2 Discriminate validity of constructs

Construct	EV	TV	CV	MV
Environmental vigilance	1.00			
Technological vigilance	0.656	1.00		
Competitive vigilance	0.511	0.618	1.00	
Marketing vigilance	0.420	0.583	0.589	1.00

4.5 Structural Model Analysis

The structural model consists of the constructs or latent variables and the paths that connect them with each other (Hair et al., 2017). Figure 2 is the schematic diagram of the structural model, which starts with EV, TV, CV, and MV. The arrows linking the constructs are determined by the direction of the five hypotheses proposed in the paper. The standardized estimate for the structural model of this study shows the direct relationship between Strategic Vigilance dimensions and Competitive Capability. To clarify more, the coefficient of path Values ranges from −1 to +1, which expresses the depth of the relationship between any two constructs (Hair et al., 2017).

Ramayah et al. (2016) specified the critical values for significance in 1-tailed tests as follows: $p < 10\%$ (1.64), $p < 5\%$ (1.96), and $p < 1$ (2.58); also, as usual, the researchers in marketing utilized the significance level of $p < 5\%$. Hair et al. (2017) stated that the bias-corrected bootstrap confidence intervals (lower limit, upper limit) allow testing whether a path coefficient is significantly different from zero. If the confidence interval for an estimated path coefficient does not include zero, this means there is a significant effect of this path (Hair et al., 2017). Therefore, the

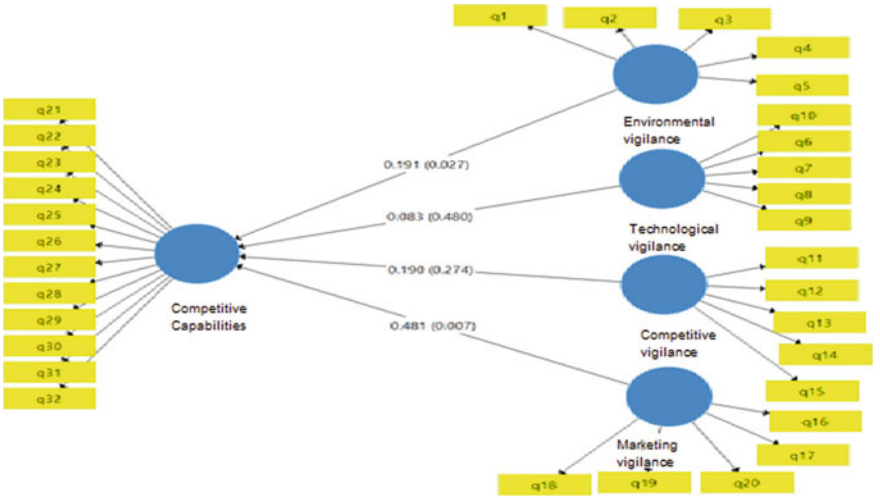

Fig. 2 Structural model results

Table 3 Summary of the structural model results

Hypothesis	Relationship (direct)	Direct effect (β)	t-statistic	p values	Decision
H1.1	Direct relationship EV → CC	0.191	2.211	0.027	Supported**
H1.2	Direct relationship TV → CC	0.083	0.708	0.480	Not supported
H1.3	Direct relationship MV → CC	0.190	1.095	0.274	Not supported
H1.4	Direct relationship CV → CC	0.481	2.710	0.007	Supported*
H1	Direct relationship SV → CC	0.836	23.087	0.000	Supported**

Note Significance level at ** $p < 0.01$, * $p < 0.05$ (one-tailed). LL, lower limit at 5%; UL, upper limit at 95% confidence interval; BC, bias corrected

researcher set 5000 subsamples with a replacement from the bootstrap cases equal to the original set of data which is 138 and the results of the structural model for this study are shown in Table 3.

As can be observed in Table 3, the path coefficients of EV were found to have a significant relationship with CC; the result indicated that ($\beta = 0.191$; t-statistic of 2.211), which supported H1.1. Otherwise, the path coefficients of TV were found to have insignificant relationship with CC; where the result indicated that ($\beta = 0.083$; t-statistic of 0.708), which that mean that H1.2 is not supported. Also, the path coefficients of MV were found to have insignificant relationship with CC; where the result indicated that ($\beta = 0.190$; t-statistic of 1.095), which means that H1.3 is not supported. As for the path coefficients of CV were found to have a significant relationship with CC; the result indicated that ($\beta = 0.481$; t-statistic of 2.710), which supported H1.4. Furthermore, the path coefficients of SV were found to have a significant relationship with CC; the result indicated that ($\beta = 0.836$; t-statistic of 23.087), Moreover (R^2) = (0.698 which supported H1.

5 Discussions

study results showed that the strategic vigilance system adoption helps to control all components of its environment through the four basic types of adoption of strategic vigilance: commercial vigilance, technological vigilance, competitive vigilance, and environmental vigilance, as the use of strategic vigilance functions enhances the organization competitiveness and allows it to reach high net sales levels and achieve significant income and profit margins. According to these results and studies, this is evidence of the insurance companies' awareness of the need to follow up and monitor all information within their work environment (insurance), and reinforces

the insurance companies' awareness that information represents a strong point for the company if it is strategically monitored to avoid its risks and exploit its opportunities. It also indicates that Jordanian insurance companies' ability to understand and apply strategic vigilance in the company contributes vitally to improving and enhancing competitive capabilities, and leads the company towards differentiation, which gives it an advantage over its competitors in the market.

6 Recommendations

In light of the study findings, the researcher reached a number of recommendations that can be taken by Jordanian insurance companies' managers and decision makers in order to advance their current situation. Researchers recommended the necessity of establishing units for strategic vigilance within insurance companies because of their significant role in raising competitive capabilities levels within these companies. The researcher also recommended the need to form special work teams equipped with the minimum capabilities to enhance interest in the monitoring and collecting information process.

The Impact of Emotional Intelligence (EI) on Teamwork Performance in Information Technology Sector in Jordan

Majed Kamel Ali Al-Azzam, Marah Jameel Albash, Ziad Mohd Ali Smadi, Reham Zuhier Qasim Almomani, Ali Zakariya Al-Quran, Sulieman Ibraheem Shelash Al-Hawary, Mohammad Mousa Eldahamsheh, Anber Abraheem Shlash Mohammad, and Abdullah Ibrahim Mohammad

Abstract The study aimed to investigate the impact of emotional intelligence on teamwork performance. The study population consisted of all employees working in the IT private sector in Jordan. From all IT companies working in this sector, four IT firms, at King Hussein Business Park, were selected with total number of (80) IT employees. A questionnaire was developed as the study instrument, which was composed of ten dimensions with (65) items. Multiple regression analysis was used for testing the study hypotheses. The study results found that emotional intelligence

https://doi.org/10.1007/978-3-031-12382-5_58

has a significant impact on teamwork performance. Based on the study results, the researchers recommend managers and decision makers to build good relationships with each other to improve the communication of information and ideas among the team members, and to have enough ability to overwhelm disputes occurring during the practice of work activities, which will make the work be achieved in smoother and faster mode.

Keywords Emotional intelligence · Teamwork performance · Information technology sector · Jordan

1 Introduction

Information technology (IT) sector is one of the most advanced sectors in Jordanian economy, where its growth rates are the highest in Jordan at a rate of 50% per year. Its future development is considered as a gateway for modernizing economic and social life in the kingdom (Batool 2013). Previous research has proven that intellectual quotient (IQ) is not the main factor that can predict the success and brilliance of employees at work. Emotional intelligence (EI) is an important element to determine employee's skills and competencies in communication and information technology, where the person with high (EI) is more able to build relationships and manage conflicts with others, because of their elevated capacity to understand the needs of the others they engage with (Lopes et al., 2005). EI which is considered as a set of skills and competencies, mainly based on knowledge, understanding, management and leadership of personal feelings and emotions between the individual and others, as well as internally between the individual and himself (Marzuki et al., 2015; Alameeri et al., 2020; Odeh et al. 2021). Newman and Joseph (2010) stated that in an organization, emotion regulation relates to job performance. It is well known that the good use and management of emotions leads to a positive influence on motivation (which in turn affects productivity and performance).

Moreover, increased emotional intelligence leads to improved personal and professional human interactions, which leads to a higher level of job performance of the employees in return (Batool 2013; Alsharari & Alshurideh, 2020). Emotional intelligence is an important predictor of key organizational outcomes including job satisfaction (Daus & Ashkanasy 2005; Al-Dhuhouri et al. 2020). According to the theory of emotional intelligence, a person who can understand his feelings and emotions and has full awareness of them as well as his ability to control stress can certainly have better relationships with colleagues and supervisors, hence, better job performance (Kafetsios & Zampetakis 2008; Obeidat et al. 2019). In addition, most of the organizations seek for an employee, who has the ability to cope with change and respond. Accordingly, Moghadam, Tehrani, and Amin (2011) proved in their study that the employee who has high (EI) affects positively in coping with situations and doing tasks in effective ways, especially in teamwork.

Information technology (IT) employees were selected for this study for the importance of IT sector, which is a highly value-added sector contributing significantly to gross domestic product (GDP) in Jordan which makes IT sector an important study sector to enhance employee performance individually or in teamwork. In addition, IT employees' job requires consistent concentration when they are coding programs, coping with stress. Also, they need to recognize their own as well as others' emotions in view of the nature of their work that follows teamwork.

According to several studies (e.g: Stys & Brown 2004; Singh, 2006), EI integrative components, such as consistent interactions and communications, cooperation with others, adaptability to stresses and conflicts, and self-motivation are very critical factors that increase the levels of the individual's productivity leading to the organizational performance. Therefore, EI factors have been examined against teamwork performance. According to Extremera and Rey (2016), EI factors have a significant role in the employee's efficiency and performance. He added that self-motivation, as an EI variable, is the inner force that drives individuals to accomplish personal and organizational goals, but regarding to social skills (such as, communication and cooperation) by virtue of the nature of IT staff's job they need to communicate with their teams as well as customers who communicate either through email or face to face to solve their problems or to convey their ideas to them, so for these reasons this study finds it is very important to reveal the levels of common EI social skills that are represented in (Communication, Cooperation, Adaptability to situation, Stress and Conflict Management, and motivation) as indicated by EI models, such Goleman Model of IE (1998), Bar-on Model, Singh model (2006), at employees of Jordanian IT sector, and investigate their impact on their teamwork performance.

2 Theoretical Background and Hypotheses Development

2.1 Intelligence (EI)

For long time, Emotional intelligence (EI) concept has developed gradually according to its increasing importance at all scientific fields so that the term of (EI) has become an essential at the level of individuals, teams, and even organizations that aspire to improve and develop its performance. Emotional intelligence (EI) is a defined as a conceptualization that has been discussed progressively by the literature of social psychology. Recently, emotional intelligence has been given much importance in research especially in psychological research. The concept of emotional intelligence was early introduced by Salovey and Mayer (1990). Who defined emotional intelligence as the individual's capability to manage his own emotions and the emotions of other individuals, to distinguish among them and to utilize information for facilitating one's reasoning, activities, and thinking (Mayer & Salovey, 1997).

Furthermore, Emotional intelligence as specified by Singh is the personal ability to respond appropriately and successfully to a wide variety of emotional stimuli

that is drawn from within the person and his surrounding environment. Emotional intelligence is also defined as the consciousness in using feelings and emotions and employs them by standards and methods of personal knowledge to cope with current situations and problems (Stys & Brown 2004). What's more, emotional intelligence is described as the ability of an individual to adapt to, choose, and change a situation through an emotional process (Gignac, 2010).

Another definition of Emotional intelligence is that it composed of a set of significant parts of individual's internal and external dealings, mindset, personality, stress management abilities, temperament adjustment and all these have significant impact on the individual and teamwork Performance (Fallahzadeh, 2011; Alshurideh et al. 2019; Alzoubi et al., 2021). Lastly, Bradberry and Greaves (2009) defined emotional intelligence as the individual's capability, aptitude, recognition assignment, accurate assessment and control of his senses against other individuals and groups. Depending on all above definitions of Emotional intelligence, the researcher can define the concept as "Knowing the self's emotions and the emotions of others and employing this knowledge intelligently to choose the best method that ensures the successful management of different life situations".

Individuals who have higher emotional intelligence are more expected to regulate, understand, and control emotions excellently in themselves as well as in the other individuals (Wijekoon et al. 2017; AlShehhi et al. 2020). There is substantial evidence that emotional intelligence is a better predictor of success than intelligence quotient. On the basis of intelligence quotient, one may get into a field but the ultimate success in that field depends upon emotional intelligence (Johar et al., 2019).

People who have a high level of emotional intelligence know their own feelings and manage them well, beside they understand and treat others' feelings properly. Accordingly, they are distinguished in all areas of life, more satisfied with themselves, efficient in their lives, and able to control their mental structure pushing their production forward (Huang & Lee, 2019). On the other hand, people with low level of emotional intelligence do not have the ability that can enable them to cope with stressful events, and thus they are characterized by depression, frustration and low level of production (Allozi et al., 2022; Zirak & Ahmadian, 2015).

Emotional intelligence helps individuals resolve emotional problems in their daily life, enhance their perception of positive emotions, and reduce negative emotions, eventually bringing life satisfaction (Chew et al.2013; Agha et al., 2021). Generally, it is believed that individuals who perceive more positive and fewer negative emotions in their daily life have higher subjective well-being (Fallahzadeh, 2011; Nuseir et al. 2021). Overall, people with a high level of Emotional intelligence will still demonstrate better social adjustment ability and emotional regulation skills than will do those low in Emotional intelligence and their Emotional intelligence will have a positive connection with life satisfaction (Mayer et al. 2000). In addition, Ciarrochi et al. (2000) found that this positive effect continued to exist even after general intellectual and character factors were controlled.

2.2 Team's Job Performance

Job performance is one of the most important factors for the organizations 'success. Today, many organizations seek to improve their performance through several methods, such as: adopting the team's approach, engaging employees in decision-making and policy, and motivating employees financially and morally (Al-Hawary et al., 2013; Al-Nady et al., 2013; Metabis & Al-Hawary, 2013; Al-Hawary, 2015; Al-Nady et al., 2016; Al-Lozi et al., 2017; Al-Hawary & Alajmi, 2017; Al-Hawary & Al-Namlan, 2018; Al-Lozi et al. 2018; Mohammad et al., 2020; Allahow et al. 2018; Alhalalmeh et al., 2020; Al-Hawary et al., 2020; Al-Hawary & Al-Syasneh, 2020; AlTaweel & Al-Hawary, 2021). Job performance is a fundamental concept for all organizations, because it is a phenomenon that is described as comprehensive and fundamental to all fields of administrative knowledge, as well as the dimension of the organization's survival (Saeed & Shakeel, 2013; Amarneh et al. 2021; Shamout et al., 2022).

There are several definitions of job performance; Wahyudi (2013) defined Job performance as "the output of an employee doing business". According to Zhang et al. (2014), job performance is "The glossary of administrative science terms defined performance as: "achieving a set of duties and responsibilities based on the performance rate of the trained efficient worker". Taylor and Beh (2013) defined job performance as "the process of monitoring and analyzing the employees' work and behavior, judging the degree of their competence in the work they are currently doing, and judging the prospects of future progress in their work and the extent to which they can have more responsibilities".

According to Scott et al. (2015), job performance is closely related to the nature of the work done by the employee and his understanding of the operations he performs in various types until the job tasks are accomplished. Therefore, the performance is the outcome of human behavior in the framework of the techniques and procedures that guide the work towards achieving the desired goals (Al Kurdi et al., 2021; Scott et al., 2015).

According to Strom et al. (2014), there are two main factors making up the job performance of the working staff: Task Performance (Role Behavior) and Contextual Performance. Task Performance is traditionally defined as the ability of the employee to perform his or her duties and responsibilities according to the task description, whereas Contextual Performance is the individual effort that is indirectly related to the basic tasks and activities of the job but related to stimulating tasks and processes that constitute the organizational, social and psychological environment. In other words, while performing the functional task means fulfilling job requirements successfully, contextual performance is related to the quality of social relations with the different community members: young people, the elderly, and clients, a factor that is not always linked to the job (Strom et al., 2014).

Scott et al. (2015) divided contextual performance into two sub-dimensions: facilitation of personal relationships and job dedication. Facilitation of personal relationships consists of well-planned behaviors, tends to teamwork, and support of peer

performance, whereas job dedication consists of disciplined internal behaviors such as work-related initiative, overtime work, and following of workplace rules.

2.3 The Relationship Between EI and Team' Job Performance

The extensive body of research advocates that capabilities of emotional intelligence contribute to excellent performance (Brouzos et al., 2014; Parker et al., 2004). Emotional intelligence's abilities are considered four times more significant than intelligence quotient (IQ) in deciding professional success and prestige. Emotional intelligence is a substantial predictor of performance in different work fields. Emotional skills, abilities and knowledge contribute to the enhancement of teamwork learning, their professional development for the success of higher levels of accomplishment, career success, personal wellbeing, and leadership (Chew et al., 2013).

Bar-On indicates that emotionally intelligent individuals are committed, excited and eager in their life, therefore they are usually found at the highest level of performance in their work team. Goleman (1995) expresses that emotional intelligence represents 80% of all learning while cognitive capabilities represent about 20%. Although it is a strong claim, but yet it needs to be adequately investigated that to what degree emotional intelligence really correlates to work performance, at individuals and teams.

Mayer et al. (2000) proposed that emotional intelligence improves with the increasing of age. They also reported that as emotional intelligence expanded, work-based success also improved and likewise, capabilities of communicating inspirational thoughts were also stimulated. Alternatively, as emotional intelligence diminished, oppositional behavior increased. Excellent emotional intelligence aptitudes are related to outstanding ability and capability to deal with one's own feelings and the feelings of other individuals (Brouzos et al., 2014). Based on the above literature the hypotheses study can be formulated as:

There is a significant impact of emotional intelligence (EI) on Teamwork Performance (TWP)

3 The Study Model

Below is a model that illustrates both the independent and dependent variables examined in this research study. EI's variables and their items were adopted from Bar-On, Bradberry and Greaves (2009), Extremera and Rey (2016), where TWP's variables

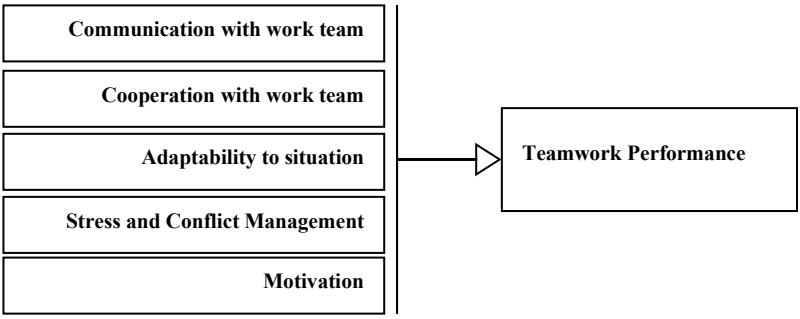

Fig. 1 Theoretical model

and their items were adopted from Froebel and Marchington, Finn et al., Higgs. All the variables' items were adapted to fit the study's environment (Fig. 1).

4 Methodology

4.1 Population and Sample of the Study

The study population consisted of all employees working in the IT private sector in Jordan. From all IT companies working in IT private sector in Jordan, four IT firms, at King Hussein Business Park (MICROSOFT, ORACLE, CISCO, IATA) were selected with a total number of (80) IT employees. Therefore, (80) questionnaires were provided to the respondents. After two weeks, (78) questionnaires were retrieved with percent of (97.5 %) of the total number of distributed questionnaires. Then, six questionnaires were excepted because they were improperly filled. Therefore, the final questionnaire's number was (72), with percent of (90%) of the total sample's number, which is very accepted for data analysis.

4.2 The Study Instrument

The questionnaire was developed as an instrument for this study, which was developed based on the literature relating to the current study topic and its concepts. **First section**: it includes the questions relating to the demographic data of the sample (Gender, Age, Scientific Qualification, and Experience). **Second section**: it includes the two main variables: **Emotional Intelligence (EI),** which was composed of (37) items measuring the following dimensions: Communication with the work team which was measured by (6) items, cooperation with the work team which was measured by (6) items, adaptability to situation which was measured by (7)

items, Stress and Conflict Management which was measured by (7) items, motivation which was measured by (11) items. **Teamwork Performance (TWP)** which was composed of (28) items measure the following dimensions: Cooperation and coordination which was measured by (6) items, effectiveness which was measured by (6) items, trust which was measured by (5) items, cohesion which was measured by (6) items, and job performance which was measured by (5) items.

4.3 Construct Validity

To test the construct validity of the study, pilot test was carried out, in which (30) questionnaires were provided to (30) IT employees who were from the main study sample, (27) Questionnaires were retrieved and were valid for testing the construct validity and reliability of the study instrument. Construct validity measures the extent to which the objectives of the instrument have been achieved, and whether the instrument is able to measure its content for which it was designed. Correlation coefficient (Pearson Correlation) was found to determine the degree of item's correlation with the total score of its dimension. Items with negative or less than 0.25 degree of correlation are considered low and preferably deleted. (Tables 1 and 2) show the results of the construct validity.

Table 1 shows that correlations' coefficients between each item of EI with its main dimension ranges between (0.465–0.869) exceeding the cut-off level (0.25), and they are significant at ($\alpha \leq 0.05$), which confirms that all EI scale items are valid to measure EI variable.

Table 2 shows that correlations' coefficients between each item of TWP with its main dimension range between (0.560–0.883) exceeding the cut-off level (0.25), and they are significant at ($\alpha \leq 0.01$), which confirms that all TWP scale items are valid to measure TWP variable.

4.4 Testing Reliability

The Reliability of the study instrument was measured by calculating the value of Cronbach's Alpha coefficient, where the result is statistically acceptable if the Cronbach's Alpha coefficient is greater than (0.60), and the more this value is close to 1 (i.e. 100 %), the more the reliability of the study instrument is acceptable.

Table 3 shows that Cronbach Alpha for EI's dimensions and TWP Dimensions ranged between (0.838–0.941) and the total Cronbach Alpha for EI value is (0.917), which confirms that EI and TWP scale can be described by reliability and all data collected for measuring EI and TWP are reliable to measure all dimensions of EI and TWP.

Table 1 Correlation coefficients between each EI's item and its dimension

EI dimensions									
Communication with work team		Cooperation with work team		Adaptability to situation		Stress and conflict management		Motivation	
Item num	Correlation	Item num	Correlation	Item num	Correlation	Item num	Correlation	Item num	Correlation
1	0.713**	1	0.692**	1	0.856**	1	0.761**	1	0.710**
2	0.814**	2	0.817**	2	0.663**	2	0.768**	2	0.626**
3	0.637**	3	0.803**	3	0.627**	3	0.680**	3	0.465*
4	0.485*	4	0.788**	4	**0.403**	4	**0.341**	4	0.792**
5	0.590**	5	0.623**	5	0.794**	5	0.810**	5	0.748**
6	0.757**	6	0.645**	6	0.869**	6	0.757**	6	0.867**
7	**0.434**			7	0.843**	7	0.710**	7	0.739**

** Correlation is significant at the 0.01 level (2-tailed)

* Correlation is significant at the 0.05 level (2-tailed)

Table 2 Correlation coefficients between each TWP's item and its dimension

(TWP) dimensions									
Cooperation and coordination		Effectiveness		Trust		Cohesion		Job performance	
Item	Pearson correlation	Item	Pearson correlation	Item	Pearson correlation	Item	Pearson correlation	Item	Pearson correlation
1	**0.326**	1	0.628**	1	0.866**	1	0.881**	1	0.842**

Table 3 Cronbach Alpha values for "EI" dimensions and TWP dimensions

Variables	(Cronbach Alpha)	Num. of items
Communication with work team	0.910	6
Cooperation with work team	0.909	6
Adaptability to situation	0.898	6
Stress and conflict management	0.917	6
motivation	0.902	7
Cooperation and coordination	0.862	4
Effectiveness	0.838	6
Trust	0.858	5
Cohesion	0.836	6
Job performance	0.941	5

4.5 Testing Normality (Kolmogorov–Smirnov & Shapiro Tests)

Kolmogorov-Smirnov test and Shapiro test were used for testing normality of data distribution, which is used in case the number of cases is ≥ 50. In these tests, data are described as normally distributed in case the significance is > (0.05).

Based on the tests' data shown in Table 4, the data of the two main variables (EI and TWP) was normally distributed, where the significance values for all dimensions were greater than 5%.

4.6 The Study Model Fit

According to the nature of data in this study, parametric methods are considered the most appropriate methods for measuring the impact of variables. Parametric methods include the diagnosis of "Multicollinearity" between independent variables and "Autocorrelation", where the ideal situation in multiple regression requires that the independent variables should be strongly associated with the dependent variable, at the same time should not be correlated with each other, where the strong correlation between the independent variables lead to a decrease in the value of (R), because the independent variables share the same variance of the dependent variable creating difficulty of determining the relative importance of each independent variable.

Table 4 Normal distribution test of data based on (K-S) values

EI variables	Mean	SD	Kolmogorov–Smirnov (Sig.)	Shapiro–Wilk (Sig.)
Communication with work team	4.0447	0.55113	0.200	0.327
Cooperation with work team	3.9127	0.61151	0.089	0.207
Adaptability to situation	3.9365	0.63108	0.096	0.263
Stress and Conflict Management	3.8095	0.65361	0.122	0.234
Motivation	3.9437	0.54884	0.113	0.166
TWP variables	*Mean*	*SD*	*Kolmogorov–***Smirnov** *(***Sig.***)*	*Shapiro–Wilk (Sig.)*
Cooperation and coordination	3.8571	0.57563	0.102	0.192
Effectiveness	3.9968	0.72318	0.123	0.077
Trust	3.9238	0.63396	0.132	0.200
Cohesion	3.9762	0.62425	0.235	0.317
Job performance	3.2762	0.7402	0.200	0.252

5 Testing Hypotheses

Two main tests were used for confirming that the study is devoid of multicollinearity; variance inflation factor (VIF) which should be ($\leq$10), and tolerance which should be ($\geq$1), and less 5 should VIF between $\geq$ 1 and $\leq$ 5. Table 5 shows that the values of VIF and Tolerance have met these two conditions, which indicates that there is not "Multicollinearity" between the independent variables, and thus they are suitable for multiple linear regression analysis relating to the main hypothesis.

Multiple regression analysis was employed to test the study hypotheses which states that: "There is a significant impact of emotional intelligence (EI) on Teamwork Performance (TWP)". In this model, emotional intelligence acts as the dependent variable and Teamwork Performance, as the independent variables. From the result as shown in Table 5, the regression model was statistically significant ($F = 357.106$; $R2 = 0.86$; $P = 0.000$). The adjR2 is 0.86, which means that 86% of the variation in Teamwork Performance can be explained by emotional intelligence. The proposed model was adequate as the F-statistic = 357.106 were significant at the 5% level ($p < 0.05$). This indicates that the overall model was reasonable fit and there was a statistically significant association between emotional intelligence and Teamwork Performance.

Table 5 also shows that Communication with work team (ß = 0.707, $p < 0.05$), Cooperation with work team (ß = 0.811; $p < 0.05$), Adaptability to situation (ß = 0.154, $p < 0.05$), Stress and conflict management (ß = 0.419; $p < 0.05$), and

Table 5 Regression summary of emotional intelligence and teamwork performance

Model	Standardized coefficients ß	T	SIG	Collinearity statistics	
				Tolerance	VIF
Communication with work team	0.707	3.500	0.002	0.459	2.180
Cooperation with work team	0.811	6.293	0.000	0.264	3.787
Adaptability to situation	0.154	2.336	0.034	0.287	3.481
Stress and conflict management	0.419	3.101	0.007	0.337	2.963
Motivation	0.703	3.116	0.003	0.367	2.728

Notes Adj. R 2 = 0.86; Sig. F = 0.000; F-value = 357.106; dependent variable, Teamwork Performance
$p < 0.05$

Motivation (ß = 0.703; $p < 0.05$) had a significant effect on Teamwork Performance. Cooperation with work team had the highest effect on Teamwork Performance. This provides evidence to support H1a, H1b, H1c, H1d, and H1e.

6 Discussion

The results showed that dimension of emotional intelligence (as a whole) has come within the high level, from the study sample individuals' perspective, where communication with work team obtained the highest degree, while stress and conflict management got the lowest degree. The follows explain detailed discussion of emotional intelligence and its dimensions.

The study results found that Communication with work team has been classified in the first rank, which means that the relationships among all teamwork members are based on respect and appreciation feelings even there is difference in opinions and ideas, which is regarded very important for teamwork performance. Also, the results confirmed that teamwork members are mostly having a dialogue mode when facing problems or variance in suggestions, which means that IT private sector companies reinforce their employees' interaction and integration by providing training and development programs that grows their personal and social skills.

The study results found that motivation was found at a high level with the fifth rank in IT industry in Jordan. This result proves that IT employees in Jordan are practicing their work with motivating emotions that support them to do work actively. This intrapersonal emotional motivation may be attributed to external motivation provided by the organization's management to increase their employees' job satisfaction, and thus increases their performance. This result indicates that IT employees may have

stability motives, which are (motivation and emotional stability), that are considered integrated properties drawn from intrapersonal emotional intelligence.

The study results found that Adaptability to Situation was found at a high level with the third rank in IT private sector in Jordan. This result explains that teamwork employees in IT sector in Jordan behave emotionally adapting their thinking according to the situation conditions. This means they have ability to be flexible to accept new changes in their companies. The results proved that employee of IT sector in Jordan has a high level of emotional intelligence by understanding emotions and feelings of his team members. By this respond to the external environment represented in other employees in the organization but outside the teamwork, and IT sector employee has typically the concept of emotional intelligence defined by Goleman (1995) that emotional intelligence is the individual's ability to understand his emotions, the emotions of others, their knowledge and directions, control and deal with them positively, motivate the self, manage emotions and relationships with others effectively.

The study results found that Cooperation with the Work Team was found at a high level with the second rank in IT private sector in Jordan. This explains that teamwork members have good understanding of the team goals and objectives, and thus try to work in a cooperative manner to achieve those objectives effectively. The results indicated the teamwork member has willingness to help each other by providing suitable information to his colleagues for purpose of helping them to accomplish their job's tasks. This cooperative behavior goes beyond this advantage when the teamwork member tries to facilitate the tasks required from the colleagues as initiative to work team even if the colleagues have not asked the help. But this advantage must be activated in case of absence of some members, which means that some job' s positions are related to specific employees but not integrated to others.

The study results found that Conflict and Stress Management was found at a high level with the fourth rank in IT private sector in Jordan. Teamwork has many stressful situations that need a person who deals with the stresses and conflicts flexibility and wisely by control of emotions. IT sector mostly depends on cooperation and interaction among team members, which entails stresses tolerance and flexible ability to manage teamwork-based conflicts. This result confirms that IT employees in Jordan have ability to manage stressful situations and deal with conflicts intelligently complying to the concept of Conflict management included in Goleman model (1995) and Singh model (2006) that expressed conflict management as The individual's ability to negotiate, resolve disputes, deal with difficult characters and long-term problems in a diplomatic and tactical method, in addition to the encouragement of open debate, as well as focus on latent and invisible conflict points.

The study results found that the Teamwork Performance has come in the high level at IT sector in Jordan. This refers to that IT private sector in Jordan depends on teamwork as a cooperative and collaborative work. Such this work enhances the investment of the organizational capabilities and core competences in a synergy mode. This high level of teamwork performance in IT sector is attained as outcome of multi-diversified skills' combination at the individuals of work team. This interpretation is supported by Frykman et al. (2014), where they asserted that any professional skills, such as

communicative skills, positive interaction, conflicts solving, have become very critical for an organization aspiring for competitive position. Such these highly required skills can be achieved just by teamwork, therefore managers and employers are looking for individuals who can practice their work in very collaborative environment (Frykman et al., 2014).

The study found that emotional intelligence at employees working in IT sectors has a significant impact on teamwork performance. This result explains that emotional intelligence at individuals belonging to teamwork supports and motivates the employees' ability and persistence to achieve their work activities effectively increasing their teamwork performance. This result supports Bar-On opinion who mentioned that emotionally intelligent individuals are committed, excited and eager in their life, therefore they are usually found at the highest level of performance in their work team. Also, the results support opinion of Goleman (1995), who expressed that emotional intelligence represents 80% of all learning while cognitive capabilities represent about 20%, which means that when IT teamwork's' employees are found intelligently emotional, they will be more eligible to learning. Moreover, this result can be interpreted by Chew et al. (2013), by conforming those Emotional skills, abilities and knowledge enhance effectively team work learning, their professional work achievement, career success, and leadership. Also, supported by Qualter et al. found that Emotional intelligence is a substantial predictor of performance in different work fields. The result is consistent with the study of Higgs, which confirmed that Emotional intelligence is strongly correlated to the performance of employees' staff. The result is consistent with the study of Law et al. (2007), which found that Emotional intelligence is a true predictive tool about job performance, and it comes consistently with the study of Lee et al. (2018), which showed Positive correlation between emotional intelligence and teamwork skills post-workshop. Also, the result comes consistently with the study of Johar et al. (2019), which found emotional intelligence with its dimensions (emotional awareness, emotional management, and social emotional awareness) positively correlated with academic performance.

7 Recommendations

According to the results of the study, the researcher recommends managers and decision makers to build good relationships among employees to facilitate the communication of information and ideas among the team members. This flexible information communication between the team members should motivate the innovative and creative thinking at the IT employees effectively. Teamwork members should activate the process of knowledge sharing and application. Knowledge sharing among the team members will make the new concept easily shared and valuable at all the employees, and according to which they can develop their work performance. IT employees should have enough ability to overwhelm disputes occurring during the practice of work activities, which will make the work be achieved in smoother and faster mode. This positive behavior of IT employee may be supported and be more

enhanced when IT employee has an initiative to give the most priority to the work duties more than personal stubbornness. IT employees should try to get an opportunity that may lead to their work improvement and their skills development, whether inside or outside the organization. Therefore, they should try to be included in training programs that may develop their options' capabilities and improve their functional skills so that they can be able to adapt to new business processes and new IT development. Finally, Leaders of companies in Jordanian IT should build proper mechanism that can enable the teamwork members to work in an integrative manner. Which mean that an employee must be distributed in his team position based on his skills and capabilities. Such this mechanism of employees' distribution should lead the teamwork employees to practice their work activities interactively and consistently overcoming some functional gaps penetrating teamwork performance.

The Impact of Functional Withdrawal on Organizational Commitment as Perceived by Nurses Working in Public Hospitals in Jordan

Raed Ismael Ababneh, Bashaier Hatem Khasawneh, Reham Zuhier Qasim Almomani, Main Naser Alolayyan, Ziad Mohd Ali Smadi, Hanan Mohammad Almomani, Fatima Lahcen Yachou Aityassine, Sulieman Ibraheem Shelash Al-Hawary, and Dheifallah Ibrahim Mohammad

Abstract The major aim of the study was to examine the impact of functional withdrawal on organizational commitment. Therefore, it focused on Jordanian public hospitals operating in the north region. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a random

sample of (306) nurses via email. Structural equation modeling (SEM) was conducted to test hypotheses. The results demonstrated in Table 2 show that functional withdrawal has a negative impact on organizational commitment. In light of the findings of the study, managers and decision makers in hospital management should provide support, material and moral incentives, and educational, development and promotion opportunities for employees, especially nurses, with the need to focus on knowing the needs of nurses to increase their connection with their organization and reduce their tendency to search for new opportunities and leave work.

Keywords Functional withdrawal · Organizational commitment public hospitals · Jordan

1 Introduction

Organizations seek to find and provide an appropriate environmental and practical environment in which the employee feels his importance and his role in achieving the organization's goals (Al-Hawary & Al-Hamwan, 2017; AlTaweel & Al-Hawary, 2021). Despite the efforts made by these organizations to satisfy the workers and improve their performance (Al-Nady et al., 2013; Allahow et al., 2018; Al-Hawary & Al-Syasneh, 2020; Mohammad et al., 2020), the workers must be exposed to pressures and circumstances that push them to carry out practices and behaviors that have a negative impact on the individual and the organization, which may make the individual fall under the practice and behavior of the so-called career withdrawal, which is one of the most behaviors (Sweissi & Mahjar, 2017). Job withdrawal is one of the most important administrative problems faced by organizations, which troubles working managers and researchers in organizational affairs because of its negative effects and the material and moral loss it causes to the organization and to individuals, especially if the organization spends a lot of its financial resources on training and developing the employee to become an expert and efficient (Al-Hawary, 2009; Al-Hawary & Nusair, 2017; Al-Hawary et al., 2012; Sweissi & Mahjar, 2017).

Job withdrawal occurs when the employee is not satisfied with his work, which negatively affects job performance and production, as well as commitment to the job and the organization (Al Kurdi et al., 2021; Allozi et al., 2022). As for psychological withdrawal, it is a set of actions and behaviors that an individual performs to escape and stay away from performing the tasks and duties assigned to him, where the individual is physically present and mentally and psychologically absent from work, among these practices include daydreaming, building informal social relationships, pretending to be busy, surfing the Internet and doing other work during the official working hours that have nothing to do with the job duties he performs (Sweissi & Mahjar, 2017). Job withdrawal, both physical and psychological, plays an important role in the decrease in organizational loyalty, which increases the losses of organizations and job instability, which in turn will negatively affect the level of overall performance (Al Kurdi et al., 2020a, b; Alameeri et al., 2020).

The health sector is one of the important sectors in which the medical staff has a decisive role in providing treatment services to patients in an efficient and effective manner (Aburayya et al., 2020a, b). However, the presence of job withdrawal behaviors, especially for nurses, will increase the degree of their instability and loyalty to the hospital in which they work, and thus lower the level of health services provided to citizens. It was noticed that the percentage of employees late to come to work on time and the increase in spending of official working hours outside the departments in which they work through social conversations, in addition to the observation of nurses' preoccupation with using modern means of communication, smart phones and social media in abundance during working hours with no attention to achievement and complete the tasks required (Aburayya et al., 2020c, d; Alshurideh, 2014).

The mentioned practices fall under the organizational term, which is job withdrawal, as it is considered one of the negative and unhealthy phenomena in organizations because of its undesirable effects at the individual, group and organizational levels (AlShehhi et al., 2020; Hayajneh et al., 2021). Withdrawal is a way for an individual to escape from the reality of work, whose negative effects are reflected on the organization, which requires striving and working hard to avoid them by controlling these behaviors and standing at the level of their practice and finding appropriate solutions to them (Alsuwaidi et al., 2020; Al-bawaia et al., 2022). The interest of researchers and business organizations has increased recently in issues related to organizational loyalty, as it is one of the most important goals that organizations seek to gain from their employees to increase the strength of the employee's attachment and his love to work because of its impact on job performance. Therefore, this study seeks to find out the effect of practicing job withdrawal behaviors on the organizational commitment of workers in the Jordanian health sector (Alshurideh, 2019, 2022; Alshurideh et al., 2020; Alzoubi et al., 2022).

2 Theoretical Framework and Hypotheses Development

2.1 Functional Withdrawals

Functional withdrawal is defined as a set of behaviors and practices carried out by an individual that express separation from his organization and his unwillingness to work in it (Redmond, 2010). Functional withdrawal is also defined as the employee's interruption or cessation of work in his organization with his desire, choice, and transfer to work in another organization (Al-Ghanim, 2003). Kaplan et al. (2009) defines functional withdrawal as a set of behaviors and practices that the employee performs when he decides not to stay in his work for reasons beyond his control so that he is less accomplished, performing and participating in work. There are two types of functional withdrawal, namely physical withdrawal and psychological withdrawal, and that both types It is not separated from the other and that they lead

to the result of each other, but this does not mean that the employee practices all behaviors at the same time. The functional withdrawal includes two types.

Psychological Withdrawal: Psychological withdrawal behaviors represent the individual's presence physically, but his absence mentally and psychologically (Sweissi & Mahjar, 2017). Lim et al. (2002) defined psychological withdrawal as a set of behaviors that the employee performs, which is represented by his physical presence and his mental absence from his work environment, which is represented by several behaviors, namely daydreaming, electronic surfing, pretending to be busy, doing side jobs, and building informal social relationships. From an organizational point of view, daydreaming is defined as showing the employee his preoccupation with his work and camouflaging, but he is originally busy and thinking about other things that are not related to work, and it is a way to relieve work pressure and escape from reality without seeking to solve the problem, so that these dreams become a means of escaping and withdrawing from the organization (Sweissi & Mahjar, 2017). Building informal social relations is clearly a bad withdrawal behavior that negatively affects the functioning and safety of work on the one hand, and it has a positive impact by increasing cooperation and love of teamwork and cooperation between individuals at work. It is considered entertainment for the employee that distances him from the work atmosphere. As for doing side jobs (**Moon Lighting**), it is the individual's exploitation of work time and resources to complete other tasks outside the scope of work or for the benefit of a job (Lim et al., 2002).

In this case, the individual is physically present at his place of work, but all his energy and effort are concentrated in another personal work that is not related to his current work. **Looking busy**: It is for the employee to appear intentionally that he is busy with something even though he is not doing any task, and the reason for this may be in order to avoid his manager assigning him other tasks. By pretending to organize papers and files or sitting at a computer pretending to complete a work-related task when in reality there is no work to be done (Hanish & Hulin, 1990). As for **Cyber loafing** is the use of the Internet and social media during official working hours for personal purposes and not for work purposes, and this behavior is considered a way to combat negative working conditions (Chen & Lim, 2012).

Physical withdrawal, which is defined as a set of behaviors and actions that the individual practices to avoid performing the tasks and duties entrusted to him, and the behaviors of physical withdrawal are represented in several practices, including **(Tardiness)**: It is the person's arrival late to work or leaving early before the end of the work. **Long breaks**: There are several reasons that drive the employee, the most important of which is the feeling of dissatisfaction with work, the lack of incentive to encourage working hard and boredom from the work routine. **Missing Meetings**, it is the employee's ignoring important meetings and work meetings that are part of his job. **Absenteeism**: It is the employee's failure to attend work, either with an excuse, because of illness or an emergency, or it may be without justification and is represented by the employee's absence for one or more days from work (Harrison & Price, 2003). And the last one is to leave work with the individual's desire or to resign (**Quitting**) due to circumstances related to the work itself or the employee, and it is the last solution for the employee and the highest degree of physical withdrawal.

2.2 Organizational Commitment

The concept of organizational commitment is one of the prevailing organizational concepts and one of the goals that all organizations strive to achieve (Alhalalmeh et al., 2020; Al-Hawary, 2013; Al-Hawary & Alajmi, 2017; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Obiadat, 2021; Al-Hawary et al., 2020). Commitment, in the linguistic and idiomatic sense, expresses sincerity and fulfillment of the covenant, and it is an individual's feeling of love and devotion to something, his attachment, and his feeling of responsibility towards this thing (Al-Hawary et al., 2013; Al-Hawary & Abu-Laimon, 2013; Metabis & Al-Hawary, 2013; Al-Hawary, 2015; Al-Lozi et al., 2017; Al-Hawary & Al-Namlan, 2018; Al-Lozi et al., 2018; Al-Quran et al., 2020). Steers and Mowady (1974) defined commitment as: the strength of belonging and integration of the individual within the organization in which he works and his effective contribution to it, with a strong desire to continue working and belief in the organization's goals. It is the extent of the strong connection and integration between the individual and the organization, which leads him to accept the goals and values of the organization and work hard to achieve what the organization desires to achieve, and the desire to continue working in it and remain as a member (Al-Hawary, 2011; Al-Hawary & Aldaihani, 2016; Al-Hawary & Hadad, 2016; Al-Nady et al., 2016).

Judeh (2004) defined commitment as: a state of connection between an individual and his organization represented by his belief in the goals and values of this organization and through which he expresses his desire to work in it. Al-Fahdawi (2004) defined it as the level of the employee's positive feeling about his organization and commitment to its values and objectives, and the constant feeling of connection, pride in it, and his love for working, regardless of the financial return that he will derive from the work. Also, Al-Rawashdah (2007) defined organizational commitment as the unwillingness of the individual to leave his work in the organization in which he works for any reason, whether financial or other reasons, and his feeling that he is an integral part of the organization and his attachment to it and its values while striving to achieve its goals.

The dimensions of organizational commitment differ according to the entrance and axis through which it is studied, as the dimensions of organizational commitment varied. Organizational commitment consists of several components linked to each other and not separate, as these dimensions were classified in several models, including the model (Allen & Meyer, 1996), which is the model adopted by the study, where it classified the dimensions of organizational commitment as follows; **Affective Commitment**: It is the individual's feeling of pride in belonging to the organization in which he works and adopting its activities in a positive way, in addition to his feeling that he is part of the organization and that its problems belong to him, as the individual feels that he has strong relationships and friendships that work to keep him in the organization with a brotherly atmosphere that attracts and attracts him To continue working in it (Awaida, 2008). **Normative Commitment**: It expresses the individual's sense of obligation to remain in the organization and not to think about leaving it, and the feeling of guilt when leaving it because of a moral

and ethical commitment that works to keep him in the organization. **Continuance Commitment**: It is the individual's assessment of the benefits that he will derive and the losses that will result from staying with the organization or leaving it. This evaluation is affected by several factors, including the abundance or lack of available alternatives and jobs, the number of years of work in the organization itself, and the difference in systems between organizations (Alshraideh et al., 2017; Al-Khayyal et al., 2020; Alketbi et al., 2020).

2.3 Functional Withdrawal and Organizational Commitment

Making the organization the perfect place for the employee, motivating him, strengthening relations between the members of the organization, and improving working conditions, which leads in one way or another to a feeling of commitment to the organizations. Many studies have shown that these practices differ from one person to another depending on personal factors and characteristics such as gender, age and other characteristics that enable a person to deal with the circumstances surrounding him (Turan, 2015). Studies have shown that the practice of these behaviors is associated with several organizational factors such as the level of job satisfaction and job and organizational commitment (Bennett & Naumann, 2004). The employee's withdrawal practices reduce the effort he exerts at work, while not paying attention to the interest of the organization, and his interest is in preserving the material benefit that he achieves from staying at work in it (Harrison et al., 2006).

Several studies have mentioned functional withdrawal behaviors within the list of behaviors that the employee commits by stealing and exploiting work time by practicing behaviors that do not serve the interest and workflow, but rather negatively reflect on the performance of the organization and achieve the individual interest of the person who practices these behaviors (Brock et al., 2013). The employee's practice of functional withdrawal behavior is also considered as a disregard for the work and its requirements in a negative way that is reflected on the quality of the services provided. The researcher believes that being late for work becomes a withdrawal behavior if it occurs frequently and almost daily and in all periods of work and without justification or an official excuse, as the employee does not feel guilty because of his practice of this behavior. Based on the foregoing theoretical literature, the study hypothesis can be formulated as follows.

There is a significant effect of functional withdrawal on organizational commitment.

3 Study Model

See Fig. 1.

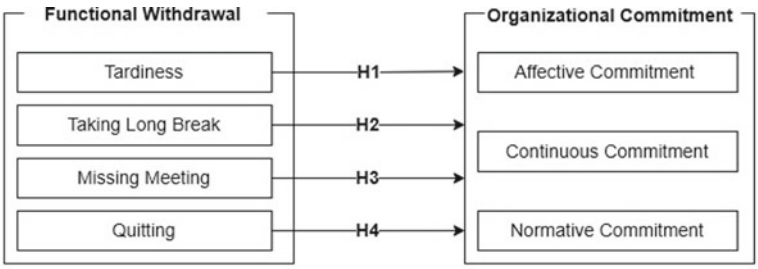

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of functional withdrawal on organizational commitment. Therefore, it focused on Jordanian public hospitals operating in the north region. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a random sample of (306) nurses via email. In total, (285) responses were received including (18) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (267) responses suitable to analysis requirements that were formed a response rate of (87.25%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (17) items to measure functional withdrawal based on (Chen & Lim, 2012). These questions were distributed into dimensions as follows: four items dedicated for measuring tardiness, four items dedicated for measuring taking long break, four items dedicated for measuring missing meeting, and five items dedicated for measuring quitting. Whereas the second section included (15) items developed to measure organizational commitment according to what was pointed by (Allen & Meyer, 1996). This variable was a second-order construct divided into three first-order constructs.

Affective commitment measured by five items, continuous commitment measured through five items, and normative commitment measured using five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Al-Adamat et al., 2020; Al-Gasawneh & Al-Adamat, 2020; Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.543–0.913), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. Tardiness	**0.762**						
2. Taking long break	0.301	**0.741**					
3. Missing meeting	0.394	0.341	**0.744**				
4. Quitting	0.461	0.332	0.406	**0.764**			
5. Affective commitment	0.553	0.503	0.624	0.637	**0.740**		
6. Continuous commitment	0.512	0.645	0.534	0.622	0.524	**0.756**	
7. Normative commitment	0.603	0.614	0.550	0.574	0.584	0.647	**0.775**
VIF	2.514	2.066	1.581	2.368	–	–	–
Loadings range	0.703–0.814	0.645–0.834	0.543–0.864	0.675–0.913	0.675–0.824	0.670–0.826	0.707–0.865
AVE	0.580	0.549	0.553	0.583	0.547	0.571	0.600
MSV	0.418	0.461	0.501	0.466	0.513	0.409	0.511
Internal consistency	0.845	0.826	0.827	0.872	0.857	0.866	0.880
Composite reliability	0.846	0.828	0.829	0.874	0.858	0.869	0.882

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	Tardiness → organizational commitment	−0.557**	−14.164	0.002
H2	Taking long break → organizational commitment	−0.486*	−11.754	0.03
H3	Missing meeting → organizational commitment	−0.602***	−16.297	0.000
H4	Quitting → organizational commitment	−0.521**	−13.065	0.008

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.715, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker–Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.051, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the organizational commitment and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that functional withdrawal has a negative impact on organizational commitment. Moreover, the results indicated that the highest impact was for missing meeting ($\beta = -0.602$, $t = -16.297$, $p = 0.000$), followed by tardiness ($\beta = -0.557$, $t = -14.164$, $p = 0.002$), then quitting ($\beta = -0.521$, $t = -13.065$, $p = 0.008$), and finally the lowest impact was for taking long break ($\beta = -0.486$, $t = -11.754$, $p = 0.03$).

6 Discussion

The results of the study revealed that there is insignificant effect of physical withdrawal on organizational commitment, which may be due to the employee's exposure to personal and social conditions that push him to practice these behaviors in a certain period of his work and does not mean his lack of love for work and the organization. The study results inconsistent with (Dahlke, 1996). It was also found that there was insignificant effect of physical withdrawal on emotional commitment. The employee's practice of one of the physical withdrawal behaviors does not mean the employee's lack of emotional commitment with his organization and place of work,

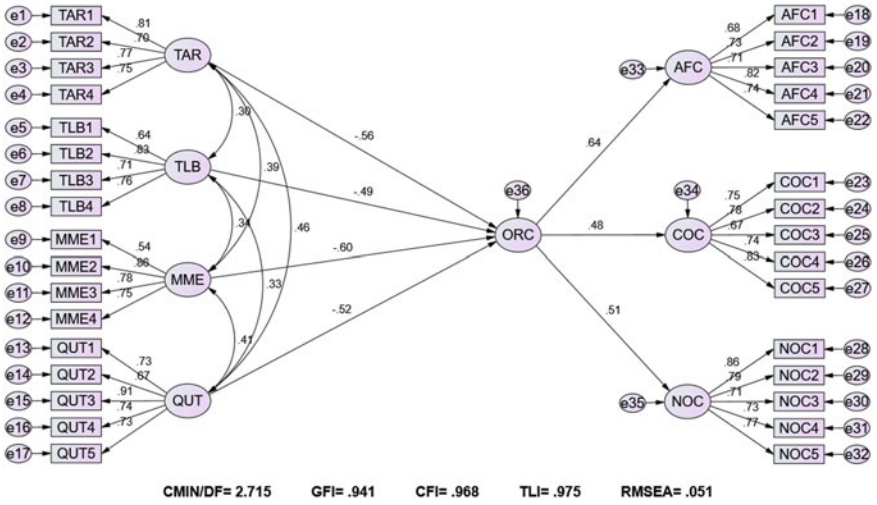

Fig. 2 SEM results of the functional withdrawal effect on organizational commitment

or his unhappiness with working in it, but the employee may be exposed to circumstances that push him to practice such behaviors such as the transportation crisis and family emergency circumstances, or obtaining work in a place close to his residence, which leads him to leave this Place and resignation and be more stable. The result of this study inconsistent with Somer (2009), Taris et al. (2004), and Somers and Binbaum (2000), which showed a negative relationship between physical withdrawal and organizational loyalty.

The study also found that there was insignificant effect of the remaining dimensions of physical withdrawal on continuous organizational commitment. The researchers attribute this result to the fact that the employee often seeks the best opportunities with the best financial return and the nature of the work that is more comfortable and closest to his place of residence and with better job privileges. He linked in his previous work is the payoff and the lack of better opportunities. It was also found that there is a negative, statistically significant effect of leaving work on organizational commitment, with no statistical significance for the remaining dimensions of physical withdrawal on organizational loyalty. In its conclusion, the study results agreed with Somers and Binbaum (2000) and Falkenburg and Schyns (2007).

7 Recommendations

In light of the findings of the study, managers and decision makers in hospital management should provide support, material and moral incentives, and educational, development and promotion opportunities for employees, especially nurses, with the need

Licensed to (putm@utm.my)

to focus on knowing the needs of nurses to increase their connection with their organization and reduce their tendency to search for new opportunities and leave work, and imposing deterrent penalties for those who are found to have exploited work hours to complete their personal matters during official working hours. Involve nurses in setting policies and making decisions that organize their work. Taking care of newly appointed individuals and recent graduates by holding meetings with them and informing them of the organization's vision, goals, values and policies to increase their awareness and enhance their loyalty to the organization.

The Impact of Human Resources Agility on Job Performance in—Islamic Banks Operating in Jordan

Ibrahim Yousef Al-Armeti, Majed Kamel Ali Al-Azzam, Mohammad Issa Ghafel Alkhawaldeh, Ayat Mohammad, Yahia Salim Melhem, Raed Ismael Ababneh, Sulieman Ibraheem Shelash Al-Hawary, and Muhammad Turki Alshurideh

Abstract The study aimed to identify the impact of human resource agility on job performance in Islamic banks operating in Jordan. The study population consists of all managers in the upper management, middle management, and lower management in these banks. The study adopted the stratified random sample that is suitable for the managers in the upper, middle management and the lower management, who

are (148) respondents. To achieve the goals of the study and test its hypotheses, the researcher used the descriptive analytical approach, and collected data with a questionnaire used by the researcher as a main performance of collecting information. Smart PLS program was used to test study hypotheses. The study results showed a statistically significant effect of human resource agility on job performance in Islamic banks operating in Jordan. Based on the results of the study, the study recommends assisting decision makers in solving problems, among which was to enhance interest in practicing adaptive capacity, creativity in problem solving, professional flexibility, and learning skills.

Keywords Human resource agility · Job performance · Islamic banks · Jordan

1 Introduction

In the past, organizations dealt negative with individuals and did not provide them with the appropriate work environment, they considered individual like a machine and does not have any moral interests, and the organizations were only thinking of achieving their goal without looking at individuals' needs and desires. The organizations later began to recognize their employees' rights with the increasing control of the external environment factors, which eventually made them recognize the human element value and consider it the most important component, and one of the most important basic resources, in addition the added value that it can be added by individuals. Job performance concept appeared in the managerial literature as part of organizations overall performance, then the researchers' interest increased in line with their interest in the organization's overall performance, rather more researchers try to explore variables that affect job performance to improve and take their advantage (Al Kurdi et al., 2021; Allozi et al., 2022; Dhani & Sharma, 2017; Hayajneh et al., 2021; Kashyap, 2014).

Human resources agility is one of the most important topics that researchers and managers have paid great attention to, in response to the intense competition between business organizations in the markets, and the technological development (Al-Hawary, 2011, 2015; AlTaweel & Al-Hawary, 2021; Shakhour et al., 2021). Organizations has also contributed to the pursuit of using different methods from competitors that put them first in the local and global markets, and this will be not achieved without workers partnership.

Jordan banking sector contributes to economic development by providing job opportunities and services that promote well-being and increase people purchasing power, which calls for an attempt to advance this vital sector and to improve all the variables related to it for survival, growth and continuity. This puts on the shoulders of every bank to try to find a special advantage that makes it ahead of competition and owning a larger market share compared to other banks, and since the number of Islamic banks in the world is increasing, each bank has to provide its own services through which it can gain a larger number of customers (Al Kurdi et al., 2020a, b).

It is worth noting that this can be achieved by investing in human resources and raising their performance levels, as attention to the human resource agility results in distinctive, efficient and effective performance (the ability to adapt, creativity in solving problems, professional flexibility, learning work skills, bearing work pressures), therefore, each organization must provide an appropriate work environment for employees and pay attention to raising their skills and training them in a way that positively affects employees performance (performance of the context, performance of tasks).

The concept of human resource agility is attractive to researchers and scholars because it is one of the new topics that Arab literature lacks in, especially in its analytical form through studying the impact of human resource agility on job performance. Islamic banks operating in Jordan, like other business organizations, are exposed to high competition between them, and thus they must preserve their human resources and seek to improve the level of their work skills by using human resources agility that support job performance, as human resources agility must have a positive impact on employees job performance and those who contribute to raising the organizational performance levels, which may necessarily lead to organizational goals achievement and continuity (Alkalha et al., 2012; Al-bawaia et al., 2022).

2 Literature Review and Hypotheses Development

2.1 Human Resources Agility

Organizations operate in a fast-moving environment that requires rethinking of the human resources through planned education, helping to develop key competencies that enable individuals to maintain focus, and perform well in current and future jobs (Al-Quran et al., 2020; Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Al-Namlan, 2018). Developing key competencies in an employee is essential to improving their performance and to empower them with capabilities in an agile context to improve performance (Al-Hawary et al., 2013; Al-Lozi et al., 2017, 2018).Since changing organizations have become more the rule than the exception, the human element agility has become as well (Jager et al., 2019), the effective use of human resource agility is often a critical factor in organizations in the long term to succeed over competitors, so organizations depend on agile human resources highly. Human resources, in their general sense, are known as job performance capabilities to enhance organizational competitive opportunities to survive in the business world, turning them into opportunities that can be exploited (Altamony et al., 2012; Alavi, 2016; Al-Hawary & Alajmi, 2017; Shamout et al., 2022). Agile organizations are able to meet the customers' needs and develop new, high-quality products with high competitiveness. Human element is an important element to develop his knowledge, ideas, judgment and cooperation quickly in line with the new working conditions called (human resource agility) or (individual agility) (Alhalalmeh et al, 2020;

Alshurideh et al., 2022). The aspect of HR agility is very important and has practical implications for the direct methods used in intervening for the technological, cultural and control changes needed for the organization (Khambayat & Affiliations, 2019). We can define HR agility as the human resources ability to respond quickly to market changes and flexibly deal with the unexpected to survive in the business environment. Human resources must be flexible and trainable to adapt quickly and easily to market conditions, also known as enhancing capabilities to survive in a globally volatile work environment (Muduli, 2013).

In the past decade, human resource agility training has been utilized in manufacturing and service operations. (Iravani & Krishnamurthy, 2006). Human resource agility has many dimensions, and the majority of researchers used the same human resource agility dimensions, which are (the ability to adapt, creativity in problem solving, professional flexibility, work stress tolerance, learning work skills) (Mubarak, 2012; Al-kasasbeh et al., 2016; AlHamad et al., 2022). Some researchers have used human resource agility dimensions as follows (flexibility, adaptation, motivation, training, participation, and empowerment) (Al-Hawary & Al-Syasneh, 2020). Other researchers dealt with the dimensions of workforce agility as (flexibility, creativity, quality) (Mubarak, 2012).

It is noted that there are similar and close dimensions when researchers study the subject of human resource agility, but a few have adopted the dimensions (proactive, adaptive, and flexible) (Al-Hawary et al., 2020). For achieving the study objectives, the dimensions were adopted as follows, **adaptability:** the employee's ability to change and adjust himself and his behavior better in the organization, adapting between people and cultures, learning new skills and responsibilities (Alavi et al., 2014), **problem solving innovation:** is to start activities that have a positive impact on the organization, and it is expected from them to change and start activities that lead to solving problems and improving work. (Alavi et al., 2014). **Professional flexibility:** It is the employee effective performance under pressure resulting from changing the environment and the applied strategies and solutions, which is reflected in a positive impact that leads to new ideas and technological techniques and dealing with the unexpected situation and pressures (Alavi et al., 2014), this may result in the employee's ability to tackle problems to achieve the organization's goals and move flexibly and effectively (Muduli, 2013). **Bearing work pressure:** It is the employee's ability to withstand the conditions that lead to stress and pressures in the situations that the individual is exposed to at his work, stress does not match the physical and psychological changes with individuals who cannot deal with work requirements (Mohammad et al., 2020). **Learning work skills:** It is learning new ways to perform jobs and teaching workers new skills through training programs provided by the organization, which is the mainstay of human resources that keeps pace with rapid developments and helps in training workers to prepare for a new job or profession in the organization (Allahow et al., 2018).

2.2 Job Performance

Performance has received great attention in human resource studies because of its importance to the individual (Al-Hawary & Alajmi, 2017). Organization and task performance are defined as the implementation of job burdens for employee responsibilities and duties (Mohammad, 2019). The success of performing the task depends mainly on the workoutcome, which has a strong relationship with the organization strategic objectives, customer satisfaction and economic development (Al-Hawary & Hadad, 2016; Al-Hawary & Obiadat, 2021; Al-Nady et al., 2013, 2016; Alolayyan et al., 2018; Alshurideh et al., 2017a, 2017b; Muhtasom et al., 2017). General concept of job performance can be developed as the extent to which the managerial processes that are accomplished in a specific period of time conform to the pre-established plans, identify weaknesses, and develop scientific and practical solutions. And give workers the chance to follow their needs, self-esteem, self-follow and respect for others (Al-Hawary & Hadad, 2016; AlShehhi et al., 2020; Alsuwaidi et al., 2020).

Employee performance is the main factor to achieve the organization goals that must be focused on, by achieving performance in light of work such as: job positions, job satisfaction, commitment to accomplish the task (Ghani et al., 2016; Al-Dhuhouri et al., 2020). It is also certain that job performance refers to the total value expected to organize the separate behaviour that the individual implements within a short period of time so that we obtain the expected quality and quantity from an employee in a particular job, and this is evidence that individual performance is the basis of motivation, willing and ability to do this task (Mohamad & Jais, 2016; Nuseir et al., 2021). Here we can define job performance in general as a set of processes that determine and measure the employee's performance and their rewards for the efforts they make to achieve what is required. Also, job performance may be defined as the degree of achievement and tasks completion that make up an individual's job that is reflected in job requirements fulfilment that often overlap between performance and effort, while effort refers to the energy expended, performance is measured on the results achieved by the individual (Al-Haddad, 2016; Al Mehrez et al., 2020). While some defined job performance as the employee's ability to complete the tasks assigned to him and contribute to the achievement of organization's goals. The employee's performance is inspired by a sense of job affiliation and thus to obtain efficiency and effectiveness in the workplace. (Adagbabiri & Okolie, 2019; Odeh et al., 2021).

There are several dimensions that were addressed in previous studies regarding job performance, but the focus of most researchers revolved around two of these dimensions, namely "context performance" and "task performance". In this study, we address these two dimensions; **Tasks performance:** which is related to the work plan construction and through which all planning and coordination skills are used to achieve the required performance. **Contextual performance:** called organizational citizenship behavior such as protecting, volunteering, and helping others to develop at work.

Licensed to (putm@utm.my)

Although job performance dimensions are task performance and contextual performance, but it is necessary to separate them when processing, it is not a condition that they occur together. For example, the employee may be high-performance in performing the tasks, but is weak in providing a good environment to increase organization effectiveness or provide assistance to others. Task performance is the activities and plans that help transform raw materials into goods and services by obtaining individuals and using distributors to sell goods and services using all planning and supervision skills to ensure that the organization performs its functions efficiently and effectively. Contextual performance is what concerned with achieving the organization effectiveness through providing a good environment for performing tasks, including behaviours such as staying motivated and making extra effort, volunteering to carry out activities, helping and cooperating with others, a commitment to follow organizational rules and procedures, providing support to others and defending the organization goals.

2.3 Human Resource Agility and Job Performance

Taran (2019) asserts that healthcare organizations are subject to change and this may lead organizations to invest in developing workforce agility and resilience where social change in people is facilitated by creating societies that adapt in an optimistic way and find opportunities that benefit society even through negative changes. Workforce agility can be built by encouraging the capabilities of: learning, teamwork, problem solving, information seeking and decision-making, and failure to adapt to change is a major barrier to workforce agility, which necessitates companies to develop workforce agility dynamic ability (Onyait, 2019). According to Harikrishnan and Suresh (2018), age, health status, and work environment are the critical factors that influence workforce agility. Ogbo & Wilfred (2014) confirmed that there is an impact of the diversity of workforce agility on improving organizational performance, and that education has an impact on workforce agility, which often affects the increase in corporate profitability. Azuara (2015) presented an evidence supports the need for more future research, in order to deepen the understanding of the mechanisms related to human resource agility evolution and the main challenges that leaders face in implementing workforce agility. There are many studies that confirm the positive relationship between the individual components of workforce agility and organizational intelligence, and the positive relationship between workforce diversity and agility (Sohrabi, Asari & Hozoori, 2014). The workforce agility also has a significant impact on organizational memory (Al-faouri, Al-nsour & Al-kasasbeh, 2013). Today's business environment has put pressures on the organization to build human resources agility (workforce), improve the performance of its ability to adapt to the environment, its effectiveness and its implementation on time, agility has emerged as a new single solution to manage a dynamic environment and has become a vital factor for the success of contemporary organizations today (Al-faouri, Al-nsour & Al-kasasbeh, 2013; Lee et al., 2022a, b). Effective use of the workforce is a critical

factor in the long-term for the organization to succeed and that agility depends on smart people rather than systems and human resource capabilities that affect job performance and enhance chances of organization to survive in the competitive environment (Alavi, 2016). Based on the literature review above, the study hypothesis can be formulated as follows:

There is no statistically significant effect of human resource agility on job performance in Islamic banks operating in Jordan.

3 Methodology

3.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of human resources agility on job performance. Therefore, it focused on Islamic banks operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a random stratified sample of (242) managers via email. In total, (173) responses were received including (25) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (148) responses suitable to analysis requirements that were formed a response rate of (61.16%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

3.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (21) items to measure human resources agility based on (Hozoori, 2014). These questions were distributed into dimensions as follows: three items dedicated for measuring adaptation ability, four items dedicated for measuring problem solving creativity, five items dedicated for measuring professional flexibility, five items dedicated for measuring learning work skills, and four items dedicated for measuring bearing work pressure. Whereas the second section included (10) items developed to measure job performance according to what was pointed by (Arocas & Del Valle, 2021; Xie & Li, 2021). This variable was a second-order construct divided into two first-order

constructs. Task performance measured by three items, and contextual performance measured using seven items.

4 Findings

4.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Al-Adamat et al., 2020; Al-Gasawneh et al., 2020; Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.697–0.909), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approaches based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

4.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. ADA	**0.765**						
2. PSC	0.384	**0.858**

Composite reliability	0.808	0.918	0.897	0.918	0.908	0.815	0.816

Note ADA: adaptation ability, PSC: problem solving creativity, PRF: professional flexibility, LWS: learning work skills, BWP: bearing work pressure, TAP: task performance, COP: contextual performance, bold fonts refer to square root of AVE

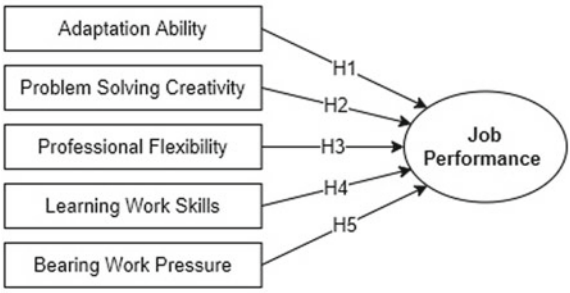

Fig. 1 Research model

in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.648, which is less than 3 the upper limit of this indicator (Fig. 2). The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.046, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the job performance and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that most human resources agility dimensions had a positive impact on job performance except adaptation ability ($\beta = 0.107$, $t = 1.207$, $p = 0.228$) and problem-solving creativity ($\beta = 0.027$, $t = 0.508$, $p = 0.612$). However, the results indicated that the highest impact was for learning work skills ($\beta = 0.412$, $t = 8.905$, $p = 0.000$), followed by professional flexibility ($\beta = 0.352$, $t = 3.952$, $p = 0.000$), and finally the lowest impact was for bearing work pressure ($\beta = 0.268$, $t = 3.501$, $p = 0.000$).

5 Discussions

The results indicated that the bank employees deal with various situations and overcome the consequences, and this is what characterized employees with the ability to understand the complex ideas of effective adaptation to the environment, furthermore the employees are able to face sudden changes in the environment so that the bank employees can respond to unexpected changes in the internal and external environment. The researcher believes that the workers in Islamic banks have the responsibility towards performing their work so that the workers have creative solutions to solve work problems, and the workers present creative ideas to take decisions related

H4	LWS → JPE	0.412	8.905***	0.000
H50	BWP → JPE	0.268	3.501***	0.000

Note ADA: adaptation ability, PSC: problem solving creativity, PRF: professional flexibility, LWS: learning work skills, BWP: bearing work pressure, JPE: job performance, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

to solving work problems so that teamwork and an effective communication system contribute to providing creative solutions to work problems, and that the work nature these banks Islamic need creativity in solving problems. It was found that employees of Islamic banks operating in Jordan are keen to participate in training courses and bear work pressures in order to achieve the investigated Islamic banks objectives.

Team members exchange knowledge and ideas, Staff actively participate in group discussions, work, and meetings in banks. Staff like to deal with additional responsibilities, and communicate effectively with colleagues to solve problems and make decisions in Islamic banks. The study found that dimensions of human resource agility availability affects Islamic banks performance, the bank's ability to adapt to environmental changes, and creatively solve problems facing the bank, as well as the

bank's employees flexibility and their ability to learn the new methods entrusted to them, and learning new ways of dealing with others, and bearing the various work pressures in the bank quickly enough, all of this effectively contributed to increasing job performance in Islamic banks operating in Jordan. This is in agreement with the following studies (Al-faouri, Al-nsour & Al-kasasbeh, 2013), (Ogbo & Wilfred, 2014) and (Sohrabi, Asari & Hoozoori, 2014) that examines the relationship between workforce agility and organizational intelligence. These studies also showed a relationship between workforce agility and organizational intelligence, and this is consistent with the current study of the presence of an impact of human resources agility on job performance in Islamic banks operating in Jordan, but differed individually (adaptation ability, creativity in solving problems) because there was no insignificant effect in the current study. It also agreed with Mohammad's (2019) study.

6 Recommendations

Through the study findings, the researcher made a number of recommendations for managers and decision-makers in Islamic banks. The researcher aims behind these recommendations to enhance the desired benefits from human resource agility application, and among these recommendations: Strengthening the interest in practicing the ability to adapt, and the necessity of paying attention to the employees of Islamic banks operating in Jordan in order to face any sudden changes in the environment through training. And the promotion of interest in practicing creativity in solving problems and the need to develop an effective communication system in Islamic banks operating in Jordan in order to provide the best solutions to the problems faced by workers in the studied banks. Overcoming situations in order to achieve the highest level of performance among employees. Exploiting the creativity dimensions, the effective communication system, and the responsibility towards the employees' performance in solving the problems they have to achieve the highest levels of job performance.

The Impact of Strategic Orientation on Organizational Ambidexterity at the Hotels Sector in Jordan

Sandy Fawzi Al-Barakat, Sana aNawaf Al-Nsour, Ziad Mohd Ali Smadi, Mohammad Mousa Eldahamsheh, Sulieman Ibraheem Shelash Al-Hawary, Fuad N. Al-Shaikh, and Muhammad Turki Alshurideh

Abstract The aim of the study was to examine the impact of strategic orientation on organizational ambidexterity. Therefore, it focused on five-star hotels in Jordan. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a random-stratified sample of (215) managers. In total, (193) responses were received including (8) invalid to statistical analysis due to

uncompleted or inaccurate. Hence, the final sample contained (185) responses suitable to analysis requirements. Structural equation modeling (SEM) was conducted to test hypotheses. The results showed that strategic orientation had a positive impact on organizational ambidexterity. Moreover, the results indicated that the highest impact was for technology orientation. Based on the study results, the researchers recommend hotel managers to develop strategic directions by updating their general strategies to contribute to increasing the market share compared to other competing hotels.

Keywords Strategic orientations · Organizational ambidexterity · Hotels' sector · Jordan

1 Introduction

Strategic directions represent the outlines of the organizations strategies when they little details of the strategy content and the strategy implementation, In order to make strategies and take decisions about organizations, there must be leaders with a vision that is compatible with creative and innovative thinking in drawing strategic directions, which is a tool for coordinating the organization efforts (Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Hadad, 2016; Al-Nady et al., 2013; AlTaweel & Al-Hawary, 2021). The idea of organizational ambidexterity came as one of those trends through which organizations can face challenges and environmental changes and stand strong towards them for their survival and continuity in their work performance. Organizational ambidexterity topic has captured the attention of many researchers, as organizations must be exceptionally ambidextrous and simultaneous to strike a balance between exploratory and exploitative activities.

The tourism sector is based on a number of components, including the facilities availability, and tourist facilities that provide services that tourists need during their trips, and the most important of these establishments are hotels, as they are those facilities that provide places for housing and sleeping, in addition to many Of services it provides, so hotels presence in the countries has become indispensable, given the volume of services provided by such establishments, and among the most important hotels are the international five-star hotels. Through previous literature review, it was found that few studies employ the approach (strategic directions) in the study of organizational ambidexterity, especially in hotels in Jordan, so this research is a new contribution within the Jordanian environment, specifically the hotel sector, the research also provides evidence that can be used by hotel managers in Jordan to keep pace with the rapid developments by highlighting the importance of the impact of strategic directions in achieving organizational ambidexterity.

The hotels sector has become a major focus in the revitalizing tourism process in Jordan, as it is a supportive and enhancing sector for the tourism movement, and because of the great similarity in the services provided by hotels, and the rapid development and emergence of the globalization concept and its applications, the hotel

sector has put the hotel sector in front of great challenges and competitors, especially the crises of (Corona crisis), emphasized to the senior and middle management in the hotel sector the importance of adaptation and the ability to move quickly towards exploring new opportunities for the purpose of survival in the current and future environment (Alaali et al., 2021; Aljumah et al., 2021; Al-Hamad et al., 2021; Nuseir et al., 2021). The challenges facing the hotel sector require adopting new methods that enable it to explore the opportunities surrounding it and at the same time working to exploit those opportunities according to structurally independent teams capable of changing their structures according to that environment requirements, and for the purpose of balancing these methods requires following what is called organizational ambidexterity. (O'reilly & Tushman, 2013). However, the development of (dynamic) capabilities is important for the hotel sector to balance the activities of exploring new opportunities and exploiting current opportunities, which represent the main challenge to reach the hotel sector level, which represents the transition from the current situation to the future change management, so it is necessary to adopt strategic directions through develop strategies characterized by high flexibility to move from one strategic option to another and according to the conditions imposed by the environment surrounding the hotel sector.

2 Literature Review and Hypotheses Development

2.1 Strategic Orientation

The performance concept always contributes to the strategic goals achievement, the performance concept has become included in strategic thinking and its directions, and the organizations' goal has now become to achieve high strategic performance levels in the field of their activities. It is necessary to improve performance and develop organizations, which is no longer optional but has become an essential condition to ensure survival and continuity (Wheelen & Hunger, 2008; Al-Hawary, 2011; Al-Hawary, 2013; Al-Hawary et al., 2013; Metabis & Al-Hawary, 2013; Al-Hawary & Abu-Laimon, 2013; Al-Nady et al., 2016: Al-Lozi et al., 2017; Alshurideh et al., 2017; Allahow et al., 2018; Alolayyan et al., 2018; Alhalalmeh et al., 2020; Al-Quran et al., 2020; Mohammad et al., 2020). Strategic directions are defined as a specific approach that the organization applies to reach superior and continuous performance in the course of its work, as strategic directions work to establish an approach linked to the goals of improving the organization's permanent performance, and reflecting managers' awareness of the surrounding environment and their reactions to environmental conditions (Jandab, 2013; Kabrilyants et al., 2021; Tariq et al., 2022). Strategic directions importance lies in the organization's compatibility of its resources with current opportunities, and it also helps the organization to be more compatible and adaptive to the surrounding environmental changes, and helps to explore new markets, work on developing radical innovations, and finding behaviors

that help the organization achieve superior performance. (Al Suwaidi et al., 2020; Alameeri et al., 2021; Alshurideh et al., 2019; Alzoubi et al., 2022; Slater & Oslan, 2001).

There are dimensions of strategic directions, three of which have been selected because they represent a comprehensive set of strategic directions critical to the organization success. (Covin & Slevin, 1989; Narver & Slater, 1990) includes: **Market Orientation**: which is defined as the organization's culture that finds the most effective necessary behaviors to provide the greatest value to customers (Narver & Slater, 1990), market orientation is part of the organizations culture, which poses a challenge to any organization that has few technological capabilities available to it and which are scarce in these markets, and whose markets are characterized by stereotyping and must subject its requirements to continuous innovation to achieve more productivity at a lower cost. **Entrepreneurial orientation**: which is the organization ability that makes it possess the desire to innovate and to act independently and the tendency to take risks in order to meet the future customers' requirements in the market. It is also concerned with the organization strategic leadership aspects, and that today's business environment is more dynamic, so markets and organizations must achieve the competitive advantage that distinguishes them from other competitors. **Technology Orientation** which is defined as the ability to obtain modern technological knowledge and use it in the new products development, and it is also known as the use of advanced technologies in the development of new products, the new technology rapid integration, and the new product ideas proactive creation. (Gatignon & Xuereb, 1997, 78, 82).

2.2 Strategic Ambidexterity

Organizational ambidexterity has dealt with many controversial managerial definitions due to the different literary and scientific opinions that dealt with the concept of ambidexterity Organizational ambidexterity, or strategic ambidexterity, and all terms include the process of exploring and exploiting opportunities. Many researchers have addressed the organizational ambidexterity, most notably the organization's simultaneous pursuit of exploration and exploitation activities (Jansen et al., 2009). Ambidextrous organizations are superior organizations that enable innovation by exploiting their existing products and exploring new opportunities to promote more radical innovations (Andriopoulos & Lewis, 2010). Organizational ambidexterity is the organizations need to strike a balance between exploitation and exploration to achieve superior performance. The organizational ambidexterity importance is reflected in enabling organizations to achieve the goal of long-term survival in order to ensure continuity and future growth. (Yigit, 2013). Through the research and development processes in the organization, it enables the working managers to work through the information and various alternatives presence for the decisions in order to reduce the conflict between the exploration and the exploitation activities. (Prange & Schlegelmich, 2009).

There are two dimensions that the researcher identified for organizational ambidexterity as discussed by Bodwell and Chermack (2010) and Cao et al. (2009) which are: **Exploring Opportunities**: which represents the organization's ability to move quickly to explore new opportunities, prepare to adapt to volatile markets, leads to the new customers and markets emergence, new distribution channels creation, and the exploration of new opportunities requires new knowledge that is completely different and distinguished by research, difference, and flexibility. **Opportunity Exploitation**: which is the organization ability to improve activities to generate value in the short term, as it is designed to meet current customers' needs in the current markets, and seeks to expand the knowledge and skills available, and expand the current services and products while increasing the current distribution channels, and that the opportunities exploitation represents the activities of organizational learning, namely, refinement, efficiency, and implementation. And that exploitation is reflected in the organization's evaluation of opportunities in the environment that do not necessarily fall within the scope of its strategies, which is reflected in the identification of future opportunities (Brion & Mothe, 2010).

2.3 Strategic Directions and Organizational Ambidexterity

There are many organizations that are able to pursue innovative and proactive programs in a gradual or radical way, because of their full market orientation, and that linking exploration and exploitation activities leads to enabling new business units to practice market orientation behaviors towards new markets, and to respond quickly to them through its application, Therefore, managers must also arrange product markets in a proactive and rapid manner with market-oriented behaviors at the same time, by allocating the working managers in the organization to tangible and intangible resources (Li et al., 2008, p. 1022). The entrepreneurial orientation indicates that some proactive and innovative organizations adopt risk (Tuan, 2016), and the entrepreneurial orientation strikes a balance and link between exploration and exploitation as a dynamic task rather than as a static match (Westernan, Macfarlan & Iansitti, 2006, 230). There are few studies that dealt with the link between technology orientation and organizational ambidexterity, as pointed by Rotharrmal & Alexandre (2009). Managers in the organization must follow an approach based on modern technology use, through the development of a cost-oriented plan, and to promote high efficiencies and invest in existing markets for products (Kortmann, 2015, p. 3). And some creative organizations are discovering and entering new markets, and using new proactive technology, rather than focusing on existing capabilities and new product markets (Talke, Salomo, Kock, 2011; Almaazmi et al., 2020). Based on the above, study hypothesis can be formulated as follows:

There is a statistically significant impact of the strategic directions on organizational ambidexterity in the hotel sector in Jordan.

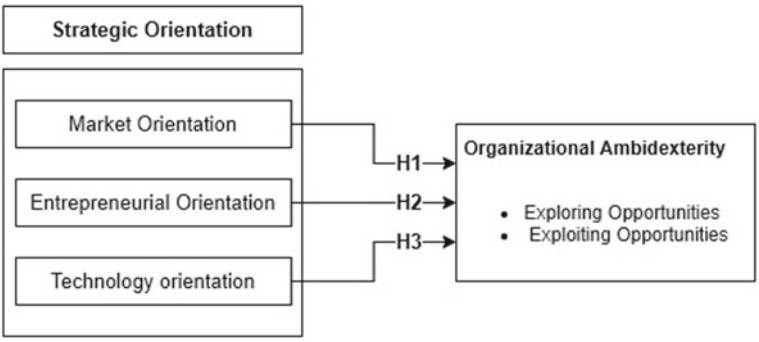

Fig. 1 Research model

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of strategic orientation on organizational ambidexterity. Therefore, it focused on five-stars hotels in Jordan. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a random-stratified sample of (215) managers via email. In total, (193) responses were received including (8) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (185) responses suitable to analysis requirements that were formed a response rate of (86.04%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group,

educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (21) items to measure strategic orientation based on (Beliaeva et al., 2018; Tseng et al., 2019). These questions were distributed into dimensions as follows: seven items dedicated for measuring market orientation, seven items dedicated for measuring entrepreneurial orientation, and seven items dedicated for measuring technology orientation. Whereas the second section included (14) items developed to measure organizational ambidexterity according to what was pointed by (Peng et al., 2019). This variable was a second-order construct divided into two first-order constructs. Exploring opportunities measured by seven items and exploiting opportunities measured using seven items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Al-Hawary & Alhajri, 2020; Al-Hawary & Obiadat, 2021; Al-Hawary et al., 2020; Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.637–0.864), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approaches based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5
1. Market Orientation (MO)	**0.749**				
2. Entrepreneurial Orientation (EO)	0.294	**0.757**			
3. Technology Orientation (TO)	0.355	0.364	**0.744**		
4. Exploring Opportunities (ER)	0.415	0.605	0.597	**0.751**	
5. Exploiting Opportunities (ET)	0.524	0.578	0.622	0.615	**0.745**
VIF	2.641	2.078	2.235	– -	– -
Loadings range	0.637–0.824	0.673–0.854	0.656–0.802	0.694–0.833	0.688–0.864
AVE	0.561	0.574	0.554	0.563	0.555
MSV	0.415	0.495	0.503	0.425	0.510
Internal consistency	0.896	0.901	0.894	0.898	0.894
Composite reliability	0.899	0.903	0.896	0.900	0.897

Note Bold fonts refer to $\sqrt{\text{AVE}}$

Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Figs. 1 and 2.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.739, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.019, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the organizational ambidexterity and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results

Licensed to (putm@utm.my)

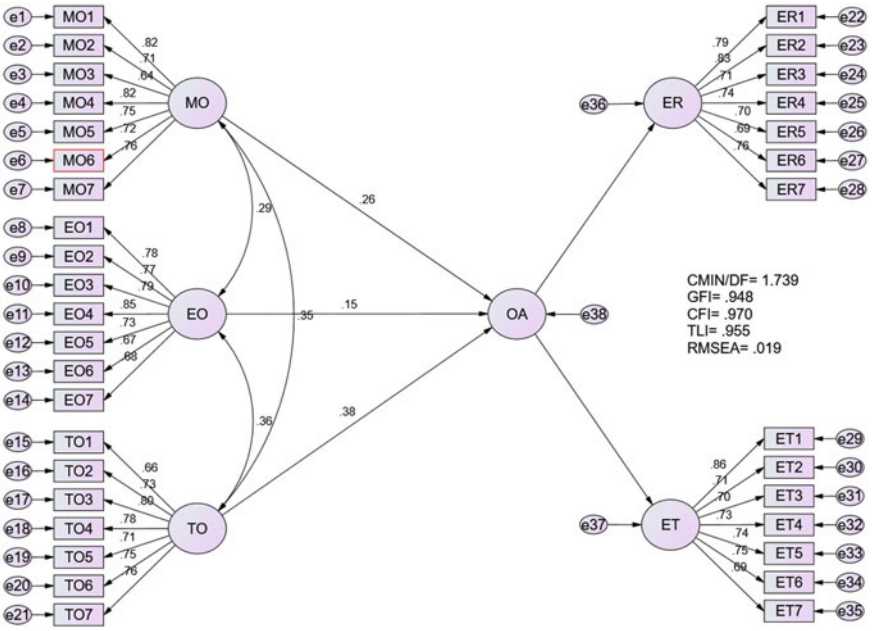

Fig. 2 SEM results of the strategic orientation effect on organizational ambidexterity

of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that strategic orientation dimensions had a positive impact on organizational ambidexterity. Moreover, the results indicated that the highest impact was for technology orientation ($\beta = 0.380$, $t = 5.924$, $p = 0.000$), followed by market orientation ($\beta = 0.257$, $t = 4.560$, $p = 0.000$), and finally the lowest impact was for entrepreneurial orientation ($\beta = 0.151$, $t = 2.526$, $p = 0.012$).

Table 2 Hypothesis testing

Hypothesis	Relation	Standard Beta	*t* value	*p* value
H1	Market Orientation → Organizational Ambidexterity	0.257***	4.560	0.000
H2	Entrepreneurial Orientation →Organizational Ambidexterity	0.151*	2.526	0.012
H3	Technology Orientation → Organizational Ambidexterity	0.380***	5.924	0.000

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

6 Discussion

The hotel sector management has the ability to form and formulate a strategy that achieves its goals and has the ability to develop its vision and implement it to achieve the desired goals, by activating the role of human capital and paying attention to it, investing in the development of new technology, building an effective organizational culture, as well as establishing strategic oversight facilitate flexibility and encourage innovative behaviors to help obtain superior performance and maintain competitive advantage, study results also revealed that hotels support the market orientation, through the management keenness in the hotel sector to study the market and competitors in order to satisfy customers and know their reactions towards the provided services, and their participation in the new services development, and work to distinguish their services from competitors by providing new offers on those services, The hotel sector management also seeks to study the competitors strengths to be able to develop and improve its services in order to meet the customer's needs, maintain them and attract new customers, the internal environment, and the application of the latest modern work methods in the new hotel services, and this supports the administration's directions in achieving its marketing objectives, profitability, survival and competition.

The results confirm the management's endeavor in the surveyed hotels to achieve leadership in work through the application of a number of practices that confirm the pioneering orientation, including their organizational structures review and development on a continuous basis to adapt to the surrounding developments, and encourage them to present new ideas with the intention of developing and simplifying work procedures and improving the provided service levels, as well as allocating sufficient budgets for the creating new services process, which contributes to achieving its planned goals in short and long-term strategic plans.

The results showed that the surveyed hotels management is taking advantage of the available opportunities to achieve its goals, and to confront environmental challenges in the hotel sector, which is most vulnerable to developments and environmental changes, especially since Jordan has suffered from political events in the Middle East region, as well as the health symptom that the whole world suffers from (Coronavirus). Which necessitates the surveyed hotels management to develop a risk strategy that includes procedures and practices to take advantage of the available opportunities with a view to improving the efficiency of the hotel services provided and investing in new opportunities. The results also confirm that the surveyed hotels management is able to explore the available opportunities and sense the environment in order to improve its services provided to customers and achieve its goals, and its ability to explore opportunities brings it more new customers and makes it able to develop and innovate new hotel services, and exploit the opportunities available by other hotels, as well as creating new outlets in providing its current services, and marketing hotel services that do not exist with competitors, or at least distinguished from competitors, which contributes to increasing the market share compared to competitors.

The results concluded that there is a statistically significant impact of the strategic orientation variable with its dimensions: (market orientation, pioneering orientation, and technology orientation) on organizational ambidexterity in the hotel sector in Jordan. Keeping pace with and using modern technology that fits with the internal environment, applying the latest modern work methods in new hotel services, and striving to achieve leadership in work, this positively affects its ability to achieve organizational ambidexterity in terms of exploring new opportunities and exploiting the current opportunity that is working towards achieving its goals. The application of the latest modern working methods in new hotel services, building new technological solutions to meet customers' needs, and taking the initiative in using advanced technologies in developing new services compared to competitors, supports the management's directions in achieving its marketing objectives, profitability, survival and competition, which means that technology orientation is considered an important factor in achieving organizational ambidexterity in terms of exploring new opportunities and exploiting the available opportunities that work towards achieving its goals (Alshurideh et al., 2012; Al Kurdi et al., 2020a, b; Alshamsi et al., 2020; Alzoubi et al., 2020; Alshurideh, 2022).

The results are agreed with the result of Rady and Qassem (2018), which showed the existence of a positive correlation and effect with significant between strategic directions and organizational ambidexterity. The results are also in agreement with the study of Hijjawi (2019), which showed that regulatory ambidexterity plays an important role in increasing the ability of the Jordanian telecommunications sector to face volatile environmental disruptions.

7 Recommendations

Based on the previous results, the study recommends hotel managers to develop strategic directions by updating their general strategies to contribute to increasing the market share compared to other competing hotels. Increasing interest in the market orientation through a better study of the market and competitors and following more advanced methods for collecting information that improve the quality of the hotel service. The study also recommends enhancing the technology orientation role, so that hotel management uses technology and keeps pace with it constantly, through its development and modernization, and the application of the latest modern work methods in new hotel services, encouraging and supporting new ideas presented by various managerial levels in the hotel sector with the aim of developing and simplifying work procedures and improving the service provided to customers.

The Effect of Total Quality Management on the Organizational Reputation: The Moderating Role of Quality Standards in Jordanian Public Universities

Enas Ahmad Alshuqairat, Basem Yousef Ahmad Barqawi, Zaki Abdellateef Khalaf Khalaylah, Mohammed saleem khlif Alshura, Maali M. Al-mzary, Muhammad Turki Alshurideh, Sulieman Ibraheem Shelash Al-Hawary, Anber Abraheem Shlash Mohammad, and Ala Ahmed Hassan Odeibat

Abstract This study aimed to identify the modified role of quality standards in the impact of the application of total quality management on the organizational reputation of Jordanian public universities. The study population consisted of (5477) faculty members in five public universities. The study sample consisted of a proportional stratified sample of (390) individuals, and after the questionnaire was distributed with (410), 390 were recovered, valid for the purposes of statistical analysis. For the purposes of achieving the objectives of the study, multiple regression analysis and the

multiple hierarchical regression analysis were used. The study results showed that quality standards play a statistically significant role on the impact of total quality management on organizational reputation. The researchers recommend the necessity for Jordanian public universities to pay attention to the standard because of its important role in the application of total quality management, as well as activating the role of accreditation and quality centers and supporting them with all the needs of qualified financial and human resources.

Keywords Total quality management · Quality standards · Organizational reputation · Jordanian Public University

1 Introduction

Total Quality Management, with its dimensions, forms an important interwoven chain in creating a significant competitive advantage and reputation, as evidenced by high-quality inputs and outputs (Aburayya et al., 2020a; Al-Hawary & Abu-Laimon, 2013). While performance indicators are the tools that are used to measure and control the main and subsidiary processes in the administrative systems in order to produce a high-quality end product that reflects a favorable image of the organizations outputs and activities (Al-Hawary & Al-Smeran, 2017; Aburayya et al., 2020b; Al-Quran et al., 2020; Al-Hawary & Obiadat, 2021; AlTaweel & Al-Hawary, 2021). Universities are the most important educational institutions that embrace students, and they are the most important inputs and outputs of the educational process, working to provide them with knowledge, experience, scientific and practical skills, that refine and develop their personality and enable them to provide service, product, and knowledge to their community, to assist it in achieving its goals (Al-Hawary & Alwan, 2016; Al-Hawary & Batayneh, 2010; Al-Hawary, 2010a, 2010b).

Universities are now working to attract and retain the largest number of students in the context of global competition through their reputation, and even help them achieve high performance in an era marked by the renaissance of knowledge and technology, as it no longer recognizes stereotypes, but has become characterized by the multiplicity and diversity of knowledge, and is considered an important indicator in ranking and reputation, and thus the pursuit of excellence in an era marked by the renaissance of knowledge and technology, as it no longer recognizes stereotype (Al-Hawary & Al-Khazaleh, 2020; Alshurideh et al., 2021). Researchers believe that the reputation of Jordanian public universities has been shattered in recent years, not only locally but also among Arab universities, because the modern experience of international university rankings is a modern and contemporary experience that universities in general use to raise their reputation levels. However, it remains constrained by a set of limited and narrow metrics, and because university education has grown dramatically in the last ten years, accompanied by a slew of barriers and challenges,, in addition to shortcomings in implementing the total quality management strategy and quality assurance standards as required, which raises standards and indicators

Licensed to (putm@utm.my)

of public university success and raises their reputation to wherever they want, which prompted them to seriously adopt the application of total quality management and academic accreditation in higher education institutions, which prompted them to seriously adopt the application of total quality management and academic accreditation in higher education institutions (Bakht, 2015; Shakhatra & Tarawneh, 2019; Al Kurdi et al., 2020a). This research was conducted with the goal of underlining our universities' involvement in the implementation and dedication to total quality management and assurance standards, as well as the fate of their academic and educational reputation on the Arab and worldwide levels.

2 Theoretical Framework and Hypotheses Development

2.1 Total Quality Management

Total Quality Management (TQM) is one of the most prominent modern concepts in management, and as a result of what the market witnessed of a great competitive image, to provide the best products and services to its customers and clients, this competition moved to a sector that was far from this competition due to the different services provided to the beneficiaries, to enter the education sector The circle of competition in providing its educational services in a better and better way than it was before (Al-Hawary, 2013; Al-Nady et al., 2013; Al-Hawary& Al-Menhaly, 2016; Alshurideh et al., 2017; Al-Maroof et al., 2021). As a result, there has been a noticeable increase in the adoption of this concept in higher education institutions, and it has quickly spread from the industrial and production sectors to the education sector, where it has become urgent and necessary as a result of the rapid advancement of knowledge and technology, which has increased competition (Alhalalmeh et al., 2020; Al-Hawary & Al-Syasneh, 2020; Aljumah et al., 2021; Mohammad et al., 2020). And, given that the graduate is (the final service of the educational process), universities must meet and satisfy the needs of society by generating cadres capable of competition, progress, and improvement in an era of globalization and vast knowledge and technology.

The importance of quality in today's organizations is centered on working to keep up with the requirements and levels of quality, as well as the latest work technologies, and to meet the customer's requirements and desires (Abu Qaaud et al., 2011; Al-Hawary et al., 2017; Harahsheh et al., 2021; Hellman & Liu, 2013), as quality plays a major role in achieving the best levels of performance in all areas, and thus achieving expected satisfaction from customers (Alshurideh et al., 2012; Alzoubi et al., 2022; Hellman & Liu, 2013), as quality plays a major role in achieving the best levels of performance in all areas (Alshurideh et al., 2019; Paraschivescu & Caprioara, 2014). Total quality management, according to the researchers, is a philosophy that focuses on reaching the greatest and highest degree of operational quality and performance through the participation of working individuals, continuous improvement processes,

and addressing the needs and wishes of beneficiaries (Krajewski et al., 2013, p.180; Alzoubi et al., 2020). While Hasham (2018) sees it as a management model based on the most efficient use of time, Hasham (2018) sees it as a strategic plan with clear goals that is characterized by constant evaluation, rectification, and successful review. This is due to the fact that quality management and time management work together to increase productivity by lowering mistake rates and preventing waste in the use of various resources, implying that quality management allows us to make better use of our time.

Today, total quality management has become one of the most important factors for achieving competitiveness in organizations, as the increasing demand for quality by customers makes the organization realize the critical importance in applying quality principles to meet this demand in a good way, and thus total quality management has become a major tool to achieve competitive advantage and performance higher (Al-Hawary & Alhajri, 2020; Obeidat et al., 2021), and its application has become one of the most important priorities in developed countries (Almansour, 2012; Alshamsi et al., 2020; Hassan et al., 2013).

2.2 Organizational Reputation

After the tremendous knowledge and technological revolution, our universities have recently experienced rapid and successive changes and challenges, prompting them to reconsider their level of performance by moving from local performance standards to global ones that raise their reputation, which they consider to be one of their intangible assets that they must possess and strive for, and it keeps it at a consistently good level, as it is one of the most important metrics (Al-Lozi et al., 2017; Alolayyan et al., 2018; Allahow et al., 2018). And, because the message of educational institutions is so important in the lives of people and nations at various stages of economic and social development, the goals are no longer traditional in terms of teaching, research, and knowledge, but have expanded to include all aspects of life, technical, scientific, and technological, forcing these institutions to interact with their society in order to understand its desires and needs, and because it is considered the basis for economic and social development, the goals have expanded to include all aspects of life, technical, scientific, and technological, forcing these institutions to interact (Ibrahim, 2011; Metabis & Al-Hawary, 2013; Al-Nady et al., 2016; Alshurideh, 2022).

Organizational reputation, according to Watson and Kitchen (2015), is a strategic asset that is directly tied to market prices. While another point of view suggests that it represents a kind of comprehensive collective representation of the audio-visual developments that the organization will build over time, as well as its organizational identity through performance and behavior, to later reflect the organization's many perspectives (Al-Hawary & Harahsheh, 2014; Al-Hawary & Hussien, 2017; Lee et al., 2022a, b). Othman and Mohammed (2015) divided the concept into four parts: an economic perspective, a characteristic, a behavior indication of competitive

strength, and a behavioral indicator of competitive strength. From the standpoint of the market: It's what's referred to as a brand image in marketing research. The organization's point of view is as follows: It's what researchers observe since it's anchored in the experiences and accomplishments of the people who work there, embodies the organization's culture and identity, and demonstrates high performance and an appropriate working environment. It is concluded from these different definitions that the concept of organizational reputation is: the organization's ability to consolidate the relationship with all influential parties in society, by presenting strategies and plans capable of responding to the requirements and needs of its beneficiaries in the best way, in a way that ultimately leads to increasing and raising its value and competitive reputation among its peers.

The importance of organizational reputation is reflected in what he said (Qarfi & Sahrawi, 2016), that it is a social building that the organization obtains through its stakeholder relationships, and that its good reputation helps to consolidate its relationships with them and with influential parties in society. It is also regarded an essential component in decreasing the dangers that the company may face, as loyal customers bear a portion of the risk, as well as the fact that reputation adds value to the organization's products and services. In addition, the credibility and reliability of the organizational reputation emerges in times of crisis, because it increases organizational effectiveness, and increases the granting of confidence to the organization, by creating a distinct organizational climate that helps it improve and develop the required. The opinions of researchers varied and varied about determining the dimensions of organizational reputation. Walsh et al. (2009) believes that organizational reputation is represented in five important dimensions that are summarized as: orientation to the customer (the beneficiary), the good employer, the financial capacity of the organization, the quality of its products and services, the social and environmental responsibility of the organization. While Harrison indicated that there are eight important dimensions of reputation and they are complementary among them: leadership, financial strength, type of management, customer focus, social responsibility, reliability, and the nature and quality of communications.

2.3 Quality Standards

Quality is one of the most important topics that have become modern today in our society, after the interest in it in the higher education sector has increased significantly and remarkably, as it is considered one of the important means and modern methods for improving the quality and quality of education, and its elevation and advancement in our time, which is the era of excellence, development and quality. Quality has become an urgent necessity that requires educational institutions to catch up with it and adhere to it, for its continuity and better growth. Today, quality standards have become one of the important aspects in higher education, due to their direct impact on the process of improving the educational process (Nazir et al., 2022). The application of these standards is an urgent need to strive towards achieving interaction

and communication with the variables that characterize our modern era, which bears the mark of knowledge, technology and intense competition (AlShehhi et al., 2020; Tariq et al., 2022).

The focus of attention in higher education institutions has now become the application of quality and its standards, as quality assurance depends on the application of methods and principles of total quality management on an ongoing basis, with the aim of development and improvement, and achieving the highest possible level in the practices, operations and outputs of educational institutions and the services provided by them. This is because the education system, like other systems, runs according to certain strategic plans and within a specific environment and conditions, taking into account all the circumstances and factors surrounding its environment in all its aspects.

Al-Sarayra (2008) and Al-Sayed (2012) define quality standards as a set of specifications that establish the requirements for quality systems in different higher education institutions, which it is necessary to put at the beginning of the application stages of the total quality management methodology, to help senior management in measuring the actual results on the basis of it. Without these specifications, the university will not be able to judge its performance, which are represented in admission policies, educational programs, which include (teaching methods, objectives, evaluation system, examinations, quality of faculty and administrative staff, quality of senior management, buildings and physical equipment), which It gives important outputs that meet the needs and requirements of the beneficiaries.

2.4 Total Quality Management, Organizational Reputation and Quality Standards

The researchers point out that quality-related decisions are strategic decisions that must be followed by senior management because they are one of the cornerstones of comprehensive quality management success. Top management should encourage internal and external clients to participate in decision-making, motivate them, and build and strengthen communication channels with them, as well as work on developing training and development methods to benefit from the capabilities and capabilities of its employees by empowering them and delegating powers to them, building a bridge of trust between internal and even external clients requires support. The senior management of quality policies, and their dissemination and inclusion of their strategies by making them an integral part of the organization's culture (Al Kurdi et al., 2020b; Abuhashesh et al., 2021; Odeh et al., 2021).

Al-Sarhan (2021) confirmed that total quality management in universities entails a set of processes through which the university aims to develop and improve the performance of its administrative and academic staff, work on developing study plans, and rehabilitate laboratories and libraries in order to excel in providing educational services, as evidenced by a Positive on the quality of its most important

outputs (the graduates). According to Hiizer and Render, the concept of total quality management in higher education institutions encompasses all of the educational institution's functions and activities, including (teaching methods, curricula, infrastructure, scientific research, buildings, halls and laboratories, grants and missions, and government support), all of which work to improve the educational institution's evaluation. Total quality management in the educational institution: It is a systematic procedural examination of the institution and its academic programs to measure the methodology in it, in terms of planning goals and implementation, and measuring the compatibility between actual practice with work arrangements and planned results, as well as the institution's evaluation processes through learning, improvement, and self-evaluation.

Abu Al-Rub et al. (2010) and Al-Bilawi et al. (2015) pointed to the great importance of standards, if their application through the proper application of total quality management, would enable the administration to solve the problems it faces in scientific ways, and deal with it, through corrective and preventive measures to prevent its occurrence in the future, and there will be opportunities for optimal use of human and material resources, directing its capabilities towards continuous improvement in performance, and further improving the performance of employees through their participation and participation in the decision-making and decision-making process. Thus, we find that universities' interest in total quality and standards for its guarantee, which is reflected positively on their outputs, to provide the labor market with qualified graduates equipped with science and knowledge, and academic and educational experiences, which guarantee their ability, empowerment and involvement in the market locally, Arably and globally, in a way that reflects creativity and excellence. Accordingly, the study hypothesis can be formulated as follows:

There is a statistically significant role for quality standards as a moderate variable in improving the impact of total quality management on organizational reputation in Jordanian public universities.

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of total quality management on organizational reputation through the mediating role of

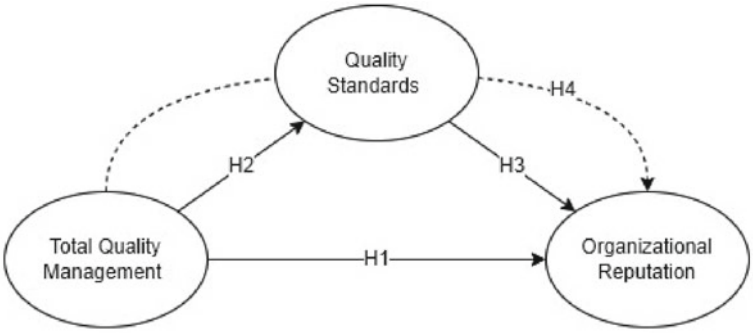

Fig. 1 Research model

quality standards. Therefore, it focused on Jordanian public universities. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a stratified sample of (410) faculty members via email. In total, (398) responses were received including nine invalids to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (390) responses suitable to analysis requirements that were formed a response rate of (95.12%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of three main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The three main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure total quality management based on (Al-Hawary & Abu-Laimon, 2013). These items were distributed into dimensions as follows: four items dedicated for measuring focus on beneficiary, four items dedicated for measuring senior management commitment, four items dedicated for measuring staff participation, four items dedicated for measuring continuous improvement, and four items dedicated for measuring training and development. The second section related to quality standards variable which contained six items developed according to. Whereas the third section included eight items developed to measure organizational reputation according to what was pointed by (Qarfi & Sahrawi, 2016).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.661–0.858), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Figs. 1 and 2.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.131, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated

Note FOB: focus on beneficiary, SMC: senior management commitment, SPA: staff participation, CIM: continuous improvement, TAD: training and development, QSS: quality standards, ORE: organizational reputation, Bold fonts in the table are the square root of average variance extracted

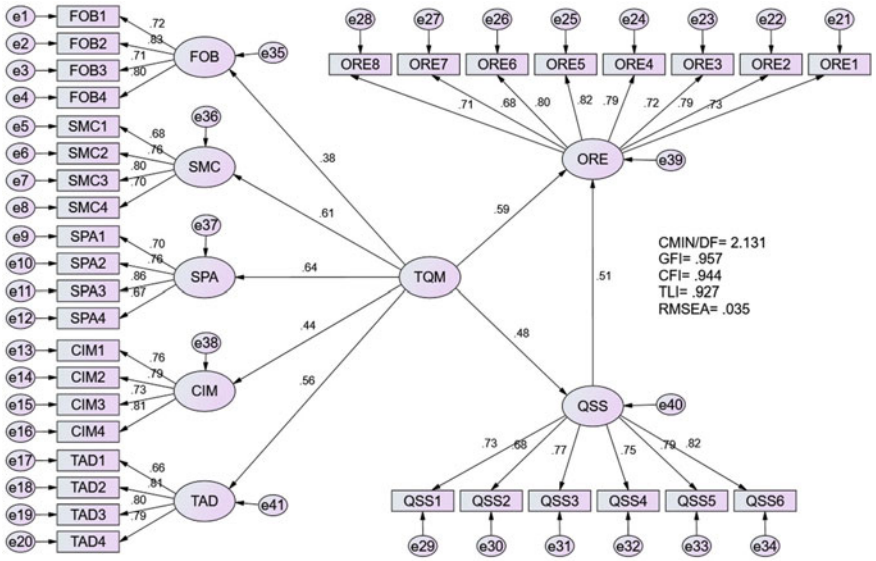

Fig. 2 SEM results of the TQM effect on OR through QS

to value 0.035, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the organizational reputation and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that total quality management has a positive direct impact on organizational reputation ($\beta = 0.594$, $t = 14.568$, $p = 0.000$) and quality standards ($\beta = 0.483$, $t = 10.332$, $p = 0.002$). Moreover, it indicated that quality standards have a positive impact on organizational reputation ($\beta = 0.512$, $t = 13.625$, $p = 0.000$). Hence, quality standards have a partial mediation effect in the relationship between total quality management and organizational reputation, where the total effect was ($\beta = 0.841$, $t = 21.096$, $p = 0.000$) with indirect effect of ($\beta = 0.247$, $p = 0.000$).

Table 2 Hypothesis testing

6 Discussion

According to the findings, quality standards as a modified variable has a statistically significant influence on improving the impact of total quality management on organizational reputation in Jordanian public universities. Whereas the results of this study showed that public universities pay attention to the application of quality standards, and this result is consistent with the study, which confirmed through the final result of his study that the increased interest in applying the principles of total quality and its guarantee standards is reflected in higher education institutions' outputs, which will be more innovative, as well as the study, which found that universities meet quality assurance criteria to a great degree. In addition, the results of the study concluded that the Jordanian public universities apply total quality management, and this reflects the awareness and appreciation of universities for the interest in applying the standards and principles of total quality to raise their performance, which will be reflected on their reputation and raise their value.

The results also showed the level of interest of universities to focus on beneficiaries at a low level in providing their services in proportion to their requirements and desires, and this is far from the essence of the principle of focus on the beneficiary, which requires that the administration share with the beneficiaries of its services in presenting their ideas about the services they desire, as well as Take advantage of the feedback through them. Universities are also interested in raising their reputation, through the reputation of their distinguished faculty members, their interest in sending students to study abroad, and building good relations with different countries. The results indicated a high interest on the part of public universities (in academic programs), which is an important criterion for quality assurance in universities, as it is considered one of the factors that attract students.

7 Recommendations

Based on the findings of the study, researchers recommend providing university facilities and buildings, especially teaching halls, with devices, equipment and modern technology that support the educational process and achieve quality goals. Providing a model for measuring the quality of services provided in universities and providing feedback to this model on a continuous basis to identify strengths and weaknesses and work to improve and develop them to achieve quality goals in gaining the satisfaction of the beneficiaries of these services. The researchers recommend increasing the effectiveness of communication between university employees (faculty members and administrators) with the administration, by facilitating access to information, and enabling them to make the decision that enables them to achieve and accomplish their work and develop their level of performance, in addition to the adoption of modern methods by universities in providing their services and activities in a manner that ensures speed response in providing its services. Increasing the dissemination and

Licensed to (putm@utm.my)

marketing of the services of Jordanian public universities contributes to attracting more students and investors, and increases the focus of the public image of it in their minds; rather, it works to enhance the desire to highlight the university's brand.

The Impact of Strategic Vigilance on Crisis Management in the Jordanian Dairy Companies: The Mediating Role of Organizational Learning

Zaki Abdellateef Khalaf Khalaylah, Mohammed Mufaddy AL-kasasbeh, Basem Yousef Ahmad Barqawi, Mohammed Saleem Khlif Alshura, Enas Ahmad Alshuqairat, Maali M. Al-mzary, Sulieman Ibraheem Shelash Al-Hawary, Muhammad Turki Alshurideh, and Barween Al Kurdi

Abstract The major aim of the study was to examine the impact of strategic vigilance on crisis management through the mediating role of organizational learning. Therefore, it focused on Jordanian dairy companies. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a sample of (285) managers via email. In total, (262) responses were

received including (16) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (246) responses suitable to analysis requirements. Structural equation modeling (SEM) was conducted to test hypotheses. The results showed that organizational learning plays a partial mediation effect on the relationship between strategic vigilance and crisis management. Based on the results, this study presents a set of recommendations to decision makers in order to better manage the crises facing their organizations.

Keywords Strategic vigilance · Crisis management · Organizational learning · Jordan

1 Introduction

Throughout history, human communities have experienced numerous cyclical or random crises. These crises have resulted in a slew of social, political, and economic ramifications (Coombs & Laufer, 2018). Simultaneously, it lowered the human development curve, which is critical for institutional growth and worldwide competitiveness in today's dynamic business environment (Zulkarnaini et al., 2019; Nuseir et al., 2021a, b). Internal environment variables, such as the bureaucratic regulatory environment, or external environment variables, such as elements of rapid technological progress and the move toward globalization, are commonly responsible for crises (Al-Hawary & Hadad, 2016; Allahow et al., 2018; Al-Hawary et al., 2020; Alhalalmeh et al., 2020; Al-Quran et al., 2020). These factors contribute to the creation of organizational instability, limiting employee innovation and management's capacity to make the appropriate decisions at the right time (Altarifi et al., 2015; Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Obiadat, 2020; Coccia, 2020; Mohammad et al., 2020). With the great changes that the world has witnessed recently related to the dynamic business environment and the spread of the Corona pandemic (Ahmad et al., 2021; Alameeri et al., 2021; Al-Dmour et al., 2021a, b; Alshurideh et al., 2021; Shah et al., 2021), which showed the extent of the fragility of the global system in dealing with crises, organizations are suffering more in maintaining their survival and continuing to provide competitive products and services to their customers by focusing on reducing or avoiding the consequences of successive crises (AlTaweel & Al-Hawary, 2020; Alves et al., 2020; Al-Hawary & Alhajri, 2020).

The ability to analyze the organization's internal and external environments is critical in giving the knowledge needed to make the best decisions at the right time. This necessitated a rethinking of the administrative processes for assessing and forecasting changes in the corporate environment in order to capitalize on opportunities and avoid risks (Al-Hawary & Al-Hamwan, 2017; Al-Hawary & Hadad, 2016; Shalakah et al., 2019). As a result, strategic vigilance has arisen as a management trend that focuses on current information and invests it to forecast future changes in order to provide a prior grasp of the surrounding environment and anticipated adjustments (Alameeri et al., 2020; Jarallah, 2021). Furthermore, it enables the business to cope with large

data, which aids in strengthening the firm's agility and enhancing its ability to attain a holistic strategic goal (Alzoubi et al., 2022; Bettahar & Aggoun, 2021). Strategic vigilance contributes to achieving organizational excellence (Jaaz & Jamal, 2021a, 2021b; Shakhour et al., 2021), improving creativity (Alaali et al., 2021; Ismaail, 2020), and increasing the ability to achieve competitive advantage (Altamony et al., 2012; Manhal & Hattab, 2018).

Furthermore, organizational learning is viewed as a strategic pattern and a driver for bringing about a fundamental shift in traditional thinking, as well as an important catalyst for implementing scientific collaboration and knowledge dissemination approaches (Al-Hawary & Aldaihani, 2016; Al-Hawary & Al-Namlan, 2018; Al-Hawary et al., 2020; Al-Lozi et al., 2017; Ashal et al., 2021; Park & Kim, 2018). Knowledge management methods enable learning organizations to be more flexible and adaptable to changing circumstances, as the accumulation of knowledge contributes to the development of employees' capabilities and skills, as well as motivating them to create products and services that meet the needs of customers (Al-Hawary, 2015; Al-Hawary & Alwan, 2016; Werlang & Rossetto, 2019). Moreover, organizational learning enables effective and efficient investment of various organization resources (Al-Hawary et al., 2020; Alshurideh et al., 2019b) and improved organizational performance (Al Kurdi et al., 2020a; Yuliansyah & Jermias, 2018).

The current study provides a framework for investing the potential of strategic vigilance in enhancing the organization's ability to monitor changes in the business environment and sense potential crises to deal with them proactively, in addition to the mediating role of organizational learning as one of the factors that limit the negative effects of crises. This research helps to throw light on Jordan's dairy industry, which is still reeling from a series of crises brought on by the country's quickly changing commercial environment and substantial technological advancements. Furthermore, it aids in the development of a dynamic strategic approach that enables the business to achieve long-term goals by depending on proactive methods for monitoring changes and reorganizing people and material resources to suit changing client demands. Therefore, this study came to examine the Impact of Organizational Learning On the relationship between Strategic Vigilance and Crisis Management in the Jordanian Dairy Companies.

2 Theoretical Framework and Hypotheses Development

2.1 Strategic Vigilance

By relying on contemporary technology and innovation activities, strategic vigilance plays a critical role in providing the firm with the essential knowledge on many areas of the business environment to discover available possibilities and avoid potential risks (Alshaer, 2020a, 2020b; Alsuwaidi et al., 2020). Strategic vigilance is defined by Drevon (2019) as a systematic, continuous, legal, and ethical process of collecting,

analyzing, processing, and disseminating information, with the goal of assisting senior management, managers, or the entire organization in making better decisions and nurturing strategic thinking through a better understanding of the internal and external environment (Al-Nady et al., 2013, 2016; Hijjawi & Mohammad, 2019). According to Tawfik, early sensing and detection of changes in the business environment's trends is accomplished through the process of continuous monitoring and analysis of the influencing factors in order to extract accurate information and disseminate it throughout the organization's various departments. Furthermore, strategic vigilance was discussed as a sophisticated organizational process that tries to maintain the organization's sustainability and continuity of operations by producing reliable information that helps to reduce the uncertainty associated with decision-making (Alyammahi et al., 2020; Heintz et al., 2016).

The researchers identified the dimensions of strategic vigilance in six dimensions that include various aspects of the internal and external activities of the organization (Lesca, 2003; Drevon, 2019; Alshaer, 2020a, 2020b). **Technological vigilance**, which expresses measures and procedures aimed at revealing the latest technical developments in the business environment and seeking to obtain and employ them to serve the organization (Ahmed et al., 2020; Dawood & Abbas, 2018). **Competitive vigilance** is the organization's mechanism used to identify its current and potential competitors and determine their strengths and weaknesses to support management decisions in following and designing a marketing approach that enables the organization to lead its market sector (Boulifa, 2008; Amarneh et al., 2021). As for commercial vigilance, it focuses on analyzing customer needs and their continuous changes to design products and services that meet their aspirations (Alyasiri, 2019; Almaazmi et al., 2020). **Social vigilance** is the observation of changes in the demographic and cultural composition of community members, which allows the organization to invest its resources in creating products that meet these changes (Dawood & Abbas, 2018; Odeh et al., 2021). **Legal vigilance** is related to following up on the latest developments in the political environment in terms of regulations, laws and legislation governing the mechanism of work in the sectors related to the activities of the organization (Drevon, 2019; Tariq et al., 2022). Finally, **environmental vigilance**, which is concerned with identifying the latest developments, initiatives and laws aimed at controlling the investment of environmental resources and preserving the environment, in order to design strategies and organizational mechanisms that ensure enhancing the ability of subsequent generations to benefit from current resources (Alshurideh et al., 2019a; Lesca, 2003).

2.2 Organizational Learning

Organizational learning and creativity are two modern contemporary notions that have sparked significant interest in the previous two decades, as they were seen as a critical strategic necessity for companies' advancement and survival (Leo et al., 2021). Furthermore, studies have shown that organizational learning improves an

organization's ability to respond to the uncertainty that comes with today's dynamic business environment (Nuseir et al., 2021a, b), creates an opportunity for long-term competitive advantage (Pratono et al., 2019; Obeidat et al., 2021), and transforms the organization into an integrated unit that strives to achieve a common vision (Yoon et al., 2018). As a result, the researchers used a variety of definitions to refer to the concept of organizational learning, which defined by Al-Amyan as "all continuous processes aimed at providing the individual with the necessary skills and knowledge based on prior experiences in order to bring about a relative and permanent change in his scientific inventory. "Organizational learning, according to (Arumugam & Munusamy, 2015), revolves around the organization's ability to improve its employees' skills and capabilities by motivating them to interact, accept positive criticism, and provide an organizational environment that promotes the exchange of knowledge and cumulative experiences. According to Al-Majali, organizational learning is a continuous activity in which an organization strives to organize and expand its employees' knowledge base and continually enhance it in order to reach common ideals that can be used to solve challenges. Some scholars have chosen to use the tripartite model to assess organizational learning, which encompasses the strategic, organizational, and cultural dimensions (Marquardt, 2002). Others such as Taher (2011) who used a four-dimensional model that included technology application, knowledge management, people empowerment, and learning dynamics to measure it.

2.3 Crisis Management

According to Karam (2018), crisis management is a set of actions intended at containing and minimizing the severity of a crisis so that it does not spiral out of control, resulting in a conflict, It is also a set of plans, strategies, methods and administrative activities appropriate to exceptional situations in order to control and contain problems and maintain the organization's balance. According to AlShobaki et al. (2017), disaster preparedness is a broad concept that encompasses planning and responding to a variety of disasters and emergencies. Crisis management is a method that allows an organization to respond in a systematic way to the impacts of a crisis, allowing the business to continue with its everyday activity of supplying products and services to consumers and making profits (Abu Hamadneh et al., 2021; Lee et al., 2022a; Zyead et al., 2017, b).

Furthermore, Sahina et al. (2015) suggested that crisis management is a continuous management process based on the organization's ability to foresee and perceive potential causes that cause crises so that they can be prevented or their effects on the organization's performance can be mitigated. Crisis management, on the other hand, entails making administrative decisions rapidly in crucial situations, as crises force decision-makers in the organization to take immediate action to mitigate the potential effects and risks associated with the occurrence of crises. Hence, crisis management can be described as the art of dealing with the exceptional circumstances facing the

Licensed to (putm@utm.my)

organization in the turbulent business environment and trying to mitigate its negative effects on the outcome of the organization's work.

2.4 Relationship of Strategic Vigilance in Crisis Management Through Organizational Learning

In today's corporate environment, strategic vigilance has become a necessity, as the organization's operations rely heavily on anticipating and analyzing information about the organization's many aspects and activities, as well as its surrounds, to aid in decision-making. Strategic vigilance, according to Alshaer (2020a, 2020b), is a preventive path that assists decision makers in the organization in anticipating adverse conditions and attempting to avoid them by restructuring organizational resources to face probable dangers. Furthermore, Al-Qutji & Al-Malahsen determined that crisis management is based on a set of organizational strategies to control the sources of the crisis and lessen the organization's negative consequences. As a result, good crisis management relies on correct information gathered in a timely way through strategic vigilance operations in monitoring and forecasting concurrent and possible changes in its analyses.

Furthermore, strategic vigilance contributes to the organization's knowledge store by giving information on many elements of its activities to multiple departments (Idris & Al-Rubaie, 2013). As a result, the organization's competitive advantages are enhanced, and its ability to tackle complex problems posed by the dynamic business environment is improved. It also helps employees increase their ability to adapt to the changing business environment by enhancing the creative components that result in innovative services and products that meet customers' expectations (Shalakah et al., 2019; Alshurideh, 2022).

Furthermore, knowledge generation and dissemination throughout the organization's numerous departments aids in enhancing the ability to detect and respond to change swiftly (Marquardt et al., 2002). Furthermore, understanding of the many facets of the organization's difficulties and crises helps to mitigate the bad effects on its performance while continually attempting to discover inventive and distinctive solutions. The study hypotheses can therefore be written as follows:

There is an impact of Organizational Learning On the relationship between Strategic Vigilance and Crisis Management in the Jordanian Dairy Companies.

3 Study Model

See Fig. 1.

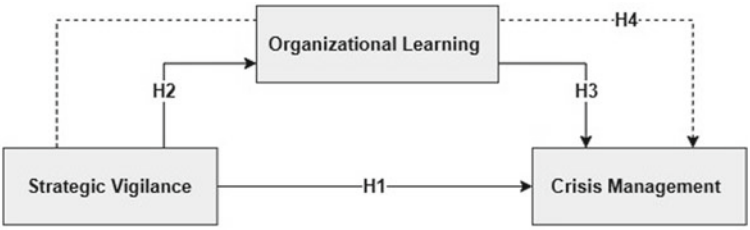

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of strategic vigilance on crisis management through the mediating role of organizational learning. Therefore, it focused on Jordanian dairy companies. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a sample of (285) managers via email. In total, (262) responses were received including (16) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (246) responses suitable to analysis requirements that were formed a response rate of (86.31%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of three main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The three main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (29) items to measure strategic vigilance based on Alshaer (2020a, 2020b) and Jaaz & Jamal (2021a, 2021b). These items were distributed into dimensions as follows: five items dedicated for measuring technological vigilance, five items dedicated for measuring business vigilance, five items dedicated for measuring social vigilance, five items dedicated for measuring competitive vigilance, four items dedicated for measuring environmental vigilance, and five items dedicated for measuring legal vigilance. The second section related to organizational learning which contained nine items developed according to (Al-Hawary et al., 2020). Whereas the third section

included nine items developed to measure crisis management according to what was pointed by (Al-Khrabsheh, 2018).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.591–0.858), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approaches based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Figs. 1 and 2.

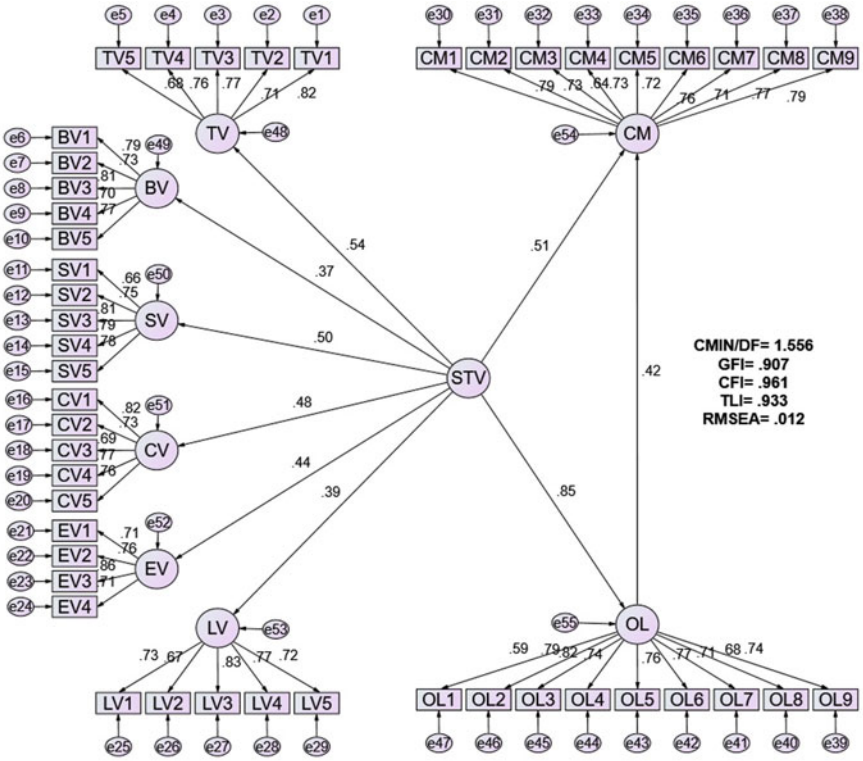

Fig. 2 SEM results of the strategic vigilance effect on crisis management through organizational learning

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.556, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker–Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.012, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the crisis management and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that strategic vigilance has a positive direct impact on crisis management ($\beta = 0.512$, $t = 7.086$, $p = 0.000$) and organizational learning ($\beta = 0.851$, $t = 15.045$, $p = 0.000$). Moreover, it indicated that organizational learning has a positive impact on crisis management ($\beta = 0.419$, $t = 7.778$, $p = 0.000$). Hence, organizational learning plays a partial mediation effect in

Table 2 Hypothesis testing

Relation	**Direct Effect**		**Indirect Effect**		**Total Effect**		
	β	p-value	β	p-value	β	t-value	p-value
Strategic Vigilance → Crisis Management	0.512	0.000			0.512	7.086	0.000
Strategic Vigilance → Organizational Learning	0.851	0.000			0.851	15.045	0.000
Organizational Learning → Crisis Management	0.419	0.000			0.419	7.778	0.000
Strategic Vigilance → Organizational Learning → Crisis Management	0.512	0.000	0.357	0.000	0.870	18.254	0.000

the relationship between strategic vigilance and crisis management, where the total effect was ($\beta = 0.870$, $t = 18.254$, $p = 0.000$) with indirect effect of ($\beta = 0.3557$, $p = 0.000$).

6 Discussion

Through the mediating role of organizational learning, the study attempted to examine the impact of strategic vigilance in crisis management. The findings revealed that strategic alertness has a direct impact on crisis management, which is consistent with previous research (Al-Tanayeeb, 2020). As a result, organizations' pursuit of a technological infrastructure, as well as training employees at various administrative levels to deal with the changing business environment, aids in the early detection of crises and the formulation of preventive plans to mitigate the negative effects of crises. Furthermore, the organization's constant concern and commitment, driven by the desire to achieve industrial leadership, drives it to monitor various aspects of business related to the nature of its activity, enhancing its ability to predict the conditions of the turbulent business environment and take proactive measures to achieve its strategic goals.

The study also found that strategic vigilance has a direct impact on organizational learning, which is consistent with previous findings (Dawood & Abbas, 2018). As a result, in addition to offering current technology to employees, permanent follow-up procedures for laws and legislative regulations contribute greatly to enhancing their ability to deal with difficulties and discover inventive solutions. Furthermore, incorporating environmentally friendly practices into different elements of the organization's operations raises employee awareness of the need to address environmental concerns and fosters a sense of social responsibility toward future generations.

Furthermore, the data revealed that organizational learning has an impact on crisis management, which is consistent with the study's conclusions (Gujarai, 2017). As a

result, creating a work environment that encourages employees to share their previous experiences and skills, allowing them to participate in organizational decision-making, and continuously training them to deal with problems improves the organization's ability to detect flaws in the business environment early and take preventative measures to mitigate their effects and reduce the likelihood of them occurring. Moreover, the results showed that organizational learning plays a mediating role in the relationship between strategic vigilance and crisis management. Therefore, the organization's ability to use modern technology to follow up and control the variables of the business environment and the competitive environment enables it to build a stock of knowledge through which it can deal with the exceptional circumstances that organizations are going through. Moreover, this stock of knowledge, based mainly on accurate and objective information, contributes to supporting the decision-making process and reducing the uncertainty associated with it.

7 Recommendations

Based on the achieved results, this study presents a set of recommendations to decision makers in order to better manage the crises facing their organizations. First, focus on following a supportive management approach to the use of technology in the various activities of the organization because of its impact on enhancing its ability to sense changes in the business environment. Second, providing training programs for employees at various administrative levels on dealing with crises and scientific methods to identify the causes of problems and find appropriate solutions within the constraints of available material resources. Third, enhancing data integration through building an information management system and applying artificial intelligence methods because of their role in disseminating the acquired knowledge in various departments of the organization and enhancing the skills and capabilities of employees to create competitive products and services that take the organization to leadership positions. Finally, forming a crisis management team comprising employees from all administrative levels and training them to deal with fluctuations arising from the turbulent environment, in addition to assigning them to prepare studies and periodic reports on potential problems and the mechanism for dealing with them.

Abstract The major aim of the study was to examine the impact of total quality management (TQM) on organizational reputation (OR). Therefore, it focused on the faculty members in five public universities, whose number is (5477) faculty members. As for the study sample, it consisted of a proportional stratified sample of (390) individuals, and after the questionnaire was distributed with (410), 390 were recovered, valid for the purposes of statistical analysis. Structural equation modeling (SEM) was conducted to test hypotheses. The results showed that all total quality management dimensions had a positive impact relationship on organizational reputation except focus on beneficiary. Based on the results of the study, researchers recommend managers and decision-makers in public universities to pay attention to

1 Introduction

In today's higher education industry, the concept of total quality has gotten a lot of attention because it is seen as a competitive weapon that will lead to globalization. Universities are regarded as one of the most important tools for societal development and modernization, as well as an important tool for transitioning from their traditional role in activities and operations (educational, academic, and administrative) to a more developed and improving role in these processes to produce high-quality results and outputs regardless of the quantity produced (Alshamsi et al., 2020; Alsharari & Alshurideh, 2020), which prompted it to adopt the philosophy of total quality management in the educational process, and control it with assurance standards and specific indicators and standards, which many researchers considered the ideal solution to make a qualitative leap in the development of its services and outputs, which is reflected positively on its reputation and standing among its peers, this allows it to realize its strategic objectives in moving to global competitive positions among universities throughout the world (Al-Hamad et al., 2021; Leo et al., 2021; Sultan et al., 2021).

The reputation of universities today is considered one of the most prominent and most important standards, which constitute a major challenge that highlights their ability or not to respond quickly to the rapid changes in the surrounding environment, and even have the ability to resolve the vision of stakeholders and beneficiaries towards it, and reflects its ability to attract students and investors (Al Kurdi et al., 2020a; Nazi et al., 2022), which compel universities to join their communities and play a role in them by providing services to their various segments, linking their various specialties to their needs, and linking their research inputs to serve and solve their problems, as well as to create a strong interaction between their resources and the service and production sectors of society (Al-Ta'i & Al-Abadi, 2009; Al-Hawary, 2010a; Al-Hawary, 2010b; Al-Hawary & Batayneh, 2010). Universities today are witnessing efforts to improve their image and reputation by adopting the quality standards required by the most famous international university rankings today, because these rankings reflect a large part of the quality of higher education.

The significance of this research stems from the discussion of comprehensive quality management, including its dimensions and standards, which create an interwoven chain of relevance in creating a significant competitive advantage and reputation, as evidenced by high-quality inputs and outputs (Alshurideh et al., 2021; Amarneh et al., 2021). Given that we are discussing our public universities, the theoretical importance of emphasizing the role of our universities in their application

and commitment to total quality management and assurance standards, as well as linking it to the fate of their academic and educational reputation on the Arab and international levels, is never less than the practical (Altamony et al., 2012; Batayneh et al., 2021).

Public universities today adopt a vision and message of excellence and a strong reputation through the provision of services (academic and pedagogical) and qualitative outputs of high quality and comprehensiveness in their plans and strategies. These are both strategic and operational plans that cover the foundations and concepts of comprehensive quality management in all of its dimensions, as well as the implementation of quality assurance standards in its programs and plans, as well as within specific indicators and standards. Researchers today believe that the reputation of Jordanian public universities has been shaken from before, not only locally, but also among Arab universities as well, because the modern experience of international university rankings is a modern and contemporary experience that universities in general use to raise the level of their reputation, but it is still within a framework limited to some limited and narrow indicators, and because university education has expanded significantly in the past ten years, and its expansion was accompanied by a number of obstacles and challenges (Alshurideh et al., 2019; Al Kurdi et al., 2020b; Alshurideh et al., 2020; AlHamad et al., 2021; Al-Maroof et al., 2021, Nuseir et al., 2021a, b), so this study came to examine the impact of total quality management with its dimensions (focus on the beneficiary, commitment of senior management, continuous improvement, participation of working individuals, training and development) on organizational reputation in Jordanian public universities.

2 Theoretical Framework and Hypotheses Development

2.1 Total Quality Management

Total Quality Management (TQM) is one of the most prominent modern management concepts, and as a result of what the market witnessed of a great competitive image, to provide the best products and services to its customers and clients, this competition moved to a sector that was far from this competition due to the different services provided to the beneficiaries, to enter the circle of competition of the education sector in providing its educational services in a cost-effective manner, after this concept was embodied in an integrated approach of modern management curricula, similar to other concepts that underwent renaissance, progress, and development, and after it was modified to keep pace with today's rapid changes in the environment, it began to focus its attention on achieving quality and excellence to gain customer satisfaction, and it evolved into a philosophy focused on achieving the level of high quality in the performance of operations, in addition to considering it a process that aims to create a distinct culture of performance through persistent pursuit between managers and employees in order to achieve the expectations of the beneficiaries, and to do all

work as required from the first time with better quality, higher effectiveness and in the shortest time (Al-Hawary & Abu-Laimon, 2013; Al-Hawary et al., 2013; Ghoneim, 2018).

Total quality management, according to the researchers, is a philosophy that focuses on reaching the greatest and highest degree of quality and process performance through employee participation, continuous improvement procedures, and addressing the needs and aspirations of beneficiaries (Al-Hawary et al., 2017; Krajewski, et al., 2013; Metabis & Al-Hawary, 2013; Mohammad et al., 2020;). While Hasham (2021) sees it as a management model based on the most efficient use of time, Hasham (2021) sees it as a strategic plan with clear goals that is characterized by constant evaluation, rectification, and successful review. This is due to the consideration that quality management and time management go in one line towards achieving productivity, by reducing error rates, and avoiding waste in the exploitation of various resources, meaning that through quality management we can use time more effectively. We conclude that total quality management is the art of managing the entity of the organization, with all of its parts and components, for the purpose of achieving excellence, and it is a philosophy or set of principles that represent the foundation for any organization that follows a continuous improvement approach, to meet the requirements and needs of its customers in the long run, based on the multiple definitions of researchers about the concept in general.

2.2 Organizational Reputation

The concept of organizational reputation has attracted the attention of many researchers and academics, by noting its results on the work of commercial and service organizations, as the researchers indicated as an indicator for the future of organization (Abdel-Fattah, 2014). Researchers differed about the concept of organizational reputation, some of them saw it as a trait that comes from the advantages that are represented by the values that the beneficiaries realize (Walsh et al., 2004), whereas Watson and Kitchen (2015) see it as a strategic asset that is directly related to market values. While another point of view suggests that it represents a kind of comprehensive collective representation of the audio-visual developments that the organization will build over time, as well as its organizational identity through performance and behavior, to later reflect the organization's many perspectives. Mahdi and Kazem (2017) believe that organizational reputation is a set of relative values (originality, credibility, reliability, integrity, creativity, and social responsibility) that an individual feels about a company through the picture he has of it, and that it is one of its assets. As a result, it has a competitive advantage that helps it attract customers, earn their loyalty, and mitigate competitive threats and crises.

Watson and Kitchen (2015) indicate that the importance of organizational reputation is due to the fact that it is the thought of all stakeholders (internal and external) about the organization's reputation and internal identity, and it is a mixture and

a time-spanned mixture of their evaluation (i.e. stakeholders) about the organization's overall performance, and its ability to face changes and adapt to it. Al-Sharifi (2019) stresses the importance of organizational reputation by highlighting its most important benefits, as it leads to: reducing costs, attracting customers, increasing profitability, setting differentiated prices, and setting competitive barriers to achieve relative stability of competitive future expectations.

According to Oncer & Yildiz (2012), the importance of organizational reputation is reflected in two important aspects: the aspect (external interest of the organization), which refers to the need to protect and improve the organization's reputation as a prerequisite for the continuation of its relationship with stakeholders and customers, which is reflected in its competitive performance; and the aspect (internal interest of the organization), which refers to the need to protect and improve the organization's reputation as a prerequisite for the continuation of While looking at the other side (internal interest), which portrays an acceptable and harmonious image of the organization's internal entity, which shapes its identity and works to improve its performance.

According to Walsh et al. (2009), organizational reputation is represented in five important dimensions that are summarized as: orientation to the customer (the beneficiary), the good employer, the organization's financial capacity, the quality of its products and services, and social responsibility. While Harrison identified eight important elements of reputation that are complementary among them, namely: leadership, financial strength, kind of management, customer focus, social responsibility, reliability, and the nature and quality of communications, adds to them. Market leadership, people quality, and ethical behavior are three more factors (Iwu-Egwuorwu, 2011; Al-Hawary et al., 2020a, 2020b; Al-Hawary & Al-Syasneh, 2020;).

This study will focus on five important dimensions of reputation as follows: **Innovation**: a process that results in unfamiliar ideas for a particular product or service (Al-Hawary, 2015; Al-Hawary & Aldaihani, 2016; AlTaweel & Al-Hawary, 2021; Fichman, 2001). It is the ability to present new ideas that, in turn, bring an organization a competitive advantage (Crossan & Apaydin, 2010; Almaazmi et al., 2020; Nuseir et al., 2021a, b). **Social responsibility**: Alhalalmeh et al. (2020) and Al-Hawary & Al-Khazaleh (2020) defined it as the commitment of business organizations to the community in which they operate, while it is seen as the customers' beliefs about the positive role of the organization toward society and the environment in general (Abu Zayyad et al., 2021; Al-Hawary, 2013; Al-Hawary & Obiadat, 2021; Alolayyan et al., 2018; Walsh et al., 2009). **The strength of the financial position**: It is what customers perceive about the organization in terms of its strength and profitability, and how they evaluate and use financial resources in a responsible manner (Shah et al., 2020, 2021; Walsh et al., 2009). **Product/service quality**: the quality of the service or product can help gain the competitive advantage of the organization, and to maintain a long-term relationship with customers and enhance their confidence in them (Abu Qaaud et al., 2011; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2016; Alshurideh et al., 2017; Al-Hawary & Alhajri, 2020). **Attractiveness**: It means the ability of the organization to attract workers, investors and customers on an ongoing basis, and work to reduce costs and turnover of its employees. A reputable organization

increases the desire of its employees to stay as well as customers (Al-Hawary & Harahsheh, 2014; Al-Hawary & Hussien, 2017; Ozbag, 2018).

2.3 Total Quality Management and Organizational Reputation

Universities are making attempts to improve their image and reputation by embracing the quality requirements mandated by the most well-known international university rankings, which reflect a significant component of higher education quality. Al-Taher concluded that the process of continuous improvement affects the achievement of competitive advantage, that the process of improvement and development is a shared responsibility among all university employees, that universities are comparing their overall performance with local and international universities, and that the university is working on task forces, conducting studies and analyses of competitive advantage to explore and benefit from strengths, weaknesses, opportunities, and threats, as well as benefiting from foreign expertise related to continuous improvement processes, and conducting studies and analyses of competitive advantage to explore and benefit from strengths, weaknesses, opportunities, and threats. According to Al-Drouqi & Al-Fitni (2021), total quality management is an integrated strategy that contributes significantly to the development of higher education institutions, that the administrative standard is the most important standard of total quality in education, and that the academic accreditation system is the most important mechanism for applying and ensuring quality.

Al-Sarhan (2021) found that public universities have a fundamental interest in two main elements: social responsibility and worker focus, in addition to a noticeable interest in the three TQM variables: organizational culture, focus on developing and improving the educational process, and adopting senior management. The term "total quality management" refers to the management of all aspects of a product's quality. By presenting results that the researcher summarized in the form of important points that dealt with how to pay attention and focus on aspects of total quality management with its principles, through its focus on the mechanisms and means that achieve the best results, (Abu Asba', 2020) confirmed that the five principles of total quality affect the achievement of a competitive advantage. Samir & Sobeih (2020) emphasized that any higher educational institution that wishes to invest and preserve its identity and brand (reputation) pays close attention to all aspects that affect its competitive reputation, such as advertising and promotion that best reflects its institutional image, strategic planning based on attracting components and elements that increase its reputation and raise its corporate brand competitively, and so on.

One of the most crucial variables influencing a student's choice of destination is the university's reputation (Ma, 2021; Al-Maroof et al., 2021). Dursun and Gumussoy

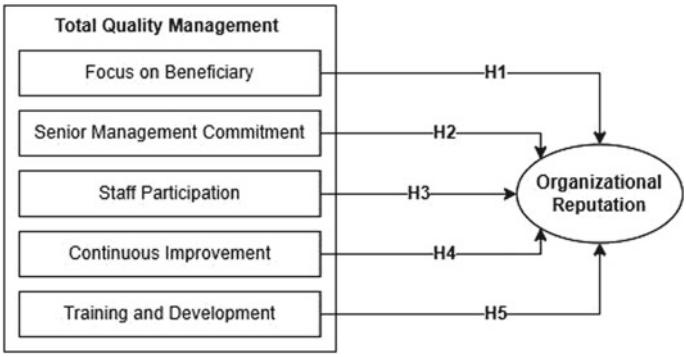

Fig. 1 Research model

(2021) underlined the impact of service quality and emotional dimension on university reputation, as well as demonstrating that personnel competency, academic leadership, and student orientation all have an impact on university reputation. Accordingly, the study hypothesis can be formulated as follows:

There is a statistically significant effect of total quality management with its dimensions (focus on the beneficiary, commitment of senior management, continuous improvement, staff participation, training and development) on the organizational reputation in Jordanian public universities.

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of total quality management (TQM) on organizational reputation (OR). Therefore, it focused on the faculty members in five public universities, whose number is (5477) faculty members. As for the study sample, it consisted of a proportional stratified sample of (390) individuals, and after the questionnaire was distributed with (410), 390 were recovered, valid for the purposes of statistical analysis (Sekaran & Bougie,

Licensed to (putm@utm.my)

2016). Data were primarily gathered through self-reported questionnaires creating by Google Forms.

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure total quality management based on (Al-Hawary & Abu-Laimon, 2013). These questions were distributed into dimensions as follows: four items dedicated for measuring focus on beneficiary, four items dedicated for measuring senior management commitment, four items dedicated for measuring staff participation, four items dedicated for measuring continuous improvement, and four items dedicated for measuring training and development. Whereas the second section included (12) items developed to measure organizational reputation according to what was pointed by (Abdel-Fattah, 2014).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.642–0.892), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approaches based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures.

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6
1. FOB	**0.742**					
2. SMC	0.384	**0.741**				
3. SPA	0.332	0.392	**0.751**			
4. CIM	0.468	0.374	0.406	**0.759**		
5. TAD	0.501	0.425	0.481	0.443	**0.752**	
6. OR	0.637	0.587	0.662	0.681	0.597	**0.749**
VIF	1.814	1.662	1.876	1.036	1.574	–
Loadings range	0.642–0.793	0.673–0.824	0.705–0.811	0.735–0.771	0.681–0.831	0.662–0.892
AVE	0.551	0.549	0.564	0.576	0.566	0.562
MSV	0.415	0.394	0.497	0.502	0.445	0.381
Internal consistency	0.828	0.826	0.834	0.842	0.836	0.937
Composite reliability	0.830	0.828	0.837	0.844	0.838	0.939

Note FOB: focus on beneficiary, SMC: senior management commitment, SPA: staff participation, CIM: continuous improvement, TAD: training and development, OR: organizational reputation, Bold fonts in the table are the square root of average variance extracted

The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Figs. 1 and 2.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.881, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker–Lewis index (TLI) were upper than the minimum accepted threshold of 0.90.

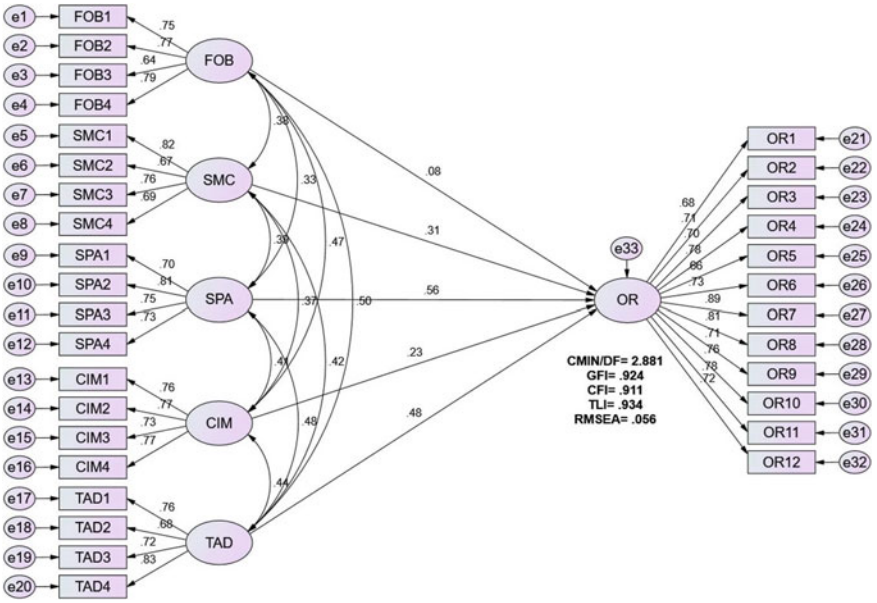

Fig. 2 SEM results of the TQM effect on OR

Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.056, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the organizational reputation and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all total quality management dimensions had a positive impact relationship on organizational reputation except focus

Table 2 Hypothesis testing

Relation	Standard Beta	*t* value	*p* value
FOB → OR	0.083	1.750	0.081
SMC → OR	0.311*	3.297	0.017
SPA → OR	0.561***	9.364	0.000
CIM → OR	0.235*	2.226	0.046
TAC → OR	0.483***	7.529	0.000

Note FOB: focus on beneficiary, SMC: senior management commitment, SPA: staff participation, CIM: continuous improvement, TAD: training and development, OR: organizational reputation

*$p < 0.05$, **$p < 0.01$, ***$p < 0.001$

on beneficiary ($\beta = 0.083$, $t = 1.750$, $p = 0.081$). Moreover, the results indicated that the highest impact was for staff participation ($\beta = 0.561$, $t = 9.364$, $p = 0.000$), followed by training and development ($\beta = 0.483$, $t = 7.529$, $p = 0.000$), then senior management commitment ($\beta = 0.311$, $t = 3.297$, $p = 0.017$), and finally the lowest impact was for continuous improvement ($\beta = 0.235$, $t = 2.226$, $p = 0.046$).

6 Discussion

The results showed that there is a positive and strong correlation between the TQM sub-variables and the organizational reputation variable, and that there is a statistically significant effect of TQM on the organizational reputation of Jordanian public universities, as it turns out that TQM was able to explain (25.1%) of the Variation in organizational reputation. This reflects universities' awareness and appreciation for the interest in applying the standards and practices of total quality to raise their performance, which will reflect on their reputation and raise their value. This is confirmed by a study (Obeid et al., 2021), which indicated the interest of the University of Jordan as one of the official universities in the application of total quality management, which contributed to raising the performance of its employees. As well as the study of Rabaa'a & Hamadat (2020), the result of which was that Jordanian private universities also implement total quality management at a high level.

The results showed that Jordanian public universities show great interest in their application of total quality management, but their interest is evident in some practices and not others. There is also a noticeable interest among Jordanian public universities with the participation of individuals in supporting the application of the practices of total quality, which is reflected positively on their overall performance. The findings also revealed that universities place a high value on subjecting faculty members to training courses that help them improve their academic performance, as well as providing financial support in the form of (financial rewards) to increase their research and scientific activity, which reflects the positive impact on faculty members' reputations at these institutions.

7 Recommendations

Based on the results of the study, researchers recommend managers and decision-makers in public universities to pay attention to the university management standard (higher leadership), which has the largest role in supporting and activating the application of total quality management, as the instability of administrative leaders and the inappropriateness of their scientific and administrative qualifications has an influential role on the level of management weakness. And activating the role of the accreditation and quality centers and supporting them with all the needs of qualified financial and human resources, which help them in achieving the effectiveness of

the application of total quality management and conducting a periodic audit for the purposes of continuous improvement. The study also recommends activating the role of liaison officers in the centers, units and colleges of universities with the Accreditation and Quality Center more and supporting it from the technical and training aspects to make a periodic inspection for the purposes of showing weaknesses and shortcomings in the practices of total quality management.

effect of work-life balance on the affective and normative commitment, and a negative effect of work-life balance on continuance commitment. These results agreed with some previous studies and differed with others. The study recommended the need to pay more attention to the balance of work because it improves employee emotional attachment and obligation to the organization and reduces their assessment of their relationship with the organization through the costs they incur in the case of leaving the organization. Researchers are recommended to study work-life balance by focusing on its dimensions and not as a whole variable.

Keywords Work-life balance · Affective commitment · Continuance commitment · And normative commitment · Food industry

1 Introduction

Work-life balance (WLB) is of interest to researchers and organizations because of its impact on the level of organizational commitment of employees. It was found that this concept means providing a suitable work environment that balances the activities of work life and the activities of family life. One of the most important effects of WLB is that it leads to reducing employee intention to leave (Agha et al., 2021; Allen & Meyer, 1990) and improving organizational commitment (Alketbi et al., 2020; Wardana et al., 2020). In particular, a higher level of WLB improves employee emotional and normative adherence (Al Kurdi et al., 2020; Khalid & Ibrahim, 2018), and lowers the level of continuance commitment (Alameeri et al., 2020; Dávila, 2019; Shabir & Gani, 2020). Nevertheless, the results reached by the researchers are mixed due to the different samples or sectors that were covered or countries, so the current study was conducted to provide an applied addition and contribute to the generalization of the previous results.

2 Literature Review and Research Hypotheses

2.1 Work-Life Balance

WLB has been defined in several ways. First, WLB is a state of simultaneous satisfaction with work and life (Clark, 2000). Second, WLB is a situation of conflict absence between work and non-work requirements (Kim, 2014). Third, WLB is a case of resources adequacy by which an employee is able to participate in both work and family life in an effective manner (Voydanoff, 2005). Fourth, WLB refers to a

A. I. Mohammad
Department of Basic Scientific Sciences, Al-Huson University College, Al-Balqa Applied University, As-Salt, Jordan

situation in which time is split between work and personal life resting on priorities (Rigby & O'Brien-Smith, 2010). Fifth, WLB is a state between employee satisfaction and employee organizational commitment (AlShehhi et al., 2020; Peng, 2018). In fact, WLB is divided into three major types: time balance, content balance, and commitment balance. The first type refers to using time to the life and work equally. The second one means that refers to an individual pleasure in both work and life. Finally, commitment balance signifies showing psychological commitment to the roles at the same degree (Tayfun & Çatir, 2014). WLB can be explained using five models: the segmentation model, the spillover model, the compensation model, the instrumental model, and the conflict model. The segmentation model assumes that work life is different from non-work life since both of them represent life-separated aspects, while the spillover model advocates that one of these aspects have a positive or negative influence on the other one. The compensation model hypothesized that one may present what the other does not offer, whereas the instrumental model proposes that the activities of one lead to success in the other, and the conflict model assumes that these two domains conflict due to the high requirements for each of them (Alsuwaidi et al., 2020; Guest, 2002).

2.2 Organizational Commitment

From Allen and Meyer's (1990) view of point, OC is a psychological statethat associate an employee to an organization and therefore reduce his or her turnover intention. Hence, the concept was deemed as a multidimensional construct used to evaluate employee attitudes toward two key work-related aspects, which are employee membership willingness and employee inclination for organizational goals (Al-Hawary & Alajmi, 2017; Al-Hawary & Mohammed, 2017; Alhalalmeh et al., 2020; Mohammad et al., 2020; Meyer & Herscovitch, 2001). Based on such a definition, OC was introduced as an employee attachment with an organization as presented by employee intention to stay and employee extra effort to achieve organizational goals (Meyer et al., 2002; Al Shebli et al., 2021). According to Meyer and Allen, commitment to an organization reflects employee need, desire and obligation to maintain his or her membership in that organization. Therefore, OC has been conceptualized in terms of three dimensions: affective commitment, continuance commitment, and normative commitment (Allen & Meyer, 1990; Allozi et al., 2022). First, affective commitment is a state of positive work-related behaviors such as organizational citizenship behavior (Alshurideh et al., 2015; Meyer et al., 2002). It represents employee wish to stay with an organization due to personally perceived causes such as goal congruence, which a state in which an employee tries to link his personal goals with an organization's goals (Al-bawaia et al., 2022). For Dávila (2019), affective commitment represents employee emotional attachment, identification, and involvement in the organization. Such a dimension can be assessed using numerous statement s such as the one formulated by Marmol (2019), which was "I would be very happy to spend the rest of my career with this [organization]" (P. 115). Second, continuance

commitment occurs when an employee remains with an organization due to a key reason, which is the need that tied the employee to the organization. In such a situation, the employee is aware of the costs of leaving the organization (Alshurideh, 2016; Dávila, 2019). In this regard, a need emerges based on the lack alternatives, leaving-associated costs, or in ability to transfer skills to a different organization (Meyer et al, 2002; Alkitbi et al., 2020). It is a result of a comparison between gains and losses in case of work leave (Alsharari & Alshurideh, 2020; Tayfun & Çatir, 2014). In other words, it is the cost incurred by the individual if he decides to leave the organization (Alshamsi et al., 2020; Koyuncu & Demirhan, 2021). An example of the items used to gauge continuance commitment is "It would be very hard for me to leave my [organization] right now, even if I wanted to" (Marmol, 2019, P. 115). Third, in Meyer and Allen's (1997) words, normative commitment refers to an employee obligation to continue employment. Likewise, Dávila (2019) defined normative commitment as employee feeling of obligation to carry on his or her work in the organization. It refers to the individual's sense of moral responsibility towards the organization (Alshurideh, 2022; Alshurideh et al., 2016; Koyuncu & Demirhan, 2021). Examples of the items that can be used to assess normative commitment include "One of the major reasons I continue to work for this [organization] is that I believe that loyalty is important and therefore feel a moral obligation to remain" (Marmol, 2019, P. 115). In short, it can be said that the emotional attachment to the organization is the reason behind the affective commitment, while the continuance commitment is related to the costs, and therefore its cause is the necessity that necessitates staying in the organization. The reason behind the normative commitment is the sense of responsibility towards the organization.

2.3 WLB and Affective Commitment

Many previous works on the effect of WLB on affective commitment revealed that WLB has a significant positive effect on affective commitment. Investigating such an effect using a sample encompassed of nurses, Tayfun and Çatir (2014) confirmed that WLB exerted a positive influence on affective commitment. Similarly, Shabir and Gani (2020) showed a significant positive relationship between WLB and affective commitment. Gathering data from Korean workers, Kim (2014) showed a positive association between WLB and affective commitment, which in turn affects employee in-role performance. On the other hand, the results of Al Momani (2017) indicated that WLB is negatively associated to affective commitment. Dávila (2019) studied the relationship between WLB practices and OC among academics at a Chilean university and established a positive bond between WLB in terms of family integration practices and affective commitment. Based on these results, the following hypothesis was presumed:

H1: There is a significant relationship between WLB and affective commitment.

2.4 WLB and Continuance Commitment

Generally, the effect of WLB on OC is well documented in the literature (Hariniet al., 2019; Malone, 2010; Sakthivel & Jayakrishnan, 2012; Wardana et al., 2020). However, prior works on the effect of WLB and continuance commitment showed different results. Khalid and Ibrahim (2018) tested the relationship between WLB and OC of radio journalists in Nigeria and concluded that WLB is a significant predictor of continuance commitment. Al Momani (2017) examined the mediating part of OC in the linkage between WLB and employee intention to leave using a sample consisted of women employees from a state hospital in Jordan and found that WLB had no significant effect on continuance commitment. Tayfun and Çatir (2014) examined the relationship between WLB and OC using a sample of nurses in Turkey and found that WLB had no significant effect on continuance commitment. Furthermore, Shabir and Gani (2020) investigated the relationship between WLB and OC among women employees in healthcare industry in India and found that WLB had a negative linkage with continuance commitment. For Dávila (2019), WBL, i.e., economic support and permissions for family responsibilities, is significantly related to continuance commitment. In order to explore the effect of WLB on continuance commitment using the current data, the following hypothesis was introduced:

H2: There is a significant relationship between WLB and continuance commitment.

2.5 WLB and Normative Commitment

For many scholars, WLB is positively related to normative commitment. Examples of previous studies in this regard include Shabir and Gani (2020) who investigated such a relationship in healthcare sector in India, as well as Tayfun and Çatir (2014) who used a sample of nurses working in a state hospital in Turkey. Explicitly, Dávila (2019) pointed out a significant positive relationship between WLB in terms of family integration and normative commitment. In their study on WLB and OC of radio journalists in Nigeria, Khalid and Ibrahim (2018) found a significant relationship between WLB and normative commitment. However, a study carried out by Al Momani (2017) on the mediating role of OC on the effect of WLB on employee intention to leave showed that WLB had a significant negative effect on normative commitment. Consequently, the following hypothesis was postulated:

H3: There is a significant relationship between WLB and normative commitment.

3 Research Methodology

3.1 Research Sample and Data Collection

The population of the study consisted of full-employment male and female employees in one large service company in food industry. Data were collected using a questionnaire administered to a randomly selected sample encompassed 250 employees, 173 questionnaires were returned, from which 11 were excluded due to incomplete responses. Therefore, the final number of the questionnaires used for data analysis purpose were 162 questionnaires.

3.2 Research Instrument

The questionnaire contains 20 items anchored using a five-pint Liker scale, in which 1 refers to strongly disagree and 5 signifies strongly agree. Employees were asked to report their agreement degree on items related to their assessment of WLB and OC statements. WLB was measured using 5 statements adopted from Marmol (2019, P. 115). Those statements were related to workload, work efficiency, family relationships, personal and self-care being, and personal wellness. OC dimensions are measured using 15 items distributed equally on affective commitment (5 items), continuance commitment (5 items), and normative commitment (5 items). These items were adapted from Dávila (2019, P. 18) who carried out a study on the relationship between WLB practices and OC among university academics, therefore, the item were reworded to suite the organization used in the current study.

3.3 Research Conceptual Model

The conceptual model of the research as shown in Fig. 1 displays the three suggested hypotheses of the research, in which WLB is assumed to exert a significant positive effect on affective commitment (AC) as stated in the first hypothesis (H1). WLB is hypothesized to show a significant positive effect on continuance commitment (CC) as indicated in the second hypothesis (H2). As well, WLB is presumed to display a significant positive effect on normative commitment (NC) as identified in the third hypothesis (H3).

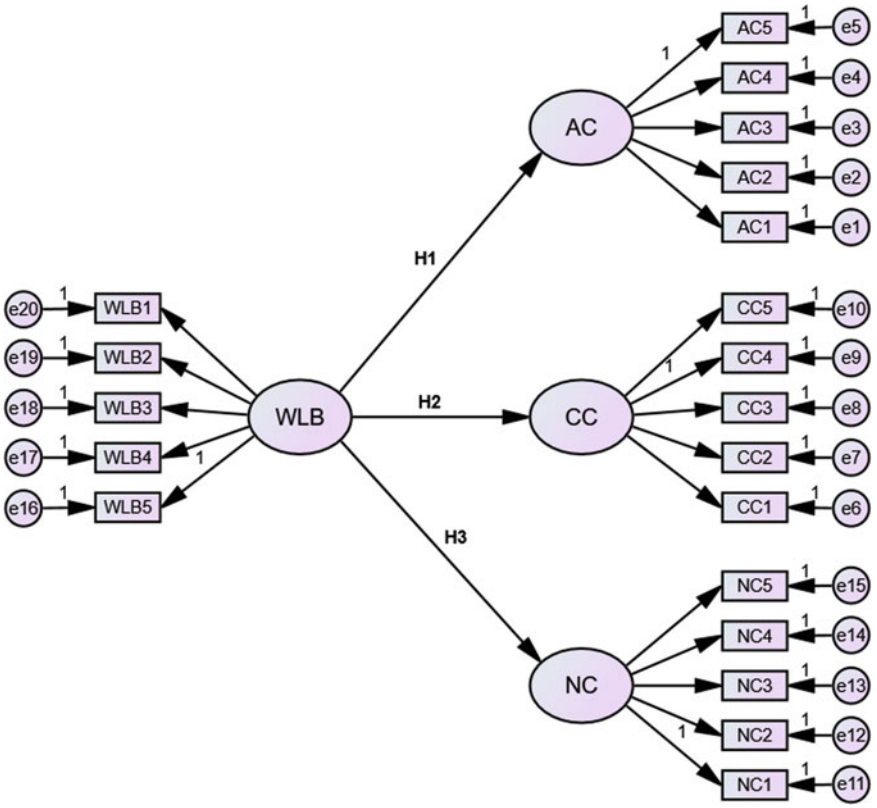

Fig. 1 Research conceptual model

3.4 Multicollinearity, Validity and Reliability

The results of multicollinearity statistics as assessed by variance inflation factor (VIF) and tolerance specify that the current data is free from multicollinearity since VIF values were less than 10and tolerance values were greater than 0.10 (Al-Hawary & Alhajri, 2020; Al-Nady et al., 2013; Altarifi et al., 2015).Exploratory factor analysis (EFA) was carried out first using IBM SPSS 24.0 in order to determine indicator loadings and to test validity in terms of convergent and discriminant values. Convergent validity was evaluated by the average variance extracted (AVE). Its value should be more than 0.50 (Al- Quran et al., 2020; Al-Hawary et al., 2020; AlTaweel & Al-Hawary, 2021), discriminant validity was evaluated using the square root of AVE values. Its value should be upper than the values of the correlation coefficients between any pair of the independent variables. The results in Table 1 show acceptable values of both convergent and discriminant validity. On the other hand, reliability was tested using Cronbach's alpha with a cut-off value of 0.70 (Mohammad et al., 2020), in addition to McDonald's Omega (ω) with a similar threshold value of 0.70

Table 1 Results of validity and reliability

Components	Items	Factor loadings	Validity		Reliability		
			AVE	√AVE	CR	α	ω
Affective Commitment (AC)	AC1	0.789	0.687	0.829	0.916	0.893	0.892
	AC2	0.811					
	AC3	0.833					
	AC4	0.824					
	AC4	0.884					
Continuance Commitment (CC)	CC1	0.842	0.707	0.841	0.923	0.931	0.929
	CC2	0.810					
	CC3	0.832					
	CC4	0.852					
	CC5	0.867					
Normative Commitment (NC)	NC1	0.818	0.629	0.793	0.894	0.843	0.836
	NC2	0.832					
	NC3	0.802					
	NC4	0.768					
	NC5	0.741					
WLB	WLB1	0.982	0.743	0.862	0.935	0.927	0.918
	WLB2	0.891					
	WLB3	0.731					
	WLB4	0.803					
	WLB5	0.883					

(Al-Hawary & Al-Syasneh, 2020)and composite reliability (CR) with a value greater than 0.70 (Mohammad, 2017; Al-Lozi et al., 2018; Al-Hawary & Obiadat, 2021). The results in Table 1 involve satisfactory values of reliability indexes. CR values ranged from 0.894 to 0.935, Cronbach's alpha coefficients ranged between 0.843 and 0.929, while McDonald's Omega values were from 0.836 to 0.929. Overall, both validity and reliability were assured.

3.5 Descriptive Statistics and Correlation Matrix

Means (M) and standard deviations (SD) were used to describe the degrees of research variables. It can be noted from Table 2 that the degrees of affective commitment, continuance commitment is moderate, and normative commitment were moderate ($M = 3.56$, $SD = 0.841$, $M = 2.89$, $SD = 0.792$, $M = 2.95$, $SD = 0.852$ respectively). The degree of WLB was also moderate ($M = 3.48$, $SD = 0.951$). In terms of Pearson correlation coefficients, the results in Table 2 illustrate that the research variables are

Table 2 Descriptive statistics and correlation matrix

Constructs	Mean	SD	(1)	(2)	(3)	(4)
(1)Affective commitment	3.56	0.841	1	–	–	–
(2)Continuance commitment	2.89	0.792	0.441**	1	–	–
(3)Normative commitment	2.95	0.852	0.452**	0.487**	1	–
(4)WLB	3.48	0.951	0.495**	0.396**	0.472**	1

** Correlation is significant at the 0.01 level (2-tailed)

Table 3 Results of model fit

Index	Measurement model	Structural model	Criteria	Result
CMIN/DF	2.381	2.381	<3.00	Accepted
GFI	0.924	0.924	>0.90	Accepted
CFI	0.964	0.964	>0.90	Accepted
RMSEA	0.072	0.072	<0.08	Accepted

significantly correlated, i.e., affective commitment had a significant correlation with both continuance commitment (r = 0.441) and normative commitment (r = 0.452). Affective commitment, continuance commitment, and normative commitment had significant correlations with WLB (r = 0.495, 0.487, 0.396 respectively).

3.6 Model Fit

Chi-square-to-degree of freedom ratio (CMIN/DF), the Goodness of Fit Index (GFI), the Comparative Fit Index (CFI), and the Root Mean Squared Approximation of Error (RMSEA) are used to test model fit. The results in Table 3 asserted that the fit indices of both measurement and structural models are accepted. CMIN/DF = 2.381, GFI = 0.924, CFI = 0.964 and RMSEA = 0.072. CMIN/DF is less than 3, GFI and CFI are greater than 0.90, and RMSEA is less than 0.08 (Al-Lozi et al., 2017; Al-Nady et al., 2016; Alolayyan et al., 2018).

3.7 Hypotheses Testing

Structural equation modeling (SEM) was applied using IBM AMOS 23.0 o test research hypotheses. Figure 2 shows the structural model of the research.

The detailed statistics as publicized in Table 4 indicate that WLB had a significant effect on all OC dimensions, i.e., affective commitment ($\beta = 0.312$, P = 0.000), continuance commitment ($\beta = -0.171$, P = 0.000), and normative commitment

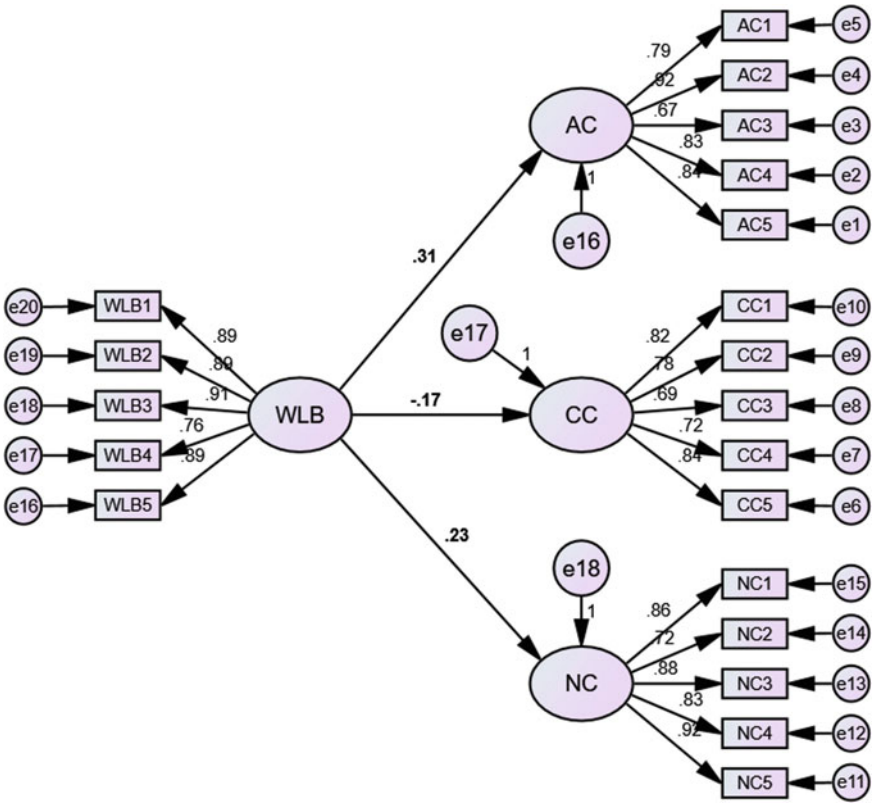

Fig. 2 Research structural model

($\beta = 0.233$, $P = 0.000$). Based on these results, the three research hypotheses were supported, which means that WLB.

Table 4 Results of hypotheses testing

Hypotheses	Paths			β	P
H1	WLB	→	AC	0.312	0.000
H2	WLB	→	CC	−0.171	0.000
H5	WLB	→	NC	0.233	0.00

4 Results and Discussion

The aim of this study was to investigate the effects of work-balance life on organizational commitment dimensions (i.e., affective commitment, continuance commitment, and normative commitment. Hence, three hypotheses were suggested. The first hypothesis assumed that WLB has a significant effect on affective commitment (H1); the second hypothesis postulated that WLB has a significant effect on continuance commitment (H2), and the third one suggested that WLB exerted a significant effect on normative commitment (H3). All these hypotheses were supported by the current data. In terms of the directions of the effects, the results showed that WLB had positive effects on affective commitment and normative commitment and a negative effect on continuance commitment. In comparison with previous works, it was noted that the first result, i.e., the significant positive effect of WLB, was echoed by Tayfun and Çatir (2014). Moreover, the second result, i.e., the significant negative effect of WLB, was found by Shabir and Gani (2020). Finally, in line with the current third result, some previous studies (e.g., Dávila, 2019) pointed out that WLB had a significant positive effect on normative commitment. In fact, these results can be explained based on the nature of each dimension of OC construct. That is, the differences between these dimensions is the reason behind these results. Emotional encourages of the individual to continue in the organization because he/she feels happy. In the case of continuance commitment, the criterion for the employee to remain in the organization is the costs incurred by him/her if he/she leaves the organization. WLB also helps to improve normative commitment because the employee feels responsible for the organization.

5 Research Conclusion and Recommendations

The study concluded the importance of WLB in improving the level of organizational commitment of the employee, and therefore organizations must focus on the other side of the employee's life, which is the personal life and providing the appropriate organizational climate that does not make the employee obliged to stay in the organization because there is no other alternative.

The Influence of Enterprise Risk Management Framework Towards Company Performance at Conglomerate Group of Companies

Azman Makmor, Nurhanan Syafiah Abdul Razak, Musmuliadi Kamaluding, and Muhammad Alshurideh

Abstract This study explores the influence of Enterprise Risk Management (ERM) framework implementation on the company performance at a conglomerate group of companies, DRB-HICOM Berhad (the Group). This study intends to solve the problem in assessing the relationship between company performance and ERM implementation by focusing on the companies that standardized their ERM implementation towards all subsidiary companies with multi-type of businesses. In this theoretical analysis, quantitative research with correlational research design will be used, and sampling analysis will be done based on the data samples from 3 main business sectors (namely automotive, properties and services) in the Group and both primary and secondary data from Group subsidiary companies. The evaluation on the adoption of the Committee of Sponsoring Organization of the Treadway Commission (COSO) ERM framework within the subsidiary companies will be a key in assessing the ERM practices within the Group. At the same time, the company performance was measured from the company revenue achievement. Different from previous researches done by previous scholars where the studies were only analyzed on one

type of business (single way of ERM implementation only and without comparison) or were done on multi-type of businesses/companies (where too many ways of ERM implementation) which contributed to the failures in assessing the relationship between companies performance and ERM implementation, this study will provide a new solution on the above shortcomings by analyzing the companies (with different type businesses) that have an identical implementation of ERM framework across the Group. This may help future researchers and ERM practitioners to develop better standardization of ERM implementation based on the COSO framework. This paper also provides an insight into the best practices in the ERM to be implemented in other companies or organizations, which will impact the company in terms of financial and non-financial performances.

Keywords Enterprise Risk Management (ERM) · Company performance · Revenue · The Committee of Sponsoring Organization of the Treadway Commission (COSO)

1 Introduction

In the world of globalization in the 21st century has created a more complex, interdependent, and uncertain world than ever witnessed before. The opportunities and challenges have come together with significant risks to a business organization (Power, 2013). For instance, the well-known financial crisis in 1998 (Asian financial crisis) and 2007 (global financial crisis) led Lehman Brothers, the United States giant investment bank went bankrupt in the year 2008. The situation has continued and spread to other countries in the whole world.

As business opportunities and risks are constantly changing, organizations need to continuously identify, assess, manage, and monitor their business opportunities and threats (Protiviti, 2006). Effective risk management in the organization can minimize the impact on any crisis events and may create opportunities for the organization to succeed in today's business environment.

Enterprise Risk Management (ERM) is an integrated approach, structured and very systematic tool for management to comprehensively manage, evaluate and mitigate all the risks in the organization to successfully achieve the organization's objective (Dickinson, 2001). Exemplary ERM implementation will benefit the company in financial impact as company performance.

Many kinds of research tried to study, investigate, and examine the relationship between ERM implementation impacts the company's performance. However, due to a lack of reliable and standard methods, most of the studies failed to address the influence of ERM framework towards company's performance. The relation between company performances with ERM has still not been resolved and needs further study to be done in this field by scholars and researchers (Mikes & Kaplan, 2013; Fraser & Schoening-Thiessen, 2010).

In previous ERM researches, most of the studies are done on a specific type of business or organization, and no research has been done on the group of companies with diversified businesses. Generally, this study aims to envisage the influence of the ERM framework on company performance in a conglomerate group of companies with diversified businesses.

Diversifying the business will offering a lot of advantages and opportunities to the group of companies. It will offer a better choice to customers, build trust in the services or products offered, create a new potential range in an additional stream of revenue, and most important is it could spread the business risks among the companies in the group (Raymond, 2016). This also is well known as a conglomerate group of companies. Merriam-webster has defined 'conglomerate' as 'A widely diversified corporate' (Merriam-webster, 2020).

2 Background of the Study

This study is conducted in one of Malaysia's largest and most diverse conglomerates, DRB-HICOM Berhad ("DRB-HICOM" or the "Group"). As a conglomerate group of companies, DRB-HICOM involves many business sectors such as automotive, services, properties, hospitality, and education. Despite having a good business reputation in the country, running a diversified business requires the Group to cautiously manage their risks as an overextension of company resources, lack of expertise, high operation cost, and reduced innovation are the challenges DRB-HICOM must face in sustaining their businesses.

As a corporate practice in the Group, all the CEOs or Head of Companies will prepare their organization Annual Management Plan (AMP), containing company business objectives and strategic plans to sustain and grow the business. The AMP will be presented and to be approved by the Group General Managing Director (GMD). The performance of the AMPs will be monitored by various Board Committees and Senior Management members in the Group, namely Board Audit Committee (BAC), Board Nomination and Remuneration Committee (BNRC), and Board Risk and Sustainability Committee (BRSC).

The responsibilities in identifying principal risks and ensuring the implementation of an appropriate system to manage these risks are delegated to the Board Risk and Sustainability Committee (BRSC), supported by the Group Risk Management Committee and chaired by GMD (Group CG Report, 2019). To ensure the risk management is well-practiced within the Group, COSO ERM Framework and ISO 3100 are two primary standards that being references to the Group.

In Malaysia, Risk Management (RM) is governed through corporate governance, which set out from essential requirements which are coming from Bank Negara Corporate Governance (BNCG) policy, Malaysia Companies Act 2016, Malaysia Code of Corporate Governance (MCCG) 2017 by Securities Commission of Malaysia and Bursa Securities Main Market Listing Requirement (MMLR) by Bursa Malaysia.

Most of the companies in Malaysia are only complying with the requirements without gauging the effectiveness of the ERM implementation in their organizations. Even though they believe there is a good impact from the ERM implementation in their organization. Still, due to the non-existence of reliable method to determine the ERM effectiveness and performance, most organizations do not care about how they manage their risks as long as the implementation meets the requirements (Kraus & Lehner, 2012).

In response to this problem, the study envisage how the eight elements in the ERM framework established by COSO may affect company performance at the conglomerate group of companies.

3 Literature Review

In the past few decades, many researchers are being published by academic researchers and practitioners in conducting studies of characteristics and the implementation of ERM (Fraser & Simkins, 2010). In determining the focus and scope of this study, previous major studies on ERM have been studied to develop a group of study streams. Based on the previous 19 major studies on ERM, the studies stream has been categorized into four categories, as shown in Fig. 1.

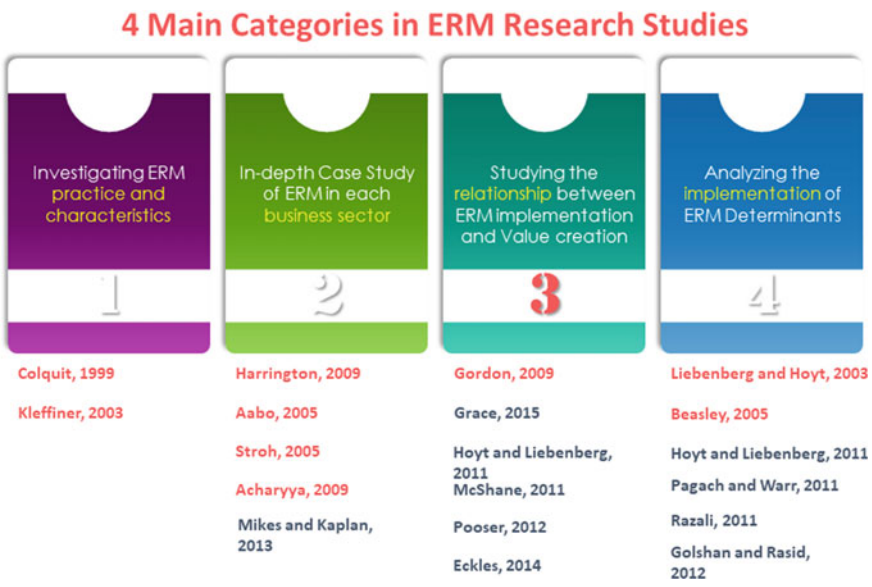

Fig. 1 Table of ERM main study streams

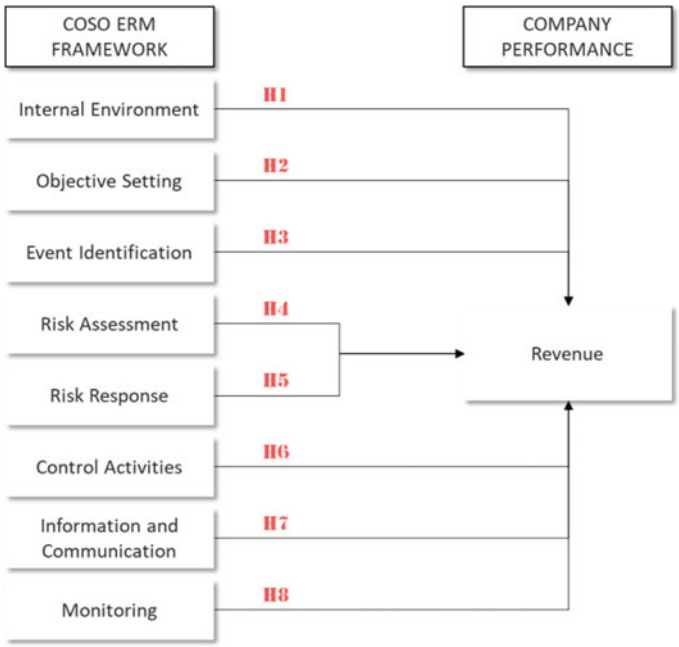

Fig. 2 Research conceptual framework

As shown in Fig. 1 above, the first category of ERM studies is the studies investigating ERM practice and characteristics (namely Colquit et al., 1999; Kleffner et al., 2003).

The second category is the studies making in-depth ERM case studies on specific business sectors (namely Aabo et al., 2005; Acharyya, 2009; Harrington et al., 2009; Mikes, 2009; Stroh, 2005).

The third category is the studies examining the relationship between ERM implementation and value creation (Gordon et al., 2009; McShane et al., 2011; Hoyt & Liebenberg, 2011; Pooser, 2012; Eckles et al., 2014; Grace et al., 2015).

Lastly, the fourth category is the studies that are analyzing the implementation of ERM determinants only (namely Beasley et al., 2005; Golshan & Rasid, 2012; Hoyt & Liebenberg, 2011; Liebenberg & Hoyt, 2003; Pagach & Warr, 2011; Razali et al., 2011).

Based on Fig. 1 above, the focus and scope of this study are under category three, which examining the relationship between ERM implementation and value creation (e.g., company performance). In-depth searching on the research that falls under this category has been done, and there are 34 kinds of research that have a similarity with this study's topics.

Further, post examining the research titles, theories, and methodologies, five kinds of research are found with close similarity with this study. Table 1 summarizes the

prominent writers and sources selection process (e.g., Teoh & Rajendran, 2015; Kashif & Fong, 2018; Ryan, 2013; Kingsley, 2017; Husam, 2017).

3.1 Research Gap Analysis

Based on the above, five prominent writers and their researches have been identified as primary sources to this study due to the similarity in the title, dependent variables, independent variables, theories, and methodologies applied in their studies.

To identify the central issues in this study, the bridges between previous topics in the primary sources need to be built. They need to be criticized as this could help in identifying the gap between previous scholarly works. The critics are tabled as per Table 2. The critics are mainly on the inconsistent and unreliable company performance measurement variables where only Return of Equity (ROE) or Return of Asset (ROA) are only being used to measure company performance.

3.2 Company Performance

Company performance which is also defined as business performance is part of an organization's effectiveness. In this 21st century, company performance is focused on how organizations fully utilize their resources to improve their capabilities and abilities in achieving their objectives (Taouab & Issor, 2019; Alshurideh et al., 2020; Alshurideh et al., 2021; Alzoubi et al., 2021; Kabrilyants et al., 2021; Tariq et al., 2022).

As one of the essential management tools for improving business performance, ERM practices also help reduce different types of risk exposure to the business (Yang & Ishtiaq, 2018). A company with established ERM practices typically enjoys high operational performance and high revenue compared to a company with a lack of ERM practices (Callahan & Soileau, 2017). It is not doubted that there is a significant positive association between ERM practices and company business performance (Callahan & Soileau, 2017; Florio & Leoni, 2017; Zou & Hassan, 2017).

Based on the research gap analysis in 3.1, to have a good measurement of company performance, it is essential to measure both ***Financial Market Measurement*** (Market valuation-Tobin's Q) and ***Business Measurement*** (Revenue, Gross Profit, GP, Profit Before Tax, PBT, and growth rate) and accounting measurement (Return on Assets, ROA, and Return on Equity, ROE). The description of each element are described as below.

i. **Market Valuation (Tobin's Q):** (Q ratio or Tobin's Q) equals the market value of a company divided by its assets' replacement cost.
ii. **Revenue:** Units Sold x Sales Price.
iii. **Gross Profit (GP)**: Revenue—Cost of Goods Sold.

Only ROE as DV
Husam (2017)	COSO ERM implementation in Jordanian commercial banks and its impact on Financial Performance	Financial performance (ROA, ROE, D/E, CAR, NPL)	Same as above (8 components in COSO ERM Framework)	Jordan Commercial banks	Concluded the COSO ERM implementation is maintaining a high level of execution	Not reliable DV. Only ROA as DV

iv. **Profit Before Tax (PBT)**: Computed by getting the total sales revenue and then subtracting the cost of goods sold, operating expenses, and interest expense.
v. **Growth Rate**: (Current total revenue—Last year total revenue)/Last year total revenue
vi. **Return on Equity (ROE)**: Calculated by dividing net income by shareholders' equity. ROE is considered the return on net assets.
vii. **Return on Asset (ROA)**: Calculated by dividing net income by average total assets. ROA shows how much profit a company can generate from its assets.

This study is proposing for all these elements to be measured as company performance. Not all types of businesses are operating with the same business model, where the best measurements to measure their performances are different depending on their business model or type of business. Thus, incorporating all these elements like a company performance will produce higher accuracy in measuring company performance achievement.

However, due to the limitation of research time constraint, this study will only discuss the revenue as a measurement for the company performance, as in the DRB-HICOM Group, revenue is the most anticipated figure by the management as a company performance indicator in this diversified business of a conglomerate group of companies.

3.3 ERM Framework Components

One of the biggest problems and difficulties in implementing the ERM framework in an organization is that there are many definitions and practice standards in ERM (Aven, 2012). In this study, the COSO ERM framework is chosen as the independent variable. COSO ERM Framework is the most accepted and practiced ERM framework by organizations (Perera, 2019). There are eight components in the COSO ERM framework, which are explained as per below:

3.3.1 Internal Environment

The internal environment influences the establishment of company strategies and objectives (Al Mehrez et al., 2020; Alshurideh, 2019; ELSamen & Alshurideh, 2012). Consideration of the internal environment is essential in determining risk appetite and integrating ERM with related initiatives. ERM's supportive internal environment is a fundamental requirement for successfully implementing an effective ERM system in an organization. The internal environment represents the "tone of the top management" that encompasses the management attitude and awareness about the importance and the relevance of the ERM towards creating and preserving the company's value. The integrated framework's internal environment represents the organization's tone, including the risk management philosophy and risk appetite.

According to Kinyua et al. (2015), they recognize a significant association between internal control environment and financial performance. According to Liebenberg and Hoyt (2003), in one of their articles on "The determinants of enterprise risk management: evidence of the appointment of chief risk officers" states that this context, it is believed that ERM supportive internal environment facilities a culture of risk aligned decision making that would positively affect the company performance.

3.3.2 Objective Setting

Selects a strategy that is utilized throughout the enterprise and aligned with and linked to the strategy (Alaali et al., 2021; Ashal et al., 2021). The point when management sets its objectives is the point they set their risk. Management needs to develop their objectives by considering the corresponding risk of achieving them. According to Gates et al. (2012), most ERM frameworks assert that risk should be identified concerning the company objectives. As per the COSOs ERM integrated framework (2014), company objectives should be aligned within the company's risk appetite and risk tolerance levels. The company engaged in ERM should better understand the aggregated risk of different business activities, providing them with a more objective basis for resource allocation that will improve return on equity (ROE) and capital efficiency (Eikenhout, 2015). According to Hoyt and Liebenberg (2011), ERM strategy aims to reduce volatility by preventing aggregation of risk across different sources. In the DRB-HICOM Group, it's an essential responsibility for the CEO to establish company's long term objectives. When the objective setting and risk are aligned, this will help top management to consider any opportunities and threat in setting the objectives for the company. With different type of businesses in the Group will established a different type and nature of the risk for the companies and definitely the type of objectives also are determined by this factor. Company objective setting is always driven by the estimated revenue that has been set by the DRB-HICOM Group, and these expected revenue is always associated with the risk elements. To this effect, it is the time of the company's objective setting to set its desired risk appetite effectively.

3.3.3 Event Identification

Event identification takes into consideration both internal and external factors that affect event occurrence. By having a consideration on internal and external factors will help companies in the Group to predict any favorable or unfavorable situation that might become a obstacle for the companies to achieve their objectives. This component will stimulate companies to make an early identification and make a proper and suffice preparation to face any events which may impact negatively or positively to the company performance. As such, event identification minimizes the risk of facing business surprises will minimize volatility in return and improve company's financial performance. According to COSO's ERM integrated framework,

it is very important for a companies to identify internal external events that will give an impact towards company in achieving their objectives and the impacts have to be distinguished between the threats and opportunities. The identified opportunities are channeled back into company's objective setting (COSO, 2004). By identifying the events and managing the threat and opportunities, will help companies to set a right strategies to ensure the company's long term objectives.

3.3.4 Risk Assessment

Allows an entity to consider how potential events might affect the achievement of objectives. Risk assessment encompasses assessing the likelihood and impact of events affecting the achievement of a company's objectives. It enables an organization to determine a more approach to address the risk factors emerging from the internal and external environment. Unlike the ISO 31000 standard on ERM (2009), which recognizes only the residual risk, ERM integrated framework assesses the risk on both inherent and residual basis. According to Solomon and Muntean (2012), a company's risk assessment based on leverage coefficients is required for the predicted behavior analysis for estimating future results. According to Deloitte and Touche LLP; Curtis and Currey (2012), Risk assessment is essential since it is how enterprises handle how significant each risk is to the achievement of their overall goals.

3.3.5 Risk Response

Management identifies risk response options and considers their effect on event likelihood and impact concerning risk tolerances and costs versus benefits and implements response options. Based on the risk assessment and in the light of the company's risk tolerance and appetite, management should decide upon the suitable response to each identified risk factor choosing amongst the risk avoidance, risk acceptance, risk-sharing, and risk reduction. An effective risk responding strategy is expected to have a positive impact on the company's performance. According to Vollmer (2015), a cost-effective and efficient risk response plan helps balance risk mitigation with the expected benefits of the strategic program.

3.3.6 Control Activities

Control activities ensure the completeness, accuracy, and validity of the various policies and procedures. Control activities are also designed to address the identified risk factors involves the management's policies and procedures to ensure that risk responses are effectively implemented. Some researchers assert that the effective implementation of control activities enhances operating efficiency and enhances company performance. According to Munene (2013), results established a significant relationship between an internal control system and financial performance.

Eniola and Akinselure (2016) state that effective internal controls will significantly improve financial performance by helping the organization to substantially reduce fraud perpetration. According to Beeler et al. (1999), internal controls provide an independent appraisal of the quality of managerial performance in carrying out assigned responsibilities for better revenue generation. Control activities usually strengthen the company's internal control functions, which enhances the efficiency and effectiveness of the operations affecting the company's performance positively.

3.3.7 Information and Communication

Information and communication are to process and refine large volumes of data into actionable information (Alshurideh et al., 2014; Alyammahi et al., 2020). Effective information communication channel is vital to achieving the intended benefits of an integrated risk management framework. Effective integration can only be achieved by ensuring effective communication among the related functions and people throughout the organization. This is a crucial feature that differentiates ERM from traditional silo-based risk management. The improvement in the organization's risk profile information is another potential source of value created by ERM (Eikenhout, 2015). According to Chaffey and Wood (2005), as cited by Olugbode et al. (2008), decisions tend to be more informed and effective when the communication is thorough and accurate. Enhanced communication of risk information lets the organizational managers make informed and risk-aligned decisions, leading to better performance.

3.3.8 Monitoring

The process of monitoring or assessing both the presence and functioning of the enterprise risk management components and the quality of the performance over time is a key factor in the process.

3.4 Relationship Between ERM Framework and Company Performance

Compared to other studies that have been done on studying the relationship between ERM framework and company performance, this research will provide better and reliable measurement on the study of the influence of ERM framework and company performance as this study will be tested not only on a single type of business but will be tested to many types of organization that exercising the same ERM implementation in their company as they being managed by a single risk management group at the holding company.

The hypothesis of this study is to propose a relationship between COSO ERM Framework (independent variables—control and change) and Company Performance (dependent variable—observes and measures). The description of the relationship between these two variables are constructed as below:

3.4.1 Internal Environment—Revenue

According to Kinyua et al. (2015), they recognize a significant association between internal control environment and financial performance. According to Liebenberg and Hoyt (2003), in one of their articles on "The determinants of enterprise risk management: evidence of the appointment of chief risk officers" states that this context, it is believed that ERM supportive internal environment facilities a culture of risk aligned decision making that would positively affect the company performance. Thus, this study derives its first hypothesis concerning ERM adoption as below:

H1: There is an impact from the internal environment in increasing the revenue at the conglomerate group of companies.

3.4.2 Objective Setting—Revenue

According to Gates et al. (2012), most ERM frameworks assert that risk should be identified concerning the company objectives. According to Hoyt and Liebenberg (2011), ERM strategy aims to reduce volatility by preventing aggregation of risk across different sources. The company engaged in ERM should better understand the aggregated risk of diverse business activities, providing them with a more objective basis for resource allocation that will improve return on equity (ROE) and capital efficiency (Eikenhout, 2015). Thus, this study derives its second hypothesis concerning ERM adoption as below:

H2: There is an impact from objective setting in increasing the revenue at the conglomerate group of companies.

3.4.3 Event Identification—Revenue

According to COSO's ERM integrated framework, the internal and external events affecting a firm's objectives must be identified, distinguishing between risks and opportunities. Opportunities are channeled back to management's strategy or objective-setting process (COSO, 2004). Thus, this study derives its third hypothesis concerning ERM adoption as below:

H3: There is an impact from event identification in increasing the revenue at the conglomerate group of companies.

3.4.4 Risk Assessment—Revenue

According to Solomon and Muntean (2012), a company's risk assessment based on leverage coefficients is required for the predicted behavior analysis for estimating future results. According to Deloitte and Touche LLP; Curtis and Currey (2012), Risk assessment is important since it is how enterprises get a handle on how significant each risk is to the achievement of their overall goals. Thus, this study derives its fourth hypothesis concerning ERM adoption as below:

H4: There is an impact from risk assessment in increasing the revenue at the conglomerate group of companies.

3.4.5 Risk Response—Revenue

According to Vollmer (2015), a cost-effective and efficient risk response plan helps balance risk mitigation with the expected benefits of the strategic program. Thus, this study derives its fifth hypothesis concerning ERM adoption as below:

H5: There is an impact from risk response in increasing the revenue at the conglomerate group of companies.

3.4.6 Control Activities—Revenue

According to Munene (2013), results established a significant relationship between an internal control system and financial performance. Eniola and Akinselure (2016) state that effective internal controls will significantly improve financial performance by helping the organization to significantly reduce fraud perpetration. According to Beeler et al. (1999), internal controls provide an independent appraisal of the quality of managerial performance in carrying out assigned responsibilities for better revenue generation. Thus, this study derives its sixth hypothesis concerning ERM adoption as below:

H6: There is an impact from control activities in increasing the revenue at the conglomerate group of companies.

3.4.7 Information and Communication—Revenue

The improvement in the organization's risk profile information is another potential source of value created by ERM (Eikenhout, 2015). According to Fisher and Kenny (2000), as cited by Olugbode et al. (2008), they suggest that organizations infuse information systems into their operations to enhance competitiveness and facilitate business growth and success. According to Chaffey and Wood (2005), as cited by Olugbode et al. (2008), decisions tend to be more informed and effective when the communication is thorough and accurate. Thus, this study derives its seventh hypothesis concerning ERM adoption as below:

H7: There is an impact from information and communication in increasing the revenue at the conglomerate group of companies.

3.4.8 Monitoring—Revenue

According to Wholey et al. (2010), government monitoring and evaluation are used to increase transparency, strengthen accountability, and improve performance. The monitoring function could be an ongoing process or timely evaluation aiming to decide whether further modifications are required for the company's ERM. Thus, this study derives its eighth hypothesis concerning ERM adoption as below:

H8: There is an impact from monitoring in increasing the revenue at the conglomerate group of companies.

4 Research Conceptual Framework

Research Underpinning Theory—The Theory of Business Performance Measurement

Business performance measurement could be measured from 3 functional analyses, such as an accounting perspective, marketing perspective, and operations perspective (Neely, 2002). These three perspectives are derived from the theories and concepts underpinning the field of business performance measurement. The theory of 'Risk in performance measurement' from Andrew Likierman has highlighted that risk management is an essential tool that needs to be integrated into business management (Likierman, 2007).

The research framework for this study is developed based on the gap found in previous literature. As explained in 2.6.2, there is a need to further the analysis in determining the influence of the ERM framework on company performance by incorporating reliable indicators to measure the relationship between the ERM framework and company performance.

From this study, it is expected to find the key determinants in the ERM framework that will impact company performance. A conceptual framework below illustrating the expectations to find through this research and also mapping out the relations between ERM framework determinants (Independent Variables) and company performance (Dependent Variables):

5 Research Methodology

The issues in this study will be studied and analyzed by adapting the quantitative research strategy. The research questions also will be addressed by using the quantitative research strategy. By using this research strategy, all the data are gathered and compiled from a survey questionnaire in analyzing the implementation and execution of the ERM framework in the Group subsidiaries.

This research target population for the survey is the whole population of a group of companies under DRB-HICOM Berhad (subsidiary companies). This is to allow to understand the current of ERM implementation ERM in the Group. Samples are clustered based on the type of business (business sectors) of the subsidiary companies. Cluster sampling design is used, and no stratification involves in population sampling.

The sampling unit for this study research is the number of subsidiary companies selected and available as a study sample. The sampling size for this study is the number of companies in DRB-HICOM Berhad (Group) that implemented ERM and practicing the same standard as per Group guidelines, which are around 40 to 45 companies. Due to this study is aiming to seek a practical ERM component to be used in performance measurement and recognize the current state of risk management in a conglomerate group of companies, it is utmost essential to obtain a survey feedback from an expert or person who is managing and governing the process of risk management within a subsidiary companies in the Group. The surveys are disseminate to all CEOs, Chief Risk Officer (CRO), Chief Financial Officer (CFO), or Risk Manager, Risk Management Committee members across the subsidiary companies in the Group.

On the statistical analysis method, descriptive statistics, cluster analysis, and factor analysis are the analysis methods that will be used in this study. Descriptive statistics are used in this research in describing the basic features of the collected data. This method provides a summary of the sample and the measures. Using this method helps simplify large amounts of data sensibly as each descriptive statistic reduces a lot of data into a more straightforward summary (Trochim, 2007). Cluster analysis is used in this study to analyze the influence of ERM implementation from different business sectors in the Group. Principal Component Analysis (PCA) is used to reduce the number of variables to components and use the principal component regression score. In this study, Partial Least Square (PLS) Regression is used to extracting latent factors when there remains factor variation in modeling, which is sometimes called a projection to latent structure that is still unobserved in structural equation modeling (Rannar et al., 1994).

In this research, Data Processing, the SPSS program has been identified to analyze the collected data and information. The original name for this software was Statistical Package for the Social Science (Quintero, 2012). For the current version (post-2015), the version name was changed to Statistical Product and Service Solutions (Hejase and Hejase, 2013). For Cluster Analysis, SPSS offers three methods, namely K-Mean Cluster, Hierarchical Cluster, and Two-Step Cluster. SPSS also be used for

Licensed to (putm@utm.my)

both Factor Analysis, i.e., Principal Component Analysis (PCA) and Partial Least Square (PLS) Regression.

Based on the regression model's data, it will be used to determine the relationship and influence of the ERM framework towards company performance.

6 Study Conclusion

By implementing risk management in an organization, the impact from crisis event to organization may be mitigated or reduced. The implementation also may create potential opportunities for organizations to achieve their business objectives and strategies. As a management tool, Enterprise Risk Management (ERM) is being used by an organization in managing, evaluating, and mitigating the risks that might become an obstacle to an organization in achieving its objectives. Well implementation of ERM will have a good impact on company financial performance. However, most of the previous studies could not resolve the problem in assessing the relationship between ERM implementation and a company's performance due to a lack of reliable and standard methods. Thus, the relationship between company performances with ERM has still not been resolved and needs further research in this area by academics.

Based on the literature study, there are none of the previous studies have been done on the conglomerate group of companies with having a standard ERM being implemented in all their subsidiaries companies. Many studies have been done to resolve the problem in assessing the relationship between ERM implementation and a company's performance, but due to a lack of reliable methods, they are unable to resolve the issue. As this study focuses on examining the influence of the ERM framework on company performance in a conglomerate group of companies, we could envisage how the COSO ERM framework will quantify the ERM implementation in the conglomerate group of companies and fill the literature gap.

As the number of implementation of ERM in organizations increases, the pressure in implementing the ERM creates a thought to researchers, risk practitioners, business owners, and organizations on whether ERM could generate a value and give a good impact as a return on the implementations.

Most of the scholars, law custodians, regulators, consultants, and corporate governance practitioners suggest that the implementation of ERM can positively impact the company's performance. This is viewed by many companies currently adopting the ERM framework in their organizations based on international standards.

This thesis provides an insight to organizations on the ERM implementation that will helps in determining factors that will influence the company performance. The benefits of this research are divided into several beneficial parties as follow:

Organization—Board of Directors, Chief Executive Officer (CEO), and senior management of the organization will prepare and develop much resilience and better strategies in achieving organizational objectives. Well implemented ERM

framework in an organization will provide reliable insight for management in preparing the company's Annual Management Plan (AMP), company strategic initiatives, the annual budget for Capital Expenditure (CAPEX), and Operational Expenditure (OPEX) and cash flow projection.

Holding company—Having a well-implemented ERM framework in all subsidiary companies will help the holding company examine the ERM implementation gap among the subsidiary companies. Companies with a low level of ERM performance must be assessed on the ERM implementation in their organization to increase the effectiveness of the ERM framework in respective companies. By understanding the relationship between ERM performances and company performance, a holding company might determine any threat in advance or any potential opportunities for the subsidiaries. This will help the holding company provide a good and accurate insight for reporting to the shareholders or for public information to increase the interest of potential investors to invest in the group of companies.

Researchers—Lack of effective determinants for ERM is the main obstacle of good ERM implementation measurement (Beasley et al., 2008; Gordon et al., 2009; McShane et al., 2011; Pagach & Warr, 2010). This study provides an approach to determine the most influential factor in the ERM framework that will impact company performance and gauge the effectiveness of ERM framework implementation in the organization. Researchers may adopt this reliable approach to conduct further studies in ERM framework implementation in various fields of business.

Regulators—In Malaysia, most of the regulators/custodians that governing the risk management didn't put any obligation to recognize listed companies that comply with any ERM framework. However, the regulators are actively supporting in maintaining effective risk management in all organizations in Malaysia through various channels such as Malaysia Companies Act 2016 (Sect. 246), Bursa's Listing Requirement (Paragraph 15.12, 15.23, 15.26), Malaysia Code of Corporate Governance 2017 (Chapter 9.1, 9.2) and Bank Negara Risk Governance 2013. This study may guide the best practice of ERM framework implementation for regulators to prepare a proper guideline or policy in the future.

Examining Employee Performance During Covid-19 Pandemic: A Study of Aerospace Manufacturing Industry in Malaysia

Mohd Zulkhaizlan Sinor, Nurhanan Syafiah Abdul Razak, Mohamad Zamhari Tahir, and Muhammad Alshurideh

Abstract During Covid-19 pandemic situation, a lot of company facing problem in sustaining their businesses. Most organization has response to the current situation in maintaining the business sustainability. Unfortunately, the changes have been made by management has given significant impact on employee performance. This quantitative study is to examine the relationship between motivation, work environment and work from home towards employee performance. The target respondents of this study are among employee in an aerospace manufacturing company in Malaysia during Covid-19 pandemic situation. Statistical Product and Service Solutions (SPSS) and Analysis of a Moment Structures AMOS will be used in analyzing the data that has been collected to get the accuracy of result. The finding shows that motivation, work environment and WFH have a significant relationship with employee performance. The finding of this study is to provide insights to manufacturing company in managing strategic change management during Covid-19 pandemic as well as for future studies in revealing the factors that influence employee performance.

1 Introduction

The end of 2019 is the beginning of a kind of epidemic known as the novel corona virus (Covid-19). The virus has become a worldwide pandemic causing a high number of deaths. In addition, the pandemic has also hampered economic sectors around the world starting in 2020 (Alshurideh et al., 2021; Amarneh et al., 2021; Wang et al., 2020). This Covid-19 pandemic crisis has affected to the uncertain global economic, social and community that cause leadership to response and make significant changes in an organization to strengthen company financial stability and plan for future growth (Al-Dmour et al., 2021; Leo et al., 2021; Shah et al., 2021). When a significant change is required, leadership should quickly increase their sense of the situation and adjust their competency as well as responding to it by relying on their professional's instinct and Human Resource Development, HRD. Critical planning of strategic change management is required. Changes to a more transformational leadership style are needed in making effective decisions on the survival of the company. This is because, an organization will grow under leaders that gives a strong purpose and roles, excellent communications, share their leadership values, concern on employee's emotional stability, make sure employees can access to the technology, ensure the organizational health and resilience during the pandemic.

Readiness to change and careful planning can derive the effectiveness of transformational leadership. Periodic evaluations as well as appropriate incentives in making change plans are important for every management. To attract employee commitment and create a common vision, a comprehensive effort in changing the attitudes, values and beliefs of all employees is among the normative methods of using the hearts (empathy) and minds in making plans. With good communication and interaction between leadership and followers, providing knowledge and clear organizational goals is one of the adaptive planning methods. Change requires negotiation, consensus and agreement from the interactions that take place (Abbasi, 2017).

While change is taking place, the ability of transformational leaders to motivate their employees is important in shaping the culture of a fair organization. In other words, fair interactional and procedural become important factors in increasing intrinsic motivation and preventing demotivation from occurring among employees in the organization (Deschamps et al., 2016).

Strategic change management is very important in making strategic decisions in determining and planning the future of a company. It is more about planning for the long term to ensure the future growth of the company such as formulating strategies, implementing strategies and re-evaluating the strategies implemented as well as making improvements (Lynch, 2018). Effective strategic change management gives the company value added, seeks, creates and strengthens in overcoming its competitive position (Fuertes et al., 2020).

1.1 Overview of Selected Company

CTRM Aero Composites is a wholly-owned subsidiary of Composites Technology Research Malaysia Sdn Bhd (CTRM) of which CTRM Sdn Bhd is a member of DRB Hicom. CTRM is a composite component manufacturer in the aerospace manufacturing industry sector which is confined to the wings and engine cover of an aircraft, supply for main commercial aircraft manufacturer in the world such as Airbus SE and Boeing Co. As the pandemic strike down the world's economy, airliners delaying the aircraft ordering or even canceling order books due to high fuselage reserves. CTRM also did not escape from this crisis since customers have reduced their demand by approximately 40% and this has impacted in a reduction of company revenue. The company needs to survive to maintain in this sector of the industry, otherwise 2200 of employees will lose their jobs.

1.2 Background of Study

Covid-19 pandemic has swept away billions from the aviation industry where the global crisis has narrow down the profit margin as well as weakened the sector growth. The crisis has given a global impact on air traffic where a drastic drop in the number of world flights is due to the Movement Control Order (MCO) across the country to curb the virus from further spreading. International flights have a very bad impact compared to domestic flights. However, the domestic aviation market experienced a steady decline due to lack of demand for airlines (Suau-sanchez et al., 2020).

According to the International Civil Aviation Organization (ICAO) reported on 25th May 2021, there was a significant decline of 60% overall in passenger numbers and about USD 371 billion of airline revenue suffered losses on gross passenger operations, impact from the Covid-19 pandemic on world scheduled passenger traffic for 2020 compared to the previous year. Nevertheless, in 2021, the decline in passenger volume is estimated at 41–49% with approximately a fall in revenue on airlines from USD 274 billion to USD 322 billion of gross passenger operations (ICAO, 2021). The crisis has narrow down the profit margin as well as weakened the sector growth.

Some leaders will respond to the crisis by rising up and facing the challenge of strengthening the economy, society and community while there are also leaders who will disappear from the struggle. At that time, authentic leaders will help the entire system in an organization and strive to overcome limitations and fears as well as further increase their performance (Dirani et al., 2020). A crisis is something unexpected that can cause stress in an organization. It occurs when there is a strategic gap due to a lack of adaptation to the changes taking place in the organization. Strategic leadership plays important roles in crisis management process (Obeidat & Al Thani, 2020). In every change that leaders have made in setting goals, they will lead to the overall performance in the organization which is basically determined from the performance of the employees.

Employees will become depressed due to the financial pressures faced during the crisis which in turn affects their productivity. In the efforts of the management has been carried out in ensuring the stability of the company has resulted in a negative impact on employee morale. Employees will feel insecurity in their jobs, fear of a pandemic, unable to adapt in the new norm situation as well as feel anxious about the future of the company. This has caused employees to lose their focus in achieving company goals as a result in declining of employee performance and in turn have an impact on the organizational performance.

In existing studies, researchers study the effects of Covid-19 pandemic on employee performance in the global aviation industries were limited to aviation services providers as well as air transportation (Alkadash & Alamarin, 2021; Buhusayen et al., 2020; Liu et al., 2020; Melas & Melasová, 2020; Suau-sanchez et al., 2020). However, there is a limited study on the effect of employee performance in aerospace manufacturing sector. Therefore, this study will determine the factors that will influence employee performance through motivation, work performance and Work from Home.

2 Literature Review

2.1 Employee Performance

Employee Performance (EP) is dependent variable that need to focus on this study. In an organization, the organizational performance indicates a company's ability to achieve independent goals efficiently. The employee performance is among the elements that can assess the efficiency of an organization through its level of productivity (Almatrooshi et al., 2016).

Employee performance can be influenced by many factors, especially during Covid-19 pandemic where the new normal changes affect employee performance. Reactions to change during a pandemic have a negative impact on employee performance. As organizations try to adapt to new situations or crises, there are changes that need to be made especially for safety. The changes basically are the barrier for employees to perform on their daily task to meet organization goals (Hamid et al., 2020).

2.2 Change in Management

To adapt in current situation, leaders need to react quickly and do some changes in strategic management plan in order to survive in the industry. Due to changes in management decision have resulted in several factors that have influenced the performance of employees. There are three factors as dimension for independent variables

Licensed to (putm@utm.my)

that need to be study which give the significant impact to Employee Performance. They are motivation, working environment and work from home.

2.2.1 Motivation

Motivation in work is measured through three components, namely the intrinsic motivation component, the extrinsic motivation component, and the demotivation component. Extrinsic motivation refers to rewards for an achievement, annual increments, food subsidies, and other things that refer to short -term motivation. Intrinsic motivation refers to appreciation, job security, good work environment, job safety, willingness to work with high commitment and others that include motivation for the long term.

By providing extrinsic motivation in the form of rewards such as overtime pay during the Covid-19 pandemic, rewards to employees who innovate in the employment process as well as savings in operating costs, etc. which play an important role in helping meet the company's operational needs. Nevertheless, it should be noted that this short-term motivation will not last long and will put risk to the company such as retrenchment, absenteeism, turnover, as well as job dissatisfaction, especially during this pandemic situation. It must be followed by intrinsic motivation whereby employees will feel more valued for success and performance achieved as well as safety in the workplace and strong working environment (Christian et al., 2020).

2.2.2 Work Environment

Every employee needs a comfortable and safe work environment, either physically or mentally. During Covid-19 pandemic, safety and optimal work environment can help employees to increase their job performance (Susilo, 2020). Therefore, it is important for an organization to create better work environment to make sure employees maintain their performance. It is because a conducive work environment can increase the efficiency of employees to work which will affect employee performance (Aropah et al., 2020).

2.2.3 Work from Home

WFH is known as telework where it is a flexible work arrangement when the employee works from home and is not in the office or on the production premises, without contact with colleagues, but the ability to communicate with colleagues using information and communication technology (Aropah et al., 2020).

Throughout the Covid-19 pandemic, work from home (WFH) has become an alternative for every company in pursuing day-to-day work. WFH will have a positive effect on employee performance where performance will increase as employees are given the freedom to reorganize work from home. WFH mode also can increase

stress on employees due to constraints that occur such as lack of resources and direction, disruption during WFH, fear of something unknown, technology issues, communication issues, time management, and so on (Sahni, 2020). However, there are advantages and disadvantages during WFH. The advantages of working from home are the working environment is more flexible, avoid transportation cost and traffic, no time constraint, very relaxing and not subject to the company rules. But the disadvantages are we need to pay electricity and internet cost. Besides, we will be more vulnerable to data security problems (Purwanto et al., 2020).

2.3 Underpinning Theory

Typically, employee performance will decline with organizational restructuring, innovation, mergers and downsizing. With effective leadership, employees' development, motivation, communication, organizational culture, and self-directed team can overcome employee performance problems (Daniel, 2019). In existing studies, researchers study the effects of Covid-19 on employee performance in global aviation industries were limited to aviation services providers as well as air transportation (Alkadash & Alamarin, 2021; Buhusayen et al., 2020; Liu et al., 2020; Melas & Melasová, 2020; Suau-sanchez et al., 2020). There are still limited of studies has been conducted on the effect of employee performance of the aero composite manufacturing sector.

There were a study shows the negative impact of Covid-19 and reaction to change on employee performance of Bangladesh. This is because they are unable to adapt to changes with new norms that affect the way they communicate and work concentration (Hamid et al., 2020). (Alkadash & Alamarin, 2021) recommend that SME's company need to consider motivation, work environment and job satisfaction factors where they show positive significant effect to the employee performance. In another study, employee motivation had a positive relationship to employee performance. Rewards and recognition are among the motivations that influence the positive relationship with employee performance. In addition, job security as well as a good work environment also have a positive relationship with employee performance. This hypothesis is as explained in Maslow's theory of Need Hierarchy because meeting their needs is more motivated and directed towards good output (Sandhu et al., 2017).

According to Christian et al. (2020), in the midst of the current Covid19 pandemics, the main needs of employees are focus on physiological needs in daily life as well as safety in employment, health and a strong work environment as other human needs are subject to current policies in curbing the current Covid-19 virus from spreading with the practice of physical distancing, self-quarantine as well as government movement control orders. The purpose is to maintain employee motivation throughout the pandemic.

Based on the results of previous studies, this research puts forward the following hypotheses:

H1: Motivation has significant impact to Employee Performance.

New normal has changed the work environment for any organization through Covid-19 pandemic. It has impact on daily activities where employees have limitation to perform daily tasks as they need to comply with government SOPs such as social distancing, wearing face masks, frequently wash their hands, sanitize workplace before and after working, no physical contact or attend any outside activities and implementation of MCO. From the study of the impact of Covid-19 on the employee performance of Bangladesh has shown the negative relationship where the fear of this pandemic has disrupted their daily routine, ways of communication and their behaviour (Hamid et al., 2020).

Based on the study, this study was made with hypothesis:

H2: Work Environment has significant impact to Employee Performance.

Based on a study wrote by Sahni (2020), among service industry employees, WFH can increase the level of stress and challenges. The findings of her study have supported the notion that the need for an effective organizational support system from management, society and psycho-social are very important. According to Susilo (2020) in his empirical study which are most of the respondents come from HR and Marketing sector shows, the people that work from home have a relationship with the job performance, job satisfaction, work environment and work motivation. However, they show that WFH has no significant relationship with job performance (Susilo, 2020). (Purwanto et al., 2020) showed the impact of WFH on Indonesian teachers where there are positive and negative impact on their performance.

The argument has come out with the next hypothesis:

H3: Work From Home has significant impact to Employee Performance.

2.4 Research Framework

(Fig. 1)

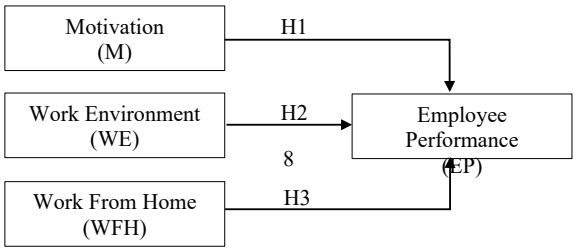

Fig. 1 Research framework

3 Methodology

3.1 Research Method

This study is a quantitative study where the respondent's coverage is among employees at CTRM, Batu Berendam, Malacca, Malaysia. This survey question has been adopted by previous studies and there have been modifications to the question to suit the scope of the study (Hamid et al., 2020; Susilo, 2020). This survey question was produced using the Likert scale in the section that focuses on dependent variable and independent variables, while in the demographic section using the category scale. There are five Likert scales used from 1 to 5 (1-strongly disagree, 2-disagree, 3-neutral, 4-agree, 5-strongly agree) are used to indicate the most appropriate answer from the respondents.

Questionnaires will be distributed to employees via Google form where the respondents are from executives and non-executives' level with experience more than 5 working years without consideration of gender, age, income & department. It is because, the majority of employees has 5 to 7 years working experience in the company. The contribution range is 10–15% of respondent for both executives and non-executives' level from the population (approximately 2200 of employees in the organization) and this study observation performed on post covid situation in FY2021. From the contribution range, 10% of senior management (Head of Department and above), 30% from middle management (Area Leader, Supervisor and Head of Section) and 60% from technicians had been involved in this study.

However, there are limitation of resource which sample population will not represent of total population of employee. Besides, high minimum range of experience employee might interrupt in data analysis to evaluate the effectiveness of change have been made. This study is conducted on only one company in the aerospace manufacturing sector in Malaysia. The small sociodemographic differences between our volunteer sample and the overall study population are not expected to greatly affect in the results.

3.2 Data Analysis Method

Based on the probability method sampling, random sampling techniques have been used in determining the sample for this study which involved full-time employee in aero composite manufacturing company. Questionnaires were distributed to employees in every department within the company via an online Google form. The study population is composing of employees working in the aero composite company in Malaysia. After receiving feedback from respondents, data will be extracted from the Google form for the evaluation and analysis process. Data obtained will be compiled using appropriate statistical analysis techniques. Statistical Product and

Service Solutions (SPSS) and Analysis of a Moment Structures (AMOS) will be used in analyzing the data that has been collected to get the accuracy of result.

4 Conclusion

The main objective of this study is to examine factors that have relationship with employee performance in an aerospace manufacturing company in Malaysia during Covid-19 pandemic. Review of the literature has shown the effects of motivation, work environment, and WFH on job satisfaction and consequently influence employee performance during the pandemic. The study has shown that motivation, work environment and WFH have a relationship with employee performance.

All other studies have agreed that motivation has a significant impact on employee performance during the Covid-19 pandemic where employees will be more diligent in achieving good performance if they are given appropriate rewards and appreciation. The work environment also has a significant impact on employee performance where if the workplace is safer, it will improve their performance. WFH shows a relationship to employee performance in different view. WFH will have a positive effect on employee performance where performance will increase as employees are given the freedom to reorganize work from home. But WFH also might increase stress among employees due to lack of resources, technology constrain and any other boundaries which caused mental health that leads to prolonged stress or even psychosomatic illness. Therefore, to sustain employee emotional, support by organization and community is require during crisis like Covid-19 pandemic and in turn will affect their mental health. However, motivation, work environment and WFH have a significant relationship to job satisfaction as a mediator and in turn have an impact on employee performance where if employees have satisfaction in doing work, then employee performance will increase.

Malaysia is in the process of providing vaccines to all citizens. In achieving herd immunity through the National COVID-19 Immunization Program (NCIP) implemented by the government will provide opportunities to all industries, especially in the aerospace sector in reviving the country's economic sector. Although the economic sector is opening up gradually, this does not mean that it is safe out there. The virus can spread through the airborne and can cause an increased case of Covid-19 infection. Thus, the results of this study will provide insights into future studies in revealing the factors that influence employee performance to help organizations give more focus to these factors during making company's strategic management changes when the organization is facing difficult situations such as this Covid-19 pandemic, in order to achieve the desired goal besides curbing the Covid-19 viruses from further spreading into the community. This can also give guidance to the company in developing a vision, mission or business strategy plan. Human Resources Department (HR) should also be involved in identifying factors that influence employee performance where HR involvement in increasing employee engagement is very important.

The Effect of Virtual Working Team on Job Performance: A Study of Aerospace Manufacturing Industry in Malaysia

Azmi Adam, Nurhanan Syafiah Abdul Razak, and Muhammad Turki Alshurideh

Abstract Job performance is one of most businesses' measures to ensure that their business is sustainable, lucrative, and expandable. It is also an important level indicator in Malaysia aerospace manufacturing industry to maintain competitiveness in the global market. By the end of 2019, when a pandemic had hit the world, the situation became more challenging where the government-imposed movement controls to prevent the disease from spreading. This situation led most aerospace manufacturing companies to explore alternative measures to maintain their business operations, including introducing work from home as a virtual working team for their indirect workers. As this strategy is just introduced in Malaysia aerospace manufacturing sector, the concern arises as to the extent of its impact on their job performance. This study purposely to examines the influence factors in the virtual working team environment and its relationship to job performance. Therefore, the findings hope to provide valuable insights to Malaysian manufacturing organizations in effectively managing their virtual working team and enhancing their employees' job performance.

1 Introduction

Malaysia's aerospace manufacturing industry has been critical in developing countries' efforts to expand and flourish, especially in the manufacturing and aviation sector. This industry has been predominantly export-oriented, which is directly contributes to Malaysia's economy. For the manufacturing industry, competent employees are the most important function for the sector to survive for a long business period. Understanding and exploiting the implications of the job performance, which is advantageous to both employers and employees. Employee performance refers to how efficiently and effectively a person does their work (Purbasari and Septian, 2017). An organization must understand how its employees perform at work to succeed in a worldwide competitive market. Employees' effort to achieve organizational objectives is determined by whether the individual succeeds or not in completing each strategy outlined and implemented effectively. It is attractive to know and discuss components of their working environment aspect related to their job performance. The issue of job performance becomes interesting to investigate in perspective of what factors can influence employees' performance.

Many factors can influence employees' performance in the manufacturing industry; however, this study will focus on a different situation where the global is dealing with a pandemic that impacts the entire socioeconomic system. To protect the community and prevent the spread of the disease, the Malaysian government has taken proactive strategies by imposing Movement Control Order (MCO). Only a few essential businesses categories are allowed to continue their operating after getting approval from the Ministry of International Trade and Industry, Malaysia (MITI). However, the approval is subject to stringent requirements with limited numbers of workers in the plant (not exceeding more than 60%). In addition, they must adhere to the government's Standard Operating Procedures (SOP). This situation gives the leadership a challenge in completing their task effectively to the given timeframe. When working from home as a virtual working team, the main concerns raised were how they managed their way of communicating effectively and the factors influencing their job performance.

1.1 Background of Study

Job performance refers to the standard to which an employee satisfies the variables specified in the job description. It also depends on an employee's abilities, experience, seriousness, and the amount of time available to perform the task (Raharjo & Sulistiasih, 2019). According to Bokhori and Halim, several factors are influencing on an employee's performance, such as personal issues, supervisory attitudes, work environment, general company culture, working conditions, job responsibilities, teamwork, employee relationships, non-financial and financial incentives rewards, and flexible working hours. Managers need to assess if their subordinates are doing

their jobs effectively and efficiently or room for improvement (Robbins, 2009). The performance of each employee has a significant impact on the company's overall performance (Onyebuchi et al., 2019). As for the aerospace manufacturing sector, it is critical to guarantee that the global supply chain is adequate to deliver commercial aircraft components so as not to be disrupted. Due to the new Covid-19 pandemic situation, many authorized industries have minimized the number of workers in their manufacturing plants to curb the spread of disease. This led to most non-direct production employees working from home as a virtual working team to communicate among employees, suppliers, and customers.

The effective virtual working team on daily routine work becomes a critical aspect that needs to be focused on since it will influence job performance. However, there were limited studies on virtual working teams related to the manufacturing industry, especially in the aerospace manufacturing sector in Malaysia. Hence, this study aims to evaluate the factors influencing job performance for Malaysia's aerospace manufacturing companies working in virtual communication during a pandemic. There are two main objectives outlined in this study; to examine the factors influencing employees' job performance of effective virtual working communication and identifying strategies for employees to enhance their job performance by effectively working in communication during a pandemic.

By conducting this research systematically and ordered, it is important to show how the study is performed. This study is limited to the Malaysian aerospace manufacturing sector and its employees, which are specializing in the aero-structure manufacturing industry and dealing with global suppliers and customers. The study focuses on the employees who have worked as a virtual working team and communicate during the pandemic from the year 2020–2021.

2 Literature Review

At a company level, the organization's dedication to systematize the objectives and mission of every individual in the company and collaboration with high-level management is required to manage the company as effectively as possible (Raharjo & Sulistiasih, 2019). According to Kassim et al. (2009), solid organizational commitment will motivate people to work toward organizational goals and employee performance.

2.1 Job Performance

Job performance is defined as the result of an employee's best effort to complete a task depending on their skills, experience, and seriousness, and the amount of time available (Raharjo and Sulistiasih, 2019). It means the precise results that a person wants to achieve in their employment and the organization's desire to attain

Licensed to (putm@utm.my)

Fig. 1 Factors most likely to bring success. *Source* 2013 HBR Analytic Services Survey

those results. While Bokhori and Halim defined it as the capability and ability of an employee to accomplish their job is referred to as employee performance. The job requirement includes each employee's responsibilities, activities, and tasks in the organization. Leadership style also has a significant and beneficial impact on organizational success and employee performance (Simsek & Ozturk, 2018).

Meanwhile, three primary elements are measured for employee performance: job productivity, job quality, and job accomplishment (Iqbal et al., 2012). However, in the context of work from home or work remotely, on job performance of employees remains uncertain (Allen et al., 2015). According to Susilo (2020), the characteristics of the job itself significantly impact job performance when working in telecommuting. Telecommuting is defined as working on a computer connected within employees from home or wherever else. It is crucial for employees in advisory or supporting tasks, such as promptness in responding and good attitude attributes, such as being trustworthy (Judge et al., 2017). Management support, trust, and communication are essential success factors for a virtual working environment (Kowalski and Swanson, 2005). Based on findings from a global survey done by Harvard Business Review (HBR) in 2013 shows that the effective communication element provides the second-highest (Fig. 1) and most influential factor to enhancing employee's performance.

2.2 Virtual Working Team

Virtual communication becomes a common platform for every meeting, discussion, presentation, and reporting of all necessary information among employees as a daily routine works. Virtual communication is more complex than face-to-face,

demanding, and challenging communication (Lockwood, 2015). Effective communication includes words, behaviours, quick and correct responses in delivering information (Morgan et al., 2014). With the pressures of global economic competition and supported by the rapid development in communication technology, most organizations are increasingly focusing on virtual team's communication capabilities to increase the effectiveness in communication on their operation (Nydegger & Nydegger, 2010). Madell (2019) claimed that working remotely has weaknesses, such as a lack of monitoring, which increases the risk of miscommunication. Based on Mlitz (2021), many employees who work remotely do not have a properly designated workspace; instead, their living and work environments are mixed. Thus, employees struggling to focus while working remotely, and it will be affecting their job performance (Fig. 2).

A virtual working team, also known as the remote team, refers to a group of employees who collaborate and work together to plan, execute, and assess the progress of the project (Salas et al., 2008). Each working assignment and communication are through technology such as email, voice, or video conferencing services in order to collaborate. Although technology has improved communication ability, the performance of virtual working teams faces the challenge of losing knowledge due to ineffective coordination and communications and lack of time in sharing the information (Karayaz, 2008).

Most previous studies show that virtual team communication is more effective when it is coordinated with the right style and traits of the leaders (Balthazard et al., 2009; Hoch & Kozlowski, 2014; Kelley & Kelloway, 2012). In addition, the practical key elements for a virtual working team include frequent communication and

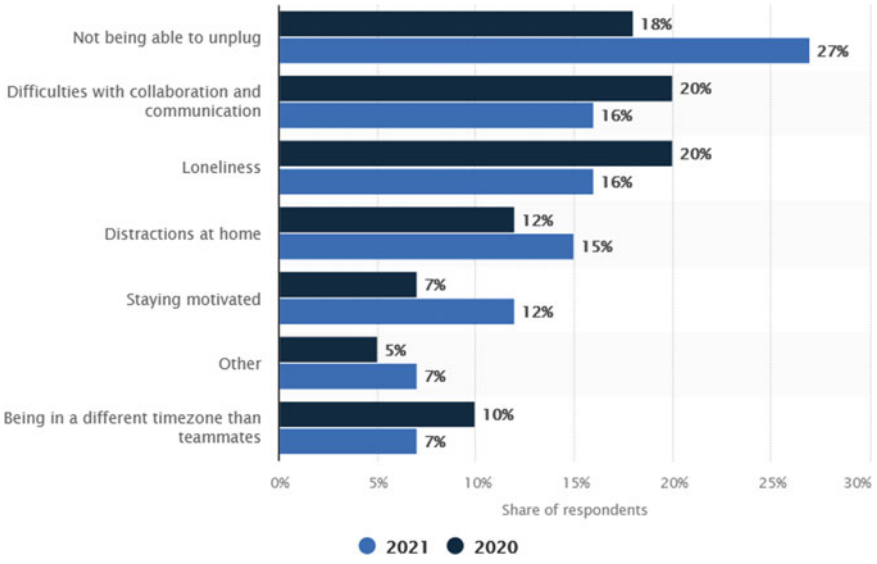

Fig. 2 Biggest struggle with working remotely. *Source* Statista 2021

have clear objectives among team members (Morgan et al., 2014). By practising regular communication positively influences the motivation of each member of the virtual team to concentrate and convey information effectively in order to complete the task perfectly according to the plan. Individual quality of work is also one of the essential parts of a virtual working team. Each employee is responsible for the output of quantity and quality required to achieve task objectives as agreed upon by the working team or their superior (Ivancevich & Matteson, 1996). According to Cullen & Sackett (2004), the concept of employee integrity itself directly impacts the quality of their job performance. Furthermore, to complete all of the tasks every day, employees must consistently have a certain level of commitment. Working as part of a team requires synchronization and subsequent interconnected activities across team members; small mistakes or delays will affect the team's goals and performance.

2.3 The Relationship Between Virtual Working Team and Job Performance

Virtual working teams depend heavily on technology communication channels to coordinate their daily work. It is crucial to examine the relation between the task's structure and coordination effectiveness as it affects individual and team performance (Victor et al., 2021). Working as a team must have strong coordination among employees in an organization. Iskandar et al. (2014) claimed its absence will show difficulty in operating business operations or, more importantly, cause serious harm between individuals. In addition, according to Karayaz (2008), virtual team performance is hampered by a lack of knowledge and skills caused by inadequate coordination, poor communication, and a lack of timely information sharing. For improvement, he suggested optimizing various application forms of collaborative information technologies through a well-coordinated system. Hence, structured coordination, diverse knowledge and expertise can be developed, integrated, and deployed.

In a virtual working environment, communication is a basic fundamental necessity to be focused on. Each employee may feel isolated, and it is critical to keep them engaged by communicating with them frequently to raise their knowledge and understanding (Teresa, 2021). The team should communicate more between virtual employees by having regularly scheduled meetings to ensure each assignment is carried out smoothly as planned and not jeopardize the team's performance. According to Morrison and Ruiz (2020), having frequent scheduled interactions among the team will promote more open conversations and mutual agreement on each activity towards the team's mission.

Works that are accomplished efficiently and with minimum direction and supervision are critical criteria in measuring job performance. Piccoli et al. (2004) mentioned two types of team effectiveness; team performance, where on-time delivery of high-quality results or products and where individual requirements are fulfilled. However, according to Awang et al. (2015), the condition of the working environment is one of

the factors influencing employees' work speed and effectiveness. When working at home, it is necessary to create a good work environment that is both comfortable and conducive to acquire concentration and produce good outcomes. Understanding the concept of quality of work that adheres to the standards such as accuracy, neatness, attention to detail, consistency, and follows procedures will improve job and team performance.

Based on past studies in literature, several elements have been identified in a virtual working team and their relationships with job performance. Hence, there are three hypotheses have been constructed to verify the correlation between the dimension of the virtual working team and job performance as follows:

H1—Team coordination has a direct positive influencing on Job Performance.

H2—Communicate frequently has a direct positive influencing on Job Performance.

H3—Quality of work has a direct positive influencing on Job Performance.

2.4 Conceptual Framework

Virtual working teams are influenced by many factors of variables that have been studied in the literature and have resulted in a variety of models for studying and connecting them to job performance. However, the studied and theoretical concept established by Victor et al. (2021) is emphasized in this research. According to the study's findings, one of the essential variables in the model is task features. The main part of the task feature is effectively coordinate their work in communication technologies where the result gives positive influence with a high confidence level. Next, an important variable is the empowerment of the team members by the leader. Empowerment consists of sharing a vision and regularly communicating within the team to create a significant connection to the team performance. Another important factor identified in the study is working at a high-efficiency level for an extended period. It entails delivering high-quality results and solutions on time, ensuring all stakeholders' satisfaction, and increasing their job performance.

Based on this underpinning theory, the framework is designed to examine the relationship between three dimensions in a virtual working team as an independent variable and the dependent variable's job performance. The three dimensions are team coordination, communication frequently, and quality of work. The study's model was developed after a thorough evaluation of the scientific literature on the subject (Fig. 3).

3 Research Methodology

This study uses a quantitative causal method for analyzing the effect and relevance of independent variables on dependent variables. Quantitative analysis is based on

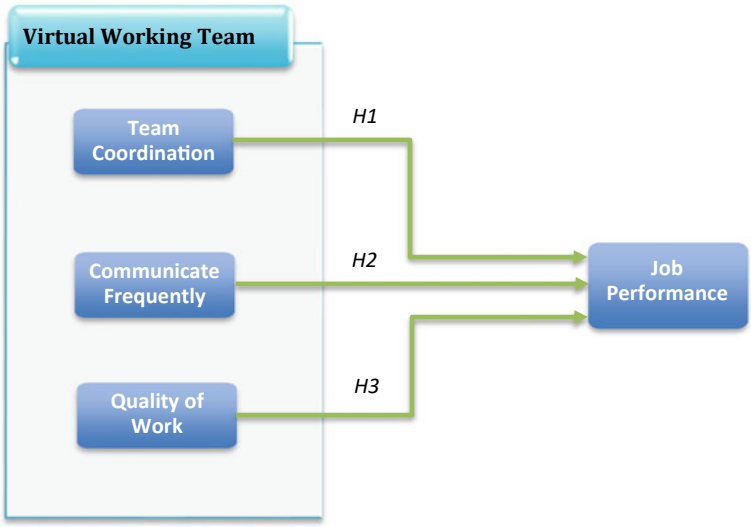

Fig. 3 Research conceptual framework

numerical results and delivers systematic conclusions covering a wide range of research topics while being more efficient, effective, and cost-effective (Ticehurst & Veal, 2000). The selected method is similar to the previous studies that have almost related to the topic (Iskandar et al., 2014; Susilo, 2020; Victor et al., 2021).

This study employs inferential statistics approaches, which means it aimed to answer the research questions by collecting and analyzing the samples and then generalizing the outcome to explain a population. Data collection will be conducted by distributing the questionnaire and completing online to the relevant aerospace manufacturing industry in Malaysia. For the population design, respondents' selection was based on an executive level in random departments, including managers, associate managers, and senior executives. Assuming that all respondents have work experience and can work from home, it is justifiable to ensure they have access to the internet. Therefore, the Purposive sampling method is being used because it is for employees who had access to the internet and had direct experience working in virtual communication. To help gather respondents, the questionnaire link will be distributed through any means of social media. The responses are measured using a 5-point Likert scale and evaluated accordingly: 1-strongly disagree; 2-disagree; 3-neutral; 4-agree; 5-strongly agree. The questionnaire targeted 500 respondents. All data will be check for response bias, validate the theory and evidence to support the interpretation. Reliable responses data will be kept and analyze further. For statistical analysis, SPSS and AMOS software will assist with the required analyses to effectively evaluate all reliable responses. The results will be presented in figures, tables, and charts, making them easier to interpret.

4 Conclusion

This study demonstrates how a realistic conceptual framework was developed to investigate and understand current factors existing in virtual working communication and their relationship to job performance. It is made a decisive contribution to the research of the influencing factors in virtual working teams on job performance in Malaysia's aerospace manufacturing industry. Furthermore, by analyzing this study's findings, the employees could improve their job performance by implementing appropriate and effective virtual working communication.

Creating Organizational Culture that Compact Corruption in Local Government: The Role of Municipal Leadership

Ehap Alahmead, Susan Boser, Ra'ed Masa'deh, and Muhammad Turki Alshurideh

Abstract Corruption in U.S. local government is a phenomenon that boosted by the decentralization tendency. Most of the literature focus on reducing opportunity for corruption by monitoring and controlling the local governments' transactions. However, opportunity reduction faces limited success in combating local governments' corruption. This chapter highlights the need to focus on corruption rationalization. According to the Fraud Triangle Theory, committing a crime requires not only an opportunity but also a rationalization process that precedes or follows the crime. The rationalization is a defense mechanism that aims to normalize the crime and restore good self-image by claiming for instance that everybody practices the crime, the crime did not hurt anyone, or the crime was unavoidable etc. This chapter focuses on how corruption in local governments is normalized (rationalized). Particularly, the role of local governments' leadership in creating and/or maintaining an organizational culture that rationalize corruption.

1 Introduction

According to Agha et al. (2021), the interest in studying ethics in the U.S. government increased after the Watergate crisis. The Ethics in Government Act of 1978 established the federal Office of Government Ethics (OGE) to lead and direct ethics management in the executive branch (Agha et al., 2021). The OGE requires each federal agency to have an ethics officer to conduct training and keep paperwork of the ethics record (Agha et al., 2021); however, the OGE requirements are overwhelming to federal employees and reduce their performance (Yang, 2009). The OGE concerns with the integrity of the federal employees; when it comes to municipality officials, the federal government has no crucial role in managing their integrity (Mackenzie & Hafclen, 2002). At the federal level, power is distributed between three branches of government, and the legislative branch (Congress) is also divided between parties. If a decision is to be taken to govern municipalities, it requires the consensus of a large number of actors (Mackenzie & Hafclen, 2002). Moreover, due to the municipalities' independency, any federal prosecutions are perceived as a violation of the local government sovereignty; besides, Washington is not concerned if a municipality lacks on ethical standards or financially corrupts as long as no federal fund is involved (Berman & Carter, 2018; Zhao & Peters, 2009). Thus, addressing local governments' integrity is the role of the state government and the citizens.

Most of the literature reviewed for this study is focused on corruption opportunity. It seeks preventing (or reducing) the chance for corruption by monitoring and controlling the transactions of local government staff and hold them accountable. While reducing the opportunity for corruption is very important, it is not enough; as the Fraud Triangle theory (Brown, 2005) presumes, fraud requires three factors: pressure, opportunity, and rationalization. Some research such as Cressey (1973) added a fourth factor to the Fraud Triangle theory, the capability. Capability includes position within the organization to create or exploit an opportunity for fraud, being smart to understand and exploit internal control weaknesses, strong ego and great confidence that he will not be detected, ability to coerce others to conceal fraud. Capability as introduced by Cressey (1973) is part of the opportunity factor not a separate one. Without having predispositions like courage and cleverness to exploit a situation and without being in a position in the organization that enables corruption, we cannot say that there is an opportunity for corruption. The study Wolfe & Hermanson (2004) explores religiosity (commitment to anti-fraud religious values) as another factor to understand fraud. Religiosity also is not a new factor; it deals with religious values that influence rationalization. Religious values like honesty and integrity mark the absence of corruption rationalization for the individual who is committed to these values. Thus, the Fraud Triangle theory is stabilized at the three factors of pressure, opportunity, and rationalization (Said et al., 2018).

The incentive (pressure) for corruption does not require much focus because it usually exists whether to satisfy a need for higher income (Free, 2015); or to satisfy a want like living a lavish lifestyle, and abusing drugs (Liu & Lin, 2012). The corruption opportunity is heavily studied, and it may be less important than

corruption rationalization (Muhtar et al., 2018). The research work (Muhtar et al., 2018) study corruption in Indonesia local governments focusing on the influence of opportunity factors like e-government (public easy access to information that improves transparency and combat corruption), and rationalization factors like the response on audit result (recommendations on audit result that received no follow-up from local government). The results show that the rationalization factors have effect on corruption; meanwhile, the opportunity factors like e-government and internal audit show no evidence of effect on corruption. In this research we will focus on corruption rationalization.

2 Literature Review

The literature review starts with discussing the three main approaches to eliminate corruption opportunity namely transparency, citizens involvement, and recentralization and explains why these approaches are problematic. Then, a discussion of corruption rationalization follows and illustrates why rationalization should be attributed to the organization culture (not only to individual characteristics). Finally, the organization culture section discusses how organizational culture emerged and maintained before ending with section on the role of municipal leadership in constructing the organization ethical culture (Ravisankar et al., 2011; Alshraideh et al., 2017; AlShurideh et al., 2019; Ashal et al., 2021; Hamadneh et al., 2021).

2.1 Opportunity

The literature in local government corruption focusses on combating corruption opportunity, which depends on the probability of being caught by auditing or monitoring systems (Nuseir et al., 2021; Al-bawaia et al., 2022). Eliminating corruption opportunity "is to deter and prevent corruption via a system of thorough and efficient observation and surveillance, including accounting, auditing, and layers of oversight" (Silva, 2010). Opportunity for corruption may depend on the economic activity in the local government area; when tourism is the major activity, there is more presence of pressure groups and lobbies who may directly participate in the political system and corruption may flourish more easily (Gong, 2015). Corruption opportunity may increase in crisis times when local officials are given relief aid and simultaneously the natural disaster brings disorder and infrastructure collapse, i.e. less chance for being caught (Anechiarico & Jacobs, 1996). Many approaches to eliminate corruption opportunity are discussed in the literature; for instance, having more women in the local government (Jimenez et al., 2017), restructuring anti-corruption agencies to produce more comprehensive integrity management (Al-bawaia et al., 2022), reducing the size of the city council (Nguyen et al., 2017), or reshaping incentive system and based it on citizens' perception of low corruption (Vijayalakshmi, 2008).

Licensed to (putm@utm.my)

However, the three approaches to eliminate corruption opportunity that have the most attention in the literature are transparency, citizens' involvement, and recentralization (as will be discussed next).

2.2 Transparency

Members of the government are more prone to corruption because they have more control over the flow of information than citizens (Bergh et al., 2017). The more transparency (the more timely information delivered to citizens), the more the citizens power to monitor the government performance and combat corruption (Bergh et al., 2017; Schopf, 2018). Transparency improved by providing the public with easy access to information (Muhtar et al., 2018). This can be achieved through information technologies such as websites, social media, and mobile technologies; the citizens who interact with municipal government through information technology have better perception of the municipality's transparency and integrity (Kim et al., 2009; Benito et al., 2015; Al Dmour et al., 2014; Valle-Cruza et al., 2016; Akour et al., 2021; Al-Hamad et al., 2021; Alshurideh et al., 2021a). Moreover, according to Vijayalakshmi (2008), transparency can be improved by attaching the official's names to government documents to clarify responsibility and establishing a computerized information center to provide citizens with information about their application's progress and related administrative rules. In addition to using information technology, law should be amended to improve transparency. Law should be amended to require posting lease or sale of property with big font on the city hall, as well as establishing an independent database of lease or sale of property (Alshurideh et al., 2021b). Law should guarantee that records and meetings are open to public to hold the local government accountable and prevent elected officials from concealing their corrupt practices (Suleman et al., 2021). Budget law should include clear rules on the timing and specifics of disclosure requirements for key items such as payments, debt, departmental budgets, as well as legal liabilities for breaching the disclosure norms. Finally, to improve transparency, local media should be developed because underdeveloped media hardly puts any pressure on the local officials (Gonzalez et al., 2017); meanwhile, municipalities with strong media presence are more likely to abide with state-mandated ethics (Ferraz & Finan, 2011). The hope of promoting transparency is that it may invite public supervision (Al-bawaia et al., 2022; Fording et al., 2003), however, even when transparency makes corruption known to the public, the public may not confront it (Suleman et al., 2021).

2.3 Citizens Involvement

Central authorities encourage local agents to actively participate to improve anti-corruption effectiveness by holding the local government accountable to citizens

(Al-bawaia et al., 2022). To reduce opportunity for corruption, citizens need to volunteer at public hearings and committees, discuss public issues they know through the media, exchange their ideas/opinions, and stand up in county meetings or city council to air their complaints (Suleman et al., 2021). Citizens can also participate by establishing a committee of outside experts to receive appeals and investigate bureaucrats, and a citizen's court that is comprised of outside academics, lawyers, and journalists to decide corruption prone issue (Vijayalakshmi, 2008). There should be effective auditing programs that monitor the elected officials' corrupt actions and timely disseminate the auditing results, i.e., shortly before an election (Coxson, 2009). Otherwise, if the citizens lack meaningful information to cast a meaningful vote, they elect officials who lack accountability to them (Klasnja & Tucker, 2013). Citizens can discipline local officials rent seeking behavior by the power of their vote; mayors with eligibility to run again are less corrupted than the second term mayors specially when the probability of corruption being detected (by judiciary agents or media) is high (Bobonis et al., 2016); municipalities in cities with high levels of electoral competition are more likely to abide with state-mandated ethics (Ferraz & Finan, 2011). Citizen's report of corrupt behavior is also an anti-corruption tool; to improve the local officials' integrity, the reporting mechanisms should be enhanced (Al-bawaia et al., 2022). There is a need to increase the public awareness of corrupt behaviors and where to report them (Alshurideh et al., 2021b).

However, relying on local agents to report corruption may not be effective. Many people do not want to involve because strong evidence is required before reporting corruption, anonymity is not guaranteed, or they do not understand their rights; even if they take the decision to report corruption they may not know where to report it (Asthana, 2008). Reporting corruption requires two preconditions, first, positive perception of the quality of anti-corruption governance (i.e., believing that their report will be taken seriously and make difference); and second, a low level of tolerance towards corruption (Masters & Graycar, 2016), both conditions are not guaranteed. For the first condition, people may not believe in their report influence because as it moves from an agency to agency, the report diminishes, it changed from the hard language of allegation to a softer approach to administrative action which makes the act of corruption disappear (Asthana, 2008) Regarding the second condition, people may tolerate corruption, (Muhtar et al., 2018) find that while in 'low-corruption' countries like Sweden voters punish corrupted politicians regardless of the state of economy, in 'high-corruption' countries like Moldavia, voters punish corrupt officials only when the economy is bad. Thus, relying on citizens or local agents' engagement to reduce opportunity for corruption may be problematic because these citizens may not have the knowledge (Alshurideh et al., 2021b), the desire (Suleman et al., 2021), or the ability (Asthana, 2008) to stand against corruption in their counties or cities.

2.4 Recentralization

Government decentralization refers to the "redistribution of powers of decision making in favor of lower levels of administrative machinery" (Gonzalez et al., 2017), Governments decentralized authority to local level assuming that local governments can better tailor the public good to suit local populations (Assad & Alshurideh, 2020). The division of authority among local governments enhances the chance for corruption (Hess, 2017) because as the authority devolves from upper levels, local officials have fewer constraints and more opportunities to abuse their power (Masters & Graycar, 2016). For instance, fiscal decentralization (decentralize the government budget to local governments) provides local officials with opportunity for fraud and aggravate corruption in local government (Tiebout, 1956) Local officials expanded power and their deep involvement in economic affairs provide opportunity for corruption (Masters & Graycar, 2016). As Salloum et al. (2020) discussed, decentralization aggravates corruption and encourages local officials to collude against the central government in China. To solve these problems, the Chinese Communist Party linked the cadre promotion to quantifiable performance, but this policy failed so, corruption and budgetary crisis have grown in the last decades. Under the current Chinese President administration, the national leadership led a central anti-corruption campaign to constrain the local officials' authority (Bobonis et al., 2016). In the United States, decentralization of authority to local governments increases their control over policies (Berman & Carter, 2018). According to Klasnja & Tucker (2013), New Public Administration practices such as decentralization, deregulation, and privatization weaken the municipalities' accountability to the state authorities.

While decentralization contributes to local government corruption, tackling the problem by recentralizing the authority is not an effective approach (Bobonis et al., 2016). The recentralization tendency may reflect the center's desire to address the local government integrity through hierarchy (Al-bawaia et al., 2022) such as state ethics commissions that seek addressing the local government integrity problem by tracking election expenditures and establish rules for conflicts of financial interest (Agha et al., 2021). However, recentralization may be counterproductive; in New York City it led to inadequate managers' authority, increased delay, and low morals (Silva, 2010). By managing the integrity problem through the state hierarchy, the central government underemphasizes the role of public participation (Al-bawaia et al., 2022), emphasizes compliance with rules and regulations over ethics (Agha et al., 2021), treats public employees as potential corrupt (Silva, 2010), and slows down the investment attraction and development (Bobonis et al., 2016).

The previously mentioned articles represent the traditional approaches to public integrity, which focus on reducing the corruption opportunity by enforcing commissions, anti-corruption agencies, formalized guidelines, or whistle-blowing (Beeri & Navot, 2013). However, there is a need to understand corruption from a behavioral perspective that may explain the individual's response to the corruption opportunity and the organizational culture in which the corrupt behavior occurs (Ko & Zhi, 2013). The opportunity elimination approaches have met with limited success because they

neglect the human factor and the need to embed virtue and values in the individual (Beeri & Navot, 2013). Individuals who engage in corruption usually work in environment that provides definitions favorable to corruption (Collins, 2012). Although the external controls (that seek eliminating corruption opportunity) are important, public administrators should have inner check (ethical values) and adhere to democratic principles while they execute their responsibilities. In conclusion, although technical solutions cannot be neglected, these solutions alone have not proved the success that their advocates had hoped; so, other approaches like developing the organizational values are essential to complement them (Beeri & Navot, 2013).

2.5 Rationalization

Rationalization is the justification made by the fraudsters to avoid feeling guilty (Cressey, 1973). Rationalization contributes to corruption because it helps the fraudster seeing himself as an honest person caught in a negative set of circumstances (Brown, 2005). It is the greatest factor causing tolerance of petty theft—which indicates a problematic organization culture. Rationalization is the factor leading to fraud in the sense that others also do it. So, it is positively related to employees' fraud (Wolfe & Hermanson, 2004).

Although understanding the nature of fraud rationalization is critical to properly formulating anti-fraud measures, it is still an under-researched issue (Said et al., 2018). Research is limited in rationalization area because it is a kind of mystery (O'Mally, 2002), it may not be observable (Kula et al., 2011), and it is difficult to measure (Hogan et al., 2008). The government employees who committed corruption usually rationalize it before they committed it with excuses that allowed them to "innocently" carry out the act like, we have no idea that the behavior is considered as bribe, bribery is our country's culture, or we are doing this as usual. Rationalization is important to justify corruption before and after committing the crime (Casabona & Grego, 2003).

Some research focus on corruption rationalization based on objective factors like low income. The public officials wage is an important factor in justifying corruption therefore "high salary for transparency" is an important policy in preventing corruption (Free, 2015). Meanwhile, other research finds that higher civil service salaries induce civil servants to demand higher bribes (Skousen et al., 2003). So, controlling corruption by increasing civil service pay is a myth because corruption is a complex social issue that cannot be tackled at the individual level (Mohd-sanusi et al., 2015).

Some researches such as (Foltz & Opoku-Agyemang, 2015) capture corruption rationalization based on age, education, and gender. The researcher in (Gong & Wu, 2012) emphasizes that younger managers want to achieve career progression quickly, so they take risks. Meanwhile, older managers seek more information, diagnosis the information precisely, and execute decisions carefully. Therefore, age may indicate the individual's moral development. Regarding the influence of education on corruption rationalization, Machado & Garter (2018) finds that individuals with knowledge

in their work area are more aware of the unethical behavior consequences while without knowledge, individuals tend to rationalize fraud as an acceptable decision. Coming to gender, Zahara (2017) find that female executives can be more ethical in decision making than males. There are two problems with studying corruption rationalization based on age, education, or gender. First, these factors assess the likelihood of corruption rationalization not actual rationalization incidents. If the employee is an old female with good education in her work field, the researcher takes this case as a low possibility for rationalizing corrupt behavior; meanwhile, that woman may in fact rationalize her corrupt behavior. Second, studying corruption rationalization based on demographic factors (age, education, and gender) downplays the important role of individual values (Wolfe & Hermanson, 2004) and organizational values (Purcell, 2014) in explaining how individuals rationalize their corrupt behavior. This study focuses on how the municipality employees rationalize the corrupt behavior based on their organizational values (culture).

The study Troy et al. (2011) replaced corruption rationalization with "personal integrity" which shifted the focus to individualistic explanations of corruption. For instance, a person may not care about rationalizing corruption because he is an industrial psychopath who lacks empathy and behaves antisocial (Steffensmeier et al., 2013). Some individuals committed fraud because they are pathological gamblers who lost control on themselves and want money to continue gambling (Albrecht et al., 1984). Some individuals are fraud predators described as "born crooks" that continuously practice fraud (unlike accidental fraudsters) (Ramamoorti, 2008). For predators "pressure and rationalization play little or no role because the predator needs only opportunity" (Ramamoorti, 2008).

The previous discussion shows that attributing corruption rationalization to individual factors like the person's demographic characteristics (Foltz & Opoku-Agyemang, 2015) or his psychological disorders (Steffensmeier et al., 2013; Albrecht et al., 1984) may be insufficient. The violator does not invent rationalization to his violation but rather uses the verbalization from the culture he is in contact with (Brown, 2005). Rationalization "is the set of ethical values that allow certain parties to commit acts of fraud" (Kelly & Hartley, 2010). Thus, cultural mechanisms that influence fraud should be considered (Steffensmeier et al., 2013). Only few studies focused on the organizational culture role in corruption (Said, 2018). Some of these studies suggest establishing an ethics' commission that foster and support inner check like ethical standards and professional values on public officials and employees (Dorminey et al., 2012). Other study suggests adopting ethical code (a set of ethical norms and principles) to create awareness on standards of ethical behavior, guide public officials on ethically "grey areas", and help public officials internalize values (Manurung & Hadian, 2013). Some research suggests developing ethics office like the one in the city of Atlanta (established after mayor corruption scandal in 2001) that provides advice on ethical decision-making, educates city employees on ethics policy, and investigates reports on ethics violation and persecute these violations (Smith, 2003). These studies suggest solutions (ethical office, ethical commissions, or code of ethics) for a corrupted culture. My research though is concerned more with how a culture that tolerates corruption emerges.

3 Method

3.1 Organizational Culture

Based on Jerinic (2006), the following discussion traces the emergence and the development of organization culture (as a field of study). The British sociologist Elliot Jaques (1952) was the first theorist who described organizational culture. He argued that researchers ignore the human and emotional elements of organizational life because they focus on organizational structure. Jaques's work inspired organization theorists from the United Kingdom (Barry Turner), Italy (Pasquale Gagliardi), Canada (Peter Frost) and United States (Linda Smircich), who all studied organizational culture by focusing on the role of symbolism in organizational life. However, these authors viewed culture as an objective entity that can be managed or a tool to enhance performance.

According to Jerinic (2006), organizational culture researchers who adopted the symbolic perspective doubt the ease with which culture can be manipulated to managerial ends. These researchers used qualitative methods because it is difficult to define culture in operational terms that captured the nuances of meaning. Culture is constructed by interaction between individuals as they interpret their surrounding and collectively create meaning. If the meaning is to be understood, it should be studied in the location and situation in which it was created by observing how the organization members speak about this meaning. The study Green (1997) stated that "Believing with Max Weber, that man is an animal suspended in webs of significance he himself has spun; I take culture to be those webs, and the analysis of it to be therefore not an experimental science in search of law but an interpretive one in search of meaning." In other words, culture should not be studied as an objective matter that is governed by universal laws (regardless of social context); rather, culture is socially constructed and as such, the researcher should focus on how and why a certain meaning is constructed in a particular social context. This study depends on (Geertz, 1973) theory of *norm circle* to better understand how organizational culture is developed and maintained.

Geertz (1973) explains the emergence of culture because of interactions between individuals in a group. He called that group the *norm circle* and defined it as "the group of people who are committed to endorsing and enforcing a particular norm". The interaction between the group members has a causal power to produce a tendency in individuals to follow standardized practices (norms). An example is the norm of not blocking a person's route. If person A is blocking person B's path, B may encourage conformance to the norm, for example, by a glare or a push. On the other hand, if person A conforms to the norm and stands aside, B may indicate approval by a smile or thanking A verbally. By the repetition of endorsing and enforcing incidents, person A realizes that s/he is expected to stand aside from the others path and develops the tendency to do so. In other words, the norm circle creates a disposition in person A to conform to the 'stand aside' norm by the influence of the norm circle members who have endorsed and enforced the norm. Person A, as a member in a norm circle, feels

committed to the other members and may act in their behalf to endorse and enforce the norm concerned and expect these members' support to do so.

Based on Geertz (1973) argument, culture has no ideational existence beyond its existence as beliefs or dispositions of individual human beings. It can only attain an objective aspect as the members of norm circles. If an organization has written documents of ethical codes or organizational values, it does not mean that the culture of this organization has an objective existence (as text on papers). Culture is not necessarily what is written, but rather what is actually practiced; and what is actually practiced is what the norm circle endorsed and enforced. The endorsement and enforcement of a norm by the norm circle is not only an *incentive* for an individual member to conform, it also serves as *feedback* that informs the individual as to whether his behavior was conforming with the norm or not. Consequently, the endorsement and enforcement mechanism (as feedback and behavior correction mechanism) explain how ambiguous shared values that may be understood differently by individuals still produce a relatively standardized behavior.

The study Geertz (1973) argues that culture is socially constructed because the individual's beliefs and behaviors arise from his/her communicative interactions with the other individuals in a particular social context. If these interactions changed, they produce different beliefs and then the normative environment may be constructed differently. Culture is composed of many cross-cutting norms, if these norms contradict; the individual conforms to the norm that is endorsed by the most powerful and resourceful group (i.e. the most powerful norm circle). Culture is maintained as long as the power of each norm circle is stable. However, cultural change occurs if a norm circle grows in size or influence on the expense of the other norm circles. In this case, the individuals conform to the norm that is endorsed by the newly more powerful group (instead of the norm they used to conform to).

3.2 Leadership

Culture is a group of shared beliefs and norms held by individuals; these norms are socially constructed, they are created and maintained through the individual's interactions with other members who endorse and enforce these norms. In organizational context, the leaders (by the virtue of their position and may be charisma) are powerful in endorsing and enforcing norms. The leading organizational psychologist, Edgar Schein, argues that leadership is critical to the creation and maintenance of culture; cultural norms emerge and change due to what leaders tend to focus on, the leaders role modeling, and their reactions to crises (Free et al., 2007).

According to Elder-Vass (2012), "leadership is a process whereby the leader influences others to reach a common goal". When an organization's leaders are perceived to be ethically positive, there are less reports of counterproductive employee behavior as in the studies (Northouse, 1999; Mayer et al., 2009; Al-dhuhouri et al., 2020; AlShehhi et al., 2020; Al Harahsheh, 2014). By contrast, when leaders become morally disengaged (underemphasizing the negative consequences of misconducts),

employees' ethical behavior is negatively affected (Al-Lozi & Papazafeiropoulou, 2012; Bonner et al., 2016). The values exhibited by leaders may significantly influence the values exhibited by other individuals in the organization (Alyammahi et al., 2020; Schminke et al., 2002). The ethical leader exhibits a set of traits that will promote the shared understanding of what constitutes unethical behavior such as corruption and what constitutes ethical behavior in an organization (Alameeri et al., 2020).

According to Salloum et al. (2020), leaders may influence the employees' perceptions of the organization's ethical climate (i.e., the employees' perception of what is appropriate or not appropriate behavior in their organization). In an egoistic climate, people care for themselves, protect their own interest, and have no room for personal moral, which correlates positively with unethical behavior (Pertiwi, 2018). Meanwhile, a positive ethical climate (that focuses on others) has a positive influence on ethical behavior (Peterson, 2002). An organization's ethical climate affects which issues organization members consider ethically relevant, and whose interests they consider when deciding on moral issues (O'Fallon & Butterfield, 2012).

Leadership may create a culture that highlights financial performance over ethical considerations by (Said, 2018; Free et al. 2007) communicating inappropriate ethical standards while extremely focusing on financial earnings and growth rates (Kula et al., 2011). The example of Enron Company illustrates the role of leadership in creating a culture that rationalizes corruption. According to Free et al., (2007), Enron Company had adopted one of the best management control systems in the United States. The control system requires that any deal needs to be assessed by risk analysts and approved from various levels in several departments, including approval from the most senior levels, and the board of directors. Enron also had other corporate governance mechanisms including (among other mechanisms) credentialed board of directors, an audit and compliance committee, external auditor, financial disclosure office of director, and a finance committee. In the late 1990s, Enron had a new CEO, Jeffrey Skilling, who change the organizational culture into what (Free et al., 2007) describe as a culture that is permissible for corruption. Under Skilling, an extreme performance-oriented culture emerged which institutionalized and tolerated deviant behavior. The "creative risk-taking" led to circumventing and breaking legal and ethical boundaries. The internal competition and the huge incentives led to private information, and deceit short term performance. In 2001, Enron became one of the biggest company bankruptcies in the US history. According to Free et al. (2007), the case of Enron company illustrates that despite the sophisticated control system (which supposed to reduce opportunity for corruption), when Enron leadership created a culture that rationalizes corruption (by prioritizing performance over ethics), the company collapsed.

An important example of leadership successfully changing unethical culture in the local government is the case of Cookingham (Gorsira et al., 2018), the manager of Kansas City between 1940 and 1959 as discussed by (Cookingham, 2020). For two decades before Cookingham arrived, every aspect of Kansas City was controlled by the corrupted and unelected political boss Tom Pendergast (Perego, 2019). In Pendergast time, illegal gambling was $ 12 million enterprise (roughly $216 million

in 2019), and the ghost voters were more than registered voters, which enabled Pendergast to control the city council elections. He developed a system of patronage hiring that bloated the payroll with illiterate police officers and employees who never show to work; a small note signed by Pendergast would guarantee a job in the city. Eventually, Pendergast was convicted of federal tax evasion and Cookingham was hired by the mayor and city council whose campaign symbol was a broom.

Realizing that cleaning the stairs starts from the top, the first challenge for Cookingham was to assess the ethical integrity of his team and determining who engaged in the unethical conduct. Cookingham himself was an example of ethical leader who does not compromise his principles. When he was rushed by the city council to fire the employees from Pendergast era quickly, he argued that not all employees were corrupted, and he defended them against the council with his letter of resignation ready in case he didn't prevail. Cookingham message to all employees was that the only allegiance which any employee owes is to all the people of Kansas City and that political action among the employees was discouraged. By these measures, Cookingham was a bright example of the leadership ability to influence the culture in local government.

The discussion above shows a significant influence for the organization leaders' values and ethical conduct on their subordinates. Geertz (1973) explained the individual's adherence to norm as a result of the norm circle (members) strength in endorsing/enforcing the norm. By the virtue of their position, leaders in municipalities may strongly enforce norms on subordinates. Thus, this study to recommend for asking the municipality employees about their perceptions of norms that rationalizes corruption that their leaders support/discourage, and how the leaders and subordinates construct meaning to these norms.

4 Conclusion

The literature review starts with discussing the three main approaches to eliminate corruption opportunity namely transparency, citizens involvement, and recentralization and explains why these approaches are problematic. Then, a discussion of corruption rationalization follows and illustrates why rationalization should be attributed to the organization culture (not only to individual characteristics). Finally, the organization culture section discusses how organizational culture emerged and maintained before ending with section on the role of municipal leadership in constructing the organization ethical culture.

Reviewing the Literature of Internal Corporate Social Responsibility on Job Satisfaction

Sura Altheeb, Bader Obeidat, Muhammad Turki Alshurideh, and Ra'ed Masa'deh

Abstract In the last decade a social responsibility for the environment, local communities, working conditions, and the ethical practices have become necessary for any organization that is aiming to be sustainable and successful in the business world. Also, job satisfaction reflects the positive and favorable attitudes of the workers that have a great effect on their performance. The purpose of this paper is to reviewing the literature and the associations among internal corporate social responsibility, job satisfaction and their dimensions.

Keywords Internal corporate social responsibility · Skills development · Working environment · Employment stability · Work life balance · Empowerment · Intrinsic job satisfaction · Extrinsic job satisfaction

1 Introduction

Corporate social responsibility defines the relation between business and larger society components (Snider et al., 2003; Masa'deh et al., 2013; Obeidat et al., 2017a, b; Abu Zayyad et al., 2020). It also discusses the delivery of shareholder's value and

promoting for the societal value. Hopkins (2003) put the most appealing definition forward for corporate social responsibility (CSR):

"CSR is concerned with treating the stakeholders of the firm ethically or in a socially responsible manner. Stakeholders exist both within a firm and outside. The aim of social responsibility is to create higher and higher standards of living, while preserving the profitability of the corporation, for its stakeholders both within and outside the corporation". Also, Chuck Robbins, CEO Cisco stated:

> As I reflect on the progress we made in fiscal year 2017, I've never been more certain that what is good for people, society, and the planet is good for business.

Employees are considered one of the primary stakeholders in any company, who are directly responsible for the success and development of the company (Aldalahmeh et al., 2018; Bauman & Skitka, 2012; Masa'deh et al., 2016; Shannak et al., 2012). Generally, being unhappy and unsatisfied at work will be reflected on the employee's personal and daily life (Schultz & Schultz, 2010; Abualoush et al., 2018a, b; Masa'deh et al., 2018; Abuhashesh et al., 2019). Hence, one of the most vital responsibilities of a company is to satisfy their employees by using both financial and non-financial incentives (Tsourela et al., 2008).

This paper is designed to review and explore the related literature in order to form a comprehensive understanding of internal corporate social responsibility and job satisfaction. Hence, the paper discusses the concepts of internal corporate social responsibility, job satisfaction and their dimensions.

2 Literature Review

2.1 Corporate Social Responsibilities

The concept of corporate social responsibility has been a very popular topic in business world and had brought many improvements to it, especially in the cases related to the environment, discrimination and abuse at workplace. The financial responsibility has been the sole bottom line driving force for the success of any organization. The corporate responsibility is considered as the second most important factor contributing to the company's reputation after the quality of its services and products (Kaufmann & Olaru, 2012). Bowen (1953) asked a vital question which is 'to what extent do the interests of business in the long run merge with the interests of society?'. Projects and external activities of any organization will have effect on the environment and society that the organization resides within. Some of these effects might be beneficial and some of them can be detrimental to it. Hence, in today's business market, companies are being put under a huge pressure to gain public trust and stay competitive in the global market (Jamali, 2007).

The social contract theory was used to explain the relationship between company and the society (Rousseau, 2008). Figure 1 shows the concept of interrelation between any organization and the components of the community.

Fig. 1 Relationship between organization and society (Rousseau, 2008)

Corporate social responsibility is found on both the external and internal domain of any company (Tamm et al., 2010). The external social responsibility is the company's involvement in some types of external social project. On the other hand, internal responsibility involves human resources practices such as training and labor participation (Calveras, 2013), in addition to dealing with all issues that can affect the well-being of the employees (Tamm et al., 2010). The corporate social responsibility (CSR) affects the stakeholders of the company; the external CSR affects the outsider stakeholders who are the consumers of products or services, whereas the internal CSR have a social effect on the internal stakeholders represented by the employees (Alshurideh et al., 2012, 2021; Elfenbein et al., 2012). Both external and internal corporate social responsibilities are linked to the services and products quality (Calveras, 2013; Moh'd et al., 2013).

Dutch social and economic council (DSEC) categorized CSR into three dimensions: profit, people and planet. 'Profit' stands for profit maximization, 'Planet' for ecological quality and 'People' for well-being in and outside the organization. Wood (1991) concluded a framework of CSR that consists of three elements: (1) responsibility principles and the motivators of action and choice; (2) intra organizational responsiveness processes for determining action and choice; and (3) resulting outcomes of action and choice. The next section will discuss in more details the internal corporate social responsibility and its impact on corporations. Furthermore, the I-CSR's dimensions and measurements will be reviewed.

2.2 Internal Corporate Social Responsibility

2.2.1 Overview of Internal Corporate Social Responsibility

Three approaches can define the corporate social responsibility: the shareholder approach, the stakeholder approach, and the social approach. The shareholder approach focuses on maximizing the profit of the company, whereas the stakeholder approach focuses on satisfying the interests of the stakeholder that can be affected by the operational activities. Finally, the societal approach suggests that as an integral part of society, companies should undertake responsibilities to the society as a whole (ELSamen & Alshurideh, 2012; Nasrullah & Rahim, 2014; Alshurideh et al., 2015; Al Mehrez et al., 2020a, b).

Previous studies found that the relation between companies and society is complex as it involves the community, employees, governments and even other companies (Cavazotte & Chang, 2016). Internal corporate social responsibility (I-CSR) has got a great attention and attraction for researcher worldwide and from different industries (Ismail, 2011), where all business leaders, government officials and academics are focusing more and more on the concept of I-CSR due to its importance (Reinhardt et al., 2008). Many companies consider CSR as a strategy employed to achieve competitive advantage (Lee et al., 2013). Employees are considered as primary stakeholders, they have a high power to influence the firm, and they are another source of stakeholder demand for CSR (Mcwilliams & Siegel, 2001).

2.2.2 Impact of Internal Corporate Social Responsibility on Companies

Two studies by Aguilera et al. (2007), Heslin and Ochoa (2008) showed that I-CSR has a positive effect on turn over, recruitment, satisfaction, retention, loyalty and commitment of employees. Hence, that will be reflected on the performance and productivity of the employees to work harder and adapt the company's policies and strategies to increase the profit of the company (Hoskins, 2005). It also provides the employees with skills that allow them to be more sensitive toward the problems around them and deal with this problem in a way that serve the company and increase the financial reward. Furthermore, others suggested that CSR should be considered as an ethical behavior, and cares for the environment. Community involvement leads to organizational morality that leads to commitment and satisfaction between the employees. Recent studies showed that adapting the concepts of I-CSR is an effective method to motivate employees (Skudiene & Auruskevicine, 2012). Internal corporate social responsibility (I-CSR) refers to how firms respond to their responsibilities concerning their employees, and the work relation sphere (Cavazotte & Chang, 2016). It focusses on employees more directly and addresses their specific needs (Aguilera et al., 2007).

Pietersz (2011) referred to I-CSR as anything done inside the organization to improve the life of its employees that affect their productivity and it is directly

reflected on the profitability of the company. It also affects the physical and psychological working environment of employees. I-CSR gives the company good reputation and promote the positive image for the employee which make them more satisfied and committed to the organization and improve the results and productivity of their work (Cavazotte & Chang, 2016). Moreover, Yousaf et al. (2016) mentioned that the most valuable benefit behind I-CSR is achieving a higher level of employee's job satisfaction and work engagement. The successful performance of any organization depends on a fully satisfied and engaged workforce (Santoso, 2014). Keraita et al. (2013) indicates that it is very important to have loyal employees for the success and stability in the business world. Therefore, investments in I-CSR encourage competent employees to stay with the company (Cooper & Wagman, 2009). This leads to retention of knowledge between the employees who are considered as an important asset for the development of the company and in reducing turnover cost (Kacmar et al., 2006).

2.2.3 Measurements of Internal Corporate Social Responsibility

Previous studies in the literature investigated various dimensions to measure the internal corporate social responsibility. Thang and Fassin (2017) stated that I-CSR comprises five components: labor relations, work life balance, social dialogue, health and safety, and training and development. Shibeika (2015) mentioned that I-CSR based on stakeholder theory is divided into eight dimensions: training and career development, health and safety, employees' rights, employees' welfare, vacation entitlement, social work environment, workplace diversity and disabled support. Calveras (2013) categorized I-CSR into labor stability, employee participation, and high commitment human resource practices such as training and high wages. Others categorize internal corporate social responsibility to work life balance, training and education, health and safety, human rights and workplace diversity. According to Longo et al. (2005), internal CSR can be classified to four categories: value classes' which include social equity, health and safety at workplace, well-being and satisfaction of the worker and quality of work.

Yousaf et al. (2016) focused on training and education, health and safety and human rights as the three components of I-CSR. Mory et al. (2015) stated that internal CSR comprises seven components derived based on social exchange theory: employment stability, working environment, skills development, work life balance, empowerment, workface diversity and tangible employee involvement. For the purpose of this study and incompatible with how the employees are being affected in pharmaceutical market in Jordan, the dimensions which were chosen to measure the I-CSR are: the skills development, working environment, employment stability, work life balance and empowerment.

Skills Development

Knowledge and skills development are considered the driving forces of economic growth and social development for any country. Countries with higher and better levels of skilled human capital are more likely to respond to the challenges facing it and having a better chance to benefits form the opportunities of globalization compared to the countries with low skilled workforce and employees (Planning Commission, 2007).

Skill development can be defined as all the efforts that allow somebody to learn to do something better than before or do something new that has not been done before. Mory et al. (2015) defines skills developments as to which extent the employees' skills are promoted within the organization. Due to globalization, skills development becomes an essential part of employee's life to meet the new demand of changing economic and new technology (Kawar, 2001; Tarhini et al., 2017). According to Bayley (2015), skills development is focusing on two different segments: education and vocational training. Good education and training can enhance people's capacities and creativity, empower people, raise productivity of workers, and contribute to boost future innovation. Some studies for European countries show that a one percent increase in training days leads to a three percent increase in productivity. Education and development have been associated with positive organizational outcomes such as performance and it promote greater level of efficiency through learning new skills used in the work place (Barney, 2000; Ferraz & Gallardo- Vázquez, 2016).

Trainings offer the employees the opportunity to learn new concepts and gain highly required skills. When these skills and concepts are put into practice, the outcomes from their work will be more qualified and their productivity will increase (Joyce & Showers, 2002).

Working Environment

Mory et al. (2015) refers the working conditions to the health and safety status at work place. Most countries have legislations to protect workers from hazards and accidents at work (Frick et al., 2000). The workplace environment is part of a collective perception that directly contribute to satisfaction and performance of employees (Davis & Newstrom, 1999). According to Terry Irwin the TCII strategic and Management consultant, a healthy work environment can be achieved when maintaining these three aspects: the ethics and value foundation upon which the organization rests, the policies that take those principles and convert them into day-to-day actions and the corporeal environment in which people work.

Some researchers indicate that workplace must be safe in order to reduce the accidents that have negative impact on employee's health. Health and safety practices should be effective and efficient to influence employee satisfaction positively and attract them to work for a longer time in the organization. Good working conditions can reduce any work-related illness and disease that can occur inside the organization. Most of the organizations care about health and safety because that will prevent the

Licensed to (putm@utm.my)

legal and financial issues associated with any accidents that might occur during the working hours (Hughes & Ferrett, 2011).

There is a strong relationship between improving health and safety and the satisfaction of the employees. Mostly, job satisfaction can be described as the extent to which the working environment meets the need and values of employees. Some researchers found a strong relationship between good working conditions at the organization and corporate social performance. Health and safety are considered a legal compliance leads to competitive advantage and world class business performance. Furthermore, health and safety have a strong relationship with intangible issue such as reputation, brand name, morale and customer satisfaction (Smallman & John, 2001).

Employment Stability

Employment stability is what the company can provide for the employees regarding job security. It must provide comfort, support, security and stability for the employees regarding their jobs (Mory et al., 2015). When providing employment stability, employees will be more flexible about their work roles, more involved in their jobs and more committed to the success of the organization (Al Kurdi et al., 2020; Gerhart, 1991). Lin and Wei (2006) focused on employment security and mentioned it as one of the most vital issues in the present time. Moreover, there is a strong positive relationship between job security and job satisfaction and with the commitment of the employees (Jandaghi et al., 2011).

The majority of companies are focusing on motivating their employees, to make them work hard and to be loyal to the company. Hence, they are offering the employees a job security as a part of their plans in motivating them to invest more time and effort (Leung, 2009).

Work Life Balance

'An employee must live two separate lives, one at work, and the second at home' (Lyness & Judiesch, 2014). Work life balance first appeared in 1986 (Byrne, 2005). Mory et al. (2015) explained that the balance in working life offered by the company could be achieved when there is no conflict between employee's family life and work. They measure this dimension as the time you spend in work compared to time spent in doing something you enjoy. Many companies have been helping their employees to balance between the demand of work and their personal life knowing that this will be reflected on their satisfaction and eventually on the company's plans and goals (Agha et al, 2021; Grady et al., 2008).

Welford (2008) considered the work life balance as an essential part of corporate social responsibility. Work in general causes stress and burnout for workers, which affects the performance and the ability to perform all tasks efficiently. Therefore, being able to balance between work and personal life is so important for individuals

to relax and recharge. Companies that care about work life balance have a great ability in attracting and maintaining qualified and highly skilled employees.

Work life balance can be achieved by creating an internal culture that minimize negative norms and designing policies that support this issue such as flexible work hours, paid maternity leave, leave and time off, health assistance and vacations. Lazar et al. (2010) mentioned that work life balance could increase the participation of female personnel and make use of their capacities and capabilities. In order to keep the employees motivated and maintain an effective performance, the organization should include and work on the concept of work life balance in their corporate social responsibility strategy and plans.

Empowerment

Focusing on the empowerment concept as a part of the internal corporate social responsibility came after the huge escalation noticed in global competition and after facing a strong resistance for the change and the raise in the need for innovation (Drucker, 1988; Obeidat et al., 2019). Bowen and Lawler (1992) define the empowerment as sharing information with front line employees to enable them to understand the organization and act toward improving the performance of the company.

Empowerment can be classified into three categories: structural, motivational and leadership (Menon, 2001; Al Khayyal et al., 2020a). Employees' empowerment strengthens the self-efficacy and confidence to accomplish their tasks (Bettayeb et al., 2020; Ugboro & Obeng, 2000). Empowerment also increases the self-esteem of individuals, which is reflected positively on the performance of the employees and the organization (Spreitzer, 1995).

2.3 Job Satisfaction

2.3.1 Definition of Job Satisfaction

Some scholars defined the job satisfaction as the series of action and attitudes arise from emotional state of the employees towards their job experience and work environment. Moreover, job satisfaction reflects the feelings of the employees during doing their duties and responsibilities (Ardakani et al., 2013).

2.3.2 Impact of Job Satisfaction on Companies

As identified by Tewksbury and Higgins (2006), satisfied employees have a positive attitude toward their job with grater motivation and increased job performance. According to Suher et al., job satisfaction can affect the decision-making of employees regarding whether to leave the job and search for a new company or to

stay at the same position in the same company. The idea of leaving the job will no longer exists if the HR department gives the employees the opportunity to achieve personal development, reward them, evaluate their performance and provide them with environment to express themselves freely (Alshurideh, 2022; Alshurideh et al., 2022). Organizations with satisfied employees have low turnover rate. In addition, satisfied employees are easy to retain in the organization, therefore the organization is able to cut hiring cost of new employees (Cho et al., 2009; Alshraideh et al., 2017; Aburayya et al., 2020a; Kurdi et al., 2020; Hayajneh et al., 2021; Sultan et al., 2021).

The job satisfaction degree can be measured by identifying the extent to which the needs and desires of employees are meeting their expectations. In recent years, achieving a high level of job satisfaction has been an important issue facing many companies (Kusku, 2001). Job satisfaction is an indicator of organizational effectiveness (Rothmann & Coetzer, 2002). Funmilola (2013) stated that organization with satisfied employees are more productive and effective than those with dissatisfied workers, it also reduces employee's turnover and enhance the job performance. Job satisfaction is the fundamental block that leads to recognition, income, promotion and achievement of other goals that leads to the feeling of fulfilment (Kaliski, 2007).

2.3.3 Measurements of Job Satisfaction

Regarding the measurement and types of job satisfaction, many classifications have been proposed over the years. Nash (1985) mentioned that promotions, salary, work environment, work group and work conditions are factors that highly affect the job satisfaction. Lee et al. (2012) figured four types of satisfaction: social such as occupational prestige, organizational reputation and corporate social responsibility, job itself, job environment and organizational characteristic. According to Funmilola (2013), pay, promotion, supervision, work itself and working condition are the dominating dimensions of job satisfaction. Moreover, Manafi et al. (2012) proposed that there are seven types of job satisfaction: workload, perceived control, reward system and recognition, sense of community and social support, perceived fairness on the job and conflicting values.

Some researchers argued that job satisfaction is considered as a bi-dimensional concept classified to intrinsic side that depends on individual characteristic of the person and extrinsic side that depends on environment such as salary and promotion. Herzberg (1966) in his Two-factor theory classified the job satisfaction into intrinsic and extrinsic dimensions, he explained the relationship between these factors and showed how they can increase the effective commitment of employees to their company and decreased their intention to quit. Figure 2 shows Herzberg model explaining the relationship between these factors.

Also, two types of job satisfaction are being studied by researchers: the intrinsic and extrinsic in accordance to the studies provided by Olorunsola (2012) and Herzberg (1966).

Fig. 2 Relationship between job satisfaction and the intrinsic and extrinsic factors (Herzberg, 1966)

Intrinsic Job Satisfaction

Intrinsic job satisfaction is a pivotal in job behavior (Decker et al., 2009). It refers to employees feeling about their job. Many factors can contribute in evaluating the intrinsic job satisfaction such as moral values, creativity, achievement, power and independence (Abdallah et al., 2017; Al-Dmour et al., 2021; Alzoubi et al., 2020). Herzberg (1966) defined the intrinsic factors as motivating factors that are dealing with achievement, recognition, responsibility, advancement, growth, and the work itself. Intrinsic job components are focusing on the idea of using personnel abilities, job participation, job involvement, and have the feeling of accomplishment (Yang, 2009). According to Herzberg (1966) intrinsic job satisfaction factors were described as motivating factors. In 20% of the cases, the presence of these factors leads to satisfied individuals. The motivation factors are comprised of the physiological need for growth, recognition, achievement, advancement, the job itself, and responsibility.

Extrinsic factors such as managerial behavior and the reward system in the work place affect intrinsic motivation (Deci et al., 1999). In other words, their absence was not necessarily dissatisfying, but when present, they could be a very effective motivational force (Herzberg, 1966).

Extrinsic Job Satisfaction

Extrinsic job satisfaction reflects the satisfaction of employee regarding the work tasks or the work itself (Abdallah et al., 2017; Ammari et al., 2017; Al Shebli et al., 2021; Harahsheh et al., 2021). It can be achieved by providing a positive supervision behavior, and paying the employee their benefits suitable with their work load and tasks (Decker et al., 2009). Extrinsic job satisfaction is considering the need of adequate remuneration, opportunity for advancement, and being praised for

doing a good job (Yang, 2009). It can be related to "how employees feel about the portion of the work situation that is external to the work tasks or the work itself". Extrinsic satisfaction is usually influenced by environmental factors that are correlated with the work environment (Abdallah et al., 2017, p.32). Extrinsic factors show less impact on job satisfaction than the intrinsic ones. However, their absence may create dissatisfaction in the work environment (Baylor, 2010).

3 Conclusion

Recently, most of the researchers are trying to study and focus on internal corporate social responsibility as an essential factor for enhancing the employees' job satisfaction (Mory et al., 2015). The interest in internal corporate social responsibility first stemmed from questing to build strong company-employee relationship in order to achieve better level of employee engagement, which will be reflected on the organizational performance and strengthening its position in the competitive market and its reputation in the community. Internal CSR plays a vital role in increasing the productivity of the employees, it keeps them motivated to continuously achieve improvements in the quality of the product and it contributes to the research and development and the innovation in the organization (Hunaiti et al., 2009; Tarhini et al., 2015; Alshurideh et al., 2017; Abdallah et al., 2017; Alshurideh et al., 2019; Al-Khayyal et al., 2020b; Aburayya et al., 2020b; Alameeri et al., 2021; Nuseir et al., 2021).

Employees in any organization are considered the most valuable assets. Hence, it is important to keep all employees satisfied in order to increase their productivity and maintain them motivated. Many companies have been helping their employees to balance between the demand of work and their personal life knowing that this will be reflected on their satisfaction and eventually on the company's plans and goals (Grady et al., 2008).

Can Better Capabilities Lead to Better Project and Program Governance? Cases from Dubai

Mounir El Khatib, Fatma Beshwari, Maryam Beshwari, Ayesha Beshwari, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract This paper addresses how to improve project and program governance through improving process and infrastructure, resources and stakeholders, organization and culture, and leadership and decision making. A brief overview of the theoretical background of these four governance capabilities is presented. The research approach is described along with three case studies from local government entities in the UAE have been analyzed. The data collected revealed that there is a gap in project/program governance implementation within the chosen organizations for this study. The paper suggested some approaches to improve the four capabilities that can contribute to creating and enhancing the current governance structure utilized across the organizations for achieving better project execution and program benefit outcomes.

1 Introduction

Program Management is a rapidly emerging profession fulfilling a key need to be used in establishing companies both big and small. Program management can be defined as the integration of skills, knowledge, techniques, and tools to meet program objectives (Project Management Institute, 2016). The programs are used to either better manage costs, maintain overall conditions, and successfully controls over conflicts. The program management generates value through linking different groups within an organization around common processes and goals. Therefore, there has been a strong interest in business market toward establishing project and program governance (Alaali et al., 2021; AlShamsi et al., 2021). The development and implementation of program governance are essential keys for project/program managers on how to manage a successful program (Al Alshurideh, 2019; Batayneh et al., 2021). This is because organizations are facing a huge problem when it comes to managing several projects, especially if they were across the geographies without having a formal program structure (Kabrilyants et al., 2021; Odeh et al., 2021). This made top management find difficulties in monitoring and controlling various projects execution in the absence of proper governance structure and formal channels. This leads to create a disconnection between project execution and organization strategies as well as no primary body like Steering Committee to provide oversights to programs and its components. Other challenges noticed with implementing an effective program governance are inadequately executive support, globalization, and rapid change in technology and business environment (Hasan et al., 2022; Project Management Institute, 2016; Tariq et al., 2022). The problem that many program managers has struggled with is how to determine making the program governance framework adaptable to different program requirements. Therefore, the aim of this paper is to address how to improve project/program governance through improving four capabilities which are process and infrastructure, resources and stakeholders, organization culture, and leadership and decision making.

2 Literature Review

2.1 Concept of Governance

According to Klakegg, the term "governance" is closely linked to words like governing, government, and control (Klakegg et al., 2008). In organizational settings, governance offers the necessary structure based on definite roles, accountability, and transparency for managerial actions and ethical decision-making within an organization (Müller, 2009). According to literatures, there are mainly two schools of thought about governance. The first school of thought postulated that different subunits of an organization require different forms of governance, such as project governance

(Abednego & Ogunlana, 2006; Miller & Hobbs, 2005; Winch, 2001), public governance (Du & Yin, 2010; Klakegg et al., 2008; Williams et al., 2010;), network governance, knowledge governance (Ghosh et al., 2012; Pemsel et al., 2016), and IT governance (Marnewick & Labuschagne, 2009; Martin & Gregor, 2006; Willson & Pollard, 2009). This school of thought about governance is likely developed by project managers, IT managers, government officials, and academics who work exclusively within these disciplines (Guergov & Radwan, 2021; Hamadneh et al., 2021; Obaid, 2021). Proponents of this school of thought viewed governance as a function of any entity or management responsible for decision making and/or overseeing the operations and projects of the organization. They also hold that there is no integrated governance practice as all governance practices operate independently from one another.

The second school of thought was proposed by organizations like agencies that govern stock exchanges, various Institutes of Directors (Institute of Directors Southern Africa and Australian Institute of Company Directors), and the OECD. According to this school of thought, governance is a single process but has different phases, which include viability and sustainability, financial governance, governing the people within the organization, governing changes, governing relationships, and the performance of individual directors and the Board of Directors. This school of thought holds that the core values of a well-governed organization include its vision, values and ethics, commitment to corporate social responsibility (CSR) and the way the board governs itself. While these core values are not absolute, they should exclusively be the responsibility of the organization's governing board or its equivalent.

2.2 Project Governance

Project governance has been explored by several practitioners and academicians (Abednego & Ogunlana, 2006; Sankaran et al., 2007; Yin et al., 2008). Project governance is a subset of corporate governance and focuses on the areas of corporate governance that relate to project activities, such as project and program disclosure and reporting, project and program management and efficiency, project sponsorship, and portfolio direction (Garland, 2009). Project governance has been around for several years and is the tool necessary to deliver strong and accurate project analysis. According to literatures, project governance is a general term used to encompass leadership, authority, direction and control, accountability, and stewardship to accomplish a project (Akhtar et al., 2021; Cruz, 2021; Khan, 2021). Project governance, especially at the pre-stage of a project procurement is very important to determine the success of any particular project. Project governance provides the right framework through which the goals and objectives of organizational projects are set. It also provides the structure though which achieving those goals and objectives are determined, and how monitoring project performance are determined (Australian Government, 2017). The essence of project governance is to ensure that project goals

and objectives perfectly align with the organization objective and portfolio (Alzoubi et al., 2022; Aziz & Aftab, 2021; Mehmood, 2021). Hence, project governance has three main goals, which are selecting the right project, delivering the selected project effectively and efficiently, and ensuring that the selected projects can be sustained. Project governance helps in outlining the relationships between internal and external individuals involved in delivering a project, which include the project stakeholders.

2.3 Organizational Responsibility for Project Governance

As stated above, project governance is the process and framework that ensures that organizations properly set up their resources and investments to ensure that the resulting project delivery is carried out properly and as desired. Generally, project governance is implemented at different levels of the organization. For instance, project leaders receive directions from and report back to their project managers, project managers receive direction from and report back to the executive, and the executive to their director or board of directors. According to Selig (2008), effective project governance is built on three key elements, which are:

i. Leadership, organization and decision rights.
ii. Importance of flexible and scalable processes improvement; and
iii. The use of enabling technology.

Project governance starts with setting clear goals and objectives for the organization to provide the initial directions. After clear goals and objectives have been set, then strategic planning and execution of the goals and objectives ensue. The implementation of the project governance action plan, policy, and strategy will ensure that the project governance is effectively. Afterwards, a continuous loop is established to measure the project performance and compare it to the set goals and objectives of the project. This may lead to the redirection of project-related activities or changes to goals and objectives where appropriate.

2.4 Project/Program Governance Overview

Governance impacts every organization no matter how big or small, public, or private it is. So, understanding governance is an important factor to the organization because appropriate governance results in the success or failure of strategic initiatives (Project Management Institute, 2016). Program Governance can be defined as what a program is supposed to accomplish, describe how to keep the program on track, and detail how the organization can provide support. Project/program governance contains all key elements that lead to execute a successful project or program. It is important to adapt these key elements to the needs of the organization as project/program governance needs to be aligned with the business' governance (Ali et al., 2022; Alshurideh

et al., 2022; Ben-Abdallah et al., 2022). When program governance framework well designed, it will provide good practices for effective decision-making and managing the program appropriately. Program governance support creating an environment for better communication and addressing program risks, uncertainties and opportunities that occur during the program performance. It assures stakeholder engagement by establishing clear expectations for program interaction and designing, authorizing the assurance when it is required by reviewing and health checks of program delivery (Project Management Institute, 2016).

Governance capabilities is the ability of providing an efficient form of governance for the organization to gain competitive advantages and to initiate, maintain its relationship with another organization (Doğru, 2019). The purpose of governance capabilities is to allow and assure the ability to control business, process, IT system capabilities and services offering of the enterprise with an acceptable limit that set by the organization.

2.5 Process and Infrastructure

The process in governance can be defined as how an organization consolidates their management, tasks, and services in order to ensure that project or program is executed properly based on the expectation of managers and stakeholders (Alsharari, 2021; Hanaysha et al., 2021a, b; Lee & Ahmed, 2021). Applying governance can make it possible by implementing standardized practices, process, and rules across the project. To get the successful performance in process, it is very important to establish process office, test process before mandating, defining team members, documentation, risk management and communication.

Infrastructure in program governance is a backbone for achieving a long-term inclusive development. Governance of infrastructure includes a range of tools, process, decision-making and monitoring by the organization. The Program Management Office (PMO) is part of the infrastructure governance and provides support along administrative, process, financial, and staff dimensions correlate with successful program implementation. In addition, Program Management Information System (PMIS) is another component of infrastructure governance which should play a critical role in integrating between all activities, phases and systems utilized with program execution (Alshurideh et al., 2020a; Ashal et al., 2021; Kurdi et al., 2021). Therefore, organizations tend to follow the latest technology such as, blockchain and big data to enhance their infrastructure governance's system. According to Risius and Spohrer (2017), blockchain technology is used as a tool to improve the project management success factor like monitoring, communication, traceability, and scalability.

2.6 Resources and Stakeholders

Stakeholders is individual or group that has interests in decision or activity in the organization and they can be an internal or external stakeholder (ASQ, 2020). Stakeholder can be people who are invested in the project or program and who will be affected at any phases along the way (Alhamad et al., 2021; Rui et al., 2022; Shakhour et al., 2021). In addition, their input can be directly impacted on the outcome of the project. It is very important to communicate with them in order to collaborate on the project (Rafiee & Sarabdeen, 2012). Good governance can influence taking the cooperation of stakeholder into account with the concentrating on interests of a wide range of constituencies as well as assuring rapid access to information and good communication with stakeholder which leads to better results. Resource on the other hand, it is all necessary asset that is utilized to carry out certain tasks or a project and it can be person, tool, team, finance. In addition, it is very important to allocate resources before starting the project or the program (Ghazal et al., 2021). Good governance framework is encouraging the efficient use of resources and equally distribute the accountability.

2.7 Organization and Culture

Governance and organization should work together on aligning strategies, objective, and risk tolerance. In addition, they can help in clear defining of roles, accountabilities, and empowering risk management (Ali et al., 2021; Alshurideh et al., 2021). Governance and the organization contribute to identify and promote all related matters across the organization such as centralized and decentralized model, the role of leadership and how to make decision making (Al-Dhuhouri et al., 2021; AlShehhi et al., 2021). Organizational structure is the outline how certain activities are directed to meet organization goals (Alshurideh et al., 2017; Murray & Christison, 2012). A poor governance structure will leave project/program in a continuous reactive state which lead to difficulty in catch up with changing conditions.

Culture represents organization personality and it compromised of assumptions, belief, value, norm, and organization team member behavior (Abuhashesh et al., 2021; Hamadneh & Al Kurdi, 2021). Understanding the culture of the organization is critical to run a successful project/program (Al-bawaia et al., 2022; Alzoubi et al., 2020). Culture can influence the organization policies through the value held by the decision maker. Moreover, culture contributes to the interpersonal relationship of the individual and the organization relationship which is leading to change a choice of governance structure (Alzoubi & Aziz, 2021). Several elements of the organization structure and culture has effects on how project/program managed. Therefore, it is important to identify them to help in creating organizational culture that incorporates project/program management (Rafiee & Sarabdeen, 2012).

2.8 Leadership and Decision Making

Leadership in project is the act of team toward successful completion of project/program. In fact, leadership requires skill in both leadership and management. Many studies and literature found that there is a significant impact between leadership and governance (Alzoubi et al., 2021). Governance plays an important role in providing planned direction for leaders and help them to foster commitment, accountability, and shared aims. In addition, governance supports leadership in project/program through arrangement and frameworks. Also, governance provides important boundaries for leadership in the project/program (Lord et al., 2009).

Decision making in project/program is on a daily basis and can lead to success or fail of the project/program. Engagement of governance in project/program can set the boundaries within people operate. In addition, it identifies who is responsible for decision making and define the process that should use to make legitimate decisions (Hanford, 2005).

2.9 Challenges of Program Management Capabilities Development

Despite the good potentials of program management capabilities, program management has been facing a failure also in the government sector (ALnuaimi et al., 2020). This issue has been studied for several years and many studies addressed that program management in the context of efforts to improve certain organization. A study has been conducted by Council for Excellence in US government in 2008, identified five major challenges of program management capability development across government sector (Alzoubi et al., 2020). First, policies have been developed overtimes to address a specific issue and do not holistically address the challenges of program management. Second, program management is not recognized as a management discipline that is essential to organization success, performance and results. Third, stakeholder and agency executive do not understand their responsibilities and roles (Joghee et al., 2020). Fourth, no consistency in government sector for training and development a program manager. Finally, the program manager is lacking professional community within the government organization as many program management roles in the organization are working in relative isolation (Marshall et al., 2015).

3 Research Methods

This is a conceptual paper that purposes to use case studies to address how to improve project/program governance through improving capabilities specifically Process and Infrastructure, Resources and Stakeholders, Organization and Culture, and Leadership and Decision Making. Three case studies are reviewed: two from Dubai Government entities and one of the Federal Government entities. A combination of primary and secondary data has been utilized to gather the information (Alshurideh et al., 2020b). Mainly an interview was used as primary data and.gov,.org, and official organization press used as secondary data. The interviews have been done through virtual meetings and they were based on open ended structure.

3.1 Data Collection

3.1.1 Case A: Dubai Electricity & Water Authority (DEWA)

DEWA is one of the big government entities in Dubai Government that provides utility services specifically water and electricity services. DEWA considers governance as a foundation of its operation since its establishment. Good implementation of governance in DEWA starts with the top management and leadership being an example. Organization structure, control system, and operation driven by policies and documented processes have led to greater efficiency and productivity, which is a good achievement for the world governance culture (Alzoubi & Yanamandra, 2020). DEWA program governance focus is to provide active direction, periodically review the results, identify and adjustments to ensure achievements of the planned outcome that contributes to the success of the overall business strategies.

The project framework covers the classic components of governance such as board oversights, a clear organization chart and span of control, and a well-documented strategy and proper delegation of financial and administrative authorities (Lee et al., 2022b). In keeping with international guidelines, DEWA adopts the three lines of defense approach with management and supervision being the first line, risk legal compliance governance being the second line, and internal audit as third line. A board base control review system is enabled through external auditors and the government audit. DEWA organizational model decomposes all management and oversight functions and describe the relation among them.

3.1.2 Case B: Dubai Municipality (DM)

DM is one of the biggest government's institutions in Dubai and one of those institutes who are leading the development of smart services. DM has a PMO that is reported directly to the director general office in the organizational hierarchy. PMO is responsible for defining and maintaining projects executions through adapting PMI methodology (Mehmood et al., 2019). Since 2009, DM has established governance by identifying and issuing general framework and manuals based on enhanced guidance and control, filling the right, relations, and obligations.

DM Project Governance framework provides a comprehensive application of regulations, procedures, and laws as well as it is a sharing process that involve stakeholders and through which vision and missions are achieved. It includes a network of organizational relationships that gives integrated system which contributes to finishing tasks and works professionally. In addition, Program Governance framework defines management principles and decision-making hierarchy (Alzoubi et al., 2019). A unified portal called PMWeb has been used as PMIS assigned to each department to allow project managers to monitor and control activities within project (Asem Alzoubi, 2021a, 2021a, b; Eli, 2021).

3.1.3 Case C: Ministry of Climate Change and Environment (MOCCAE)

MOCCAE is one of the federal authorities that was established in February 2006 as the Ministry of Environment and Water. In 2016, the UAE Cabinet reshuffle the Ministry and subsequent integration of the climate change function, as well to changing the name to the Ministry of Climate Change and Environment (Alzoubi & Ahmed, 2019). MOCCAE aims to strengthen the UAE's efforts in preserving the environment and promoting food diversity on the national level (Miller, 2021).

MOCCAE has recently adopted organizational governance based on the new decision of the UAE Cabinet on the Governance System for the Federal Government Boards (2020). The decision was made after the COVID-19 pandemic. However, MOCCAE had started in project governance in the late 2018. It is considered as a reform for the organization and a key element to maintain the sustainability of projects and initiatives (Alnazer et al., 2017). It is a technique and infrastructure that helps in adapting to different challenges that might occur in the future.

4 Data Analysis

Program governance capabilities	Case A	Case B	Case C
Process and Infrastructure	– Well-structured as project governance – Unclear about program governance – SAP PPM as PMIS	– Well-structured as project governance – Newly introduced program governance – PMWeb as PMIS	– Newly introduced project governance – Unclear about program governance – No PMIS and mainly rely on Basic MS office
Resources and Stakeholders	– Well defined resources allocations and utilization – Lack of external stakeholder involvement	– Well defined resources allocations and utilization – Lack of external stakeholder involvement	– Traditional methods in allocating resources and estimations – Traditional methods followed to identify and involve internal and external stakeholders
Organization and Culture	– Methods are communicated across organization – Regular awareness	– Familiar with projects knowledge – Regular awareness	– Unclear project culture
Leadership and Decision Making	– Automated process – Clear direction and involvement of leadership	– Programs are linked to strategy – Automated decision-making process	– Not structured decision-making process

4.1 Case A: DEWA

DEWA has a well-structured project governance, but the concept of program governance is not clear to them. Programs are considered as big projects and follows project governance framework that in some cases could not be tailored to meet the program requirements. This is because project focuses more on product and services executions while programs focus on the benefits which is not included in project governance framework (AlHamad et al., 2022; Lee et al., 2022a; Miller, 2021).

Decision making is based an automated process and follows three levels of approvements review, confirm, and approve in Smart Document Application as well as DEWA uses SAP PPM module as PMIS tool for project management, financial and resource allocations. However, there is lack of consideration of external stakeholders with existing governance framework and it is mainly focused on internal

stakeholders like divisions, departments, and project teams. The main drawbacks found that many of big projects (programs) managers are not qualified enough to manage the execution of such projects where they usually are delayed and required many modifications and change requests due to inaccurate planning. Finally, DEWA organization culture has a shortfall of understanding program governance and its role to differentiate between projects and programs which impact the organization operational performance.

4.2 Case B: DM

Program governance in DM is still a new concept and challenging as well because it requires more efforts to establish well-structured processes with the applicable approval flow. The approval flow must be capable to develop, modify, or reconfirm the business case for the component (Mondol, 2021; Radwan & Farouk, 2021). Moreover, the management in DM has good resources and technologies. They have a PMIS called PMweb which is used for initiation, monitoring, and documenting projects within organization as well as it acts as a centralized source of all projects and programs that can help in successfully meeting the organization strategies. This system provides a cross functional system that combines many departments to work as one team in order to meet the goal and vision of the organization. In addition, top management has clear direction, roles, responsibilities toward stakeholder involvement to assure the success of the program, but there is a lack of external stakeholder involvement. Overall, DM built a professional ecosystem of confidence and credibility by actively promoting culture of governance, but still there are confusion between programs and initiatives.

4.3 Case C: MOCCAE

The ministry has recently adopted project governance. Therefore, there was some limitation in collecting the data and lack of knowledge about program governance. There is no clear approval authority for projects and PMO is still unstructured well. The programs are called initiatives and they have many initiatives that contains many project components, but there is no awareness about the correct terminologies, tools, and system. In addition, MOCCAE does not have a PMIS and mainly rely on basic MS Office documents to create project plans and share the information that create chances of creating human errors and lack of integrity. Moreover, they follow weak approach in stakeholders' identification and involvement that causes delays of the project and program (Al Ali, 2021). The resources estimations and allocation process have many drawbacks and can be biased in some cases because of inappropriate structure followed in this phase. Many of project managers are assigned based on their job roles not specialized in project management which leads to plan the project

inaccurately and results in delaying or failing the project because of many changes are occurring in the scope before and within execution phase.

4.4 Discussion of Results

Establishment of program governance is not an easy task. Indeed, huge investments are needed when it comes to improvement of project/program governance framework. Program governance needs to be tailored to an organization specific need and there are four major components that have been identified can influence how effectively implement and improve project and program governance.

4.4.1 Process and Infrastructure

Organizations must establish strategies and support infrastructure with the vision and their capabilities. PgMO must be established since it is a core part of the program infrastructure and it supports the management and coordination of the program and component work. In addition, PMIS another key aspect that must be focused on because it is used for collecting, integrating, and communicating information (Alzoubi, 2021a, 2021a, b; Farouk, 2021). It should incorporate change management system, risk database, financial management system, earned value management system, configuration management tool, and knowledge repositories. The infrastructure should be optimized, transparent, and capable in managing complexity which will help in managing the project/program more efficiently and confidently. That is why, new technologies such as blockchain and AI can be utilized to enhance the tools and skills. In addition, it will make the organization more proactive through identifying, diagnosing, and resolve performance problem before they negatively impact the business (Al Alhashmi et al., 2020; Shebli et al., 2021; Yousuf et al., 2021).

The organizations need to introduce Business Process Management (BPM) that must focus on redesigning the current processes. With BPM, organization get the flexibility of making changes to processes with minimal costs and can easily be customized to suit the requirements of the organization (Kashif et al., 2021). In addition, BPM can simplify the automation of repetitive steps with regular workflow such as elimination of redundant steps, removal of bottlenecks and introduction of parallel processing. This will result in creating a sustainable profitability and growth.

4.4.2 Resources and Stakeholders

Governance is provided by the people and processes that guide them directly for the benefit of the organization and all stakeholders. This includes the shareholders, board of directors and executive team. The main aim of governance is to breach the gap between the managers and stakeholders. It is more concerned about the organization

contribution of all the stakeholders. So, the main step for the program manager is to identify the key stakeholders and manage their concerns through providing clear program updates of the findings and ensure the continuous leadership alignment (Harahsheh et al., 2021; Kurikawa & Kaneko, 2016). The capability of the resources, external support, and experience are important aspects to the success of the program. Establishing trackers and reporting tool is one way to disciplined forecasting the resources.

4.4.3 Organization and Culture

The organization and program culture has unique aspects that need to be understood and developed appropriately to be able to match their complexity. Therefore, organizations need to search for the suitable ways to achieve the benefits from the program. Shifting the organization be a dynamic organization is one way that can be followed. Dynamic organization simulates the changes in people, processes, environment, and culture (Alshraideh et al., 2017; Zu'bi et al., 2012). It has the ability to grow the organization with less risk through dynamic strategies and operation reviews which help in removing the obstacle blocks and allows for actions that accelerate the growth (Allozi et al., 2022; Kurikawa & Kaneko, 2016).

4.4.4 Leadership and Decision Making

A critical aspect of program governance is delegated specific decision-making authority to each administrative and management role. Leadership should continuously linkage to enterprise business strategy and direction, provide administrative support and assign an executive control over program evolution and outcomes (Ali et al., 2021; Ghazal et al., 2021). Program managers can hold special group work meeting for this purpose and then establish and allocate a matrix for major decision areas and responsibility (Alameeri et al., 2021; Hanford, 2005). This will create a clear and well understood decision making authority as well as effective oversight of and insight program progress and direction (Ahmad et al., 2021; Ahmed et al., 2021; Alyammahi et al., 2020).

5 Conclusion

In conclusion, establishing an effective program governance framework is an important activity requiring concentration on all capabilities. A strong governance process provides a sustainable foundation for the organization business to support growth for the future (Alhamad et al., 2021; Kurdi et al., 2021). The three case studies analyzed in this paper revealed the need for a proper program governance framework because the program's success relies on best utilization of the governance framework, policies,

and best practices. When governance is built properly, it provides sufficient reporting and control activities. This is because governance empowers program managers to execute their responsibilities in a structured and well-defined workflow. In addition, continuous feedback and communication are necessary components of a program governance and program team members must understand each organization's values (Alzoubi & Aziz, 2021; Alzoubi et al., 2021). For best implementation, organizational structure of each component within the program must be applicable to the enterprise overall management philosophy and methods.

6 Recommendations

- Organizations should establish a clear program governance framework with stakeholder involvements instead of relying on project governance.
- Create a dedicated team for Program Management Office.
- Evaluate several models of successful program governance implementations and adapt most applicable ones.
- Identify the program roles, decision making hierarchy, strategies, and best practices.
- Introduce new technologies such as big data and blockchain to enhance the lesson learned data and program knowledge management to be utilized as a source for future project/programs.

A Trial to Improve Program Management in Government Bodies Through Focusing on Program Resource Management: Cases from UAE

Mounir El khatib, Alia Mahmood, Amani Al Azizi, Ayesha Al Marzooqi, Khalil Al Abdooli, Saeed Al Marzooqi, Sumaya Al Jasmi, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract Improving a program management in government bodies is a critical aspect, and this research paper demonstrates a thesis on Program Resource Management and its process to the success of government bodies' roles. The qualitative methodology in this paper studies the program management several aspects in terms of resource management and its effect on the success of the government sector's programs in UAE. The study covers program management's impact on the sectors and issues in government sectors in relation to the lack of professionals and its effect on the availability and clarity of the senior management career paths. The research paper addressed the main problem in program resource management and its wide effects. Similarly, the data gathered to cover the same thesis to compare and analyze the government bodies' key results and finding. The researchers have been addressed the impacts of resource management on the program management in the government sector. Since resources are always allocated and utilized with a proper record being kept in the government sector, this research analyzes the issues in the government sector. It was estimated that the program managers lack a professional community within the federal government that can provide support and a voice on issues affecting the development of program management in the sector. This give rise to several concerns which are need to be addressed and the research will be on providing a solution to this problem. Alongside that, the research pointed out that

the government-wide job series for program managers that spans business functions with a career path that extends into senior career executive management ranks is full of flaws. There is a lack of credibility and quality at the level of the management which manages the resources. The research also allowed the researchers to carry out the SWOT analysis on program resource management. This will allow to identify the major threats and the opportunities which the field has for the young aspirants in the future. The researchers' main focus is on to identify the major problems in the program resource management. The aim has been to identify these issues and then propose proper and sustainable solutions for them to ensure employees and management make better use of the resources either in the program or project. The issues like managing resource allocations, choosing the right career path and lack of training and development are a few to name which the research has discussed in detail. The aim has been to evaluate these issues by ensuring that they are analyzed from the perspective of the employees as well as the management.

Keywords Project management · Program management · Resource management · Capabilities · Government bodies · UAE

1 Introduction

One of the most continues challenges for several programs across worldwide is maintaining resource management effectively (Alkalha et al., 2012; Alshurideh et al., 2019; Zu'bi et al., 2012). In the program environments, program resource management decides the success or failure of the program. It is very essential and critical that the program manager requires to work within the uncertainty boundary and assure the necessary elements and items for the projects (Al Ali, 2021; AlHamad et al., 2022; AlHamad et al., 2021; Ali et al., 2021). Program resource management plays a vital role in ensuring the availability of the needed resources to the project managers. This will lead to accomplish projects in an approved schedule date and get program benefits.

The researchers listed out the critical success factors to support program resource management. The listing out of CSF has allowed the organizations to significantly be able to identify the key factors responsible for the success of the organization and how the organization should focus on these key factors for sustaining success for long term period. The gaps and the issues in the organizations in terms of the program resource management was done by conducting interviews from the program managers of Emirates Group, Water and Power Producer Companies (IWPP) and The Executive Council of Dubai as a source of data gathering. Each manager made suggestions to improve the capacity and capability for the project and program management. It was suggested that the program manager job series must have a clear career path and policies to support the career development of program managers. The research aimed to solve the problems of the program managers for better resources use and allocation

alongside effective management. This research explored the question under study by getting in touch with the professionals for effective results. At the end, there are a several recommendations for better use of the resources in program management.

On the other hand, program resource management faces several significant challenges, which are an insufficient correlation with the owners of the resource, poor project planning, inadequate HR planning, lack of career path, no consistency in the training of resource management, …etc. (Al Kurdi et al., 2021; Ashal et al., 2021; Shamout et al., 2022).

In this research study, we will discuss the impact of resource management on the success of the program management alongside its issues. The gaps in resource management will be addressed, and solutions will be proposed. Qualitative data is gathered from three different organizations. Then, analyze data based on the literature review and data gathering interviews. Finally, drawing the conclusion and recommendations based on data analysis.

2 Literature Review

2.1 Program Resource Management Definition and Explanation

Program resource management is a very important organizational procedure that should be regulated to ensure that the critical inputs are used accordingly. This concept entails two distinct aspects, which are program and resource management. Programs refer to the projects organized by entities, whether in the private or public sector, to achieve certain goals and objectives (NAPA, 2015). The programs might range from training and development initiatives to the construction of public amenities to serve the local citizens and international corporations operating in the country. On the other hand, resource management refers to the specific strategies instituted by an organization to promote effective and efficient use of the available inputs (Petersen & Kumar, 2015). The practice is prevalent in both private and government agencies, which thrive to promote transparency and accountability in the utilization of core resources (Ali et al., 2022; Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021). Based on the breakdown of the constituent elements, program resource management can be defined as the specific initiatives incorporated within an organization, whether government institutions or corporations, to ensure that the resources are utilized effectively and efficiently in the core operations. However, the complexity of the process varies between organizations depending on the nature and the scope of operations. Therefore, it vital for the government organizations to adopt an effective resource management strategy to enhance its output.

2.2 Resource Management Impact on Program Management in the Government Sector

Resource management can be utilized by the government agencies to ensure that the implemented programs are managed effectively to deliver maximum utility to the members of the public. The government organizations and state-owned enterprises, such as agricultural, sports, tourism, and health agencies, are faced with the challenge of allocating the resources efficiently to yield optimal returns to the members of the public (Alshurideh et al., 2020; Alshurideh et al., 2022; Alzoubi, 2021a). The complex system of governance in the government entities renders the structure porous, hence encouraging inefficient use of resources, which includes duplication of core operations and embezzlement of the available funds. As such, the introduction of an effective resource management initiative would significantly combat the above-mentioned constraint and ensure that the government utilized the tax revenue effectively to benefit its citizens.

To start with, through resource allocation, the initiative would enable the government institutions to optimize the use of the available resources. It is vital for the government institutions to identify the resources that contribute to sustainability and allocate them efficiently (Braganza et al., 2017). Resource management enables organizations to organize their available assets, whether human, financial, or physical, to align with the overall goals and objectives of the projects (Patanakul et al., 2016). For example, the government agencies can divide work accordingly so as to match the competence of each individual in the organization. The process would promote effectiveness in operations, hence preventing the common operational inadequacies, which enhance wastages. In order to actualize the process, the managers and leaders in the government organizations should often use resource allocation reports. The documentation provides a detailed overview of resource availability (Scarlett & Boyd, 2015), hence preventing schedule delays or over budgeting. As such, the enhanced reporting capabilities would support transparency and efficiency over the government projects.

In addition, the government organizations can use resource leveling, a common type of resource management technique, to enhance the execution of their projects. The agencies can analyze the current and prior projects to identify the underutilized resources (De Carvalho et al., 2015). Timely identification of the inefficiently used resources would enable the agencies to apply the inputs to their advantage, which will ultimately increase the delivery of public goods to the citizens. For example, the government organizations can utilize the range of internal skills and expertise to acquire certain professional services rather than outsourcing the competency from private institutions. The interior employers within the institutions might have special talents and expertise, such as graphic design, auditing skills, and project evaluation, which could be utilized internally to foster productivity (Ayers, 2015). As such, the action would save some finances, which will be channeled towards other viable projects that would assist the members of the public.

Furthermore, the government institutions can utilize resource forecasting, another resource management practice, to improve the outcomes of their projects. The practice utilizes the historical data and level of current operations to predict the future resource requirements before the commencement of the project. It is a reasonable plan that can be used to optimize people, materials, and budget efficiency (Alzoubi, 2021b; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, b, 2022). At the initial stages of planning, the government institutions, led by the management, will have to identify the scope, potential constraints, and possible contingencies. However, it would be essential for the managers in the government institutions to be familiar with the public project lifecycle and the general overview of the requisite resources within the organization. The management can utilize project management software to provide the required project visibility (Serrador & Turner, 2015; Kabrilyants et al., 2021; Shakhour et al., 2021). The software will also enable the management to centrally access the projects and the corresponding resources. As such, having a comprehensive expectation of the future resource requirements enables the government institutions to plan accordingly, hence promoting efficient resource utilization.

2.2.1 Program Managers Lack a Professional Community Within the Federal Government that Can Provide Support and a Voice on Issues Affecting the Development of Program Management

However, irrespective of the advantages associated with the program resource management techniques mentioned in the prior section, the program managers in the government institutions might lack the requisite support to apply the measures effectively (Alzoubi et al., 2021; Alzoubi & Aziz, 2021; Alzoubi & Ahmed, 2019). Indeed, program managers lack a professional community and backing within the federal government that can provide the necessary support and reinforcement on fundamental issues that affect the development of program management. The government organizations accompanied by poor priority, especially in the government projects, might alienate the program managers and fail to offer the necessary financial, infrastructural, and human support to ensure that the resources are utilized efficiently and effectively. As such, most of the government projects are encompassed with issues of various magnitudes.

2.2.2 A Government-Wide Job Series for Program Managers that Spans Business Functions with a Career Path that Extends into Senior Career Executive Management Ranks

The application of resource management in government programs provides a culture that prioritizes efficiency, which ultimately strengthens career development. Particularly, a government-wide job series for program managers, accompanied by resource management and viable practices, bolsters business function efficiency, hence providing a pathway for career development into senior executive positions

(Alzoubi et al., 2020a, b; Aziz & Aftab, 2021; Cruz, 2021). The application of resource management provisions by the program managers in the government institutions bolsters their reputation greatly due to the high level of productivity. As such, the process creates a path upon which the project managers can elevate into higher managerial positions. As such, it is vital for the personnel within the government organizations with the aspiration of progressing in their careers to adhere to the resource management practices in their projects.

2.3 Program Resource Management SWOT Analysis

SWOT analysis can be used by the project and program managers to identify areas in resource management that need enhancement. The strategic tool enables the project and program managers to bolster program resource management to gain optimal efficiency (Hornstein, 2015). It also enables the leading personnel to mitigate the risks associated with the functions and optimizes the entire program. The constituent quadrants of the SWOT analysis matrix are discussed below.

- **Strengths**

Program resource management has certain strengths that make it appropriate in dealing with government-related projects. To start with, it aligns with the organization's goals and objectives formulated by the program and project managers, which is enhanced productivity. Program resource management ensures that the government organizations use the available resources optimally (Kogan et al., 2017; Rui et al., 2022), therefore bolstering the output. Second, the initiative is universal, hence compatible with different projects within an organization. Precisely, program resource management can be used in any organizational process to promote effective and efficient consumption of resources. Finally, program resource management encourages a culture of creativity and inventiveness, which enables the organizations to join optimal output from the project and program team members. The strengths indicate that the initiative would be appropriate in government organizations (Eli, 2021; Ghazal et al., 2021; Guergov & Radwan, 2021; Hamadneh, Pedersen, & Al Kurdi, 2021a, 2021b).

- **Weaknesses**

Irrespective of the strengths mentioned in the prior section, program resource management is associated with certain deficiencies, which if not addressed, might hamper the effectiveness of the operations set by the program and project managers alongside their team members. To start with, the process is very sensitive and disposed to potential errors, which might lead to further loses. Particularly, the forecasting of resource needs might be affected by environmental uncertainties, which might ultimately lead to either under-allocation or over-allocation of resources (Hanaysha et al. 2021a, b). Second, relying on internal expertise, which is obtained from the project and program team members, would lead to the acquisition of services that

are not entirely professional. The reason is that the internal employees might not be as experienced as the seasoned professionals in various fields, including accounting and project evaluation. Finally, the initiative might be expensive, especially in cases where intensive forecast is required. As such, the weaknesses should be addressed to ensure that program is effective.

- **Opportunities**

Application of program resource management grants the program and project managers plenty of opportunities to flourish in their respective markets. The initiative provides an opportunity for the organizations to expand their investments to other viable projects. Particularly, through cost minimization (wastage reduction), the government organizations, which are steered by the project and program managers, would channel the saved finances to other projects that would yield optimal returns to the citizens. Second, through the government support, especially in relation to oversight, the program managers can plan effectively and acquire sufficient resources to execute the major initiatives (Patanakul et al., 2016). As such, it would be rational for the project managers to implement effective program resource management practices.

- **Threats**

There are some threats that emanate from the external surroundings, which might threaten the success of program resource management. Political instability might interrupt the government organizations operation (Patanakul et al., 2016), hence affecting their resource planning adversely. Furthermore, political realignment, especially in relation to the leadership positions of government organizations, might disorient the implementation of resource management practices. Therefore, it is essential for the government organizations to formulate viable corrective management practices to deal with the uncertainties.

2.4 Main Problem in Program Resource Management

2.4.1 Managing Resource Allocation

The project management resources require the organization to adopt the right set of procedures, techniques and philosophies in allocating these resources in order to determine success and growth in the long run. The allocation of these resources is most commonly perceived as the functional and cross-functional resources according to the requirement of the business organization. Project resource management is considered to be one of the most essential components of a business sector and requires the transparency to be maintained in terms of demand and supply of the resources to ensure the suitable business activities (Alshurideh, 2022; Dwivedula, 2019; Hamadneh et al., 2021a, b; Hasan et al., 2022).

2.4.2 Career Path

While stating a new project managing the availability of the employees and ensuring their capacity to meet the needs and requirements of the project is also extremely important. This requires the management to identify the capacity of the members involved and also in choosing the right career path for them which also supports their abilities to perform according to the project requirements. This would also support the job description of the team members based upon their previous experiences and current skills.

2.4.3 Training and Development

In most of the cases, the members of the team involved in a new project often lack certain set of skills for the completion of a project. This requires the management to design the training and development sessions for the employees in order to ensure success of the project. This would ensure that all tools and procedure are rightly utilized and monitored for ensuring success for the organization (Laslo, 2010).

2.5 CSF or Best Internal or External Factors Required to Support Program Resource Management

CSF or critical success factors are the activities which a business setup requires in order to ensure the success of the business; this supports the business in allocating its internal or external resources and managing them according to the requirement of the organization by conducting the data and business analysis and in reaching a practical approach for the business sector. This supports the organization to significantly be able to identify the key factors responsible for the success of the organization and how the organization should focus on these key factors for sustaining success for a longer period of time (Kastor & Sirakoulis, 2009).

There are a number of internal or external factors responsible for project resource management within a business sector. Some of these factors include in Table 1.

All these internal and external factors are responsible for acting as the driving force for an organization to manage and support its program resource management and allocating the right resources at the right time and conveying the performance of the organization to the stakeholders more effectively.

Table 1 The main internal and external factors responsible for project resource management

Internal factors	External factors
• Plans and policies of an organization • Human resources • Financial resources • Marketing resources • Corporate image • Labour management of the organization • PR relations • Quality of infrastructure • Project execution • IT management • Interdependency with the employees	• Customers • Suppliers • Competitors • Marketing and advertisement • Economic environment • Political and legal factors • Technological growth • Social factors • Public

2.6 Assessment and Gaps in Program Resource Management to Support Program Management

There are a number of gaps and issues observed while intending to support the project resource management for an organization. A few of the most common gaps include identifying whether the organization has the right set of resources available or not and how an organization should be able to identify which resources to request further and how. Moreover, the organization also needs to identify whether all the required resources are proactively involved within the teams and if these resources need to be explored further. Moreover, the organization also needs to effectively communicate the gaps among the team members involved in order to plan the right set of solutions for the team members (Smith, 2003).

In order to support the concept of project resource management, the organization needs to equip themselves with the resource the capabilities and processes being put to right use in terms of amount of time, money and manpower to ensure the most suitable project resource management.

3 Data Gathering

To accomplish the aims of this research, the researchers conducted three interviews among program managers from three different government organizations that are essential, huge and have a high reputation, which are;

(1) Emirates Group.
(2) Water and Power Producer Companies (IWPP).
(3) The Executive Council of Dubai.

The program managers were the purposive sampling in this study who are the most applicable professionals in the program management field. Also, they have experiences, knowledge, skills, and tools. The interviews were personal, structured, and contained qualitative data. The questions were to cover our research purpose in-depth and details. Thus, the selected program managers were from various industries, which will assist the researchers in gaining the required information from different perspectives and views.

To reach these organizations, the researchers contact the program managers' secretaries to take the permissions to meet the program managers through call conversations and emails. The importance of meeting and conducting the interviews with the program managers explained as well as the aims of the research discussed with the secretaries (Joghee et al., 2020; Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021). After getting program managers' agreements, the researchers proposed an applicable date and time for conducting interviews for the project managers. One day before the agreed interview date, the researchers sent a gentle reminder to the program managers in order to assure and confirm their availability.

The researchers were available in the organizations before 15 min of the arranged time. At the beginning of the interviews, the researchers informed the program managers that their responses will be treated highly confidential and will be used for research purposes. The interview will take approximately 45 to 60 min. Also, the researchers took their agreement to record the interviews. Finally, the researchers proceeded to interviews and took the required information and notes in order to achieve the research goal.

4 Data Analysis

The data were gathered from three government bodies where each presented professionals' roles and how crucial are their responsibilities in the success of program management in the authority. This section will discuss key results from the research qualitative data and compare of these primary findings to the literature review.

Emirates Group suggested that organizations can ensure the four factors through effective management strategy where the top management provide the right leadership focused on these factors, facilitate supportive infrastructure and ensure change implementation through proven standards and practices, clearly defining the change and aligning it to the set goals and objectives, effective communication, and through practical training to provide knowledge, skills, and competencies needed for efficient operation as change is rolled out. IWPP suggested that all the employees must complete the Position Qualification Requirement (PQR), written instinct tests, and assessment interview. Doing so gives a good indicator that they are well-trained and competent (Lee, Azmi, et al., 2022a, b; Lee, Romzi, et al., 2022a, b; Mehmood, 2021; Mehmood et al., 2019). For experienced professionals, IWPP chooses them based on the size of the program and its requirements. To check how supportive the infrastructure is, organizations must review their past performance with what they have and how

Licensed to (putm@utm.my)

good their infrastructure compared to what available in the market. To ensure proven standards and practices, IWPP follows the federal law of power and Abu Dhabi financial law references, follows the Power and Water Purchase Agreement, refers to the international power and water practices in the Middle East and Europe, and attending the yearly user summits that takes place in different countries in the world to check the global standards. The Executive Council of Dubai believes that to ensure the four factors, employees should undergo job-related education programs with experienced professionals and being grouped in teams with similar skill sets. Moreover, it was suggested to create a well-structured framework to gives employees incentives to be more productive and maintain a higher quality of work ethics. The practices build bridges between members to acknowledge the importance of following standards allowing for constant skill growth. The three organizations agreed with the findings in the literature review of how important those four factors resource management.

To improve the capacity and capability for the project and program management, Emirates Group suggested a similar solution to the literature review of providing a capable workforce to support the organization. Emirates Group suggested ensuring consistent, senior-level support the discipline of program management, integrate program management as part of the organization's mission, and involve the staff in the planning for change initiatives (Miller, 2021; Mondol, 2021; Obaid, 2021; Radwan & Farouk, 2021). IWPP's suggestions were about the concept discussed in the literature review of using the right resources at the right time and the concept of priority. IWPP believes that fewer priority projects should be removed or delayed focusing on the projects that are directly supporting the strategy of the company. Also, using the right resource at the right time, the company will have more resources to work with. Similarly, to IWPP, the Executive Council of Dubai suggested that to increase the capacity and capability of the programs, and organizations must focus on their goals and standards for projects.

Emirates Group's implementation for improving the government-wide capability for project and program management is to make sure that executives and stakeholders clearly understand their roles and responsibilities as well as consistency in development and training. IWPP implementation is about using quality tools such as the Deming wheel, Kizan continues improvement, and the fishbone diagram. The Executive Council of Dubai suggested that a clear vision and plan are the key to successful implementation for enhancements.

To improve the government-wide capability for both project as well as program management, there are several recommendations raised from the interviewees. Emirates Group recommended using an integrated approach to develop policy. The integration of performance improvement, goal setting, and the strategic planning process play an essential role in program management. Also, leadership should support program management, as active support from top agency leadership has proved to be a critical factor in the success of change management initiatives. Besides that, establishing roles and responsibilities of the agency's stakeholders in the program management processes will assist in promoting accountability and achievement of set goals. IWPP suggestions were to listen and refer to the department of finance yearly governmental budget that gives clear limitations or priorities of the

country's/government every year requirement. This gives the overall country's vision and mission toward the right project requirement, to avoid objecting and rejection of the projects after putting all the efforts and resources for years. Also, it is very significant that all the EMDs/CEOs of different sectors gather regularly to discuss the main agendas on the development of the country to use all the experience brains to improve all areas simultaneously. The Executive Council of Dubai recommended that government services should coop with the latest technology to serve the public faster, more comfortable, and for consistent improvements. Public awareness about their role in project sustainability. This can be achieved via caretaking and appreciating the projects to promote longevity and quality of projects.

To resolve the issue with the inconsistency in the training and development of program managers, Emirates Group suggested first to make sure that the program manager job series have a clear career path and policies to support the career development of program managers. Also, Emirates Group suggested that organizations should comply with the policies guiding the certification of personnel in program management and design a systematic approach to program managers' training and development. IWPP suggested enrolling program managers in courses that require a real competency/certification. Also, IWPP suggested enrolling the program managers in courses based on their yearly appraisal and direct supervisor recommendation. Emirates Group and IWPP responses were aligned with the findings in the literature review regarding how to choose the courses based on their skills and performances. On the other hand, the Executive Council of Dubai believes that it is impossible to create a consistent training and development program for such practice because of the different functions and services in each organization.

The observation shows a successful strategy followed by top management technique in Emirates Group to allocate the responsibility and skills of stakeholders. The results from Emirates Group interview show significant details in which VIP stakeholders' responsibility are determined and training programs to be conducted when required. The other result summarizes that the Authority priories the communication between stakeholders and consider the opinion of all parties where they believe how significant this sharing will change in the Resource Management requirement and delivering the strategy benefits. Emirates Group offer training program to ensure that all members have clear understanding of the roles of each. On the other hand, IWPP uses modern technique to evaluate the performance of stakeholders and assess the number of completed projects against planned projects. The Executive Council ensures the importance of relating the program topics and functions to the organization nature of works and top management ensures the curriculum of the topics. Similarly, the literature review emphasized that stakeholders should understand governance roles and the authority strategy by utilizing tools and procedures by management and introducing effective resource management initiatives to ensure the full understanding by stakeholders.

It's assessed that Emirates team support each other, and every professional maintain a good environment and IWPP team provide transparency in the meetings between public and private sectors professionals. And the Executive Council support developing team-based project structure that involves various members with different

qualifications. This matches with the research literature review in clarifying that the availability of resource management application helps in strengthening career development and supports business function. Also, this provide a career series for the career development of senior level. This path puts the project managers into higher managerial positions.

The most important results from Emirates Group Interview emphasizes the important of Project Manager Career path, Project Manager Tasks and its effect to the Emirates Group Strategy. IWPP focus on business quality and clear career path to senior management to get the desired output and benefits. This doesn't reflect with literature review views where it highlighted that the government entities lack employees with experiences and background in program management where this may cause a failure in many aspects.

5 Recommendations

The research analyzed the primary data gathered from three government bodies where the analysis highlighted the main findings and finalized the interpretation of each. The main statement that summarized the analysis is addressing the point in which government bodies' lack of professionals in program management that would change in the prosperity of the entities. The three government bodies improve the issue in offering trainings and programs to qualify the organization Human Resources.

There are several essential recommendations to initiate strong program resource management, including:

1. Preparing a clear description of the program resource management roles and responsibilities for the executives and key stakeholders.
2. Creating an official job description, job series, as well as a career path for program managers based on theories that are applied for all organizations.
3. The consistency of the program resource management required to develop and evolve a standards-based model via the federal government.
4. Program resource managers required to initiate a professional community among the federal government. To create this new community, people should be incentives to join the community. They can be incentives with financial bonuses within their organizations, and with volunteer hours from the government.
5. Implementing an integrated approach for both program policy as well as a program road map.
6. Designating senior executives per each organization in order to be responsible for both program policy as well as strategy.
7. Creating integration between program management, strategic planning, goals, and performances.
8. In government bodies, it's recommended to promote successful entrepreneurs that see challenges as opportunities to achieve the success.

9. To consider recommendations in legal aspects, top management should designate more project and program managers for the sake of the success of program management.
10. Develop a high level training and work shop to support program and resource management
11. Set up a strategy to develop a creative lesson learned regards the resource in pervious projects and programs and share it will all program members to better plan future.
12. Create a portal for sharing the information and experience among involved employee in the project to have a better allocation of resource next time.

6 Research Limitation

In despite of the above provided details and information, there were several limitations faced during the research. For instance, we have selected 6 organizations to meet with their program managers and interview them to explore, have more accurate data about the subject and to achieve the research objectives. However, 3 out of 6 organizations have approved our request to have the same completed and which lead to the success of the research. Other limitation faced is the timeline. Due to the official holidays and year end, it was difficult to schedule a suitable time with the interviewees since the time requested is between 45–60 min. In addition, the interviewees were very discreet regarding the information provided during the interview and most of the questions were answered very generally. Which this led the researchers to ask more specific questions to gain the information needed related to the respective organization.

7 Conclusion

Before the start of any project, the resources requirements have to be well-defined including quantity and type since it's an important component in any project success. Resource management application has a huge impact on the success of any program or project if it's applied efficiently. The literature review has deal with the importance of program resource management and its important impact in the government sectors. One of its impacts it helps in reducing the number of outsourcing while utilizing the internal resources skills and experience in achieving the program goals and objectives. As per the interviews conducted with the program managers of Emirates Group, Water and Power Producer Companies (IWPP) and The Executive Council of Dubai, it was concluded that the program manager job series must have a clear career path and policies to support the career development of program managers. It was farther concluded that resource management could be made more effective if more emphasis is put on the importance of project manager career path, project manager tasks and

their effect on the company overall. Further addition was made regarding the fact that resource management puts excess focus on business quality and clear career path to senior management to get the desired output and benefits. If these two are lacking, the organization will suffer in the long run. Applying resource management leads in reaching to a smooth project success. There should more adoption of the resource management in both government and private sectors. Which this will give the opportunity for skills development. Moreover, organizations should be more aware about the benefits of program resource management and arrange for more specific trainings for the respective teams who should apply resource management.

Appendix

Appendix 1: Interview 1 (Emirates Group)

1. **There is no guarantee of success in large-scale, complex change initiatives.**

   However if program management is undertaken by:

   1. **Well-trained,**
   2. **Experienced professionals**
   3. **Supportive infrastructure**
   4. **Proven standards and practices**

We believe that success will be more consistently achieved

How organizations can ensure these 4 factors?

Emirates Group, it can ensure these factors through effective management strategy where the top management provide the right leadership focused on these factors. The top leadership of the group should be equipped with the capacity to coach their direct reports and to facilitate supportive infrastructure and ensure change implementation through proven standards and practices. They should be in a position to engage in conversations with individual team members to find ways of making sure that these 4 factors are taken care of adequately thereby increasing the possibility of success of the change initiative.

Emirates Group can ensure these 4 factors by clearly defining the change and aligning it to the set goals and objectives. Doing so will provide an opportunity for the organization and its leaders and team members to critically review the aspects of the change initiative to ensure they integrate these 4 factors, thereby contributing to the success of the change process.

Emirates Group can ensure these 4 factors through effective communication. They should determine the most effective means of communication for the team members. The communication strategy should take into account aspects like the

timeline regarding how change will be communicated incrementally, which channels to use and what would be the key messages.

Emirates Group can ensure these 4 factors is through effective training to provide knowledge, skills, and competencies needed for efficient operation as change is rolled out.

2. **Program management is not consistently recognized as a management discipline that is essential to government performance, success, and results.**

What *solutions* for improving government-wide *capability* for project and program management

The solutions include ensuring consistent, senior-level support the discipline of program management in Emirates Group; program management should be made an integral part of accomplishing the organization's mission rather than being considered as a technical or administrative specialty focused on the implementation; and, program management staff to be consistently involved in the planning for change initiatives.

What *Implementation* for improving government-wide capability for project and program management

The implementation for improving government-wide capability for project and program management is that which entails executives and stakeholders clearly understanding their roles and responsibilities. It also entails ensuring consistency across the government in both the development and training of the involved personnel, especially program managers.

What *recommendations* for improving government-wide capability for project and program management

(i) The development of government-wide program and project management policy should be done using an integrated approach.
(ii) The leadership should support program management, as active support from top agency leadership has proved to be a critical factor in the success of change management initiatives. Such support is vital in facilitating the alignment of diverse groups within the organization.
(iii) There should be clearly established roles and responsibilities of agency's stakeholders in the program management processes to promote accountability and achievement of set goals.
(iv) Program management should be integrated into performance improvement, goal-setting, and strategic planning process.

3. **There is no consistency across the government in the training and development of program managers. How this can be resolved?**

Considering that competent and experienced program managers are the most critical determinants of successful program, it is important to resolve the problem of lack of consistency across the government in their training and development. In the case of

Emirates Group, it can be resolved first by making sure that the program manager job series have a clear career path and policies to support the career development of program managers. The problem can also be solved by making sure that the Emirates Group comply with the policies guiding the certification of personnel in program management. Besides, Emirates Group should have systematic approach to program managers' training and development.

4. **Organizations executives and VIP stakeholder's governance role requires clear understanding of:**

The role of how programs are derived from strategies

And how programs are delivering strategy benefits

The roles and responsibilities of the program manager

How this can be ensured by training and development?

Training and development within the Emirates Group would ensure that organizations executives and VIP stakeholders have clear understanding of their governance roles by providing them with clear guidance on their roles and responsibilities within the program management processes. It would also enhance their skills, competencies, and knowledge regarding the various aspects of their governance roles, such as how programs are delivering strategy benefits.

5. **Program managers lack a professional community within the federal government that can provide support and a voice on issues affecting the development of program management.**

Give us your opinion in regards to your organization

While in most cases program managers lack a professional community, Emirates Group has made efforts to create a professional community. The efforts have been informed by the need to ensure that program managers work in collaboration with other professionals within the organization rather than working in relative isolation. It has created an environment where program managers are able to participate in discussions of policy, thus allowing their voice to be heard in building and improving program management capabilities within the organization.

6. **A government-wide job series for program managers that spans business functions with a career path that extends into senior career executive management ranks.**

Give us your opinion in regards to your organization

Emirates Group has made considerable efforts in establishing job series for program managers with a career path extending into senior management ranks. It has put a

policy in place supporting the career development of these professionals. As they progress to senior ranks across a job series, their levels of responsibilities also increase.

Appendix 2: Interview 2 (Water and Power Producer Companies)

1. **There is no guarantee of success in large-scale, complex change initiatives.**

However, if program management is undertaken by:

1. **Well-trained,**
2. **Experienced professionals**
3. **Supportive infrastructure**
4. **Proven standards and practices**

We believe that success will be more consistently achieved

How organizations can ensure these 4 factors?

Well, all the employees must complete the Position Qualification Requirement (PQR) that includes all the essential competencies for every job. The same is assessed in written instinct tests and finally with assessment interview and any failure will lead to repeat the exercise till reaching to full understanding and passing all the previously mentioned assessment method. This PQR has different levels for every position in order to be confirmed for the targeted position/designation.

Regarding the experienced professionals, keep in mind that the members of the project are all having not less than 15 years of experience in a relevant field particularly in power and water sector. The members had worked in numerous power and desalination plants that are having different designs and complex changes.

Actually, there is a big supportive infrastructure; one of them was mentioned in the first interview which is using a stable standard simulator. This simulator can be feeded with all the necessary data in order to provide the feasibility of the project in terms of dividends, loses, capability to handle the capital and operating budgets. Additionally, EWEC and ADPC are very professional entities that compares the bid of any open or floating tender in terms of cost effectiveness, innovation, simplicity, flexibility and prompt support to the power grid and water network in case of shortages to achieve sustainability of resources.

I believe this is really very important point, as we keen on to follow the federal law of power and Abu Dhabi financial law references in order to move on a solid foundation. Besides that, we do follow the Power and Water Purchase Agreement which is a standard agreement and was signed and agreed between all the shareholders to manage technical, training, financial and management requirements in which all are compliant with. Regarding a standard practice, we do refer to the International

power and water practices in the Middle East and Europe. This benchmark is regularly implemented between the 10 different Independent Water and Power Producer companies (IWPP) in UAE (From Fujairah till Al Dhafra). Not all that but also in Middle East and Europe as mentioned via attending the yearly user summits that takes place in different countries in the world.

2. **Program management is not consistently recognized as a management discipline that is essential to government performance, success, and results.**

- **What *solutions* for improving government-wide *capacity* for project and program management**

In fact, removing or delaying less priority projects and focusing on the projects that directly supporting the power and water demand that ensures security of the network grid is much better!

Allocating different teams for different projects in which everyone team is dedicated for one project from the day one kick off till handing over the projects. These dedicated teams must always respect the time via starting and completing the projects on time with minimum delays.

- **What *solutions* for improving government-wide *capability* for project and program management**

The capability part can be improved via increasing the capital budget of the project that needs to be handled by capable people. Those people must be result oriented, working as one team, understand the project well, know the quick wins via using simple, effective and innovative methods to during project execution.

- **What *Implementation* for improving government-wide capability for project and program management**

Use the management pioneers' methodologies to organize the projects and achieve the targets for instance, Deming wheel and KiZAN continues improvement. Furthermore, to use the right management tools, for instance fish bone diagram that illustrates the cause and effect actions to identify the bottle nicks and the remedial solutions. Finally, use the skill matrix, SWAT analysis and Pareto diagram that all can guide and lead the project to the desired targets as per the planed duration and achieve the necessary quality.

- **What *recommendations* for improving government-wide capability for project and program management**

Always listen and refer to the department of finance yearly governmental budget that gives a clear limitations or priorities of the country's/government every year requirement. Basically, it gives the overall country's vision and mission toward the right project requirement, to avoid objecting and rejection of the projects after putting all the efforts and resources for years. Additionally, I do recommend that all the EMDs/CEOs of different sectors gather every year twice or tries to discuss the main

agendas pertaining to development of the country in order to use all the experience brains to improve all sectors simultansly.

3. **There is no consistency across the government in the training and development of program managers.**

How this can be resolved?

I addition to the yearly selected training courses by the employees based on the yearly appraisal, direct supervisor recommendation, the management shall select and enroll all the managers together to the one course that needs a real competency/certification in order to be specialist. In the same program to assess the managers in an either examination or interview or (both).

4. **Organizations executives and VIP stakeholder's governance role requires clear understanding of:**

The role of how programs are derived from strategies

And how programs are delivering strategy benefits

The roles and responsibilities of the program manager

How this can be ensured by training and development?

The training department shall use a tool named primavera that organize the project and send daily and then monthly update report to the sectors that shows the work progress in detail. Implement a KPI for individual stakeholder managers that assess total number of completed projects on time and as per requirement. In addition, to have weekly and monthly meetings to ensure alignment between the strategy and the role of the program.

5. **Program managers lack a professional community within the federal government that can provide support and a voice on issues affecting the development of program management.**

Give us your opinion in regard to your organization

In our case since we're a private sector subsidized by the government as we own 40% of the project while the government own 60%, we don't face problem. The reason for that is that it is a must for every stakeholder to provide transparency via having regular meetings. These meetings' agendas are related to all aspects of the project and how construct bridges of supports in technical, administrative and financial terms.

6. **A government-wide job series for program managers that spans business functions with a career path that extends into senior career executive management ranks.**

Licensed to (putm@utm.my)

Give us your opinion in regard to your organization

In my point of view, this is a good approach that we are implementing not only to do the job in order to be completed on time, but also with the desired quality. Having a career path extended into senior career executive can lead to have the same understanding that consequently will produce the right project specification, as per all the procedures and agreements.

Having this approach can eliminate or minimize deviation of the project requirement from the tasks breakdown. This basically the right plan in order to retain the brains and having them to be loyal toward the work. This can generate proactive approaches and techniques to balance and align the program managers' ways of working into the senior staff way without misstatements that can effect negatively on the project progress or sometimes to the failure to complete the ongoing project.

Appendix 3: Interview 3 (The Executive Council of Dubai)

1. **There is no guarantee of success in large-scale, complex change initiatives.**

However, if program management is undertaken by:

1. **Well-trained,**
2. **Experienced professionals**
3. **Supportive infrastructure**
4. **Proven standards and practices**

We believe that success will be more consistently achieved

How organizations can ensure these 4 factors?

We can achieve that by scheduling consistent form of training for employees to undergo job related education programs in order to sustain an up-to-date level of experience of the relevant work With Experienced professionals, if grouped in teams with similar skills sets, can perform better especially when a suitable leader is involved in managing employees from different sectors and entities While being able to work under a well-structured framework gives employees incentives to be more productive and maintain a higher quality of work ethics mostly beneficial for group of teams with lower skill sets. The practices builds bridges between members to acknowledge the importance of following standards allowing for a constant skill growth.

2. **Program management is not consistently recognized as a management discipline that is essential to government performance, success, and results.**

- **What *solutions* for improving government-wide *capacity* for project and program management**

- **What *solutions* for improving government-wide *capability* for project and program management**
- **What *Implementation* for improving government-wide capability for project and program management**
- **What *recommendations* for improving government-wide capability for project and program management**

Setting goals and standards for projects. i.e. Dubai Government and Sheikh Mohammed Bin Rashid's vision has become the key benchmark unit for setting quality standards in executing projects.

The vision is followed by implementation. Again, His Highness's vision would not reach out without the energy put for implementing wide scale projects up to the completion.

Consistent improvements. With the ever growing age of technology, the overall government services should coop with the latest technology to service the public faster and easier.

Public awareness, the public should be more responsible to sustain the projects by caretaking and appreciating the projects to promote longevity and quality of projects. A simple example, never to throw chewing gums on pavements which can last stuck to a long time effecting the overall visuals of the street.

3. **There is no consistency across the government in the training and development of program managers.**

How this can be resolved?

It is impossible to create a nationwide consistency for such practices. In Dubai there are almost 60 entities. Each holding different functions and services.

4. **Organizations executives and VIP stakeholder's governance role requires clear understanding of:**

The role of how programs are derived from strategies

And how programs are delivering strategy benefits

The roles and responsibilities of the program manager

How this can be ensured by training and development?

To ensure proper exposure of the learning programs to the intended project managers. The topics of the programs should be relevant to the nature of works being exposed to the project managers. Executives should review the curriculum modules for each course.

5. **Program managers lack a professional community within the federal government that can provide support and a voice on issues affecting the development of program management.**

Give us your opinion in regard to your organization

The lack comes because of the absence of dedicated proper research and development program to become solely assigned to support the project managers. A simple solution is to use team based project structure (horizontal style) with members from different entities and backgrounds.

Project Quality Management in the United Arab Emirates Mining and Construction Sector: A Literature Review

Mounir El Khatib, Haitham M. Alzoubi, Muhammad Alshurideh, and Ali A. Alzoubi

Abstract The United Arab Emirates (UAE) presents a special set of circumstances for sustainable long-term development and economic growth. In this paper, quality management in the mining and industries have been identified such circumstances. More specifically, this paper examines the level of integration of quality management practices in UAE's mining and construction sectors. Using a literature-based approach, the paper identifies the common factors that lead to failure during project management. Recommendations are also offered accordingly. Also, this paper concludes that although there is a general awareness of the need for quality management in the UAE, quality related issues are not uncommon in both industries. Moreover, delays and poorly structured processes are the main issues causes of low quality projects.

1 Introduction

For many years, crude oil has been the biggest contributor to the economy of countries in the Middle East, including United Arab Emirates (UAE). Oil mining is still an important activity in the UAE but the recent price instabilities and transition from overreliance on hydro fuels has forced the region to diversify its focus to other minerals and the construction industry as a way of bolstering the economy even more (Shahbaz et al., 2014). Modern highways, connecting high end cities have emerged within a short period of time. Today cities like Dubai that were once barren deserts have transformed into beautiful cities, characterized by modern hospitals, hotels, schools and airports (Aburayya et al., 2020; Delgado, 2016; Taryam et al., 2020). In fact, with the ongoing plans to transform Dubai into a major tourist destination, the construction industry might soon be ranked higher than oil as the leading contributor to the economy (Al Batayneh et al., 2021; Al Shebli et al., 2021; AlSuwaidi et al., 2021; Madi Odeh et al., 2021).

From an economic point of view, growth in the construction and mining industries is an entirely good thing. Yet, the complexity that is inherent in new projects presents significant huddles to researchers and project managers on the basis that determining the vital success factors is a continuous and complicated process. As Greeff and Barker (2014) declared, one of the common characteristics between the construction and mining industries is their fragmentation. Compared to the manufacturing sector, for example, construction projects involve multiple shareholders including contractors, the government and miners (Greeff & Barker, 2014). As a direct result of this complexity, each year the UAE reports considerable number of construction claims on the basis of low quality projects that fail to meet the stakeholders' requirements (Mishmish & El-Sayegh, 2018). In fact, the main reason for failure in many projects failure to understand stakeholder's needs and expectations as well as failing to consider the consumer environment or the end users of a service or product.

2 Problem Statement

Many construction industries in the United Arab Emirates underestimate the capacity of customers to identify service quality; they fail to apprehend that customers not only evaluate end service but are also affected by the way a service or product is delivered (Alshurideh, 2022; Awadhi et al., 2021; Mishmish & El-Sayegh, 2018). Moreover, the management of mining and construction projects requires a comprehensive understanding of modern management practices coupled with the understanding of the best practices in design and construction (Mehmood et al., 2019; Alshurideh et al., 2022; Shamout et al., 2022). In this paper the author will investigate the important elements of Project quality management in UAE's mining and construction sector.

3 Objectives of the Research

1. To Investigate the level of integration between quality management with projects in the United Arab Emirates mining and construction sector.
2. To study the success and deficiency factors in project quality management.
3. To come up with recommendations that will guide project managers and organizations on proper ways of delivering projects that satisfy customers throughout the project lifecycle.

4 Research Method

This research is based on the Organization Project Management Model (OPM3) as described by the Project Management Institute (PMI). This method is preferred because it not only provides a guideline for understanding the best practices in project management but also recommends measures to ensure that projects meet quality standards including the capability to perform predictably and consistently (Alzoubi et al., 2021; Hanaysha, Al-Shaikh, et al., 2021a, b). In this regard, OPM3 describes three key elements to successful quality Project Management: (PMI, 2017).

Knowledge acquired by investigating successful projects.
Assessment of existing needs (i.e. level of integration of quality management with projects in the UAE's mining and construction sector) and recommend improvements.
Improvement based on assessments to determine the necessary steps to attaining improvement goals.

The research employed a literature-based approach as the primary data collection method. In this regard, the authors reviewed key research papers and articles relating to quality management in UAE's construction and mining industries.

5 Background and Literature Review

5.1 The Concept of Quality Management

According to Rumane (2017), quality is a strategic imperative that helps organizations improve the bottom line, thus quality is defined on the basis of conformance to guidelines and requirements. In other words, quality is not gauged in terms of the common concepts of goodness, beautiful or excellent (Rumane, 2017). Instead, any service, process or product that is delivered in a manner that conforms to the client's requirements is seen as quality. This view is echoed by Pepall (2014) who stated that quality is "meeting the customer's (agreed) requirements, formal and informal,

at the lowest cost, first time, every time." The Project Management Advisor (PMA) defines requirements in project management as specifications on the "capabilities, features or attributes of the project's deliverables" Requirements are drawn from an analysis of stakeholders' wishes and needs and thus is an expression of the mutual understanding and agreement between the parties involved (Ali et al., 2021; Ghazal et al., 2021). Hence, the definition of quality can be, more or less, said to be the ability to conform to the stakeholder's wishes (Ali et al., 2022; Alnazer et al., 2017).

Yang and Trewn (2004) asserted that although the concept of quality has been around for a longtime, it was not until the 1940s, during World War 2, that people started viewing quality as a statistical concept. During this time, the military introduced statistical sampling techniques to manage quality. Monitoring was also done using quality control charts were production process. Notably, Chung (2002) suggests that it was not until the 1960s that people viewed quality as an organization-wide concept i.e., quality was now not only used in production but in most business processes (Mukherjee, 2006).

5.2 Quality Management in the Construction and Mining Industries

As already established, the general aims of quality management is to achieve standardization (Pepall, 2014). The quality of a mineral or complete structure is an assimilation of all the relevant activities that ensure the results of a mining/construction project are satisfactory. According to the concept of quality management is more than reacting to events in the during site production. Rather, it is a strategic business function that governs all business processes in construction organizations so that organizations that fail to guarantee quality delivery are unable to compete for new projects (Alshamsi et al., 2021; Alshurideh et al., 2019; Alzoubi, 2021a; Farouk, 2021).

In his study Chung, (2002), asserted that the concept of quality management in the construction industry became popular in the 1980s and is still being practiced today. Generally, the ISO 9000 family of quality management standards is used in construction organizations to govern service delivery so that it meets the needs of all the stakeholders involved (Alzoubi et al., 2022; Obaid, 2021). This is possible on the basis that the ISO 9000 quality management standards establish the fundamentals of quality management systems and proposes "coordinated activities to direct and control an organization with regard to quality" (Peach, 2003). The activities of directing and controlling with relation to quality encompass establishing the necessary quality policies, objectives, quality planning, quality assurance, quality improvement: and quality control (ISO, 2009).

The quality planning function consists of specifying quality objectives and putting into place the necessary operational resources, and, processes to attain the quality

Licensed to (putm@utm.my)

management objectives (Al Hamad et al., 2021, 2022). One of the peculiar challenges faced by researchers and project managers alike is discerning the different in meanings between quality management and quality related activities including Quality Control (QC) and Quality Assurance (QA) (Alnuaimi et al., 2021; Alzoubi & Ahmed, 2019; Joghee et al., 2020). Mukherjee (2006) made the distinction between the terms, thus; QC and QA are essentially sub-elements of project quality management. In terms of functional relevance, QC and QA find meaning during the implementation phase while quality management represents the organization's strategically philosophy as regards project completion (Mukherjee, 2006). In this regard, quality management is relevant at all stages of project (Alketbi et al., 2020; AlMehrzi et al., 2020; Mashaqi et al., 2020). Finally, the aims of quality improvement, are to increase an organization's ability to fulfil all the quality requirements (Al Dmour et al., 2014; Pepall, 2014).

In both construction and mining projects the quality control function involves ensuring that the product specifications are met, inspection of tender documents, etc. (Alzoubi, 2021b; Hanaysha et al., 2021a). At the very basic, quality in construction and mining organizations translates to ensuring high level products that meet the customer's needs (Al Ali, 2021; Kashif et al., 2021). But quality also gives these organizations a competitive edge over competitors and thus safeguards business survival (Rumane, 2017). Similarly, it is equally important to manage the quality of services delivery during the pre-tender stage and this should be practiced through the entire lifetime of mining and construction projects (Guergov & Radwan, 2021; Khan, 2021; Mondol, 2021). As Taher (2009) noted that in construction, and generally all civil engineering projects, a satisfactory product is only essential but not all that is required. In fact, most defects in buildings arise from faulty design processes and inadequacies when incorporating the design in the construction (Akhtar et al., 2021; Eli, 2021).

Just like in most projects, QC consists of activities that govern the implementation of QA programs so that when implemented effectively, QC programs reduce the risk of mistakes and accidents. According to Greeff and Barker (2014), quality assurance in the construction and mining sectors involves ensuring that relevant activities are put in place to meet the quality management requirements of a project. Such activities include setting standards, training guidelines, procedures and policies (Alsharari, 2021; Mehmood, 2021). In essence, good QA practices serve as a shield against quality related issues in the sense that the defined procedures, for example, are a framework to gauge avoid accidents (Aziz & Aftab, 2021; Miller, 2021). Policies are equally important as they give early warnings when there is potential clash of internal and external processes.

6 Findings and Discussion

6.1 Quality Management with Projects in the Construction Sector

From a general perspective, quality management appears to be a well understood concept in the United Arab Emirates (Magd & Nabulsi, 2012). Yet, a more granular review of the literature indicates that construction claims are a leading hindrance in construction projects, mainly because claims cause delays (El-Sayegh & Mansour, 2015; Zaneldin, 2006). In a pilot study by Zaneldin (2006), the researcher studied the main causes of construction claims and analyze their frequency in Abu Dhabi and Dubai. While quality management systems have been adopted in the UAE, there is still a considerable number of quality related claims including changes claims, extra work claims and delay claims. As shown in the Table 1 and as claimed by Zaneldin, (2006), change related claims are the most frequent.

The assertions made by Zaneldin, (2006), conquer with the information gathered from general interviews and surveys conducted in this study. In fact, there was a general consensus among respondents that the most common quality management issues in UAE's construction industry are related to minor issues like not reproducing the design in the actual work and delays. A research by Ren et al. (2008) asserted that delays is generally the most common quality related issues that is experienced in UAE's construction industry (Fig. 1).

El-Sayegh and Mansour (2015) also identified the major causes of delays stating that "they {causes} vary from the unrealistic project duration, nominated sub-contractors, and the culture impacts". These factors have also been identified by other authors who emphasize that delays are a major failure factor and a leading reason for low quality in Saudi Arabia's construction sector (Cruz, 2021; Lee & Ahmed, 2021; Radwan & Farouk, 2021). The importance of time has also been emphasized in quality management literature due to the importance of time delays to both contractors and business owners (Jarkas & Younes, 2014; Mishmish & El-Sayegh, 2018).

Table 1 Causes of construction delays in the UAE

Types of claims	Weighted average	Importance index (%)	Rank
Changes claims	2.48	62.0	1
Extra-work claims	2.46	61.5	2
Delay claims	2.00	50.0	3
Non-performance claims	1.54	38.5	4
Different site conditions claims	1.46	36.5	5
Acceleration claims	1.39	34.8	6
Damage claims	1.14	28.5	7
Contract ambiguity claims	1.07	26.8	8

Factors, Reasons and Causes of delay	Client	Consultant	Contractor
	Regular interference and poor communication	Incomplete contract documents	Inappropriate organization management
	Variation order and late approval for payment	Incomplete drawings	Lack of technical professional in the organisation
	Late supply of information and late decision making	Poor design management	Unsmooth external and internal communications
	Project objectives are not very clear	Slow response	Lack coordination with sub-contractors
	Nomination of Sub-contractors and suppliers	Delayed approval of drawings and BOQ for construction	Centralization with top management
	Many provisional sums and prime cost	Inadequate duration for inspection	Delayed mobilization
	Duration is not enough for constructing the project	Experience of staff in management and technical inspection	Incompetent contractor staff
	Irregular payments and disturbed cash flow of main contractor	Delay in submittal and approval	Poor planning, scheduling or resource management
	Routine of government authorities and approvals	Poor communication between consultant staff	Poor quality control
	Irregular attending of weekly meetings	Poor quality control	Congested construction site

Fig. 1 Factors, reasons and Causes of Delays in UAE's construction sector (Ren et al., 2008)

6.2 Quality Management with Projects in the Mining Sector

Respected to the fact that there are limited studies that have studied the quality management topic in the United Arab Emirates. However, some existing literature show a high level of awareness among mining organizations as declared by Alhanshi and Albraiki (2015). Good to keep in mind that most project managers are aware of quality management and expect mining organizations to act in the best interests of their clients (Alzoubi & Aziz, 2021; Hamadneh et al., 2021). However, other quality managers are not aware of the granular details and activities of the individual functions in quality management (Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, b; Lee et al., 2022a, b).

Existing literature asserts these findings. Elbadawi and Selim (2016), for example, suggested that managers of mining organizations in the UAE feel that quality is a critical element of any mining project. Moreover, organizations should play their part to ensure that by adhering to quality standards and supporting initiatives that are support quality management (Alshurideh et al., 2020; Alzoubi et al., 2020a, b). Existing literature also asserts that it is important to establish the requirements of a project at the inception stage so that project participants can attain the right balance the design requirements and the needs of the owner. In a study by Al Hashmi (2013), the author explored project critical failure factors in UAE's gas and oil industries (Fig. 2).

Using the likert methodology as demonstrated by Denni-fiberesima and Rani (2011) found out that scope of works, procurement, and communication are the critical factors that determine the success or failure of mining projects. Referring to

Most Five Important Scope of Work Factors

Most Five Important Scope of Work Factors		
Ranking No.	***Code No.***	***Procurement Factors***
1	P16	Unsuitable type of contract
2	P12	Inappropriate contractor selection criteria
3	P14	Incapable contractor
4	P17	Lack of experience of subcontractor
5	P13	Poor project material delivery system

Fig. 3 Procurement factors that result in Quality related problems in UAE's Mining Industry (Al Hashmi, 2013)

Most Five Important Scope of Work Factors		
Ranking No.	***Code No.***	***Procurement Factors***
1	C2	Un-established communication procedure within the project organization
2	C5	Lack of communication between stakeholders
3	C13	Lack of sharing information
4	C7	Incompetent project documentation management system
5	C12	Late and incomplete feedback

Fig. 4 Communication Factors that result in Quality related problems in UAE's Mining Industry (Al Hashmi, 2013)

scope, for example, at the very basic, this involves the owner's requirements so that quality consists of balancing the aesthetic needs with the owner's economic muscle. Scope may also include the professional's needs for time and adequate resources to complete a project. Figure 3, shows the common failures associated with the scope of construction projects. Al Hashmi (2013) also discussed the other two group of factors, identifying five areas of deficiency for each as seen in Fig. 4.

7 Conclusion and Recommendations

The mining and construction industries are two of the biggest contributors to UAE's development and economic growth. Because of the backward and forward linkages that these two industries have with each other and other industries, sustainability and quality are inescapable requirements. In essence, the construction and mining sectors have multiplier impact on larger economy. This research has shown that project participants in the UAE are generally aware of these facts and also the need for quality

management. Yet, quality related issues are still an issue in UAE's construction and mining projects.

Based on the outcomes, the deficiency factors in terms of quality management evidently revolve around easily solvable issues such as delays during the inception stage and broken communication channels. In this regard, the authors believe that a shift in focus to structured process is the way forward for both industries. In essence, the absence of structured processes hinders the important functions of total quality management on the basis that there is inadequate control of work activities which eventually plays a key role in quality related issue, particularly time delays. On a practical level, the problem of unstructured problems can be overcome by developing a project steering committee which is involved in managing the project from start to finish and approves any additional work. Of course, proper communication channels are a vital requirement for such a committee to function appropriate. As discussed above, communication is also an important deficiency factor in UAE's mining and construction sector. To avoid breakdown in communication, it is recommended that organizations put in place new communication channels, encompassing all project participants. Preferably, such a system should be implemented at least three months prior to initiation of the project.

Finally, in the case when quality claims cannot be avoided claims should be settled and resolved swiftly to avoid delays. The paper proposes three methods of resolving claims in that regard; litigation, mediation, arbitration or negotiation**.** But the more important step is to analyze the causes of delays in projects. The results of this study indicate that this is an important success factor in UAE's mining and construction industry. Not only that, but quality assurance, quality control and timing can help organizations to improve quality management systems.

E-Government Implementation: A Case Study of Jordanian e-Government Program

Mua'ad Abu-Faraj, Ra'ed Masa'deh, and Muhammad Turki Alshurideh

Abstract The diffusion of Information and Communication Technologies (ICTs) including the high-speed Internet within the private sector and the exemplar of the private sector's implementation and use of e-commerce and e-business have caused the public sector around the world to start thinking about this phenomenon become aware of its potentials and consequently utilize them. Therefore, governments around the world started investing heavily in e-Government projects, along with e-services in order to exploit the expected benefits of this phenomenon. E-Government is a new approach followed by nations in providing better services to people and businesses. It increases the efficiency of departments, reduces the cost, streamlines the processes and thus provides several benefits to all stakeholders involved. In this paper, we describe a case study on the successful implementation of e-Government in Jordan using Chan, Lau, and Pan's e-Government Implementation Framework. The various e-Government initiatives undertaken by the Jordanian government have been described using the four components, namely information content, ICT infrastructure, e-Government Infostructure, and e-Government promotion.

1 Introduction

Many definitions for Electronic Government (e-Government) have been adopted. For example, (Heeks, 2001) defined e-Government as the initiative of the public sector to use ICTs to improve existing processes and good governance, build good relationships within society, provide citizens and businesses with more convenient access to online government services, and increase effectiveness and efficiency in the public sector entities. E-Government services can enhance a country's economic and social development by releasing citizens' time and cost, providing citizens with more convenient access to government information and services. Government e-services also encourage foreign investment that will contribute to a country's economy and social development.

E-Government has been recognized as a tool for radically improving the way governments interact with their citizens. While the obvious benefits of e-Government include providing convenience and easy access to customers thereby resulting in improved services to citizens, reduction of costs (by re-deploying resources from back-end processing to front-end customer service); providing easier access to information, increasing transparency and communication between government departments and with the public, the long term benefit of e-Government is also to make it easier for people to conduct their daily lives and business in the nation, thereby making it an attractive location to attract global talent. On the other hand, introducing e-Government requires a transformation in the way the government structure functions—thereby requiring a change in the organizational culture, managerial styles, systems and procedures apart from large financial investments towards technology upgrades. In order to ensure that e-Government is actually bringing about the changes that are desired (via the benefits) it is vital that strict performance measures be instituted on a continuous basis to check the effectiveness of e-Government.

In this paper, we describe a case study on the successful implementation of e-Government in Jordan. This study is done based on Chan, Lau, and Pan's e-Government Implementation Framework which has been published in by Chan et al. (2008). The various e-government initiatives undertaken by Jordan government have been described using the four components, namely information content, ICT infrastructure, e-Government infostructure, and e-Government promotion.

2 Jordan e-Government

E-Government in Jordan is a national program initiated by his Majesty King Abdullah II. The purpose of the e-Government program is to improve the performance of government backend processes that generate services with the end users in terms of efficiency, accuracy, time and cost effectiveness, transparency, and accountability. Services are at the heart of e-Government in Jordan. E-Government in Jordan is dedicated to delivering services to people across society, irrespective of location,

economic status, education or ICT ability. Government e-services should be delivered to citizens in a seamless manner, citizens should have the ability to use the government e-services and also feel confident using them as declared by MoICT (2013) and Blakemore and Dutton (2003).

In 2017, the Jordanian government unveiled its Economic Growth Plan (EGP) that aims to automate procedures to reach an e-government by 2020. In 2018, citizens and businesses have access to more than 100 e-Services offered by various institutions, with the number expected to reach 131 e-services in 2019 and 293 e-services in 2020 as given by Ghazal (2018). According to the United Nations (UN) e-Government survey 2018 as mentioned by United Nations (2018); Jordan ranked 98th globally and 8th regionally. The purpose of this survey is to measure countries' use of information and communications technologies to deliver public services. The Index captures the scope and quality of online services, status of telecommunication infrastructure and existing human capacity and is rated between zero (lowest) and one (highest). Despite Jordan's e-Government Development Index (EGDI) value was 0.5575 compared with 0.5123 in 2016, Jordan drops seven places globally.

The key emphasis of the Jordanian e-Government program has started with the re-engineering of processes to become more efficient, as well as human performance development and eventually, deployment of best practices using the latest technologies as a tool to enable government stakeholders to implement the new processes. The Ministry of Communications and Information Technology (MoICT) has been assigned to take the lead in coordinating the efforts of implementing the e-Government program and providing support where needed in the implementation MoICT (MoICT, 2013).

The deployment of e-Government in Jordan can be achieved by consolidating government resources, engaging greater citizen participation in the local economic development and facilitating citizen access to government services demonstrating more citizen empowerment and less government control over public data. e-Inclusion, the participation of all in e-Government is imperative to promote economic and social empowerment through ICT for all citizens including vulnerable groups pre-identified by the United Nations as the poor, illiterate, blind, old, young, immigrants and women as mentioned by the United Nations in United Nations (2012). The Strategy for development and implementation of e-Government in Jordan crystallizes this vision into objectives; it presents priority e-Government initiatives, tools and projects as shown in Fig. 1; and it identifies targets and milestones to facilitate performance control and raises accountability by clearly defining the responsibilities of key stakeholders as given by Majdalawi et al. (2015).

This strategy emphasizes the e-Government role of encouraging and motivating government entities to deliver high-quality customer-centric and performance-driven services to e-Government beneficiaries while transforming from traditional service delivery to more effective and efficient service providers to their beneficiaries (Citizens, Residents, Visitors, Businesses, Government Entities and Government Employees).

The four stages of e-transformation are evolving around the maturity of service delivery (emerging, enhanced, transactional, Connected). Government of Jordan

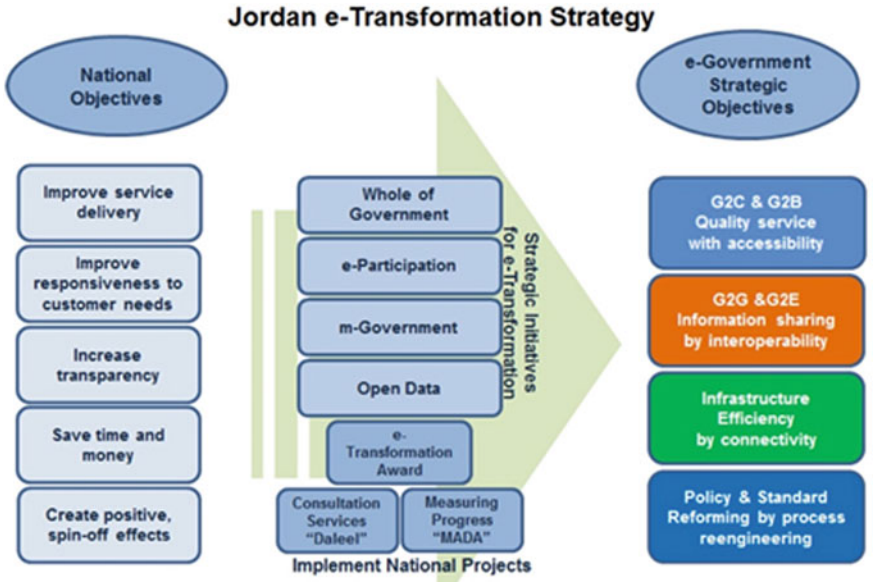

Fig. 1 Jordan e-Transformation Strategy (MoICT, 2018)

is aiming to achieve the transactional stage by end of this Strategy term. Jordan is currently in the late enhanced stage given that Government of Jordan offer more sources of information through the National Government Portal (www.jordan.gov.jo), the National Contact Center (NCC), the National Mobile Portal and National SMS Gateway as given by Jordan e-Government (2017).

3 E-Government Implementation Framework

Abu-Shanab and Abu Baker (2011) have proposed a model for evaluating the Jordanian e-Government website from users' perspective, this study was conducted in 2011. This model was proposed based on study a sample of 300 Jordanian students, they were asked to perform specific tasks and answered questions related to these tasks. The study focused on usability, accessibility and privacy/security as factors in predicting the adoption of e-government website.

Chan et al., (2008) offer a macro perspective of the various activities involved in the implementation of e-Government through an interpretive analysis of the various e-Government-related initiatives undertaken by the Singapore Government. The analysis led to the identification of four main components in the implementation of e-Government, namely (i) information content, (ii) ICT infrastructure, (iii) e-Government Infostructure, and (iv) e-Government promotion. These four components were then conceptually integrated into the e-Government Implementation

Framework. Sethi et al., 2008) have applied the same framework proposed by Chan et al. (2008) to study the case of the e-Government in Dubai. In this paper, the same framework implemented by Chan et al. (2008) and (Sethi et al., 2008), will be used as a descriptive tool to organize and coordinate various e-Government initiatives in Jordan. This framework will also be used as a prescriptive structure to plan and strategize e-Government implementation in Jordan.

4 ICT Infrastructure

Jordan is already a regional leader when it comes to the ICT sector and one of the main launch pads of entrepreneurship in the Middle East and North Africa. The sector is one of Jordan's fastest growing industries, contributing 12% of the GDP and creating over 80,000 value-added jobs (6% of the labor force). Jordan's ICT exports grew eight-fold since 2001 and currently reach over 40 countries around the globe. Amman is recognized as one of the 10 best destinations to start a technology firm worldwide and a leading center for developing Arabic internet content as mentioned by Oxford Business Group (2018).

The ICT sector in Jordan consists of the IT industry (software and content providers), the telecommunication industry with three main telecom companies (Orange, Zain and Umniah), and the Business Process Outsourcing (BPO) industry (call centers). The ICT sector accounts for approximately 12 percent of GDP direct and indirect, and 84,000 jobs (direct employment figures for the IT industry reached 16,000, with indirect and induced employment for ICT estimated at around 68,000). The sector attracts an average of USD 150 million in investments annually as given by MoICT (2017). Competition is strongest in the broadband and mobile markets. Jordan has emerged as a regional tech startup hub due to an ICT-focused educational system, low startup costs, and business-friendly environment. Its growing reputation is increasingly attracting international capital eager to tap into the region's under-served, but growing online market. Due to the country's small market, most start-ups in Jordan either focus exclusively on, or grow with, the expectation of expanding into the wealthier markets of the Middle East Gulf Region as mentioned by MoICT (2009).

The three network operators compete in a mobile market, with a majority of their subscribers being prepaid users. All three have launched LTE networks, which is underpinning mobile broadband growth. The potential for large-scale mobile internet penetration due to competition has captured the attention of Jordan's technology start-up companies (Al-Omari, 2006). Many are developing applications to target the higher spending demographic traditionally associated with mobile internet early adopters. Jordan's initiative to develop an e-payment infrastructure coincides with a rollout of Near Field Communications (NFC) mobile payment terminals across Jordan by MasterCard and a number of partners.

In March 2015, the Central Bank of Jordan (CBJ) announced the launch of the eFAWATEERcom portal (www.eFAWATEERcom.jo) that will enable clients inquire about, review and settle their bills on-line. The portal was established in partnership with Madfoo3atCom for Electronic Payments Company as the main operator, MasterCard Internet Gateway Service (MiGS), and Emerging Markets Payments Group (EMP Group) as the hosting company (Times, 2017). Payments through eFAWATEERcom, an online bill payment service, have increased to JD3.643 billion by the end of July, 2018, compared with JD1.208 billion in the same period of 2017, marking a 200 per cent increase, the number of bills paid through the service in this year's January-July period stood at 4.869 million, compared with 2.303 million invoices that were paid in the same period of 2017, as given by Times (2018).

The Jordanian government is committed to completing its National Broadband Network (NBN) project, which is owned by MoICT. The objective of the National Broadband Network is to connect all public schools, governmental entities, health entities, community colleges, and knowledge stations. The network has been broken up into 3 phases, Middle phase, North phase and South phase. These phases are connected to each other by an Overlay Network which will provide physical connectivity between the Point of Presences (POPs) for each module and the National Data Centers. Public facilities will be connected to the National Broadband Network by the end of 2019, this will greatly boost e-services, e-commerce, e-health and e-education in Jordan. The network will provide high speed connectivity between public facilities, hospitals, schools and government agencies (Ghazal, 2016).

5 Information Content

The United Nations has identified "Five Stage e-Government Model", this model is useful in developing the e-services that are being offered by the various government departments in Jordan as shown in Table 1 as published by United Nations (2002).

In 2018, citizens and businesses have access more than 100 e-Services on the National Government Portal four of which are transactional and three of those services offer online payment through the Jordan Payment Gateway (JoPAY). Many more online information and interactional services are offered on government official websites. The National Mobile Gateway and SMS Gateway offer 40 Government

Table 1 The Stages of e-Government

The Stages of e-Government	
Emerging	An official government online presence is established
Enhanced	Government sites increase; information becomes more dynamic
Interactive	Users can download forms, e-mail officials and interact through the web
Transactional	Users can actually pay for services and other transactions online
Seamless	Full integration of e-services across administrative boundaries

e-Services that are offered by 22 government agencies while the National Contact Center (NCC) is currently serving citizens and businesses by answering calls for 22 government agencies regarding over 200 services in addition to receiving citizens' complaints and suggestions against government services. In addition, as of today, 77 government Agencies have subscribed to National SMS Gateway push services (MoICT, 2017).

At the time of the portal launch in 2003, the Jordanian e-Government was in "Emerging Stage" with an Internet presence through its official portal with 15 e-services, in addition to launching the strategic plan of the e-Government in Jordan. Also, during the emerging stage, the government started working on the National Broadband Network and the Secured Government Network (SGN). E-government efforts accelerated in Jordan since 2003, entering the "Enhanced" stage three years later. By 2006 the number of e-services rose to more than 30, also the government launched the National SMS gateway.

The Jordanian e-Government project has entered "Interactive Stage" in 2009, with 55 online e-service also the government focused on providing newer official websites and enhanced national portal. Furthermore, the e-Government integrated many systems such as Government Finance Management Information System (GFMIS) by Ministry of Finance, Human Resource Management Information System (HRMIS) being developed by the Civil Status Bureau and Inventory Management System that is developed by the General Supply Department. In 2013, the government has activated the e-Government Steering Committee (EGSC) which is responsible of setting the strategic directions for e-Government in Jordan as announced by the Jordan e-Government (Jordan e-Government, 2017). The Jordanian e-Government promoted to "Transactional Stage" in 2013, were 96 e-services have been released including mobile services. The government also activated e-Procurement in addition to the e-participation policy. The government utilized the existing shared and composite services, integrate related vertical services and integrate government systems through Enterprise Service Bus (ESB) for the purpose of providing cross governmental services. The Jordanian e-Government is supposed to enter the "Seamless Stage" by 2020, were the number of e-services will be more than 290 e-services, and all public facilities are connected to the National Broadband Network.

To improve government efficiency and enable each entity to focus on its core functionality rather than managing administrative and financial systems, government must work as a holistic government by organizing and standardizing processes across government entities around user needs. This will solve the current silos of public sector which create redundancy and fragmentation in government. This approach can also enable different entities to reap the benefit of information sharing to facilitate service provision and reduce the burden on citizens in term of running around different agencies to authenticate documents and clearances. Table 2 shows the development stages of the e-Government in Jordan.

The governmental departments in Jordan have huge differences in its technical competencies, core business process and each of them is equipped with uniform applications, this forced the e-Government management to use a single centralized entity with well-defined common tools known as National e-Government tools. These

Table 2 Jordan e-Government Transformation into Maturity

e-Service	2003–2005	2006–2008	2009–2012	2013–2015	2016–2020
G2C and G2B	15 online e-services	30 online e-services on National Portal and Official websites	55 online e-services on enhanced National Portal and newer official website	96 online e-services on enhanced National Portal and newer official website launching Mobile services	More than 100 online e-services on 2018 Launch Bekhedmetkom e-services to reach 131 e-services in 2019 and 293 in 2020
G2G and G2E			GFMIS HRMIS IMIS	e-Procurement	
Institutional	Launch the initial strategy of e-Government program	National Strategy (2006–2009) Roadmap EGSC 70 CIO units	National Strategy (2014–2016) Roadmap 37 additional CIO units Launching eFAWATEERcom portal	Activate EGSC CIO Council MADA Daleel e-Government award	
Business		Training 10,000 government employees	Training 3000 government employees		Training 5000 government employees
Legal			e-Transaction Amendments Draft	e-Participation Policy	
Infrastructure	Launch SGN to include 14 entities Start working on the National Broadband Network	Launch National Portal SMS gateway	Launch Mobile Gateway, Payment Gateway ESB SGN to include 73 entities with enhanced portal	Transactional National portal PKI Cloud Computing Data Model and Open Data Standards	Public facilities will be connected to the National Broadband Network

tools which are shown in Table 3 are considered as expedited service delivery by other government departments and helped to achieve cost savings by providing commonly utilized e-services to other departments. These tools will help other departments to pay more efforts toward e-Transformation to better serve their beneficiaries and improve the overall progress of Jordan achievements compared with regional and global countries (Navarra, 2007).

Table 3 National e-Government tools

Synergistic Tool	Description
eFAWATEERcom	eFAWATEERcom is an electronic bill presentment and payment system that is owned by the Central Bank of Jordan and aims at providing this service to its customers through different banking channels and payment service providers
MADA	Jordan e-Government Program mandate to follow up on the progress of e-Transformation in Jordan
Daleel	initiative guiding tool to promote e-Government consulting services toward business development and employ accumulative knowledge and experience in enabling government entities to achieve e-Transformation
Bekhedmetkom	Interactive platform to communicate with the government (Ask government, Suggestion, Complement, Complaint, Reporting)
Profiling	Is a portal provided to deliver highly personalized services to users allowing a differentiated personalized experience for each user, by unifying registration procedures and applying high security and privacy calibrations?

6 E-Government Infostructure

At the early stages of the e-Government program in Jordan, there was no national portal for the e-Government services. During the years from 2003 till 2005, the e-services provided by the e-Government was considered as separate services with no major hub to accommodate these services to other participants. The e-Government website (www.jordan.gov.jo), launched in 2008. The number of e-services at that time was around 30 e-services. The aim of the e-Government portal was to be a central hub for all the services provided by the government. The e-Government program started creating new e-services and then integrating these e-services to the e-Government portal.

In 2010, the portal was revamped with the addition of more e-services and new implementation approach. This development phase included an important approach to give the governmental departments the freedom to create their own services and content and publishing these services at their own portals while remaining an integral part of the portal e-Government. This approach can be described in other words by following a decentralized approach with the governmental department and centralized approach in the main e-Government portal. At that time, the portal offered 55 e-services targeting various segments of the community including the individuals, business sector, and the private sector. In 2014, the e-Government program launched mobile services and it added its portal to the e-Government website. These mobile services include launching SMS gateway and launching mobile applications, which are available on iOS and Google Play stores.

In 2016 the e-Government portal was again revamped with more user-friendly features. The e-Government portal provides 96 online e-services on enhanced national Portal and newer official website. The bilingual portal was divided into four groups: citizen, resident, investor, and visitor/tourist. The relevant e-services were

listed under each group. In 2018, The portal is positioned as central hub and it is considered as the gateway to all government departments and their services, in addition to the portal of each governmental department. The portal provides more than 100 e-services with the aim to provide 131 e-services in 2019 and 293 in 2020. The e-Government official website provides the Government Entities which includes prime ministry, ministries, and government agencies. Also, it provides "Bekhedmetkom", which is interactive platform to communicate with the government (Ask government, Suggestion, Complement, Complaint, Reporting). In 2018, the mobile applications portal includes more than 25 different mobile applications.

The fast evolvement of ICT has offered government multiple service delivery channels. Since beneficiaries vary in their literacy, location and accessibility to those channels, they require diverse service provision. Internet has proven to be the least effective channel to reach Jordanians. Mobile penetration has exceeded by far all expectations and should be utilized as one of the main delivery channels in Jordan. Ultimately, e-Government services should transform the way all beneficiaries interact with government.

7 E-Government Promotion

The e-Government Promotion concept focuses on enhancing governance and achieving efficient, convenient, more responsive citizen-oriented public services delivery to provide better access to online public services. The e-Government Promotion can be achieved through:

- Support in improving e-Government interoperability, and applying an effective business process reengineering mechanism (Awareness);
- Assistance in enhancing government online services delivery (Assistance);
- Enhancing e-Government institutional (Assurance).

The e-government promotion involves a three-prong approach of awareness, assistance and assurance (Chan et al., 2008). The first prong of awareness referred to the various publicity activities and strategies employed by the Jordanian e-Government to raise the public's awareness of e-services. Jordanian e-government has conducted different approaches to promote the participants to use e-services, such as online marketing, marketing with government departments, announcement on public TV stations and newspapers. For example, The Jordanian e-Government has launched two tools: "Daleel", and "Bekhedmetkom". Daleel is initiative guiding tool to promote e-Government consulting services toward business development and employ accumulative knowledge and experience in enabling government entities to achieve e-Transformation. Bekhedmetkom is an interactive platform to communicate with the government. The government also has launched a national award for content development which evaluates the creativity and innovation in the content as well as the creativity and innovation in the usage of the content as mentioned by Odat and Khazaaleh (2012).

Creating awareness about government e-services was not enough; the next task was to improve the computer literacy rates. This was addressed by the second prong of assistance, where Jordanian e-Government provided assistance though the different initiatives that targeted the use and diffusion of ICT in schools in Jordan. The government also has launched a national project to connect 3,000 public schools, ministry directorates and military education schools to an integrated network, which enabled more than 1.5 million students and 80,000 teachers to benefit from this project. The communications network will provide teachers and students with an interactive learning environment, and will also allow administrators to communicate more easily, expediting decision making. The Jordanian government also worked on integrating ICT use into university curriculum in areas such as journalism (facebook use, twitter use, etc.), drama and the arts which are becoming ICT and digital content heavy as given by Al-Yaseen et al. (2013).

The final prong of assurance in e-Government promotion is very crucial as it provides assurance on privacy and security issues of e-services (Chan et al., 2008). The quality evaluation of government departments' services by Jordanian e-Government was based on a number of well-defined criteria, one of which was security and privacy of e-services. It was extremely important to Jordanian e-Government that the security and privacy policy of e-services was created in both English and Arabic by the government departments and made known to the users. In order to increase users' confidence in the website, all government departments were advised to add a statement around security of the website and how information was shared with other government organizations. Furthermore, to enhance the reliability of the statement, government departments were instructed to add a link or reference to any kind of legislation in the security and privacy statement. At the same time, online payment security of centralized service, eFAWATEERcom was beefed up to match the world class security standard.

Other than the three prongs of e-Government promotion, Jordanian e-Government also launched a "Bekhedmetkom" through Jordan.gov.jo portal in 2016 to measure customer satisfaction level and enhance the quality of e-services. It invited the public to submit their suggestions, complains, compliments, and views on Jordanian government's official portal, Jordan.gov.jo.

8 Discussion

The Jordanian e-Government provides a variety of online services for both individuals and businesses. The Jordanian e-Government has managed to add more than 100 e-services to its portal, there is still much work to be done in this filed. The percent of e-services that the Jordanian government managed to get online compared to the services it provides is very low, also this percent compared to the other countries in the region is also considered very low.

The ICT infrastructure in Jordan is developing very fast, also Jordan has enjoyed a strong leadership, this enabled Jordan to move from the informational government

Licensed to (putm@utm.my)

websites to transactional websites and currently the aim is to fully integrate of e-services across the administrative boundaries (reaching seamless phase) by 2020.

Strong Leadership, Commitment and Vision: e-Government is a complex initiative involving multiple stakeholders and entities. The strong leadership with unified and coherent vision is extremely important for e-Government success. The Jordanian e-Government project aims to ease the lives of people and businesses interacting with the government.

Flexible and Robust Infrastructure: The successful implementation of e-Government initiative depends on the underlying ICT infrastructure comprising of secure servers, routers, firewalls, internet connectivity etc. In order to incorporate changes and additions in the technology infrastructure, Jordanian e-Government had formulated a technology master plan (National Strategy Roadmap) right from start for the required infrastructure and its related architecture.

Central Flexible Model: To better manage and monitor its e-Government initiative, Jordanian government chose a hybrid approach which accelerated the release of new e-services. Jordanian e-Government is centrally controlled and monitored the e-services development of various government departments, the government departments were given the freedom to creatively build their own e-services in the earlier phase of e-Government initiative.

Development Strategies: Although the overall vision of Jordanian e-Government remained the same, the development strategies kept changing to meet the vision. The biggest challenge faced by Jordanian e-Government in the initial phase of the e-Government initiative was difference in the technical competence of various government departments. Some departments were technically qualified and demonstrated high competency, while others lacked even the minimum technological infrastructure. To bridge the digital divide among the government departments in the initial phase, Jordanian e-Government established a number of strategies such as providing support to government departments through work teams sharing e-services, and wide training programs.

Development of Human Resources: The e-Government initiative can't be successful without the development of human resources. An individual (citizen or employee) is the basis of the success or failure of this initiative. Without citizens or employees able to accept electronic systems, the e-Government model can collapse. Realizing the importance of raising the technical qualification of both citizens and employees, The Jordanian e-Government launched several training programs for government.

Public–Private Partnerships: e-Government initiatives require a variety of business and IT skills such as business process reengineering, systems analysis and design, networks, software design and implementation etc. In order to address the IT skills shortage, the Jordanian e-Government had formed strategic alliances with private sector to complement its competencies in various areas such as portal hosting and management, customer care, electronic payment, and mobile services among others. These strategic partnerships had been a critical step in achieving both short-term and long-term strategic objectives of Jordanian e-Government.

To conclude, this is believed to be the most up-to-date and comprehensive analysis of Jordan's plans and assessment of its level of readiness for delivery of e-Government services. The findings present a number of key factors that hinder Jordan's e-Government development. These findings can be useful for researchers and practitioners, as they provide rich insights on e-Government development. The findings can be also useful to other developing countries, as they can help them in understanding citizen related challenges when designing, planning and implementing their e-Government initiatives.

The Impact of the Motivational Culture on the Job Satisfaction of Aqaba Special Economic Zone Authority Employee's in Jordan

Shaker Habis Nawafleh, Ra'ed Masa'deh, and Muhammad Alshurideh

Abstract The aim of this study was to examine the impact of Motivational Culture on the Job Satisfaction among the employees in the Aqaba Special Economic Zone Authority. Descriptive, correlational, cross-sectional design were used by distributing of (115) self-reporting questionnaire, which was consist of three parts; the first part was for the demographical characteristics of the employees, the second part was for the Motivation at Work Scale (MAWS) and the third part was the Short Form Minnesota Satisfaction Questionnaire (SFMSQ). The results revealed that motivational culture and the job satisfaction levels were in a moderate level {38.4 (SD = 4.392)} and {62.6 (SD = 14.87)}. Moreover, the regression results reveals that there was a strong significance positive impact of the motivational culture on the job satisfaction (r = 0.78); and (61%) of motivational culture for the employee could be explained from motivational culture. The positive effect of motivational culture in the promoting a high level of job satisfaction, need more focus by the human resources departments to maximum the benefit of the motivational culture.

1 Introduction

Human resources are considered the key to the success of any organization, they are the most valuable and essential part of any successful operating system (Alrowwad & Abualoush, 2020; Lorincová et al., 2019; Rapsanjani & Johannes, 2019). Without Qualified human resources, other resources will be Ineffective (Pancasila et al., 2020), so Organizational goal achievement couldn't depend on the technological excellence alone because the quality of the employees is a crucial foundation stone (Aldmour & Obeidat, 2017; Bernanthos, 2018; Rozi & Sunarsi, 2020; Vanesa et al., 2019). Each organization Seeks to have special characteristics that recognize it from other organizations, these characteristics help the organization to keep the best employees within their team, this characteristic is called motivation (Abuhashesh & Al-Dmour, 2019; Bernanthos, 2018; Hayajneh et al., 2021; Paais & Pattiruhu, 2020; Rozi & Sunarsi, 2020). The presence of expert and high-quality employees will enhance the productivity of the organization (Al-dalahmeh et al., 2018; Obeidat & Altheeb, 2018).

1.1 Background

Human resources are considered the key to the success of any organization, they are the most valuable and essential part of any successful operating system (Alrowwad & Abualoush, 2020; Lorincová et al., 2019; Rapsanjani & Johannes, 2019). Without Qualified human resources, other resources will be Ineffective (Pancasila et al., 2020), so Organizational goal achievement couldn't depend on the technological excellence alone because the quality of the employees is a crucial foundation stone (Aldmour & Obeidat, 2017; Bernanthos, 2018; Rozi & Sunarsi, 2020; Vanesa et al., 2019). Each organization Seeks to have special characteristics that recognize it from other organizations, these characteristics help the organization to keep the best employees within their team, this characteristic is called motivation (Abuhashesh & Al-Dmour, 2019; Bernanthos, 2018; Hayajneh et al., 2021; Paais & Pattiruhu, 2020; Rozi & Sunarsi, 2020; Vanesa et al., 2019). The presence of expert and high-quality employees will enhance the productivity of the organization (Al-dalahmeh et al., 2018; Obeidat & Altheeb, 2018).

1.2 Problem Statement

Organizational employee satisfaction affects their performance which has a negative effect on the organization's performance and its ability to perform the desired goals (Paais & Pattiruhu, 2020), and it is difficult to suppose that we can have an effective business without professional teamwork which is hard to have without a reward

and motivation system (Ali & Anwar, 2021), each organization needs to give more attention to the employees' needs and talents in order to help them in their future plans which help in the improvement of the company's productive (Pancasila et al., 2020).

1.3 Significance of the Study

Human resources management department in the Aqaba Special Economic Zone Authority intended to enhance the job satisfaction levels for its employees. The researcher highlights in this study the positive impact of the motivational culture on the job satisfaction levels for the Aqaba Special Economic Zone Authority employees and helps the Human resources management department work hard to achieve their aim to increase job satisfaction levels of their employees.

1.4 Purpose and Research Questions

The objective of this study was to examine the impact of motivational culture in the Aqaba Special Economic Zone Authority on job satisfaction levels for its employees. To accomplish this goal, the researcher focuses on a number of objectives:

- To recognize the levels of motivational culture and job satisfaction among the employees in the Aqaba Special Economic Zone Authority.
- To investigate the impact of motivational culture on job satisfaction among the employees in the Aqaba Special Economic Zone Authority.

These objectives guided the researcher to identify the following research questions:

- What are the levels of motivational culture and job satisfaction among the employees in the Aqaba Special Economic Zone Authority?
- Is there an impact of motivational culture on job satisfaction among the employees in the Aqaba Special Economic Zone Authority?

Accordingly, the following hypothesis is presented. In fact, in this study the decision to accept or reject the hypothesis is based on statistical significance. Statistical significance considered as a description for a result or experiment when the probability is less than the significance level. The current study objective to examine the following hypothesis:

H1: There is an impact of motivational culture on job satisfaction among the employees in the Aqaba Special Economic Zone Authority.

1.5 Study Variables and Framework

This study was involved two major variables:

(1) Motivational Culture

The word motivation is originating from the Latin word "movere", which means to "transfer" or "push" (Pang & Lu, 2018).

Motivation is a group of situations and worth's to influence the individual to realize the specific goal in correspondence with the individual goals (Sudiardhita et al., 2018). It could be a form of organizational philosophy and values adopted by human resources within the organization, but the formation of motivation is enhanced by the organizational managers (Bernanthos, 2018).

Developing a well-structured motivation system is an essential element for the organization to authorize employees to produce the maximum benefits for the organization (Pang & Lu, 2018).

Work motivation is the force that remains within an individual, which, fosters his attitude to take action (Barasa et al., 2018). It is the gift of mobility that inspired a person's affection for them to work simultaneously, work productively, and incorporated with every attempt to achieve satisfaction (Vanesa et al., 2019).

Motivational culture is a set of phenomena of physical and spiritual survival of the organization's personnel: the controlling moral rules and values, customs that emerge from the moment of induction of the project and are shared by the majority of its employees (Lebedynets & Zhurakivska, 2021).

(2) Job Satisfaction

Job satisfaction reflects the emotional state (either pleasant or unpleasant) in which employees saw their work. Job satisfaction reflects an employee's point of view across his work, job satisfaction is a serious agent to be considered in the perception of the organizational behavior (Barasa et al., 2018; Masa'deh, 2016; Vratskikh et al., 2016).

Job Satisfaction is a fundamental standard that cannot be overestimated, representing an integration of psychological, physiological, and environmental situations that mark an employee's satisfaction with their job, emotional stability, and judgment (Davidescu et al., 2020; Masa'deh et al., 2019; Sudiardhita et al., 2018).

Job satisfaction is one of the most significant factors to get the best work result. When a person feels satisfaction in the work of course he will attempt as much as possible with all the skills that have to accomplish the job task (Barasa et al., 2018).

In order to achieve the study goal, the researcher develops the following Study frame work:

Source: Authors

2 Literature Review

2.1 Motivational Culture

The influence of the motivation and job satisfaction against employees' performance among Indonesian employees were studied in a descriptive study by Bernanthos (2018) depending in the results of an (114) employees' respond which revealed that there was moderate levels of a motivation and job satisfaction, and positive, significant effect of the motivation process on the employees' performance. Furthermore, a study was conducted by Rozi and Sunarsi (2020) in South of Indonesia to determine the effect of motivation and work experience on employee performance; the researchers involved (43 respondent) in their study and the result reflect that (47.6%) of the employee performance are influenced by motivational attitude.

2.2 Job Satisfaction

Job satisfaction considered as the most influential variable on the employee's performance, as a conclusion of the results of a descriptive study of Rapsanjani and Johannes (2019) which was aimed to examine the effect of remuneration, work motivation and job satisfaction on employee's performance among Indonesian employees in housekeeping department in Jakarta. Moreover, Ali and Anwar (2021) conduct a study in Iraq among 128 bank employees to analyze the effect of the culture on employee satisfaction in different banks in 2021, and the result show that compensation as motivation has significant positive influence on job satisfaction in the analysis of the randomly collected questionnaire which was developed by researchers previously.

2.3 The Impact of Motivational Culture on Job Satisfaction

The effect of compensation, motivation of employee and work satisfaction to employee performance pt. Bank in Indonesia were studied by Sudiardhita et al. (2018) among 346 Bank's employees, and the results shows that the work motivation has a positive

and significant effect on job satisfaction which affected positively in the employees' performance. From another point of view, Paais and Pattiruhu (2020) perform a study to investigates the effect of motivation, leadership, and organizational culture on job satisfaction, and employee performance among employees in Central Maluku Regency, Indonesia, the result showed that work motivation and organizational culture had a positive and significant effect on performance, but did not significantly influence employee job satisfaction.

3 Methodology

3.1 Research Design

This study used a descriptive, correlational, cross-sectional design to assess impact of the motivational culture on the job satisfaction among Aqaba Special Economic Zone Authority Employee's, Jordan, and evaluate the levels of motivational culture among employees.

3.2 Population and Sample

The accessible population of the study was all employees in the Aqaba Special Economic Zone Authority. The sample size was calculated using G-power program with α probability of (5%) and power of (95%), with a medium effect size of (0.15), so the calculating program indicated the minimum number of sample is (107) employees.

3.3 Instrument of Data Collection

In order to achieve the goal of the study and based on previous literature, the researcher designed the study questionnaire, which was consisted of three parts; the first part was for the demographical characteristics of the employees, the second part was for the Motivation at Work Scale (MAWS) and the third part was Short Form Minnesota Satisfaction Questionnaire (SFMSQ).

The Motivation at Work Scale (MAWS) was used on its English version for data collection. It was developed by Gagne et al. (2010). It contains 12 items. First three items were related to intrinsic (indicating inner motivation), next three to identification (self-actualization), next three for introjections (getting inspiration) and the last three items were related to extrinsic (motivated from external sources, i.e., promotion, money etc.) level of motivation. A 5-point Likert system was used to respond

Table 1 The instrument reliability

	Variables	No of items	Alpha value
1	Motivation at Work Scale (MAWS)	12	0.88
2	Short Form Minnesota Satisfaction Questionnaire (SFMSQ)	20	0.78

Prepared by researcher depend on pilot study results

to the items, (1) for strongly disagree, (2) for disagree, (3) for Neutral, (4) for agree, and (5) for strongly agree. The increased of the scale sub-total indicated increase Motivational level (Gagne et al., 2010).

The Short Form Minnesota Satisfaction Questionnaire (SFMSQ) in an English form, was used to assess job satisfaction using a 5-point Likert scale ranging from one (extremely dissatisfied) to five (extremely satisfied). It consists of 20 items, and each item represents a feature in the work environment. The possible scores for SFMSQ range from 20 to 100. The level of job satisfaction classified to high satisfaction for score of (>75), low level for score (<25), while the score in the middle range of percentile (26–74) would indicate average satisfaction level (Al-Dmour et al., 2021).

For collecting the data, convenience sampling technique was used to distribute the questionnaire for the employees. But before conducting the study, pilot testing is performed by taking (15) employees for the purpose of checking the reliability of the questionnaire. The responses of the employees were scored and the reliability of the instrument was determined using Cronbach's Alpha. The statistically acceptable value of the coefficient of alpha responses to the questionnaire for all Cronbach is 70%. The result shows that the Cronbach's alpha ranges from (0.78) to (0.88) which show the scale is reliable, as in Table 1.

3.4 Data Analysis

After collecting the valid questionnaires and calculating the response rate, the data has been coded manually and entered to Statistical Package for Social Sciences (SSPS version 21) data base. Descriptive statistics (mean and standard deviation) were used to the employee's demographical characteristics. Another descriptive statistic (mean and standard deviation) used to calculate the motivational levels and job satisfaction level for research question number one. Inferential statistics (Pearson correlation and simple liner regression) were used for testing the impact of motivational culture on job satisfaction level for the employees in order to answer the question number two.

3.5 Ethical Considerations

The approval of the Aqaba Special Economic Zone Authority to conduct this study among the Authority employees was confirmed. Informed consent has been obtained for each participant and the confidentiality and anonymity where guaranteed, and emphasizing that the participating is voluntary; the participant could withdraw at any time during the data collection time. There is no risk on the involved employees and no financial issues in participating in this study. The researcher's phone numbers were mentioned, for any questions, or any help for the participants in filling out the questionnaire.

4 Results

4.1 Demographical Information

The researcher distributed (115) questionnaires among the employees in the Aqaba Special Economic Zone Authority. Only (110) questionnaires were valid for analysis, making the response rate of 96%. The analysis of the demographical characteristic of the sample shows that the mean age of the sample was 27.3 years (SD = 4.96) ranged from (22–45) years. And the average monthly income was ranged between (700 – 2000) JD. With the sample mean 1250 JD. (SD = 350). While the mean of the experience level for the participant was 10 years (SD = 4.5) as represented in Table 2. Furthermore, the Categorical Characteristic of the sample showed in Table 3; which revealed that out of (110) employees participated in this study; almost more than the half of the participants (57%) were male. Almost the half of the employees (47%) has BCS degree in the view of educational levels, and (29%) of the participants were has higher education.

Table 2 Demographical characteristic of the sample (N = 110)

Category	Mean	SD	Rang
Age	27.3 years	4.96	22–45 years
Monthly income	1250 JD	350	700–2000 JD
Experience level	10 years	4.5	2–19 years

Prepared by researcher depend on SPSS results

Table 3 Categorical Socio-demographic information of about the respondents (N = 110)

Category	Component	Frequency	Percentage (%)
Gander	Male	63	57
	Female	47	43
Educational level	School	26	24
	BSC	53	47
	M.A	28	26
	Ph.D.	3	3

Prepared by researcher depend on SPSS results

Table 4 Levels of MAWS and SFMSQ (N = 110)

	Scale	Mean	SD.	Range
1	Motivation at Work Scale (MAWS)	38.4	4.392	33–48
2	Short Form Minnesota Satisfaction Questionnaire (SFMSQ)	62.6	14.87	48–82

Prepared by researcher depend on pilot study results

4.2 The Answers of Research Questions

4.2.1 The First Research Question

To answer the first research question (What are the levels of motivational culture and job satisfaction among the employees in the Aqaba Special Economic Zone Authority?); the researcher analyzes the responses of the participant for the questionnaire of "Motivation of the Work Scale (MAWS)" and "Short Form Minnesota Satisfaction Questionnaire (SFMSQ)", by using the descriptive statistics (mean, standard deviation and frequency). Analyzing the responses of the participating employees to ward "MAWS" shows that the scores were ranged from (33) to (48) and the mean was {38.4 (SD = 4.392)}, which revealed a moderate level of work motivation among the employees in the Aqaba Special Economic Zone Authority. In the anther point of view, the result of participant respondent to ward "SFMSQ" revealed that the scores ranged from (48) to (82) and the mean was {62.6 (SD = 14.87)}, which revealed a moderate level of job satisfaction among the employees in the Aqaba Special Economic Zone Authority, as in Table 4.

4.2.2 The Second Research Question

To answer the second research question (Is there an impact of motivational culture on job satisfaction among the employees in the Aqaba Special Economic Zone

Table 5 Result of regression model for the impact of motivational culture on job satisfaction

Model	F	Sig. F	*R*	R^2
1	20.74	0.001**	0.78	0.61

Prepared by researcher depend on SPSS results

Authority?); the researcher applied simple liner Regression analysis. The regression result Table 5; reveals that the regression equation reaches the significance ($F = 20.74$, $p < 0.001$**). And there was a positive strong significance impact for motivational culture on job satisfaction ($r = 0.78$); the results conclude that (61%) of the job satisfaction could be explained from motivational culture.

5 Discussion and Conclusions

Studying the levels of work motivation among employees in the Aqaba Special Economic Zone Authority reported a moderate level of work motivation {M = 38.4 (SD = 4.392)}. Such a supported result was reported in Indonesia by Bernanthos (2018) during studying the levels of work motivation among employee questionnaire data in Private Universities and report moderate levels of work motivation with mean {39.3(SD = 3.796)} (Bernanthos, 2018). The results of job satisfaction levels indicate a moderate level of job satisfaction among the employees; the mean was {62.6 (SD = 14.87)}. These results were supported by previous studying of job satisfaction levels among employees working at Housekeeping Department in Indonesia and revealed the job satisfaction mean (58.3 (SD = 35.3%) (Rapsanjani & Johannes, 2019).

Furthermore, the results of this study indicate that there a there was a positive strong significance impact for motivational culture on job satisfaction among the employees in the Aqaba Special Economic Zone Authority, this impact can be explaining (61%) of the employee's job satisfaction a result from motivational culture. Such a strongly positive impact motivational culture was reported by Ali and Anwar (2021), by studying the impact of motivational culture on job satisfaction.

This study highlights on the impact of motivational culture on job satisfaction among the employees in the Aqaba Special Economic Zone Authority, and reported that the motivational culture can explain (61%) of the job satisfaction level and indicate that there a significance relationship between motivational culture and the job satisfaction level. This relationship helps the organizations to work more to promote employee job satisfaction high. In addition, the Aqaba Special Economic Zone Authority should offer better services in alignment with the latest Information Systems as suggested by researchers (e.g., Abuhashesh & Al-Dmour, 2018; Al-Dmour et al., 2021; Alshurideh et al., 2021; Davidescu et al., 2020; Lorincová et al., 2019; Madi Odeh et al., 2021; Obeidat et al., 2019; Paais & Pattiruhu, 2020; Pancasila et al., 2020; Pang & Lu, 2018; Rozi & Sunarsi, 2020; Shannak et al., 2012; Sudiardhita et al., 2018; Vanesa et al., 2019; Zureik & Al-Sondos, 2021).

According to the result of the study, employee's motivational level for the whole sample was "moderate", and in the aim to increase this level, the researcher recommended to the human resources managers to increase the behaviors that promote motivational culture by taking into consideration employees' desires and expectations, reinforcing communication within the authority (Al Kurdi et al., 2020; Alameeri et al., 2020; Al-bawaia et al., 2022; AlShehhi et al., 2020; Alsuwaidi et al., 2020; Bettayeb et al., 2020; Kurdi et al., 2020), and establishing open communication channels directly with the employees (Aljumah et al., 2021; Alshurideh, 2022; Alshurideh et al., 2014; Alyammahi et al., 2020; Sweiss et al., 2021). Similar studies can be carried out by comparing governmental and private organizations in the aim of co-operations between the different organizations to increase the levels of motivational level and job satisfaction among the employee (Aburayya et al., 2020; Al-Khayyal et al., 2020; Alshurideh et al., 2012; Alzoubi et al., 2020, 2022).

Strategic Leadership and Its Role on Implementing Public Policies in the Government Departments in Karak Governorate

Kamel Mohammad Al-hawajreh, Alaa Radwan Al-Nawaiseh, Reham Zuhier Qasim Almomani, Menahi Mosallam Alqahtani, Basem Yousef Ahmad Barqawi, Muhammad Turki Alshurideh, Sulieman Ibraheem Shelash Al-Hawary, Ayat Mohammad, and Anber Abraheem Shlash Mohammad

Abstract The major aim of the study was to examine the impact of strategic leadership on implementing public policies in government departments in Karak Governorate. Therefore, it was focused on government departments in Karak Governorate in Jordan. Data were primarily gathered through questionnaires which were distributed to a random sample of (175) respondent. In total, (175) responses were

received including (5) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (170) responses. Structural equation modeling (SEM) was conducted to test hypotheses. The study reached the presence of a statistically significant effect of strategic leadership on the implementation of public policies. The study recommended the necessity of paying attention to human capital in government departments in Karak governorate and enhancing interest in ethical practices from major implications in planning activities and processes and participation with stakeholders in providing services and preserving government departments'resources in Karak governorate.

1 Introduction

The relationship between the state and the individual has been characterized since its existence by complexity and effective change, which was reflected in the diversity of ideas, and theories that sought to clarify and explain them, and this is represented through the basic role played by the leadership in its strategic concept in paying attention to the organizations development in order to achieve its vision, mission and overall performance (AlTaweel & Al-Hawary, 2021; Mohammad et al., 2020; Al-Hawary & Al-Syasneh, 2020; Alhalalmeh et al., 2020; Al-Hawary & Obiadat, 2021; Al-Quran et al., 2020; Allahow et al., 2018; Alolayyan et al., 2018; Alshurideh et al., 2017; Al-Lozi et al., 2017; Al-Nady et al., 2016; Al-Hawary & Hadad, 2016; Al-Nady et al., 2013; Al-Hawary et al., 2013).

Organizations are greatly affected by the strategic leadership practices (Alameeri et al., 2020; AlShehhi et al., 2020). Indeed, those who chronicle the organizations appear to be chronicling the leadership figures who led these organizations (Al-Dhuhouri et al., 2020; Odeh et al., 2021). Strategic leadership is also concerned with forming strategic decisions that represent the core administrative process in response to the adaptation reality to bring about the required change, taking into account the expectations of individuals and society (Al-Hawary & Mohammed, 2017; Al-Hawary et al., 2012; Al-Hawary, 2009; Harahsheh et al., 2021). The implementation of public policies differs between countries according to production factors reality and the variables related to economic and social ...etc. Based on that, public policies implementation must be based on the executive government apparatus and the administrative component in the different regions of the country. This requires local councils to generate energies and resources to activate this implementation process. Also, achieving the set goals and objectives requires a solid formulation of these policies, in line with the possibility of implementing these policies.

The importance of the role of strategic leaders in implementing policies by linking the two stages of formulation and implementation of public policies from the reality of local councils in the governorates is not hidden (Allozi et al., 2022; Tariq et al., 2022). The importance of strategic leader's role in implementing policies by linking the two stages of public policies formulation and implementation from the reality of local councils in the governorates is become clear (Alkalha et al., 2012; Zu'bi et al., 2012). The implementing public policies process is considered one of the main pillars of all government departments (Alaali et al., 2021; Alzoubi et al., 2022). Because it is directly related to improving the efficiency and effectiveness of these departments, As a result of the current rapid developments, these developments require the adoption of a management approach based on providing unfamiliar services of high quality; to reach outstanding performance, Jordanian government departments in Karak governorate work like other departments in other governorates, in the face of changing environmental conditions with a high degree of complexity, which calls for the need to adopt effective strategic leadership practices, according to an administrative methodology, focused on achieving excellence in sustainable performance, which is based on creating lower cost services,

Relying on the formulation and implementation of the general policy related to each department and its dissemination, public resources planning and mobilization, especially the scarce ones, and stakeholders' participation and achievement that enable them to adapt to the emerging changes that affect government departments in light of the threats they face (Alshurideh et al., 2019a, 2022). In general, these departments success requires keeping pace with strategic leadership practices in their developments. Because it is one of the important tools that enable these departments to deal with the environmental uncertainty, and it is considered one of the important factors in supporting, coordinating and unifying all efforts in order to achieve the strategic goals efficiently and effectively (Aburayya et al., 2020; Alshurideh et al., 2019b). Accordingly, the purpose consistent with this study is to show the role of strategic leadership practices on implementing public policies in government departments in Karak Governorate.

2 Literature Review and Hypotheses Development

2.1 Strategic Leadership

There are many definitions and concepts according to the researchers view to leadership and its concepts, but there is no specific agreement about its concept, or even general agreement about leadership component, as some researchers focused on leadership as the outcome of interaction between the leader, subordinates and the situation as a continuous process (Meuser et al., 2016; Batayneh et al., 2021), There are many definitions of strategic leadership with the multiplicity of functions it performs, where strategic leadership is defined as the leader's ability to visualize future visions, deep

strategic thinking, identify environmental changes that will affect the level of organization continuous improvement, and work with others to take the necessary actions to achieve a better future., while maintaining flexibility in implementation, reviewing and evaluating tasks and procedures (Alyammahi et al., 2020). It is also defined by Ratanasongtham and Ussahawanitchakit (2015) as leadership that possesses the ability to predict, visualize, maintain flexibility, empower others, develop competencies and capabilities, improve organizational structures, and choose to develop the next leader's generation of leader, sustain an effective organizational culture, and emphasize ethical practices. While Al-Nafar (2015) referred to strategic leadership as the leadership capable of developing a clear and appropriate strategic vision based on strategic objectives in accordance with an appropriate organizational culture in order to develop a human cadre that is characterized by values, ethics, innovation, and flexibility that works to bring about change and continuous development that leads to excellence and uniqueness. Looking at the previous definitions of strategic leadership concept, it becomes clear that strategic leadership focuses on a set of activities and operations, including determining the organization current situation, formulating the organization strategic direction, strategic alliances, implementing change and making strategic decisions to ensure the organization's growth and continuity, improving its outputs, and achieving its desired goals (Ahmad et al., 2021; Al-Dmour et al., 2021).

According to what was indicated by Muwafaq, the strategic leadership importance lies in the fact that it contributes to: building the organization's strategy, achieving long-term success and prosperity, and enhancing the continuous competitive advantage. Poor strategic leadership practices cause the organization to lose focus on defining long-term direction. Strategic leadership enhances the ability to deal with different types of individuals personalities inside and outside the organization, and coordinate with parties that did not interact in the first place, in addition to enhancing commitment and participation, and confirming the ethical model in organizational relations, with consideration of strategic leadership as the organization representative and its negotiator in dealing with relevant external agencies, entities, and organizations (Ashal et al., 2021; Ben-Abdallah et al., 2022).

What distinguishes strategic leadership is that it has an impact that extends outside the functional scope of the leader and business units, and sometimes outside the organization, which means that the organization is a strongly interconnected system, as decisions taken in one part of the business units affect other parts of the organization, and the impact of strategic leadership extends to long period of time, The strategic leader keeps long-term goals in his mind, and works to achieve short-term goals derived from long-term goals, which requires balancing and harmonizing these two types of organizational goals (Njeri, 2017). The strategic leader keeps long-term goals in his mind, and works to achieve short-term goals derived from long-term goals, which requires balancing and harmonizing these two types of organizational goals (Njeri, 2017).

There are a number of strategic leadership practices that were dealt with by researchers and constituted a basic requirement for this type of leadership. The researcher decided to address a number of them in agreement with the study population, which are as follows: Strategic direction: It refers to the general path chosen by

the organization to achieve its strategic goals, taking into account the external environment conditions in which it is active, and its available resources while adhering to the available capabilities. Human capital: It refers to the processes related to training, education, and other professional initiatives in order to increase the knowledge level, skills, abilities, values, and employee's social assets that leads to employee satisfaction and performance (Ukenna et al., 2010). Ethical practices: They refer to a set of foundations, standards and principles that are the basis for the proper behavior that individuals must undertake to abide by at work (Al-Aqili, 2014). It is also referred to as a practical framework for decision-making and it serves as a means to refine and evaluate practices, because it reflects a set of standards, values, and ethical principles that guide the behavior and actions of employees. Strategic control: it is defined as an administrative process that seeks to detect deviations, whether positive or negative, with the aim of correcting them, taking into account if everything is done in accordance with established plans, instructions issued, and applicable principles. It includes all the organization moral and material parts (Reza, 2011).

2.2 Public Policies Implementation

Public policies have kept pace with developments in the social sciences fields such as economics, management and politics, as a scientific field that intersects with all these sciences. Therefore, researchers, experts, academics and leaders have been interested in the issue of public policies because of its great importance at the institutions, public organizations and government's levels. There are many definitions of public policies to include all aspects of decisions issued by the government, or which it authorizes in order to fulfill societal demands. The public policies approved and implemented by the political system are characterized by diversity and comprehensiveness that affects all community life. Therefore, public policy has been defined as a set of plans, programs, decisions and activities resulting from the official authorities to solve current and future problems in all sectors. It is issued in the form of decisions, laws and regulations with the allocation of financial and technical resources to achieve the public interest (Salihi, 2019). Public policy is what the government does or intends to do to solve a general problem facing the community in order to provide the community required needs, It is an organized effort aimed at analyzing, understanding and evaluating how the government dose its role in serving the community, and improving the government performance efficiency (Altamony et al., 2012; Farghaly, 2019). implementing public policies importance came from the fact that it helps in obtaining more knowledge about its sources, stages, active contributors, its importance, and its effects on society, and a deeper understanding of society and its needs through knowledge of the foundations and results of public policy programs, and this deepening course increases the understanding of the relationship between the political system and its society. There is a set of dimensions that constitute the implementation of public policies structure, and in many cases they are closely interconnected, and the separation of one of them constitutes a flaw in

the implementation of the rest of the dimensions in a way that achieves their implementation effectiveness. The researcher decided to address a number of dimensions that, the researcher formed dimensions that are closely related to the study population. They were addressed as follows: public policy Formulation and dissemination: This process represents the activities that take place before they are announced by the government, and according to what (Ikelegbe mentioned, 2005), said it includes defining the problem related to the policy, developing, analyzing alternatives and selecting the appropriate alternatives for implementation. Planning for implementation and moving resources): Planning and resource mobilization are referred to as contemplation, reflection and insight into the past, present and future, and study the size of required policies and required resources availability through which this can be implemented (Hussain and Jassim, 2017). Stakeholders Participation: (Freeman, 1984) define stakeholders as an individual or group that influences by the organization's achievement of its objectives. It is noteworthy that the policy that is effectively developed without the intervention of the capital owner may lead to difficulty in implementation because it does not reflect the actual needs and does not take into account the feelings of the shareholders and owners who may contribute to the policy implementation (Klein & Knight, 2005).

2.3 Strategic Leadership and Its Role in Implementing Public Policies

Boal and Schultzy (2007) emphasizes that strategic leadership is a critical element in developing the organizational capabilities through opportunities and avoiding threats in a timely manner, Strategic leadership helps in making strategic decisions, creating and communicating the future vision, developing structures, activating oversight and organizational processes, maintaining an effective organizational culture, and spreading the ethical values system in the organization culture. According to Muwafaq, the strategic leadership importance lies in the fact that it contributes to: building the organization's strategy, achieving long-term success, and enhancing the continuous competitive advantage. And that the strategic leadership practices weakness makes the organization lose focus on determining the long-term direction. Strategic leadership enhances the ability to deal with different types of individuals personalities inside and outside the organization, and coordinate with parties that did not interact in the first place, in addition to enhancing commitment and participation, and confirming the ethical model in organizational relations, with consideration of strategic leadership as the representative of the organization and its negotiator in dealing with relevant external agencies, bodies, and organizations. Al-Arif pointed to strategic leadership importance in the process of evaluating organizational performance, through balanced control of decisions, directions, and what it does in providing advice and guidance. As for Al-Qaryouti (2006), says that public

policy helps in identifying the activities and programs undertaken by the government and their results, and public policy helps in analyzing and formulating policies, providing alternatives and solutions to the problems presented, and implementing them. In addition to assisting the government in adopting successful policies to achieve the planned goals, it also works to improve the knowledge of the problems facing society through scientific diagnosis of these problems and educating politicians with the latest methods used in the process of developing, implementing and evaluating public policies. In addition to identifying the determinants that benefit the government in the process of drawing up and implementing public policy, in order to seek a greater understanding of its role, assistance in predicting foreign public policies that affect internal policies, taking precautions for them, and assisting the government in setting programs and public policies that can receive affirmation and support. Based on what was discussed, the study hypothesis can be formulated as follows:

There is a statistically significant impact of the strategic leadership practices on the implementation of public policies in government departments in Karak Governorate.

3 Study Model

See Fig. 1.

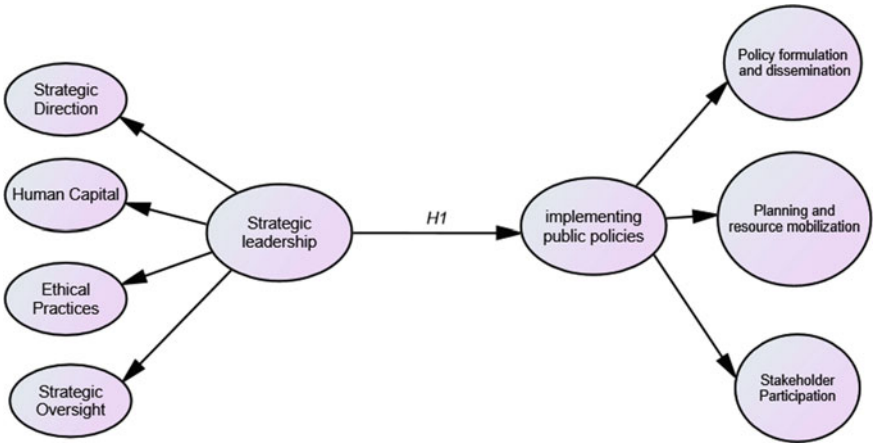

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of strategic leadership on implementing public policies in government departments in Karak Governorate. Therefore, it was focused on government departments in Karak Governorate in Jordan. Data were primarily gathered through questionnaires which were distributed to a random sample of (175) respondent. In total, (175) responses were received including (5) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (170) responses suitable to analysis requirements that were formed a response rate of 97.86) %) where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A questionnaire consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (19) items to measure strategic leadership based on Kabetu and Iravo, Kitonga et al. These questions were distributed into dimensions as follows: five items dedicated for measuring strategic direction, four items dedicated for measuring human capital, five items dedicated for measuring ethical practices, and five items dedicated for measuring strategic oversight. Whereas the second section included (14) items developed to measure implementation of public policy according to what was pointed by Mthethwa, Khan, Marume. This variable was divided into three dimensions: policy formulation and dissemination that was measured through four items, planning and resource mobilization which measured by five items, and stakeholder participationwas measured using five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv25. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.620–0.895), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in (Figs. 1 and 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.199, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90.

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. SD	**0.766**						
2. HC	0.556	**0.782**

7. SP	0.794	0.622	0.605	0.759	0.761	0.709	**0.787**
VIF	3.195	3.017	2.960	2.779	–	–	–
Loadingsrange	0.805–0.849	0.782–0.822	0.758–0.847	0.705–0.884	0.826–0.891	0.620–0.895	0.750–0.890
AVE	0.868	0.731	0.850	0.860	0.839	0.826	0.813
MSV	0.614	0.549	0.543	0.497	0.556	0.485	0.469
Internal consistency	0.884	0.823	0.858	0.883	0.894	0.693	0.753
Composite reliability	0.748	0.865	0.874	0.905	0.911	0.945	0.877

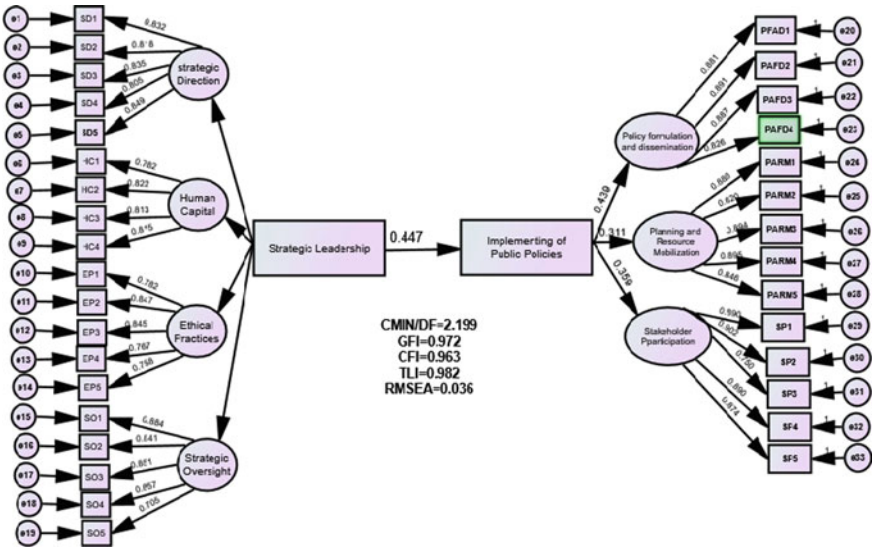

Fig. 2 SEM results of the digital marketing effect on mental image

Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.036, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all strategic leadership practices have a positive impact relationship on implementing public policies except human capital and ethical practices which have no impact on implementation public policies ($\beta = 121$, $t = 1.207$, $p = 0.229$ and $\beta = 0.068$, $t = 0.682$, $p = 0.496$). However, the results

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	strategic direction→implementing public policies	0.355	3.242	0.001
H2	Human capital→implementing public policies	0.121	1.207	0.229
H3	Ethical practices→implementing public policies	0.068	0.682	0.496
H4	Strategic Oversight→implementing public policies	0.333	3.447	0.001

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

indicated that the highest impact was for Strategic Oversight ($\beta = 0.35533$, $t = 3.447$, $p = 0.001$), followed by socialization ($\beta = 0.285$, $t = 4.781$, $p = 0.000$), and finally the lowest impact was for strategic direction ($\beta = 0.335$, $t = 3.242$, $p = 0.001$).

6 Discussions

The study results showed that leaders in government departments in Karak governorate carry out strategic leadership practices related to their departments in the governorate according to their priorities, this is due to the leaders keenness to achieve the strategic direction of the departments with their commitment to implement the laws and regulations governing the activities and operations. These leaders are also keen to apply ethical practices and pay attention to human capital as it represents the basis for these departments, The results of the study confirmed the ability of leaders in government departments affiliated to the governor of Karak to determine their objectives clarity in addressing the expected problems to implement the public policy that has been formulated, and the adoption of various strategies in formulating objectives when formulating public policies in the governorate so that these public policies adopted by leaders lead In the government departments in Karak governorate, new programs should be set up so that the beneficiaries are aware of their benefits. It also shows the leaders keenness in government departments in Karak governorate to plan for potential changes in public policies, work systems and procedures, with their ability to draw plans in their departments according to the capabilities to implement public policy.

The results indicated the leaders' interest in the aspects related to the stakeholder's participation and related to their keenness on effective communication with the audience and employees, with the leaders' awareness of the public needs analyzing importance according to time, and their keenness to receive complaints and work to resolve them with the general policy unconfident. The results revealed a statistically significant impact of the general strategic leadership practices on public policies in government departments in Karak Governorate. This result can be explained by the adoption of government departments in Karak governorate to the strategic leadership practices represented in strategic direction and strategic control, This reinforces two dimensions of strategic leadership, one related to the strategic vision of government departments, and the other dimension is related to the strategic control process, which means the process of control and oversight in government departments in the governorate so that they are able to face challenges, anticipate the future and take advantage of opportunities.

The results also indicated that the government departments in the Karak governorate were able to draw up, formulate and publish the general policy, in line with the complementary and coordinating viewpoint between the various government departments in the Karak governorate. The results indicated that the government adoption of strategic direction dimensions and strategic control ensures the achievement of these departments aspirations to exploit resources in a high degree, based on their

Licensed to (putm@utm.my)

scarcity and decline, which requires careful vision and organizational control over all available resources and the possibility of using them to meet citizens needs and desires in Karak Governorate. The government departments in the Karak governorate does their internal functions and operations and link them to citizen's needs, desires and tendencies, in accordance with the stakeholders in the governorate, and based on strategic plans prepared in partnership with stakeholders and civil society organizations in Karak governorate. This result is consistent with Al-Amri and Al-Janabi (2020), which indicated that there is an impact of strategic leadership practices in avoiding strategic pitfalls, and Juma's study (2019), which showed that there is an impact of strategic leadership practices in enhancing strategic performance, and also agreed with the study.

7 Recommendations

Based on the previous results, the study recommends the need to pay attention to human capital in government departments in Karak governorate, as it represents one of the strategic leadership practices because of its reflection on the quality of services provided by employees and that its efficiency enhances interest in public policy formulation, planning, resource mobilization and the participation of stakeholders in Karak governorate. The study also recommends the need to enhance attention to ethical practices in government departments in Karak governorate because of their great repercussions in activities and planning processes and participation with stakeholders in providing services and preserving government departments' materials in Karak governorate, also the need to enhance stakeholders participation when formulating public policies, as these parties are part of the work environment of these departments, and these departments success lies in the extent of their stakeholders participation.

to statistical analysis due to uncompleted or inaccurate. Hence, the final questionnaires contained (238) responses suitable to analysis requirements. Structural equation modeling (SEM) was conducted to test hypotheses. The results showed that all innovative leadership dimensions have a positive impact relationship on strategic intelligence except changeability which has no impact on Strategic Intelligence. Based on the study results, managers and decision makers of insurance companies have to instill enthusiasm and courage in employees, allowing them to express themselves more freely, with follow-up to identify complaints that may arise from a lack of knowledge or a lack of coordination or integration between departments and units at the institutional level.

Keywords Innovative leadership · The strategic intelligence · Insurance companies · Jordan

1 Introduction

The link between leadership and innovation is important in the success of the continuation of innovative processes within society and in the development and creation of the creative climate (Alameeri et al., 2020; AlShehhi et al., 2020; Odeh et al., 2021). Innovative leaders are not only satisfied with rearranging existing structures but are motivated by the continuous quest to find a better way (Al-Dhuhouri et al., 2020; Harahsheh et al., 2021). The innovative leadership style is discovery and self-renewal and their impact contributes to achieving the broader interest and raises the awareness of leadership, followers and the institution as a whole (Al-Hawary, 2009; Al-Hawary et al., 2012; Alzoubi et al., 2022). Innovation gives leadership characteristics that distinguish it from other leaders, such as openness towards change, the desire to identify internal problems and issues, in addition to giving the ability to control the environment in which he lives, confidence in the ability of others to achieve and bear responsibility, respect for others' choices, and the ability to rush towards learning and using culture, appreciating the achievements of others, and moving towards the future with full force (Mohammad et al., 2020; Al-Hawary & Mohammed, 2017; Al-Zubaidi et al., 2015). The communications and information technology revolution has contributed to unprecedented scientific, cultural, and technological developments in human history. To keep up with these developments, institutions of all kinds and orientations are reviewing their policies, objectives, technologies, and activities related to creativity, change, and continuous improvement of their services and products (Al-Hawary & Ismael, 2010; Al-Hawary et al., 2013; Al-Nady et al., 2013; Al-Hawary & Hadad, 2016; Al-Nady et al., 2016; Al-Lozi et al., 2017; Allahow et al., 2018; Al-Hawary & Al-Syasneh, 2020; Al-Hawary et al., 2020a,

M. S. K. Alshura
Faculty of Money and Management, Management Department, The World Islamic Science University, P.O. Box1101, Amman 11947, Jordan

2020b; Al-Hawary & Alhajri, 2020; Al- Quran et al., 2020; Alhalalmeh et al., 2020; Al-Hawary & Obiadat, 2021; AlTaweel & Al-Hawary, 2021; Alshurideh et al., 2022).

Organizations must prepare leaders and provide them with the skills they need to complete the responsibilities entrusted to them to the best of their abilities and achieve the organization's goals and objectives (Mohammad et al., 2020; Al-Hawary et al., 2012; Al-Hawary, 2009; Al-Hawary & Mohammed, 2017; Al-Hawary & Al-Hamwan, 2017). Monitoring the developments in developed countries shows that institutions were able to overcome all obstacles by encouraging creative practices and putting them into practice on the ground, as well as updating the various methods of work that were a reason for countries' superiority and progress, provided that these methods and tools were adapted to suit Arab environments.

Strategic intelligence was named one of the types of intelligence that anchors leadership traits, then finding creative leaders, especially in light of the growing importance of leadership in institutions and reliance on traits (intelligence, mind, and personality) in judging the efficiency of leaders (Al-Hawary & Hadad, 2016; Allozi et al., 2022). The true responsibility of the innovative leader is to uncover and invest his followers' innovative energies, as well as to work to ensure that his organization learns innovation and creativity on a constant basis. In general, the performance of these institutions depends on keeping up with new strategic management advancements. Strategic intelligence is also considered an advanced field; it is one of the most important tools for these institutions to deal with the environmental uncertainty they face, and it is a key factor in supporting and coordinating all efforts to unite them in order to achieve strategic goals efficiently and effectively (Al Kurdi et al., 2020; Alshurideh, 2022; Alsuwaidi et al., 2020; Kurdi et al., 2020). The study mainly aimed to determine the role that innovative Leadership plays on enhancing strategic intelligence.

2 Theoretical Framework and Hypotheses Development

2.1 Innovative Leadership

It is clear that the innovative leadership in the organization is the innovator who translates knowledge into choices and who has ideas that are new and useful and related to solving specific problems or re-combining known patterns in unique forms. Innovative leadership is the ability to change, renew or create a new approach or style, and use it with techniques. It is noticeable that innovative leadership contains all the characteristics of these styles, but each of them quotes a characteristic or advantage of the innovative leadership. Innovative leadership is also defined as working continuously to influence employees and convince them to accept work in order to achieve the goals of the organization according to the method determined by the innovative leader who can Re-dissolving the differences and contradictions between work goals

and the goals of the institution (Bilton, 2010; Al Mehrez et al., 2020; Al Naqbi et al., 2020; Al Suwaidi et al., 2020; Nuseir et al., 2021; Lee et al., 2022a, 2022b).

Carr defined innovative leadership as the ability to change, renew or introduce a new approach or method, and use it with modern technologies that fit with the requirements of the environment and the aspirations of the modern era and meet the needs of institutions and society together. Al-Baz (2012) defines it as the innovator who translates knowledge into new choices and who has ideas that are new, useful and related to solving specific problems or re-combining known patterns of knowledge in unique forms, while Eid refers to it as "leadership that pursues an unconventional approach." in the development of the institution, in order to achieve continuous adaptation to the changes accompanying the field of work at the local and international levels, and those who practice it possess special characteristics and skills that are compatible with the requirements of applying modern trends in management." Innovative leadership has a set of basic features that appear to influence the behavior of leaders, and for the purposes of this study the following dimensions were adopted:

Problem solving and decision-making: This refers to the ability to comprehend and comprehend what is truly going on in a scenario, including other people's behaviors and feelings. An understanding of what is going on in daily events in a way that aids productivity, followed by the ability to act successfully in response to those conditions. **Changeability**: by generating novel ideas and recommendations for scenarios in which the institution must follow certain administrative guidelines in order to accomplish self-renewal and gain a competitive edge (Al-Jafra, 2013). **Initiative** is a trait of a creative leader that fosters initiative, hires creative individuals, encourages healthy and ethical competition, and does not suffocate excitement and originality with oppression and professional envy. **The ability to communicate** entails devising the most effective methods for identifying ideas, information, and directions by establishing a social structure in which opinions, trends, and knowledge are formed (Alyammahi et al., 2020; Sweiss et al., 2021). **Stimulating creativity**: a paragraph about a mental trait that allows an individual to think in unique ways, and this necessitates thorough preparation by the institution's upper management (Al-Zubaidi et al., 2015). **Creative knowledge**: This is the knowledge that enables a company to lead its industry.

2.2 Strategic Intelligence

Strategic intelligence is defined as "a systematic and ongoing process of producing smart information necessary for an organization's activity that is characterized by its strategic value and in an actionable form to aid long-term decision-making" (Ahmadi et al., 2020). It's also known as the essential competences required to make decisions that affect an institution's future and capacity to compete with others. This process qualifies its owner to have a set of synergistic analytical skills that leaders in organizations use in general to improve their ability to identify and understand

systems, predict their behavior, and devise modifications to them in order to produce the desired effects, as these skills work together as a system, to help them with future aspirations that determine the nature of business future that the organization wants to achieve based on the environment i.e. It encourages firms to form cooperative partnerships in order to find investment possibilities, improve the quality of their products, or increase the efficiency of their operations.

Strategic intelligence is the delivery of the correct information to the appropriate people at the right time so that they may make the best and most practical decisions for the organization's future (Muslim & Qader, 2015). Basadur (2014) defined strategic intelligence as an aggregate formula for multiple sorts of skills in the context of determining the most efficient and effective ways for the institution's position to deal with future challenges and opportunities. Several studies looked into the various aspects of the idea of strategic intelligence, with the following being the most common: **Systems thinking**: It refers to the individuals' ability to deal with a group of variables, address them or research their relationship, and analyze them in a way that helps them explain their causes and outcomes and profit from them in attaining the overall goals that the institution tries to achieve is referred to as systems thinking (Al-Sheikhly, and Ibrahim, 2015). **Strategic vision** is a set of concepts for driving company development operations that is usually contained in a document or statement so that all management of the organization can share the same vision and make decisions based on common principles and the firm's mission (Yanez, Uruburu, Moreno & Lumbreras, 2019). An agreement between two or more institutions to collaborate and exchange material and/or intellectual resources is referred to as a **strategic partnership**, and their relationship is formalized through an employment contract. This form of agreement is designed to assist both parties in achieving their objectives (Kaur et al., 2019).

2.3 Innovative Leadership and Strategic Intelligence

Strategic intelligence is seen as the organization's protective shield, as it is involved in every stage of the organization's strategies and activities., and relying on the traits (intelligence, mind, and personality) in judging the efficiency of its leaders, as well as the leaders' need to enjoy different types of intelligence and employ them in adapting to new technology, the emergence of employment and information patterns (such as the internet). Innovative leaders no longer rely on a single sort of intelligence; instead, they must diversify the types of intelligence rather than relying on a single model to assess intelligence efficiency.

The responsibility of leading the institution in an innovative manner is placed on the shoulders of higher leadership, which necessitates all of the characteristics of sharp and strategic intelligence. No single leader can take on all issues and topics and manage them from the top, so the true role of the creative leader is to reveal creative energies to subordinates, invest them, and work to teach his organization to learn innovation. Organizations must adopt the concept of a good and modern leadership

Licensed to (putm@utm.my)

style, which is accomplished through attracting and employing highly skilled leaders, as well as establishing fair processes for evaluating their performance and providing suitable incentives.

In general, organizational success necessitates keeping up with changes in the world of leadership and implementing them efficiently and successfully as a work strategy. Obtaining advanced positions in leadership, global competitiveness indicators, liberating employees' creative and intellectual powers, allowing for positive engagement, and developing the spirit of collaboration and, within organizations, innovative leadership is regarded as a critical component that must not be overlooked. In one way or another, innovative leadership helps the institution improve its performance. The relevance of innovative leadership in working on the organization's continual development and progress by promoting and supporting the leader's presentation of new ideas, facilitating the institution's work with external parties, given that the leader has special skills that enable him to understand with the various external parties that the institution deals with, read expectations distinctly from competitors, and possess a vision that supports creativity, which provides opportunities and the ability to discover products or new services (Al-Nashar, 2018).

Strategic intelligence is a tool for providing comprehensive information on the external environment to senior decision-makers in a timely manner to support the strategy development process, and the reasons for strategic intelligence's increasing importance in supporting the decision-making process are discussed (Al Abdali et al., 2012). Zhang, Siribanpitak, and Charoenkul (2018) discovered a link between creative leadership strategies and encouraging innovation among Chinese teachers, while Abd, Abbas, and Khudair discovered an effect of strategic management practices on organizational leadership through strategic intelligence, which was confirmed by Tham and Kim (2002) that strategic intelligence is important because it is part of the organization's culture, and it improves the culture of teamwork and sharing information by preparing information for all departments and allowing management and employees to contribute their perspectives on the future by involving them in decision-making.

Organizations that apply the most strategic intelligence will undoubtedly achieve excellence, sustainability, and performance excellence, as strategic intelligence plays an important role in solving problems, removing barriers and restrictions, and structural reorganization, which aids in development and change to keep pace with the demands of the environment, and plays a fundamental role in improving the situation, the growth and development of intangible assets, which are among the most essential resources of any firm, the competitiveness of companies. Those interested in strategic intelligence have also done a lot of research and study in the subject of intelligence. Because of its significance, previous research has found a statistically significant relationship between strategic intelligence practices and organizational ingenuity, as well as a relationship between senior leaders' strategic intelligence and promoting organizational excellence among academic leaders at Hamdania University. Accordingly, the study hypothesis can be formulated as follows:

There is a statistically significant effect of creative leadership on strategic intelligence.

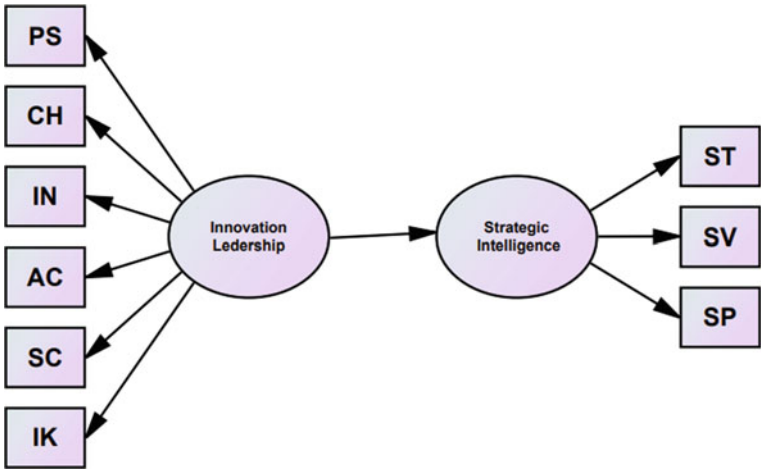

Fig. 1 Research Model

3 Study Model

See (Fig. 1).

4 Methodology

4.1 Population and Sample Selection

A quantitative method based on a questionnaire was used in this study for data collection and sample selection. The aim of the study was to examine the impact of innovative leadership practices on strategic intelligence in insurance companies in Jordan. Data were primarily gathered through the questionnaires which were distributed to the managers of the different levels. In total, (256) responses were received including (18) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final questionnaires contained (238) responses suitable to analysis requirements., where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (24) items to measure innovative leadership based on (Zhang et al., 2018). These questions were distributed into dimensions as follows: four items dedicated for measuring problems solving and decisions making, four items dedicated for measuring changeability, four items dedicated for measuring initiate, four items dedicated for measuring ability to communicate, four items dedicated for measuring stimulating creativity and four items dedicated for measuring innovative knowledge. Whereas the second section included (9) items developed to measure strategic intelligence according to what was pointed by (Ahmadi et al., 2020). This variable was divided into three dimensions: systems thinking that was measured through three items, strategic vision which measured by three items and strategic partnership was measured using three items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.518–0.661), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7	8	9

discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (de Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.198 which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.046, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019).To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2 (Fig. 2).

The results demonstrated in Table 2 show that all innovative leadership dimensions have a positive impact relationship on strategic intelligenceexcept changeability which has no impact on Strategic Intelligence ($\beta = 0.048$, $t = 1.002$, $p = 0.317$)

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	Problems solving and decisions making → Strategic Intelligence	0.214	*5.335	0.000
H2	Changeability → Strategic Intelligence	0.048	1.002	0.317
H3	Initiate → Strategic Intelligence	0.134	*2.913	0.004
H4	Ability to communicate → Strategic Intelligence	0.093	1.557	0.061
H5	Stimulating creativity → Strategic Intelligence	0.124	*2.446	0.016
H6	Innovative knowledge → Strategic Intelligence	0.259	*5.540	0.000

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

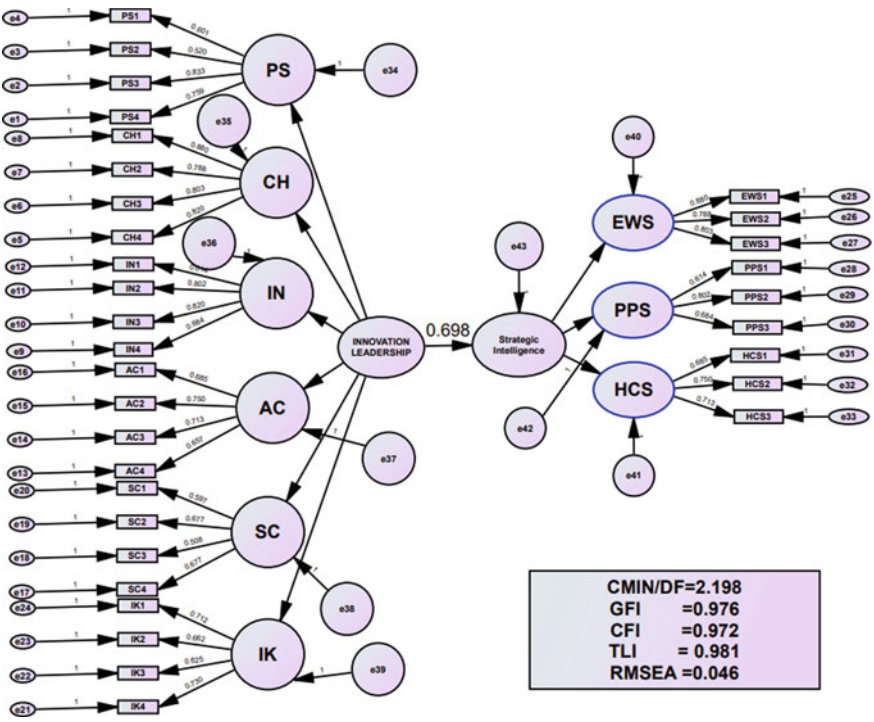

Fig. 2 SEM results of the digital marketing effect on mental image

and Ability to communicate (β = 0.093, $t = 1.557$, $p = 0.061$). However, the results indicated that the highest impact was for innovative knowledge (β = 0.259, $t = 5.540$, $p = 0.000$), followed by problems solving and decisions making (β = 0.214, $t = 5.335$, $p = 0.00$), and finally the lowest impact was for stimulating creativity (β = 0.124, $t = 2.446$, $p = 0.016$).

6 Discussion and Recommendations

Leadership in insurance companies in Jordan has features related to creative leadership with the ability to solve problems and make decisions, and what distinguishes it is also its active role in taking the initiative, and to achieve all the features, leadership needs knowledge because knowledge represents strength in the institution, and knowledge needs it all the operations that the company wants to accomplish, in addition, the communication system in the companies plays a major role in facilitating the delivery of knowledge that enhances the possibility of solving problems and making decisions, Leaders have the ability to anticipate problems that their institutions may

face before they occur, and despite the numerous obstacles to work in these institutions, they are able to focus on their work and complete their tasks, which motivates these leaders to seek out all new knowledge in their fields. To improve its ability to face future problems, which requires leaders of these companies to instill enthusiasm and courage in employees, allowing them to express themselves more freely, with follow-up to identify complaints that may arise from a lack of knowledge or a lack of coordination or integration between departments and units at the institutional level.

The findings show that the companies are concerned with the perception of the institution as a coherent and harmonious system, with a reliance on the study of ideas collectively rather than individually to feel their value in the long run, and the analysis of any problem by looking at its combined causes rather than separating its factors from each other, which aids in seeing the events that surround the institution more clearly, and enhances the companies effectiveness. This result is consistent with the study's findings. The results of the research proved that there is an impact of innovative leadership in enhancing strategic intelligence, that the presence of innovative knowledge is the basis for solutions to problems that companies have not previously dealt with. To do so, it is necessary to activate the communication system in institutions in order to achieve competitiveness among them, and then to move toward the application of ideas to bring about the necessary change, and these practices must be governed by a set of practices that enhance learning, where these practices must be reflected in learning processes to consolidate and devote it to serving the objectives. The findings of this theory are consistent with those of Jatheer, Al-Abadi, and Al-Qaisi and Qassem. The findings of the study also matched those of Al-Quwaz, who used the Asia Company in Iraq as a case study to validate the impact of strategic knowledge in boosting strategic intelligence.

The Impact of Organizational Innovation Capabilities on Sustainable Performance: The Mediating Role of Organizational Commitment

Mohammed Saleem Khlif Alshura, Faisal Khaleefah Jasem Alsabah, Raed Ismael Ababneh, Muhammad Turki Alshurideh, Mohammad Issa Ghafel Alkhawaldeh, Faraj Mazyed Faraj Aldaihani, Ayat Mohammad, Sulieman Ibraheem Shelash Al-Hawary, and Anber Abraheem Shlash Mohammad

Abstract The major aim of the study was to examine the impact of organizational ambidexterity on sustainable performance in the presence of organizational commitment as a mediator. Therefore, it focused on Kuwaiti Industrial sector. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a sample of (450) administrators via email. In total, (402)

responses were received including (10) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (392) responses suitable to analysis requirements that were formed a response rate of (87.11%). structural equation modeling (SEM) was conducted to test hypotheses. The results showed that organizational commitment mediated the relationship between organizational capabilities and sustainable performance. Based on the research results the researchers recommend the oil sector to follow up the information related to the latest technological methods used in its sector, providing attention to setting the plans that aim at improving the human resources and train them to support exploration and exploitation skills.

1 Introduction

Sustainable performance concept is based on development concept (social and economic development in line with environmental constraints), needs concept (resources redistribution to ensure the life quality for all) and future generations' concept (the possibility of using resources in the long term to ensure the necessary quality of life for future generations). Where the essence of sustainable performance concept stems from the triple bottom line concept, which includes a balance between three pillars of sustainability, namely environmental sustainability, which focuses on maintaining the quality of the environment necessary to carry out economic activities and the quality of people's lives, and social sustainability, which strives to ensure human rights and equality, and preserve cultural identity., respect for cultural diversity, ethnicity and religion, and economic sustainability necessary to maintain the natural, social and human capital necessary for income and standards of living (AlTaweel & Al-Hawary, 2021; Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Mohammed, 2017; Al-Hawary et al., 2012; Al-Hawary, 2009). Ambidexterity has become a popular concept for understanding certain aspects of organizational planning, and it plays an important role in competition because it supports organizational growth and enhances organizations' future vision for survival in addition to the challenges faced by organizations that have forced them to adopt organizational ambidexterity as an integral part of their strategy, as it is considered essential that be aware of these challenges in the local and global business environment (Al-Nady et al., 2013, 2016; Al-Hawary & Aldaihani, 2016; Allahow et al., 2018; Mohammad et al., 2020; Al-Hawary & Hadad, 2016; Al-Hawary & Obiadat, 2021; Alhalalmeh et al., 2020; Al-Hawary & Alhajri, 2020; Alshurideh et al., 2017; Alolayyan et al., 2018; Metabis & Al-Hawary, 2013). This highlights the human element role in achieving this and what it requires of the employee's stay in the organization in order to achieve the goals set

A. A. S. Mohammad
Marketing Department, Faculty of Administrative and Financial Sciences, Petra University, B.O Box: 961343, Amman 11196, Jordan

and maintains the presence of the workforce committed to the organization in order to achieve a high level of organizational commitment (Al-Hawary & Alajmi, 2017; Al-Hawary & Nusair, 2017; Al-Hawary et al., 2020; Al-Lozi et al., 2017, 2018). This study is an objective attempt to shed light on the rapid development of modern administrative concepts, especially the organizational ambidexterity concept, which has become an effective management method and its role in promoting sustainable performance, as well as achieving the oil companies' goals through theoretical knowledge to achieve a clear understanding and define the concepts and objectives of the variables under discussion. Study importance also lies in applying the study to one of the most important economic sectors in Kuwait capital, which is the petroleum sector. The petroleum sector in the Kuwait capital is one of the most important economic sectors that contribute to the gross domestic production. As oil companies operate in a very dynamic and complex environment, and this is what prompted them to adapt to work in the administrative, economic, technological and societal fields, they are obliged to respond quickly to environmental changes, because the lack of a rapid response may lead to damage their work and their retreat from their competitors. Thus, these companies must effectively manage the changing business conditions, trying to retain their customers as well as attract new ones (Alshurideh, 2016, 2022; Alkitbi et al., 2020; Alsharari & Alshurideh, 2020), and this is what made the capabilities and skills that help them to succeed through achieving organizational ambidexterity of great importance to them. It is also necessary to ensure, through this study, a high level of organizational commitment that may contribute to enhancing sustainable performance in the Kuwaiti petroleum sector (Oyewobi et al., 2019).

2 Literature Review and Hypotheses Development

2.1 Organizational Ambidexterity

Organizational ambidexterity broadly refers to the organization's ability to pursue two different things at the same time, that is, the organization can exploit existing competencies in addition to exploring new opportunities with equal skill based on adapting to changing environmental conditions and obtaining a sustainable competitive advantage (Altamony et al., 2012; Obeidat et al., 2021; Shamout et al., 2022). It also depends on both exploiting existing resources and exploring new opportunities in order to make an innovation (Al Naqbi et al., 2020; Alameeri et al., 2021). The concept of ambidexterity is the ability to use both hands equally effectively. In the field of organizations ambidexterity is related to balancing the capabilities that exist in the organization and the way to use them, and at the same time searching for other possibilities, which are exploitation and exploration. Booth-Kewley et al. (2017) emphasize the same idea, noting that from a terminological perspective, the word "ambidextrous" means the ability to use both hands equally at the same time. Kafetz

opoulos (19,2020) defines organizational ambidexterity as the organization ability to implement and adopt incremental and revolutionary changes, while Du et al., (2020, 50) defined them as organizations that are able to exploit existing competencies as well as explore new opportunities. Gürlek (2021) defined organizational ambidexterity as the organization's ability to implement new changes in its environment in an orderly and correct manner. Organizational ambidexterity is also defined by Bresciani et al. (2018) as the organization ability to exploit existing competencies and explore new opportunities at the same time. For long-term survival, the organization needs to exploit existing capabilities and explore alternative opportunities (Martin et al., 2019). The ability to do both activities simultaneously is called organizational ambidexterity. It is the ability to combine contradictory, inconsistent and sometimes incompatible organizational elements such as exploratory and exploitative activities, strategies, structures, processes, mindsets, behaviors, etc. (Posch & Garaus, 2020). At the core of ambidexterity, there are two different activities–exploration and exploitation. The exploitation purpose is to improve and increase performance. While exploration goal, in turn, is to look for new opportunities and experiment. Both exploration and exploitation are necessary if the company aim to remain sustainable and to continue for the long term (Alshurideh et al., 2020; Alshurideh et al., 2022; Lee et al., 2022a, 2022b). But at the same time, many organizations struggle to strike a balance between exploration and exploitation, discovery and exploitation are the most important capabilities of organizational ambidexterity (López-Sánchez & Santos-Vijande, 2020).

2.2 Sustainable Performance

Sustainability is a broad term, as it draws on politics, economics, philosophy and other social sciences in addition to the natural sciences. Sustainability skills and environmental awareness are a priority in many organizations, as organizations seek to comply with new legislation related to urban planning, environmental consulting (the built and natural environment), and agriculture, not for profit. In addition to corporate strategies, health assessment and planning, and even in law and decision-making (Alzoubi et al., 2022; Ben-Abdallah et al., 2022; Ögmundarson et al., 2020). Rosenberg et al. (2021) indicates that sustainability practices support health, environmental, human and economic practices, where the sustainability principle assumes that resources are limited and must be used wisely, taking into account long-term priorities and the consequences of the ways in which resources are used.

Pislaru et al. (2019) defined sustainable performance as the competitiveness of an organization that ensures a sustainable presence in the marketplace and is able to reconcile all partners expectations, create value for shareholders and customers, and recognize the sustainable development importance. On the other hand, Huo

et al. (2019) viewed sustainable performance as the alignment of financial, environmental and social objectives in delivering an organization's core business activities in order to maximize value, including operational excellence, risk management, product innovation, growth, and governance to transform business performance and radically improve it and create stakeholders value. Among the types of sustainable performance on which previous studies focused.

Among the most prominent types of sustainable performance mentioned in previous studies, **Economic performance**: It is a practical and actionable toolkit that designs strategies to act on unexpected and unpredictable economic events (Al-Jarrah et al., 2012; Poltronieri et al., 2019), **Social performance** is the effective translation of organization's mission into practical reality in line with accepted social values related to improving the individuals lives in society and giving them the opportunity to work and develop. **Environmental Performance**: Ojo and Fauzi (2020) find that organizations' environmental performance helps individual governments assess progress in achieving their environmental goals; In addition to promoting continuous policy dialogue and peer learning; and stimulate greater governments accountability to each other and to public opinion.

2.3 Organizational Commitment

Organizational commitment takes an important role in employees' retention and turnover in organizations, and organizational commitment appears when employees are committed to their work in the organization and are motivated to achieve high performance levels (Al Kurdi et al., 2020; Alameeri et al., 2020; Al-Hawary & Alajmi, 2017; Kurdi et al., 2020). Karami et al. (2017) noted that workplace commitment can be divided into different aspects, where an employee may be committed to the job, profession, goals, teams, leaders, or organization, However, it is well recognized that employees develop more than one commitment related to work, and while all of these can be seen in the workplace and affect the overall employee commitment in the workplace, they all have their own characteristics. While Kaplan and Kaplan (2018) assure that just as commitment is difficult to comprehensively define, the same difficulty lies in organizational commitment, however, it has been possible to find common factors for different definitions, Alhalalmeh et al. (2020) define organizational commitment as the organization member psychological view towards his association with the organization in which he works, and organizational commitment plays a vital role in determining whether the employee will stay with the organization for a longer period of time and work enthusiastically towards achieving organizational goals. As for Imamoglu et al. (2019) viewed organizational commitment as the employee's relationship size with the organization and the extent of the strength of this relationship, and organizational commitment is related to many things, including the employee's belief in the organization's goals and values, and the employee's position in making effort for the organization and the desire to stay.

Novitasari et al. (2020) define organizational commitment as the employee's attachment to the organization based on the intention to remain in it; adherence to the organization values and goals; And the willingness to make an extra effort in its favor, that is, for individuals to look at the extent to which their values and goals are related to the organization values as part of the organizational commitment, so it is considered the link between the individual employee and the organization. Labrague et al. (2018) argue that the important theories of organizational commitment are a Three Component Model (TCM), and according to this theory, there are three distinct components of organizational commitment: Emotional commitment is the emotional attachment that an employee has to the organization, ongoing commitment which is the employee's belief that leaving the organization will be costly. The last dimension of the organizational commitment model is normative commitment, which is seen as the obligation sense to keep going because it is the right thing to do (AlShehhi et al., 2020; Alsuwaidi et al., 2020; Gopinath et al., 2020; Allozi et al., 2022).

2.4 Organizational Ambidexterity, Sustainable Performance and Organizational Commitment

Kraner (2018) indicates that there are many previous studies that proved that organizational ambidexterity has a significant impact on organizational excellence, where the researcher confirmed that organizational ambidexterity with its complete concept and capabilities can contribute significantly to increasing the organization growth despite the difficulty of achieving it on a practical level. As Backović and Djurić (2019) pointed out that the achieving organizational ambidexterity at the practical level lies in "balancing", finding and creating a balance between discovery and exploitation in an equal manner at the same time maintaining the highest possible performance level, while Campanella et al. (2020) agreed with the same opinion, pointing out that organizational ambidexterity appears to be a management term of some kind, but in reality there is a great conflict between the organizational ambidexterity abilities in terms of exploration and exploitation. Limaj and Bernroider (2019) argue that organizational ambidexterity has a positive effect on organizational excellence, where researchers found that ambidexterity had a positive impact on the organizations growth by creating an appropriate balance in the adaptation attempts in a turbulent environment, The previous literature–Felício et al. (2019) and Rialti et al. (2019) highlights some of achieving ambidexterity in organizations outcomes, where organizational ambidexterity can lead to better performance, better founders, long-term success and sustainable competitive advantage. Sustainability is now viewed as a key business imperative that leads to cost savings and value creation. While many organizations already have a sustainability strategy in place, there is a growing need to make this business more focused, in terms of operational excellence, risk management, and product innovation, growth, and governance (Almaazmi et al., 2020; Al

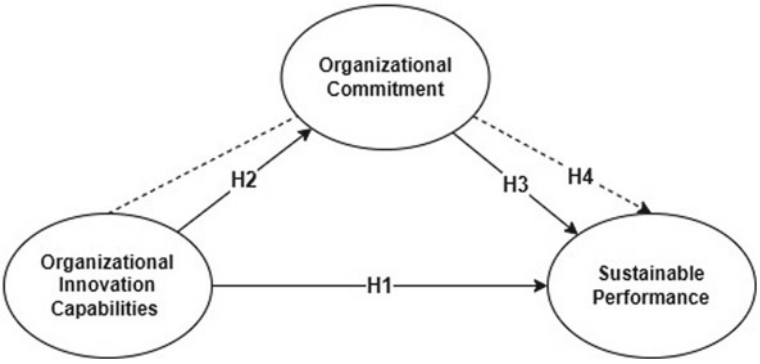

Fig. 1 Research model

Suwaidi et al., 2020; Belhadi et al., 2021). Rialti et al. (2019) study was found that organizational commitment has a positive and significant impact on economic performance, and organizational commitment has a positive and important impact on environmental performance, and a positive and significant impact on social performance, and organizational commitment has a positive and important impact on the company's performance in sustainability. Accordingly, the study hypothesis can be formulated as follows:

There is a significant impact of organizational ambidexterity on achieving sustainable performance in the presence of organizational commitment in oil companies in the capital of Kuwait.

3 Study Model

See (Fig. 1).

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of organizational ambidexterity on sustainable performance in the presence of organizational commitment as a mediator. Therefore, it focused on Kuwaiti Industrial sector. Data were primarily gathered through self-reported questionnaires created

by Google Forms which were distributed to a sample of (450) administrators via email. In total, (402) responses were received including (10) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (392) responses suitable to analysis requirements that were formed a response rate of (87.11%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of three main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The three main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (15) items to measure organizational ambidexterity capabilities based on (López-Sánchez & Santos-Vijande, 2020). These items were distributed into dimensions as follows: five items dedicated for measuring acknowledgment, five items dedicated for measuring exploitation, and five items dedicated for measuring re-engineering. The second section related to organizational commitment variable which contained eight items developed according to (Al-Hawary & Alajmi, 2017). Whereas the third section included (15) items developed to measure sustainable performance according to what was pointed by (Ojo & Fauzi, 2020). This variable was a second-order construct divided into three first-order constructs. Economic performance measured by five items, environmental performance measured through five items, and social performance measured using five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.582–0.902), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. Acknowledgment	**0.747**						
2. Exploitation	0.312	**0.768**					
3. Re-Engineering	0.297	0.344	**0.748**				
4. Organizational Commitment	0.415	0.281	0.461	**0.760**			
5. Economic Performance	0.364	0.384	0.320	0.566	**0.761**		
6. Environmental Performance	0.481	0.465	0.405	0.502	0.468	**0.777**	
7. Social Performance	0.375	0.597	0.554	0.495	0.566	0.591	**0.742**
VIF	1.805	1.225	1.648	–	–	–	–
Loadings range	0.643–0.823	0.671–0.902	0.705–0.813	0.582–0.871	0.705–0.824	0.726–0.825	0.681–0.792
AVE	0.558	0.589	0.559	0.578	0.579	0.603	0.551
MSV	0.415	0.387	0.501	0.495	0.461	0.513	0.466
Internal consistency	0.860	0.875	0.861	0.913	0.870	0.883	0.857
Composite reliability	0.862	0.878	0.863	0.915	0.873	0.884	0.859

Note All correlations have a significance level less than 0.05, bold fonts refer to the square root of AVE

Licensed to (putm@utm.my)

of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (de Leeuw et al., 2019).

5.2 *Structural Model*

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1. (Fig. 2)

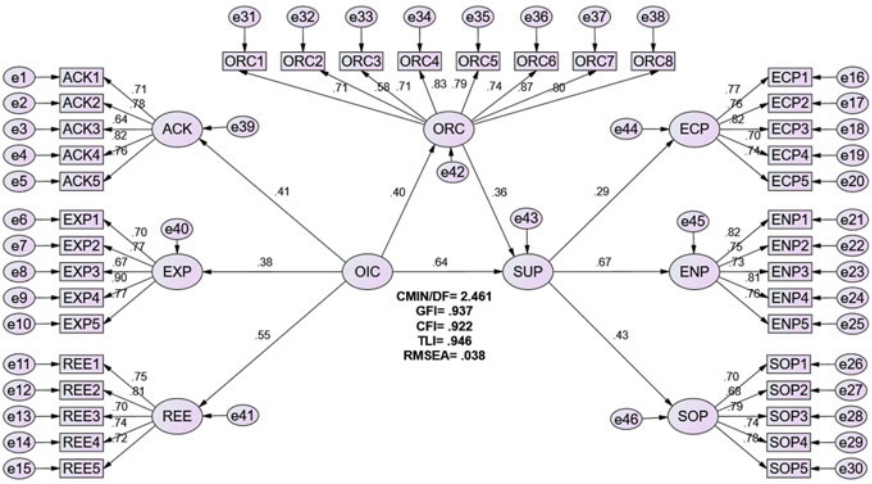

Fig. 2 SEM results of the organizational innovation capabilities effect on sustainable performance through organizational commitment

Table 2 Hypothesis testing

Relation	Direct effect		Indirect effect		Total effect		
	β	*p* value	β	*p* value	β	*t* value	*p* value
OIC → SUP	0.642***	0.000			0.642***	18.609	0.000
OIC → ORC	0.403**	0.002			0.403**	16.224	0.002
ORC → SUP	0.364***	0.000			0.364***	12.166	0.000
OIC → ORC → SUP	0.642***	0.000	0.147*	0.02	0.789*	21.547	0.02

Note OIC: Organizational Innovation Capabilities, SUP: Sustainable Performance, ORC: Organizational Commitment, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.461, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.038, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the sustainable performance and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that organizational ambidexterity have a positive direct effect on sustainable performance ($\beta = 0.642$, $t = 18.609$, $p = 0.000$) and organizational commitment($\beta = 0.403$, $t = 16.224$, $p = 0.002$). Organizational commitment has also positive direct effect on sustainable performance ($\beta = 0.364$, $t = 12.166$, $p = 0.000$). Furthermore, organizational commitment mediated the relationship between organizational capabilities and sustainable performance with total effect ($\beta = 0.789$, $t = 21.547$, $p = 0.02$) and indirect effect ($\beta = 0.147$, $p = 0.02$).

6 Discussion

The study results showed an impact of organizational ambidexterity on sustainable performance through organizational commitment, study results showed that the organizational ambidexterity strategy application achieves cost-effectiveness and helps organizations meet different customer's needs. In addition, organizational ambidexterity is critical to organizational survival and success. Also, reaching a state of organizational excellence requires providing constructive feedback, not negative criticism, and employees must be provided with constructive comments whenever needed, study results showed that organizational commitment can lead to a stable and productive workforce and help employees to increase their creativity and contribute to organizational development initiatives. Also, highly committed employees do not leave

the organization because they are dissatisfied and tend to undertake difficult work activities, as committed members are usually achievers and innovative mentors with the ultimate goal of participating and improving performance. When an employee commits to an organization, many positive outcomes can be seen for the individual as well as for the organization itself. One of the advantages that it can affect the customer's well-being, additionally, increases employee's job satisfaction increases commitment. An organization can benefit from committed employees in a variety of ways, at scale, in terms of increasing their ability to influence the organization's effectiveness, employees are also less likely to leave the organization, which reduces employee turnover. Equally important, committed employees can often make things work even without good systems, and they are key to increased productivity in organizations. This result agrees with Muhammad, which confirmed the existence of a significant correlation between organizational ambidexterity and sustainable performance, it also agrees with the study of Hijjawi and Mohammad, which confirmed that organizational ambidexterity had a significant effect on organizational conflict.

7 Recommendations

Based on the research results the researchers recommend the oil sector to follow up the information related to the latest technological methods used in its sector, providing attention to setting the plans that aim at improving the human resources and train them to support exploration and exploitation skills Support the organizational culture the promote organizational commitment. Reducing the amount of wastage that cause harm to the environment to the least possible level, reducing the risks associated with work to the least possible level.

Authentic Leadership and Its Impact on Sustainable Performance: The Mediating Role of Knowledge Ability in Jordan Customs Department

Mohammed Saleem Khlif Alshura, Saud Saleh Alloush Abu Tayeh, Yahia Salim Melhem, Fuad N. Al-Shaikh, Hanan Mohammad Almomani, Fatima Lahcen Yachou Aityassine, Reham Zuhier Qasim Almomani, Sulieman Ibraheem Shelash Al-Hawary, and Anber Abraheem Shlash Mohammad

Abstract The study aimed to identify the impact of authentic leadership on sustainable performance through knowledge Ability from the point of view of employees in Jordan customs department. The study population consisted of all 678 employees in the border centers of the Jordan Customs Service, where a random sample was taken proportional represented by the study population by 271 individuals, and the study

used the statistical package for social sciences (SPSS), in addition to using the Amos program. The study concluded that there is a statistically significant effect of authentic leadership in sustainable performance through knowledge Ability from the point of view of employees in border centers in the Jordan Customs Department. The study recommended a set of recommendations and suggestions that contribute to maintaining the sustainability of performance and enhancing growth and development in the Jordanian Customs Department.

Keywords Authentic leadership · Sustainable performance · Knowledge ability · Customs department · Jordan

1 Introduction

Leadership plays an important role in the individuals, societies and organizations level, as history has witnessed over the past ages nations and societies that have risen and developed thanks to their great leaders, and many organizations have achieved success and development at the global level through their leaders work, and on the contrary, leaders have been a cause of organizations failure and extinction (Alameeri et al., 2020; Al-Hawary, 2009; Al-Hawary et al., 2012, 2013; Metabis & Al-Hawary, 2013). On the other hand, recent years have witnessed many conferences dealing with ethics especially in work ethics, most of which centered on the necessity of creating a global ethical charter and limiting scandals and violations in the business field (Al-Hawary, 2015; Al-Hawary & Abu-Laimon, 2013; Al-Lozi et al., 2017; AlShehhi et al., 2020; Alyammahi et al., 2020). Organizations leadership style is the basis of organizations work, as it is mainly responsible for their progress or decline in front of competing organizations, as the issue of leadership is considered one of the most important topics in management science (Al-Dhuhouri et al., 2020; Odeh et al., 2021). Authentic leadership theory clarifies the behaviors that leaders must exhibit as well as addressing the absence of the most important of these behaviors that leaders may lack, and as a reaction to the business environment that is characterized by technological developments and changes and intense competition; Organizations have found new ways to counter these developments, Organizations must pay attention to the employees positive state and their sense of vitality and optimism towards achieving personal and organizational goals, which is better and positively reflected on the organizations overall performance continuity and sustainability (Alhalalmeh et al., 2020; Al-Hawary & Alajmi, 2017; Al-Hawary & Al-Namlan, 2018; Al-Hawary & Hadad, 2016; Al-Hawary & Obiadat, 2021; Al-Hawary et al., 2020; Al-Nady et al., 2013; Harahsheh et al., 2021; Mohammad et al., 2020). The authentic leadership style has emerged recently, in which leaders apply the principles and values of honesty, transparency and ethical standards. The term sustainable performance has emerged

Licensed to (putm@utm.my)

as a modern management concept concerned with society and the environment as basic pillars for achieving sustainable growth and development. It is not limited to achieving financial and economic performance only, but also integrates all social and environmental conditions within the organization's strategic plan (Al- Quran et al., 2020). As well as the term knowledge competence, which requires more time and work to understand and clarify, as it represents all the capabilities that contribute to building a pioneering knowledge organization capable of keeping pace with all developments in the surrounding environment, and providing the best services with the least time and effort, through the optimal use of modern technology and workers attention and motivating towards creativity and excellence (Allahow et al., 2018; Al-Hawary & Al-Syasneh, 2020; AlTaweel & Al-Hawary, 2021; Al-Hawary & Alwan, 2016; Al-Hawary & Aldaihani, 2016).

Study importance stems from the importance of the effect achieved by authentic leadership on sustainable performance through the knowledge ability in the Jordan Customs Department. Where this study linked between modern variables and dealt with modern sub-dimensions of those variables which are of great importance in organizations growth and development study problem is the Jordanian Customs Department sustainable performance and how to maintain this performance in light of the surrounding environmental changes, through authentic leadership, and with the emergence of contemporary global challenges and the spread of the global epidemic of covid-19, All this led to a decline in revenues and customs collections, due to border closures and global closures of trade outlets, here, authentic leadership appeared to be the best solution in overcoming these difficulties and transforming challenges into opportunities (Almazrouei et al., 2020; Allozi et al., 2022). However, the problem lies in the existence of different standards in the Customs Department regarding the extent of plans implementation, either due to negligence or shortcomings in legislation or changes in regulations and laws that affect the implementation process (Al Kurdi et al., 2021; Alshurideh, 2022). While this gap remains, the performance outputs and the quality of provided services are affected, and this gap may lead to a decrease in revenues levels, and this was evident during the year (2020), where revenues decreased from the year (2019) by (39) million dinars, and the department also witnessed a decrease in the customs data registered numbers as in 2019 (819) thousand customs declarations, In 2020, it amounted to (699) thousand statements.

This study came to clarify the relationship between authentic leadership as a modern leadership style and sustainable performance, which ensures the organization permanence and survival. This study attempts to provide a qualitative addition to knowledge that helps decision makers to identify this modern leadership style, which helps in making change decisions and facing challenges. The study focused on authentic leadership in terms of concept, application requirements, and advantages achieved by organizations in which there is authentic leadership, and also dealt with the relationship and role of authentic leadership in maintaining the performance sustainability and continuity. Also, many studies focused on the authentic leadership concept, its components, its importance and its relationship to the organizational, market and economic performance of business organizations. This study comes to shed light on the components of authentic leadership in the Jordanian

Customs Department, and this study contributes to measuring the extent of authentic leadership influence the Jordanian Customs Department overall performance.

2 Literature Review and Hypotheses Development

2.1 Authentic Leadership

Organizations dominant leadership style is the main focus of their work, as it is responsible for their progress or decline extent with competing organizations (Al-Hawary & Nusair, 2017)**.** The issue of leadership is considered one of the most important topics in management science, and perhaps clarifying the most important behaviors that leaders must have was the share of the original leadership theory, as well as addressing the absence of the most important of these behaviors that leaders may lack, As organizations are operating in a business environment characterized by technological developments and changes, and intense competition; Therefore, it is necessary to adopt new methods to confront these developments, especially the crises that the world has faced as a result of the Corona pandemic and the subsequent economic crises, and the breakdown of organizations (Alshurideh et al., 2021; Pendleton and Jonathan 2021, 18).

Authentic leadership includes, at its roots, all positive qualities, such as self-confidence, integrity, and credibility, and seeks to achieve the goal in order to achieve psychological and social well-being, through the application of positive features of leadership, based on authentic leader values, believes, and the consistent behaviors (Muhammed & Zaim, 2020, 14–15). Authentic leadership focuses on building followers' strengths, developing their capabilities, expanding their thinking, and creating a positive organizational context. The authenticity approach indicates that it is linked to followers' attitudes and behaviors and that the most important effects of authentic leadership are those whose results are due to the working and subordinate individual's behavior and actions. The authentic leadership effect arises through the individual sense of social affiliation between the leader and the follower (Chalon, 2018, 36). In light of this, studies and research have clarified multiple definitions of authentic leadership. Studies have shown that the authentic leadership essence is the availability of frankness, integrity and transparency, and positive psychological capabilities, such as (trust, hope and optimism), high moral behaviors and trust between the leaders and subordinates.

Studies also emphasized that authentic leadership focuses on positive behaviors that include enhancing self-confidence, sincerity, credibility, merit, and high moral values that are reflected in improving the relationship between the leader and his subordinates (Linda & Chester, 2013). Nair and Shrekumar (2021) believes that authentic leadership is formed as a result of the stimulating events that the individual goes through, during the various stages of his life, which generates experiences and capabilities in facing circumstances, and these experiences formed lead to the

positive psychological capabilities development (e.g., hope, optimism and confidence). Which leads to the development of self-awareness within the individual, and positive self-development leads to authentic leadership formation with a high degree of self-awareness and the ability to express values and behaviors with full force and determination. Authentic leadership is also defined as a leader's behavior pattern based on promoting positive self-development, a transparent and ethical leadership behavior that encourages openness in sharing information necessary for decision-making while accepting subordinates' views (Sparks, 2021, 55).

Self-awareness is one of the most essential aspects of authentic leadership, because it includes special knowledge of authentic leader values, beliefs, motives and experiences, and it refers to the successful leader behavior according to his motives and desires, as it helps the leader to control his emotions and deal based on value, Self-awareness represents a guarantee that the leader will take full responsibility for his behavior and his work, as it is not a point he reach, but rather it is an ongoing process. As for the Balanced Processing, it refers to the leader collecting the data and information necessary to make decisions, analyzing them accurately and objectively, extracting the results and discussing them before making the decision. With regard to the Internalized Moral Perspective, it means that managers possess and demonstrate internal moral standards and values rather than recognizing external pressures, however, originality reflects managers' ability to achieve harmony with themselves and their followers broadly, to achieve cooperation within and outside the organization.

Therefore, managers' values should be consistent with those generally accepted in the environment (e.g. society, organization) (Alshurideh et al., 2017, 2019). Individuals who have high levels of self-regulation manage their behavior to conform to ethical standards, which, on the one hand, represent the consistency of managers' behavior with their own values, and on the other hand, the managers' behavior consistency with the ethical rules that prevail within society and the organization (Alshurideh et al., 2017). And finally, relations transparency, that through transparency, ideas and beliefs are exchanged between the leader and the followers, as it works to present the authentic personality to others, and thus more confidence and reduce inappropriate emotions, which contributes to reducing organizational conflict intensity. Transparency in relationships also includes revealing the leader's authentic inner self and not the illusion or artificial personality. By showing the true self, the leader can gain the subordinates confidence and enhance their organizational commitment. And this also includes exchanging information and ideas with credibility and clarity (Al-Mansi, 2019).

2.2 Sustainable Performance

Organizations and companies seek to develop their competencies and resources, by noting the discrepancy in talents, aspirations and performance levels, and seek to build programs and policies to improve and raise organizations performance levels

and encourage the transfer of knowledge and expertise within the work environment, as this requires the leaders with experience, knowledge and ability to face difficulties (Chalon, 2018, 15)**.** Organizations looking for sustainability have goals that go beyond traditional concepts. The emergence of sustainable development concept has forced organizations to integrate the sustainable development dimensions and making sustainability a part of the organization's strategy, and this requires radical changes in the organization's performance. Sustainable performance is real performance and gives indications that the organization is moving in the right direction because it is a continuous and it can be expected in the future (Majid, 2020). Hence, sustainable performance is a combination of economic, social and environmental performance as it extends beyond the organization boundaries, and does not only address financial results, but extends to include taking into account working individuals' interests, the surrounding community and the natural environment (AlTaweel & Al-Hawary, 2021).

Ziemak and Katarzyna (2020) defines sustainable performance as the process of interaction between the organization work, the environment and society requirements, and profitability levels, and includes the extent to which the organization has succeeded in translating its goals into practical reality to maintain sustainability and continuity, to achieve more positives and reduce negatives, taking into account satisfying customers and employees and maintaining workplace safety. Rasool et al. refers to sustainable performance as the process of coordinating financial, environmental and social goals in order to maximize value, and it is based on four pillars that include achieving goals, use of resources, internal processes, and stakeholders.

Sustainable performance importance is based on the great responsibility that falls on organizations shoulders in the global economy, so performance sustainability has become a must, as it achieves a state of integration between the decisions taken daily by the organizations in order to facilitate business and enters the organizations in a new phase represented by how to transform into entities that serve the environmental, social and economic interests while preserving the stakeholders at the same time (Al-Mansi, 2019; Shamout et al., 2022).

2.3 Knowledge Ability

Al-Mansi (2019) indicated that knowledge ability represents the individual's ability to have a great knowledge of their working conditions and understand the procedures and rules they follow, that enable them to act in the appropriate way away from traditional organizational structures, and they have the ability to make better changes and use cognitive thinking to analyze problems and develop appropriate solutions (Al-Hawary & Al-Namlan, 2018; Al-Maroof et al., 2021; Al Mehrez et al., 2020). This means that they have an integrated cognitive knowledge that generates for them the ability to achieve high performance. Knowledge ability includes all cognitive capabilities and modern institutional methods that keep pace with development in order to be able to process the business content and tasks assigned to them; Cognitive

competence is one of the modern concepts that has attracted the researchers' attention and has become the most prominent guarantee for the future building requirements by focusing on the sustainable work efficiency and the employing the mental energies of working individuals efficiency (Agha et al., 2021; Al-Mawla & Harbi, 2019).

Knowledge ability importance is represented by what was stated by some writers and researchers. It has been pointed out that knowledge ability is linked to knowledge and experience, it absorbs its components and benefit from its potential and leads to policies and practice development and the means and strategies adoption, and it is capable of overcoming all obstacles and difficulties that prevent the goals achievement. To catch up with progress requires scientific and knowledge capabilities that give the organization and society the reasons for solid strength, and it also promotes working individuals to higher positions in their specialization field, and they are those who have the ability to assume responsibility and build ideas that serve the production or service process and have a spirit of responsibility (Al Suwaidi et al., 2020; Al-Mawla & Harbi, 2019).

The researchers tried directly or indirectly to describe the knowledge ability through a set of dimensions that came after the processes of analysis and interpretation of all its related aspects, the purpose of accurately defining knowledge ability dimensions is that it represents a great importance to the organization and reflects a distinguished level of human competencies, personal excellence, and commitment to moral guidance. As defined by the researchers, knowledge ability dimensions are as follows: Information Technology which is defined as a set of software, hardware, communications, database management and various data processing technologies that are used in computer-based information systems (Ibarra, 2015). Creative thinking which represents the ability to organize ideas in a different way, in order to invent new things, and includes restructuring knowledge to form a new vision (Proctor, 2021, 8).

2.4 Authentic Leadership, Sustainable Performance and Knowledge Ability

By reviewing books and studies on authentic leadership, the researcher concluded that it is based on the leader individual capabilities, where decisions are made based on clear and accurate information and with the others participation. It enhances trust between the leader and subordinates, which is reflected in the organization overall performance. Authentic leadership is closely related to the organization internal quality (organizational culture and organizational climate), and it is linked to job satisfaction, and this ultimately leads to raising the productivity levels, The researchers found that whenever there was an improvement in the level of job satisfaction by 5%, there was an increase of 1.2% in customer satisfaction, which led to an increase in the performance level by 0.5%, leadership influence was clear

in employees performance, which increases the productivity levels (Pendleton and Jonathan 2021).

Locared refers to authentic leadership as working to build the general welfare of humanity and achieve society interest, and defines an authentic leader as that individual who is fully aware of how to think and how to act, and is seen by others as aware of his own values and the values of others, and by integrating positive qualities such as hope and optimism, he motivates the followers to perform well and identify the individuals needs and desires in order to meet them and ensure the achievement of organization general objectives. Knowledge ability is an important resource for organization creativity and innovation processes, through the acquisition of external knowledge and the maximization of internal knowledge in order to raise the organization's ability to achieve competitive advantage (Duan et al., 2020). The term knowledge ability is one of the modern terms that requires more time and work to understand it, as it represents the possibility that works to re-characterize the organization from a traditional organization to a knowledge organization, so that it turns into a pioneering organization that has a high ability to face challenges through modern technological knowledge. In this way, knowledge ability can transform the organization through the type, activity or theories used, and then transform it into a knowledge organization. It represents the characteristic that responsible individuals carry outside the traditional role, as they have knowledge ability, technological skills and institutional methods that make them capable of knowing and treating their business content (Majid, 2020). Based on the above, study hypothesis can be formulated as follows:

There is no statistically significant impact of authentic leadership on sustainable performance with the presence of knowledge ability as a mediating variable in the Jordan Customs Department.

3 Study Model

See (Fig. 1).

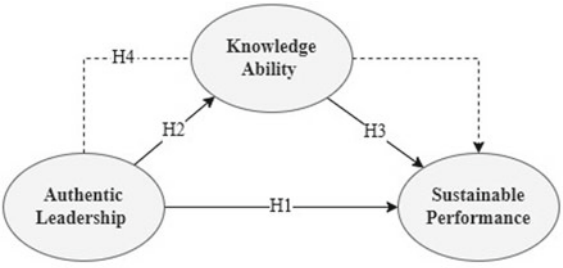

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of authentic leadership on sustainable performance through the mediating role of knowledge ability. Therefore, it focused on Jordanian customs centers. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a random sample of (320) employees via email. In total, (283) responses were received including (12) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (270) responses suitable to analysis requirements that were formed a response rate of (84.68%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of three main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The three main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (16) items to measure authentic leadership based on. These items were distributed into dimensions as follows: four items dedicated for measuring self-awareness, four items dedicated for measuring balanced processing, four items dedicated for measuring internalized moral perspective, and four items dedicated for measuring relational transparency. The second section related to knowledge ability variable which contained nine items developed according to (Al-Hawary & Alwan, 2016). These items distributed into two first-order constructs: five items for information technology and four items for creative thinking. Whereas the third section included (15) items developed to measure sustainable performance according to what was pointed by Afum et al. and Kamble et al. This variable was a second-order construct divided into three first-order constructs. Economic performance measured by five items, environmental performance measured through five items, and social performance measured using five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021; Al-Adamat et al., 2020; Al-Gasawneh & Al-Adamat, 2020). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.627–0.902), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1 (Fig. 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.348, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90.

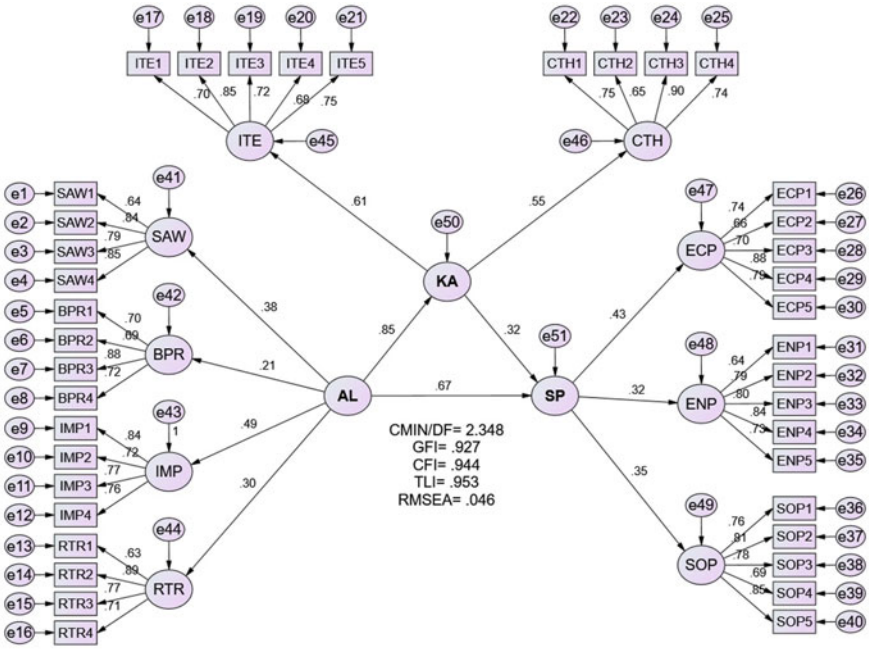

Fig. 2 SEM results of the ALimpact on SP through KA

Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.046, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the sustainable performance and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

Table 2 Hypothesis testing

Relation	Direct		Indirect		Total		
	β	p-value	β	p-value	β	t-value	p-value
Authentic Leadership → Sustainable Performance	0.672	0.000			0.672	19.367	0.000
Authentic Leadership → Knowledge Ability	0.848	0.001			0.848	21.228	0.001
Knowledge Ability → Sustainable Performance	0.325	0.03			0.325	16.015	0.03
Authentic Leadership → Knowledge Ability → Sustainable Performance	0.672	0.000	0.275	0.000	0.947	28.641	0.000

Licensed to (putm@utm.my)

The results demonstrated in Table 2 show that authentic leadership has a positive direct impact on sustainable performance ($\beta = 0.672$, $t = 19.367$, $p = 0.000$) and knowledge ability ($\beta = 0.848$, $t = 21.228$, $p = 0.001$). Moreover, it indicated that knowledge ability has a positive impact on sustainable performance ($\beta = 0.325$, $t = 16.015$, $p = 0.03$). Hence, knowledge ability has a partial mediation effect in the relationship between authentic leadership and sustainable performance, where the total effect was ($\beta = 0.947$, $t = 28.641$, $p = 0.000$) with indirect effect of ($\beta = 0.275$, $p = 0.000$).

6 Discussion

Study results indicated that there is a statistically significant impact of the authentic leadership on sustainable performance in the presence of knowledge ability, and this explains the Customs Department interests in developing leaders that contribute to growth and development and have a future vision that keeps pace with developments in addition to modernization in individuals and equipment that contribute to raising the performance levels and achieving high growth indicators. Study results showed that the mediating role played by knowledge ability between authentic leadership and sustainable performance achieves positive results, and this is an indicator that confirms that the three main variables achieve a strong correlation, in that the Customs Department works to implement the authentic leadership style and maintains performance sustainability through it. Companies and individuals dealing with the Jordanian Customs Department need facilitated services and facilities to protect investment and the national economy, facilitate trade movement, achieve the highest quality levels in providing services and facilities, and ensure goods smooth arrival.

The results showed that the study variables dimensions represented in authentic leadership, sustainable performance and knowledge ability, reached high levels of application, which indicates the awareness extent of the Customs Department of these modern managerial concepts importance, and their role in achieving performance sustainability and growth in light of the surrounding changes and difficulties that the economy suffers from world and the international trade system. Study results showed the strategic role played by the Customs Department in supplying the state treasury with revenues through the high level of economic performance. This result is consistent with the study (Balogun et al., 2020), which showed that there is a significant and clear impact of authentic leadership on the performance level.

7 Recommendations

According to the study results and conclusions, the researcher presents a set of suggestions and recommendations, which in turn can benefit the researched organization, through the study results, it is clear that it has become necessary for the

Customs Department to promote the environmental sustainability concept and to practice activities and policies that are reflected on the surrounding environment by preventing pollution, preventing the entry of products harmful to the environment and society, and promoting a culture of green environment among employees. The Customs Department is considered one of the institutions based on knowledge and technology. Therefore, the Customs Department must develop strategies based on knowledge transfer process and ease of access and conduct more knowledge transfer courses and enhance the growth and self-development levels. The study recommends also for increasing the space of participation in decision-making by listening to different viewpoints, and this is done through holding meetings and seminars that contribute to the views transfer on the performance level and strengths and weaknesses in order to overcome problems and find solutions to all customs work obstacles. Through the study results, which reflected the development and growth level reached by the Customs Department, the researcher recommends increasing the participants numbers in foreign courses to learn about global customs experiences in order to gain more experience and knowledge, as the participants number in foreign courses is few in light of the surrounding environment developments and the global competition increase.

The Impact of Innovative Leadership on Crisis Management Strategies in Public Institutions in the State of Qatar

Kamel Mohammad Al-Hawajreh, Abdullah Matar Al-Adamat, Snaid Saleh Al-Daiya Al-Marri, Zaki Abdellateef Khalaf Khalaylah, Menahi Mosallam Alqahtani, Yahia Salim Melhem, Ziad Mohd Ali Smadi, Ayat Mohammad, and Sulieman Ibraheem Shelash Al-Hawary

Abstract The study aimed to examine the impact of innovative leadership practices on crisis management strategies in public institutions in the State of Qatar. The study population consisted of public institutions in the State of Qatar. In order to achieve the objectives of the study, a questionnaire was developed to collect data from the analytical unit, the Social Statistical Sciences Package (SPSS V.25) was adopted. The

AMOS V.25 program were adopted for path analysis. The study showed an impact of Innovative leadership on crisis management strategies. The study recommended the need for Qatari public institutions to focus on creating strong relationships with strategic partners in the internal Qatari environment and the external environment.

Keywords Innovative leadership · Crisis management strategies · Public institutions · Qatar state

1 Introduction

The communications and information technology revolution has contributed to the scientific, cultural and technological developments that are unprecedented in human history, which made institutions of all kinds and orientations seek to keep pace with these developments, and review their policies, objectives, technologies and activities related to creativity, change and continuous improvement of their services and products (Al-Lozi et al., 2017; Al-Hawary & Al-Syasneh, 2020; Al-Quran et al., 2020; AlTaweel & Al-Hawary, 2021; Al-Hawary & Obiadat, 2021).

Organizations must prepare leaders and provide them with the skills that enable them to carry out the tasks entrusted to them to the fullest and to achieve the goals and objectives of the organization (Al-Hawary et al., 2012; Al-Hawary & Al-Hamwan, 2017; Al-Hawary & Mohammed, 2017; Al-Hawary, 2009; Mohammad et al., 2020). It is evident from monitoring the developments that occurred in the developed countries that the institutions were able to overcome all the obstacles they were facing by encouraging creative practices and applying them on the ground and updating the different methods of work that was a reason for the superiority and progress of countries, provided that these methods and tools are adapted to suit Arab environments (Al Kurdi et al., 2020; AlShehhi et al., 2020; Odeh et al., 2021; Alshurideh, 2022).

Since the crisis has a renewed and developed character, it needs the presence of creative leaders to deal with it by formulating a vision, a message and strategic goals to deal with crises as they occur, as most of the crises are considered emergency and sudden events that often have no introduction, and therefore the matter requires the presence of creative leaders able to take decisive decisions at the appropriate times and seize the initiative in leading, influencing and directing events as appropriate. The Ambidexterity of leadership lies in envisioning the possibility of transforming the crisis and the risks it carries into opportunities to unleash the innovative capabilities that exploit the crisis as an opportunity to reformulate conditions and find appropriate solutions (Hijjawi & Mohammad, 2019; Alameeri et al., 2020; Al-Dhuhouri et al., 2020). The real role of the innovative leader lies in revealing and investing the innovative energies of his followers, and working to make his organization learn innovation and creativity continuously (Al-Hawary et al., 2013; Al-Hawary & Hadad, 2016; Al-Hawary & Alhajri, 2020; Harahsheh et al., 2021).

Public institutions in the State of Qatar work like other institutions, facing environmental conditions, with a high degree of uncertainty and severe environmental

complexity, which leads It calls for the necessity of a creative leadership approach, according to a management methodology, that focuses on developing crisis management strategies, so that this leads to relying on finding products/services at a lower cost, and with flexibility that enables them to adapt to emerging changes that affect them in light of the threats they face, also, adopting an approach of creativity to develop the products/services provided by public institutions in the State of Qatar, and to improve the quality of the products offered to customers. Through the researcher's extrapolation of the general climate in the State of Qatar, and the sector of public sector institutions in particular, he realized that public institutions are among the most prominent sectors that have witnessed changes and new challenges, in the crisis of the blockade, which posed a major challenge to these institutions; Therefore, public institutions in the State of Qatar are required to improve their products and enhance their competitiveness indicators, especially in the midst of the challenges the world is witnessing.

In general, the success of these institutions requires keeping pace with the new developments of strategic management. Strategic intelligence is also considered an advanced field (Al-Hawary & Ismael, 2010; Al-Hawary et al., 2020; Al-Nady et al., 2013; Alzoubi et al., 2022). It is considered one of the important tools that enable these institutions to deal with the environmental uncertainty they face, and it is an important factor in supporting and coordinating all efforts to unify them in order to achieve the strategic goals efficiently and effectively (Al-Dmour et al., 2021; Ashal et al., 2021; Shakhour et al., 2021). Due to the scarcity of studies that dealt with the impact of innovative leadership on crisis management strategies, especially in the work environment in the State of Qatar, the problem of the current study appears in analyzing the impact of innovative leadership in its dimensions (problem solving and decision-making, susceptibility to change, initiative, ability to communicate, stimulating creativity, and innovative knowledge), in crisis management strategies in its dimensions (early warning strategy, preparedness and prevention strategy, damage containment strategy, recovery strategy, learning and growth strategy) in public institutions in the State of Qatar.

2 Theoretical Framework and Hypothesis Building

2.1 Innovative Leadership

Leadership is one of the most important approaches to developing strategic performance. Because of its important role in influencing employees and directing their ideas and behavior in order to achieve the goals sought by the institution, because it has a significant impact on their behavior, performance and productivity at work. Innovative leaders are satisfied not only by rearranging existing organizational structures, but are motivated by the constant quest for a better way (Al-Hawary, 2015; Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Alajmi, 2017).

The innovative leadership style is discovery and self-renewal and their impact contributes to achieving the general interest and raises the awareness of the leadership, followers and the institution as a whole, and the innovative leader is able to collect new ideas with each other in an individual way that organizes their unconnected relationship, and make them a focus of innovation (Al-Hawary & Al-Namlan, 2018; Allozi et al., 2022; Metabis & Al-Hawary, 2013). The term leadership is one of the concepts that have received great interest by researchers and those interested, as this concept has appeared in several different definitions due to the different views of researchers and the different approaches to studying this concept. Leadership is one of the most important topics that researchers have studied in depth, and despite the diversity and multiplicity of research and studies, they did not reach agreement on the concept of leadership.

The meaning of innovation in the business dictionary is to provide a new method, or a new service, which is the ability to find solutions to problems and crises through a new tool or a new technical effect, and it has been defined as the process that leads to the creation of a new idea and its output through a useful product or service, or methods of Operations (Al-Hawary & Aldaihani, 2016; Al-Hawary & Alwan, 2016; Al-Hawary & Nusair, 2017; Dogan, 2019). Other researchers also defined innovation it as a combination of abilities, preparations, and characteristics of a person which, if found in an appropriate environment, can elevate mental processes to lead to original and useful products, whether in relation to the individual's previous experiences or to the experiences of the institution, society or the world if the results are on a level of creative breakthroughs in one of the fields of human life (Hamdi, 2018).

The link between leadership and innovation is important in the success of the continuation of creative processes within society and in the development and creation of the creative climate. Innovative leaders are not only satisfied with rearranging the existing structures but are motivated by the continuous quest to find a better way. The creative leadership style is discovery and self-renewal, and their impact contributes to achieving the broader interest and raises the awareness of leadership, followers and the institution as a whole (Al Dukan, 2010). Innovation gives leadership characteristics that distinguish it from other leaders, such as openness towards change, the desire to identify internal problems and issues, in addition to giving the ability to control the environment in which he lives, confidence in the ability of others to achieve and bear responsibility, respect for others' choices, and the ability to rush towards learning and using culture, appreciating the achievements of others, and moving towards the future with full force (Al-Zubaidi & Al-Mamouri, 2015; Abuhashesh et al., 2021; Hamadneh et al., 2021).

It becomes clear that the innovative leadership in the organization is the innovator who translates knowledge into choices and who has ideas that are new and useful and related to solving specific problems or re-combining known patterns in unique forms (Al-Nady et al., 2016; Allahow et al., 2018; Alhalalmeh et al., 2020). Al-Saghir and Muhammad (2017) referred to creative leadership as the ability to change, renew or The development of a new approach or method, and its use of modern technologies that are compatible with the requirements of the environment and the aspirations of the modern era and meet the needs of the institution, on the other hand is the

Licensed to (putm@utm.my)

ability of the leader to use familiar things in an unfamiliar way, and to propose innovative ideas and solutions to the problems and issues he deals with, characterized by novelty, quality and feasibility. The traits of creators may be available, all or some of them, in the leader of the organization who has the ability to be innovative, and the absence of some of these traits does not mean her inability to lead the organization in a innovative way, but rather they are helpful and influential traits that develop creativity and creativity in the leader, and those in charge of the organization must take appropriate methods to develop these features. Innovative leadership has a set of basic features that appear to influence the behavior of leaders.

For the purposes of this study, the following dimensions were adopted: **Problem-solving and decision-making**: The sensitivity to problems and decision-making is one of the most important characteristics of leadership, as a innovative leader has the ability to face a situation that involves a problem or several problems that need to be solved or change, **Changeability**: The emergence of many changes and the many challenges facing the institution, which need a creative leader who can face those challenges, and come up with innovative solutions and proposals about them, especially after the institution's application of some administrative trends, which gave the institution more empowerment and independence to achieve self-renewal to enable the institution to Achieving a competitive advantage (Al-Jaafira, 2013). **Initiative**: It refers to the ability to be innovating and to act consciously and quickly in various situations. It is a characteristic of innovation and an administrative principle. Initiatives appear in a healthy climate that motivates workers and encourages them to take initiatives. It is the characteristic of an innovative leader who encourages the spirit of initiative. He takes the initiative and shows his initiative in making decisions that bring about important changes (Abdul Qader, 2012)**. Ability to communicate**: Communication aims to identify ideas, information and directions through a social system and the ways in which opinions, trends and knowledge are formed. **Stimulating innovation**: It is a paragraph about a mental characteristic that enables the individual to think in unconventional ways, or as it is known and popularized "thinking outside the box, which contributes in one way or another to creativity of all kinds or the use of different, unusual methods while dealing with a specific task or issue. This requires good preparation by the higher management of the institution (Al-Zubaidi & Al-Mamouri, 2015). **Innovative knowledge**: It is the knowledge that gives the institution the ability to lead the sector, and in the case the institution's differentiation is clear compared to competitors, which enables it to change the rules of the game in the style and timing that it determines, and through the knowledge pyramid, it can be said that it contributes well to clarifying how to form and build the knowledge system.

2.2 Crisis Management Strategies

The concept of crisis has several meanings, including a sudden change to the worst and the risks and opportunities it entails to restore conditions to their normal

state and find constructive solutions, or in other words, it is a turning point in unstable conditions, or a series of events that have a negative impact on the institution (Al-Zubaidi & Al-Mamouri, 2015). As for crisis management, it is the method of dealing with the crisis by the administrative and methodological processes that leaders in institutions adopt to confront the crisis before, during and after its occurrence, control and prevent it, and try to predict it by developing and implementing plans, and taking appropriate decisions through the necessary information and providing an effective communication system, achieving the desired goals, in minimal losses, cost and effort (Bobyleva & Sidorova, 2015; Alzoubi et al., 2021; Tariq et al., 2022).

The concept of crisis management refers to how to overcome the crisis by using scientific administrative methods in order to avoid its negative aspects as much as possible and maximize its answers, and crisis management is a purposeful activity based on research and obtaining the necessary information that enables management to predict the locations and trends of the expected crisis and create the appropriate climate To deal with it by taking measures to control the expected crisis**.**

The administrative literature has included a number of strategies for dealing with crises according to their nature, where the crisis differs in terms of its type, severity and causes, the goal of facing crises is to seek the available human and material capabilities to manage the situation. Therefore, the method of dealing with crises is the determinant of the management's efficiency in facing them. Accordingly, dealing with crises had to be subject to the scientific administrative approach to confirm the success factors and protect the administrative entity from any uncalculated change and secretions, present or future. Contemporary administrative thought has resulted in a set of strategies, and these strategies are consistent with the contents of technological and administrative developments, and are in agreement to some extent with the modern trends adopted by institutions towards workers and all stakeholders, taking into account the positive image of the institution, taking into account the achievement of community interest and deepening the institutional role of the organization in society (Al-Lami & Al-Issawi, 2016).

2.3 The Relationship Between Innovative Leadership and Crisis Management

The personality of the leader is clearly reflected on the institution and its management, especially when emergency matters or crises occur in the institution. The leader's adoption of a certain behavior inevitably includes the performance and satisfaction of employees to directly affect the effectiveness of the institution and depending on the nature of the crisis as an opportunity or a threat, managers and leaders of institutions may resort to changing their behavior between centralization and decentralization of crisis management, he resorts to the first type when the cause of the crisis is internal

and when the institution's ability to control external factors weakens, the leader resorts to (decentralization) and because the crisis started outside the institution, the leader needs information about the crisis and it is natural for him to resort to middle and executive management, and thus (decentralization) is a preferred method for such a situation.

Researchers believe that many institutions are exposed to different crises in which the leader exhibits different patterns and behaviors. It is obvious that the leader deals with every crisis that occurs in different patterns, so what works for managing a crisis may not work for another crisis. The crisis is a catalyst for the emergence of different types of behavior and therefore different responses to crises. Also, cooperation and respect between the leader and the workers and between them facilitates the process of containing the crisis, in order to reach the optimal leadership style, more than one style can be used at the same time. As there is no fixed leadership style that the leader follows in all situations, and the strategies used to solve the crisis are determined according to the type and severity of crises and the characteristics of leadership qualified to overcome crises, and an attempt to diagnose the nature of the relationship between the strategy used by the administrative leader in the face of the crisis and the type, severity and reasons for the occurrence of the crisis.

Al-Kaabi (2014) said that there is a significant effect relationship between successful administrative leadership and crisis management. The study of Svejenova reached several results, stating the importance of the concept of innovative leadership in the context of social change, as it increases the understanding of creative industries by proposing a social purpose as a distinctive and open engine for innovation and a different source of budget, as well as significant limits to research and practice in the creative industries. The study of Ghosh (2016) confirmed that the innovation of leaders is subject to several influences, the most important of which are technical support at work and their level of creativity, and the leadership style has positive effects on innovation. **Based on the above literature, the study hypotheses may be formulated as**:

There is a significant effect of innovative leadership on the crisis management strategies.

3 Study Model

See Fig. 1.

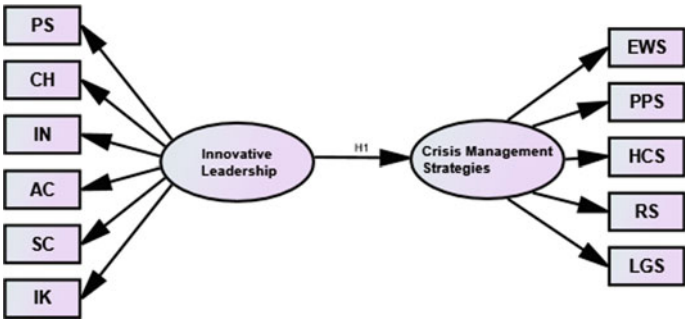

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A quantitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of innovative leadership practices on crisis management strategies in public institutions in the State of Qatar. Data were primarily gathered through the questionnaires which were distributed to a random sample of (380) postgraduate students. In total, (327) responses were received including (53) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (346) responses suitable to analysis requirements that were formed a response rate of (86.05%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (24) items to measure innovative leadership based on Zhang et al. These questions were distributed into dimensions as follows: four items dedicated for measuring problems solving and decisions making, four items dedicated for measuring changeability, four items dedicated for measuring initiate, four items dedicated for measuring ability to communicate, four items dedicated for measuring stimulating creativity and four items dedicated for measuring innovative knowledge. Whereas the second section included (15) items developed to measure crisis management strategies according to

what was pointed by Eliadis. This variable was divided into five dimensions: early warning strategy that was measured through five items, preparedness and prevention strategy which measured by five items, Harm containment strategy was measured using five items, recovery strategy that was measured by five items and learning and growth strategy was measured using five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.520–0.820), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.0002, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.038, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all innovative leadership dimensions have a positive impact relationship on crisis management strategies. However, the

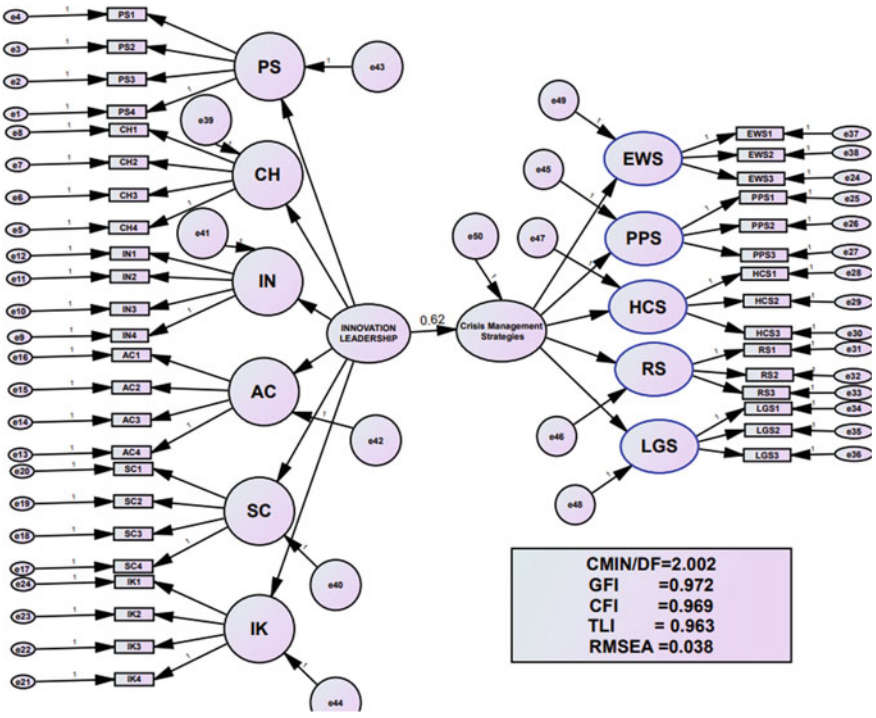

Fig. 2 SEM results of the digital marketing effect on mental image

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	Problems solving and decisions making → crisis management strategies	0.106	*8.912	0.000
H2	Changeability → crisis management strategies	0.109	*9.909	0.000
H3	Initiate → crisis management strategies	0.148	*13.910	0.000
H4	Ability to communicate → crisis management strategies	0.250	*14.176	0.000
H5	Stimulating creativity → crisis management strategies	0.247	*13.368	0.000
H6	Innovative knowledge → crisis management strategies	0.246	*11.900	0.000

results indicated that the highest impact was for combination ($\beta = 0.250$, $t = 14.176$, $p = 0.000$), followed by stimulating creativity ($\beta = 0.247$, $t = 14.368$, $p = 0.000$), and finally the lowest impact was for problems solving and decisions making ($\beta = 0.106$, $t = 8.912$, $p = 0.000$).

6 Discussion

The results showed that there is an impact of innovative leadership on crisis management strategies in public institutions in the State of Qatar, which means that public institutions in the State of Qatar follow sound methods in their keenness to exercise the dimensions related to innovative leadership in terms of problem solving, decision-making, changeability, initiative, and ability to Communication, stimulating innovation, innovative knowledge. It also shows the interest in crisis management strategies through the interest of leaders in public institutions in the State of Qatar in innovative leadership in terms of paying attention to the early warning strategy as the first stage in crisis management, which is the stage of discovering danger signs of a crisis, and these signs appear early, because the crisis is usually sent long before it occurs A long series of early warning signs, or symptoms that predict the possibility of a crisis, and unless attention is paid to these signs, it is very likely that a crisis will occur.

It is also a warning stage for sensing the crisis and is represented by the first signs and premonitions that warn of a crisis, and if it is not realized, the crisis stage comes quickly, and the warning may be direct and can be perceived and it may be the opposite. On the other hand, he showed the interest of the Public Institutions Department in the State of Qatar in strategic leadership practices. In the strategy of preparedness and prevention in terms of taking a set of prevention methods required at the stage of risk discovery, prevention includes discovering weaknesses and strengths in order to address them, and accordingly the institution must have sufficient preparations and

methods to prevent crises. The results of the current study is consistent with Hamdi (2018), which dealt with the impact of innovative leadership on crisis management in the Jordanian telecommunications sector, and Al-Qahtani (2012), which dealt with the reality of the practice of innovative leadership among secondary school principals in Riyadh from the point of view of principals and supervisors, and the results of Saed (2016), which dealt with the role of innovative leadership in improving the level of organizational culture in the Palestinian Ministry of Health.

7 Recommendations

According to the findings of the analysis, the researchers present a number of recommendations to decision-makers to enhance the desired results from the application of the dimensions of creative leadership in adopting crisis management strategies in public institutions in the State of Qatar through interest in creating strong and solid strategic partnership relationships with strategic partners in the internal environment of a Qatari state, as well as the external environment at the level of countries and regional and global institutions, and work on developing the capabilities of the leaders of public institutions in the State of Qatar through training in skills and methods of solving problems in scientific ways through scientific thinking and focusing on predicting problems before they occur. And the need for public institutions in the State of Qatar to pay attention to indicators of growth and leadership, such as training on brainstorming sessions, new ways and methods of work, generating creative ideas, enhancing innovative knowledge, and trying to inform them of what is being developed of creative methods and thinking outside the box.

A Systematic Review on the Influence of Entrepreneurial Leadership on Social Capital and Change Propensity

Khadija Alameeri, Muhammad Turki Alshurideh, and Barween Al Kurdi

Abstract The last three decades have been characterized by an increased number of research studies examining how the management of organizations has become a critical area of concern in modern literature. This paper presents a systematic literature review of the influence of entrepreneurial leadership on social capital and change propensity. The work clearly states the research question on how these variables affect a firm's success. The methodology involved drawing ideas from recent studies that have explored the association between leadership styles and an organization's ability to achieve consistent social capital and effective change management. Relevant literature was accessed on Google scholar search and used to examine the relationships between the variables. This study seeks to fill a gap in the literature by presenting a theoretically-grounded methodology that helps leaders design and adopt approaches that focus on achieving and integrating social capital in managing change in organizations.

Keywords Systematic review · Entrepreneurial · Leadership · Entrepreneurial leadership · Change propensity · Social capital

1 Introduction

Entrepreneurial leadership is the cornerstone of development for any organization that aims at achieving outstanding milestones in business. While various researchers have focused on the importance of proper management of companies, there is a need for methodical approaches to assess the significance of actualizing social capital to initiate and implement change processes (Chitsaz et al., 2019; Dean & Ford, 2017; Ximenes et al., 2019). The paper provides the literature review based on the role of entrepreneurial leadership in articulating common organizational values, vision, risk-taking, effective communication, and creativity.

A number of scholars have drawn parallels between social capital and change propensity historically and conceptually (Clark et al., 2019). In this emerging concept, some scholars define entrepreneurial leadership within a narrow view, specifically within the context of small businesses (Alameeri et al., 2021; Dost et al., 2018; Felix et al., 2019; Leitch & Volery, 2017; Mehmood et al., 2019a; Yani et al., 2020). Although it may appear as if there is a single leadership approach to the actualization of social capital, a closer examination would reveal that numerous strategies may be necessary to align these to favor the propensity of change within an organization. Alameeri et al. (2021), Al-Dhuhouri et al. (2021), AlShehhi et al. (2021), Harahsheh et al. (2021), Madi Odeh et al. (2021), Mehmood et al. (2019b) argued that this new paradigm of management stretches beyond the convergence of fields and is linked to the characteristics of leadership styles across diverse conditions and contexts.

The purpose of this paper is to provide an insight into the development of entrepreneurial leadership. The resulting systematic literature review and discussion delve into providing a conceptual map of the prevailing state of research in the new paradigm with a view of identifying directions into future studies. It provides a benchmark for further investigation into the influence of entrepreneurial leadership on social capital and inclination to change.

2 Research Question

Does entrepreneurial leadership influence the development of social capital and enable organizations to have a high propensity to change?

3 The Motivation to Investigate the Research Question

Current studies have explored the link between leadership style and the organizations' ability to attain social capital and effective change management. Nevertheless, there is growing confusion because these studies claim that such a relationship depends

on the leadership approach. Despite its growing influence on the two aspects of business, most of these studies undermine the role of entrepreneurial leadership in developing social capital and the ability of the organizations to cope with emerging changes in the business environment. Besides, studies attempting to explore the link between entrepreneurial leadership and social capital have appeared to ignore this leadership strategy's role by contending that social capital only associates with transformational and democratic leadership approaches (Abu Zayyad et al., 2021; Al Kurdi et al., 2021; Allozi et al., 2022; Al-Maroof, et al., 2021; Alshurideh et al., 2019). Other researchers have argued that social capital depends on multiple factors, including individual attitudes and behaviors in the workplace (Al Khasawneh et al., 2021a, 2021b; Aljumah et al., 2021; Almazrouei et al., 2021; Nuseir et al., 2021; Refae et al., 2021). Therefore, there is a need to determine the role of entrepreneurial leadership in developing social capital and effective change management.

4 Research Methodology

The primary method that would be applied in the literature review is the systematic review methodology. It involves a critical description and appraisal of current and previous studies associated with a particular research inquiry to determine relationships between themes and ideas (Ahmad et al., 2021; Al Naqbia et al., 2020; Al Suwaidi et al., 2021; Alhashmi et al., 2020; Alshamsi et al., 2021; Bazan et al., 2020; Linares-Espinós et al., 2018; Mehmood et al., 2019c; Mehrez et al., 2021; Mishra & Misra, 2017). The systematic review strategy will involve two significant steps: identifying the research process and determining which secondary research sources would help provide the study with the resources (Ahmad et al., 2021; Alhashmi et al., 2020; Assad & Alshurideh, 2020; Bettayeb et al., 2020). The study will adopt two search strategies. The first one will involve using Google Search Engine to locate studies relevant to the systematic review. The second one will include using specific searching terms and phrases such as "influence of entrepreneurial leadership on social capital" or influence of entrepreneurial leadership on change management."

5 Tabulated Systematic Literature Review

Author/s	Year	Title	Sample	Country of origin	Main aspect	Method	Main findings	Future directions
Mamun et al. (2018)	2018	Entrepreneurial leadership, performance, and sustainability of micro-enterprises in Malaysia	100 people	Malaysia	Establishing the link between entrepreneurial leadership, performance d sustainability of micro-enterprises	Cross-sectional research design	Entrepreneurial leadership contains emotional intelligence that sustains micro-enterprises	Future studies should incorporate relevant constructs in the present model to explain detailed aspects of entrepreneurial leadership in relation to achieving social capital and change mobility
Leitch and Volery (2017)	2017	Entrepreneurial leadership: Insights and directions	Sampled previous studies/no Primary study	Not specified	Providing insights and directions about the link entrepreneurial leadership and its impact on social capital		Entrepreneurial leadership is still evolving. It lacks appropriate tools to determine its traits and nature	Should focus on determining the key attributes of entrepreneurial leadership

(continued)

(continued)

Author/s	Year	Title	Sample	Country of origin	Main aspect	Method	Main findings	Future directions
Mishra and Misra (2017)	2015	Entrepreneurial leadership and organizational effectiveness: A comparative study of executives and non-executives	410 workers for India's firms	India	Determining the relationship between entrepreneurial leadership and organizational effectiveness		Executives and non-executives differed on the role of this leadership style on a firm's effectiveness	Future studies should include other organizational variables to draw possible links
Mehmood et al. (2019b)	2019	Impact of Entrepreneurial Leadership on Employee's Innovative Behavior: Mediating role of Psychological Empowerment	301 managers and employees of SMEs	Pakistan	The mediating role of psychological empowerment that entrepreneurial leaders have on workers		Entrepreneurial leadership has a direct impact on intelligent behaviors in workers and an indirect impact on intelligent behavior through psychological empowerment	Future researchers must adopt longitudinal to validate the existing link between entrepreneurial leadership and intelligent behavior

(continued)

(continued)

Author/s	Year	Title	Sample	Country of origin	Main aspect	Method	Main findings	Future directions
Ranjan (2018)	2018	Entrepreneurial leadership: a review of measures, antecedents, outcomes, and moderators	Review of 50 studies	India	Reviewing measures, antecedents, outcomes, and moderators. Examining the dimensions of Entrepreneurial leadership (strategic factors, communicative factors, motivational factors, personal factors, and leadership behaviors		The research discovered EL traits, including ambitiousness, performance-oriented, diplomatic behaviors, inspiration, positive attitude, intellectual stimulation	Extend future research on the possible link between the mentioned constructions and employee performance
Yang et al. (2019)	2019	Entrepreneurial Leadership and Turnover Intention of Employees: The Role of Affective Commitment and Person-job Fit	427 workers	China	The mediating role of affective commitment created by EL on-employee turnover intentions		The study discovered that EL promotes effective commitment, which eventually reduces employee turnover intentions	Future research can collect data from more companies to gather more insights into the relationship

(continued)

(continued)

Author/s	Year	Title	Sample	Country of origin	Main aspect	Method	Main findings	Future directions
Ximenes et al. (2019)	2019	Entrepreneurial leadership moderating high-performance work system and employee creativity on employee performance	200 workers	Indonesia	Entrepreneurial leadership as a moderator of performance work systems, employee creativity, and performance		The research discovered that EL influences high-performance work systems, which eventually influence employee creativity and performance	The results could not be generalized. Hence, future studies should expand the scope of the study beyond cooperatives
Miao et al. (2018)	2018	How Leadership and Public Service Motivation Enhance Innovative Behavior	281 Chinese civil servants	China	How various leadership approaches influenced innovativeness in employees		Entrepreneurial leadership influences innovation in employees	Future researchers should use objective data to determine innovative behavior

Licensed to (putm@utm.my)

(continued)

Author/s	Year	Title	Sample	Country of origin	Main aspect	Method	Main findings	Future directions
Cai et al. (2019)	2019	Does entrepreneurial leadership foster creativity among employees and teams? The mediating role of creative efficacy beliefs?	43 leaders and 237 employees	China	Using social cognitive theory, the researchers wanted to establish the link between EL, individual creativity, and team creativity		There is entrepreneurial leadership creativity generated by creative efficacy beliefs	Future research on this subject should focus on other countries that nurture collectivist cultural norms
Li et al. (2020)	2020	Impact of Entrepreneurial Leadership on Innovative Work Behaviour: Examining Mediation and Moderation Mechanisms	350	China	The influence of entrepreneurial leadership on innovative work behavior and culture among employees		There was a significant relationship between entrepreneurial leadership and innovative work behavior	The study relied on cross-sectional data of a single country. Future researchers should focus on more countries

6 Results

6.1 Entrepreneurial Leadership, Social Capital, and Change Propensity

Despite some studies ignoring the influence of entrepreneurial leadership on the organization's social capital, others have captured the issue and provided evidence for such relationships. First, it is vital to ascertain the nature and characteristics of entrepreneurial leadership before drawing the connection between the two subjects. To evaluate the critical attributes of entrepreneurial leadership, Leitch and Volery (2017) defined this leadership approach as one that involves influencing other individuals in a workplace to engage in collective efforts towards achieving shared goals. In a different study that explored entrepreneurial leadership in the context of organizational performance and sustainability, entrepreneurial leadership generally involves a combination of leadership and entrepreneurial capabilities (Mamun et al., 2018). Such combinations portray a hybrid leader who can effectively influence others to achieve a common goal, optimize risks, encourage innovation, and take advantage of presenting opportunities in a dynamic environment.

6.2 Entrepreneurial Leadership and Change Propensity

A propensity to change is the likelihood of a company to change its structure and functioning in response to emerging issues (Harrison et al., 2018; Sarabi et al., 2020; Sawaean & Ali, 2020). The research associates this unique potential of companies to high levels of innovativeness and creativity often nurtured through a careful application of the entrepreneurial leadership approach. As discussed by Dean and Ford (2017), entrepreneurial leaders discover and tap opportunities in a dynamic business environment to alleviate risks, create new ways of thriving, and increasing organizational innovativeness.

7 Limitations of the Literature Review

The research method used in this systematic literature review has numerous merits and demerits. A distinguished usefulness of the methodical search is the use of up-to-date and peer-reviewed sources to provide applicable responses to the research question. Nonetheless, the literature review has been restrained by the phrases "influence of entrepreneurial leadership on social capital" and the "influence of entrepreneurial leadership on change management" used to identify and retrieve the information. As a result, further studies should look for better sources that have not been included

in the synthesis. The approach to selecting the vital terms and keywords was intentionally meant for the identification of reliable literature on the relationship between entrepreneurial leadership and achievement of social capital in organizations. The second limitation of the study was that the search method was constrained to publications written in the English language, which led to a bias inclining to research conducted in English-speaking countries.

8 Directions for Future Research

As highlighted by the systematic literature review, the concept of entrepreneurial leadership opens vast opportunities for further research. Although this area of study has drawn increased attention recently, the influence of entrepreneurial leadership on social capital and change propensity has received little consideration (Ha et al., 2020). Intellectual developments in this concept have presented researchers with opportunities to explore the role and influence of leaders in shaping the abilities of workers to accept change processes (Dabić et al., 2021; Obeidat et al., 2021; Pasricha & Rao, 2018). Since entrepreneurs from different countries face unique challenges due to discrepancies in GDP per capita, policies and conditions suitable for business may not favor them equally (Al-Gasaymeh et al., 2015, 2020; Al-Jarrah et al., 2012; Hsiao et al., 2016; Hsu & Chen, 2019; Setini et al., 2020; Theodoraki et al., 2018). The review has raised questions that would be useful in conducting future research. For instance, how can entrepreneurial leadership attributes be developed to realize social capital and change propensity? Consequently, there is a need to carry out further surveys to come up with a definitive model of entrepreneurial leadership that clearly expresses the link between the mentioned variables.

9 Conclusion

Many studies undermine the role of leadership styles in actualizing social capital and effective change management in organizations. While many of the authors acknowledge that little research has been done to draw relationships between social capital and change propensity, the systematic literature review proves that entrepreneurial leadership is a relatively new area of study. Nonetheless, facts from the review indicate that it is an essential factor in the development of an enterprise through capitalization on human resources and active management of change. The findings of the study underpinned the conceptual development of management frameworks that promote shared values, vision, risk-taking, effective communication, and creativity. A concern that arose from the literature review is that some studies overlooked the influence of entrepreneurial leadership on the organization's social capital, while others adequately covered the issue by providing evidence for such relationships.

Factors and Challenges Influencing Women Leadership in Management: A Systematic Review

Khadija Alameeri, Muhammad Alshurideh, and Barween Al Kurdi

Abstract Leadership and management have always been common among men, yet women are stepping and succeeding into these roles too. However, with any new change that is projected to a system, challenges arise to reach adaptation or even acceptance of the change. This paper aims in pointing out the challenges and difficulties faced by women in their leadership and management roles. Six factors were studied which are competence, perception, stereotyping, harassment, organizational culture, and gender inequality on the performance and participation of a person, and thus how they impact gender discrimination. The results have presented a set of impressive challenges faced by women in their leadership roles such as gender and sex-based discrimination, stereotyping, harassment, gender inequality and perceived incompetence. This paper articulates the importance of paying attention to the factors affecting women in leadership and management in order to empower them and decrease gender discrimination in the workspace.

Keywords Women leadership · Gender inequality · Stereotyping · Lack of competence · Discrimination · Harassment · Gender inequality

1 Introduction

Nowadays, it is increasingly evident that women hold leadership positions, and this is always a topic of discussion. In the modern period, many stereotypes formed over the centuries are beginning to be rethought in society, in particular, the idea that women are destined. The paper aims to consider certain difficulties that female leaders face. Regardless of gender, a successful leader should have a certain set of personal and professional qualities. Strong character, ability to lead people, responsibility, business sense—all that is necessary for the leader. Currently, both men and women can possess these traits. Despite this, there are differences between male and female forms of management. A woman leader rarely resorts to an authoritarian style of management, she most often uses persuasion methods, tries to motivate staff, and does not force them to fulfill their goals and objectives. In conflict situations and negotiations, she might often seek a compromise, rather than coercion, carefully considers decisions, taking into account the opinions of others.

Modern working people and women in management need to make maximum personal efforts to create real competition for men in the managerial labor market. The success of professional self-realization depends not only on competencies, creative and creative thinking; but also on the gender characteristics of the individual. They also have competitive qualities such as high educational potential, sociability, responsibility, integrity, and hard work. Some features of the career strategy of women are presented, the leadership style of which is individual. Each female leader uses the experience of other leaders, including men, often shows traditionally masculine qualities, of course, not forgetting about feminine qualities, but she always introduces a personal, individual component in her professional activity, which is always tuned for success.

2 Literature Review

There are a number of key factors and challenges that directly or indirectly affect women's leadership in management. In the manufacturing industry, it is important to note that women are influenced by their level of competence, family support, and emotional stability (Al Khayyal et al., 2021; Harahsheh et al., 2021; Klenke, 2017). It is mainly due to the fact that the given field puts a significant amount of stress on women. The study conducted in New York shows that women in the automotive industry are primarily affected by appointment criteria, work environment, and skills and knowledge, and all these factors are manifested in their overall performance (Glass & Cook, 2016). In addition, stereotyping plays a major role in determining a woman's success as a leader, because it hinders career progression (Brookes, 2010). Gender inequality and stereotyping are also critical factors that influence women of color substantially due to two main components, such as racism and sexism (Abuhashesh et al., 2021; Alshurideh et al., 2021; Sanchez-Hucles & Davis,

2010). In the context of trait, contingency, and behavioral leadership, women are more likely to be subjects of gender inequality and stereotyping, and harassment (Al Kurdi & Alshurideh, 2021; Ayman & Korabik, 2010; Nuseir et al., 2021). Therefore, various leadership approaches become more challenging for female managers (Alameeri et al., 2021; Allozi et al., 2022; AlShehhi et al., 2021).

Organizational culture is another important challenge to consider due to the fact that traditional leaders cannot fully adapt to the modern concept of diversity. Therefore, they tend to exclude women from key positions (Al-Dhuhouri et al., 2021; Eagly & Chin, 2010; Madi Odeh et al., 2021). The given factor also creates a thick glass ceiling which makes it difficult for women to climb to upper management positions (Glass & Cook, 2016). On certain occasions, women may lack competence in specific fields due to the absence of proper supervision and guidance (Klenke, 2017). The given factor might be manifested in the fact that there is gender inequality in educating and training female workers (Flick, 2015). Women are prone to experience significant challenges in the context of business and entrepreneurship (Alameeri et al., 2021; Gray, 2019; Mehmood et al., 2019). The factor of stereotyping women can hinder their ability to express outstanding leadership behavior (Chin, 2011). In counseling and negotiations, there are also elements of stereotyping that constrain them in leading a successful negotiation process (Levitt, 2010). Thus, the latter notion decreases women's overall performance in a number of industries.

The factor of discrimination against women is present across many nations. In India, gender inequality in the organizational environment alongside the local culture acts as a major factor diminishing the role of a woman as a leader (Swarup, 2014). In addition, a New Zealand study shows that specific programs allow women to regain their self-confidence in order to properly perform in managerial positions in an organization (Harris & Leberman, 2012). There is a problem of objectification of women's bodies which can be a key major factor in setting the perception of women's inferiority (O'Neill, 2019). The given faulty perception is a form of sexism, which prevents women to acquire upper-management occupations (Ibarra et al., 2010). Gender inequality is also affected by women's work and family problems, where they are in a vulnerable position of duality, where they need to care for their family and perform their male counterparts (Hideg & Shen, 2019). This issue is strengthened by the fact that stereotyping based on cultures and traditions is prevalent across all fields, such as politics and business (McLean & Beigi, 2016). These factors play a detrimental role in hindering women's performance in management and their ability to reach higher positions.

3 Methods

The methodology used was primarily manifested in a systematic review of recent literature on women's performance and participation in management and the workplace. A number of sources were searched for the most relevant and important keywords regarding the subject (Ahmad et al., 2021; Ahmed et al., 2021; Al Naqbia

Licensed to (putm@utm.my)

et al., 2020; Al Suwaidi et al., 2021; Alhashmi et al., 2020; Alshamsi et al., 2021; Assad & Alshurideh, 2020a; Bettayeb et al., 2020; Mehrez et al., 2021; Shah et al., 2021). These keyword searches are summarized and presented in Table 1. A total of 123 articles and books on the subject were screened and overviewed, from which 16 sources were selected. Table 2 shows the frequency and type of databases used in the literature search as done by other studies (Alketbi et al., 2020; Al-khayyal et al., 2020; Almaazmi et al., 2021; Almazrouei et al., 2021; AlMehrzi et al., 2020; Alsuwaidi et al., 2021, 2021; Alyammahi et al., 2021; Assad & Alshurideh, 2020b; Yousuf et al., 2021).

4 Results

In order to obtain and analyze major challenges affecting women in management, the primary external factors were summarized and categorized into six classes, which are competence, perception, stereotyping, harassment, organizational culture, and gender inequality. The detailed information on each source and the external factor discussed are demonstrated in Table 3. In addition, Table 4 shows how the given external factors and databases are correlated with each other. Inclusion/exclusion criteria are represented and demonstrated in Table 5 and the critical inclusion questions are listed in Table 6. Figure 1 demonstrates the flowchart of the study selection process. The result of the quality assessment process is presented in Table 7 and the research model is presented in Fig. 2.

The following hypotheses were generated:

H1a: Stereotyping has a negative effect on women's participation in management.
H1b: Stereotyping has a negative effect on women's performance in management.

Table 3 The papers' sources chosen and the external factors found

Authors	Dependent factors	Sample size	Place	Subjects	External factors
Ayman and Korabik (2010)	Performance	180 women	India	Employees	Harassment
Brookes (2010)	Participation	135 women	Nigeria	Employees	Stereotyping
Chin (2011)	Participation	85 women	Florida	Employees	Stereotyping
Eagly and Chin (2010)	Performance	80 women	New York	Employees	Organizational culture
Flick (2015)	Performance	85 women	Arizona	Employees	Gender inequality

H2a: Discriminatory organizational culture hinders women's participation in management.
H2b: Discriminatory organizational culture hinders women's performance in management.
H3a: Gender inequality acts as barrier for women's participation in management.
H3b: Gender inequality acts as barrier for women's performance in management.
H4a: Discriminatory perception negatively affects women's participation in management.
H4b: Discriminatory perception negatively affects women's performance in management.
H5a: The lack of competence hinders women's participation in management.
H5b: The lack of competence hinders women's performance in management.

Table 4 The external factors found connected to each database used

External factors	Databases					
	SAGE journals	Wiley online library	Google scholar	APA PsycNet	Elsevier	Total
Competence	0	0	1	0	0	1
Perception	1	0	1	0	0	2
Stereotyping	1	1	1	1	0	4
Harassment	0	0	0	1	0	1
Organizational culture	1	0	1	1	1	4
Gender inequality	2	0	1	1	0	4

Table 5 The used inclusion/exclusion criteria

Inclusion criteria	Exclusion criteria
Should involve the factors and challenges that influence women in management	Factors and challenges affecting women in management are not present
Should include possible causes of women discrimination in the workplace or organization	Possible causes of discrimination are not present
The study must be in English	Non-English sources

Table 6 The critical inclusion questions used

#	Questions
1	Are the subject and goals being specifically targeted women in management?
2	Does the study specify factors and challenges affecting women in management?
3	Are data collection and analysis methods adequate?
4	Does the study contribute to the current knowledge?

H6a: Harassment negatively affects women's participation in management.
H6b: Harassment negatively affects women's performance in management.
H7: Women's participation in management faces gender discrimination.
H8: Women's performance in management faces gender discrimination.

5 Discussion

Gender discrimination in the world of work is a multilateral phenomenon with a large number of different manifestations. Nevertheless, some researchers are convinced that discrimination is becoming the norm, while others, on the contrary, deny the very fact of its existence on the basis of sex. It is necessary to analyze the degree of

discrimination against women, that is, the extent and form of restriction of their rights in any sphere of public life, primarily industrial, but also family, social, political, and spiritual. This approach aims to explore the mechanism of integration of women in the entire system of government, society, and the economy. In fact, any social institution whose activity, the principle of gender equality, is deliberately violated can act as a subject of violence. Social discrimination of women is most expediently investigated in a double plan. On one hand, this is a social phenomenon that encompasses a large demographic community, consisting of various social, professional, age, and status groups. On the other hand, it is a social process with a successive change in the state of an object. Under the influence of external and internal conditions, objective and subjective factors, the process inherent in the sustainable interaction of female society with various social institutions and communities in order to achieve equal rights and opportunities, eliminate discrimination based on gender.

The forms of social discrimination of women, depending on the sphere of their activity, can be different. By its type, discrimination can be both violent and non-violent. In any case, the basis of discriminatory actions is violence against a woman's personality. A sociological study of social discrimination against women is based on data from a number of particular sociological factors. Among them, the concept

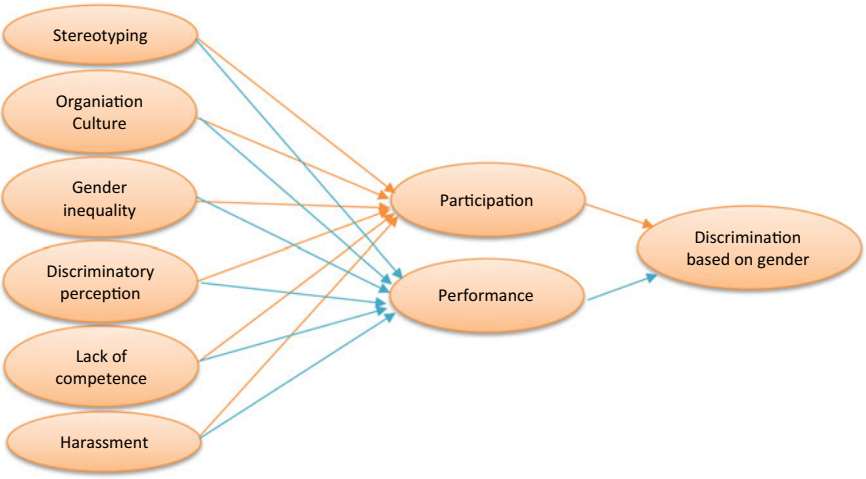

Fig. 2 The study proposed model

of gender identity reflects ideas about the field, and through their consciousness identified with it. Awareness of one's gender does not always correspond to the biological characteristics of an individual. The concept of gender ideals reflects public ideas about male and female behavior, in recent decades they have changed

significantly. The category of biological sex means taking into account the primary and secondary characteristics typical of men and women. The concept of sexual role is associated with the division of labor, with the rights and obligations of the sexes.

The female leader feels the surrounding world more subtly, does not go to an open conflict, which can harm. In relation to the staff, she is more open than men, she does not seek to keep her distance. She may be interested not only in the work process, but also in her personal life. This allows you to make the relationship more trusting, more friendly, which has a beneficial effect on the results of the work. A woman leader treats subordinates with warmth and attention, since maternal instinct is inherent in any woman. Women govern with instruments of influence based on horizontal connections, and men with instruments of power. Literary analysis has shown that there are few publications on gender management issues, all the more so when it comes to comparative analysis of gender theories. At the same time, the situation of women, who make up more than half of the population, reflects the state of society as a whole. Only recently, women began to actively occupy leadership positions, becoming the first persons of corporations, and even states.

The success of a woman as a leader and manager depends primarily on two factors—objective and subjective. The first is the efforts that the woman herself will make in order to achieve success in her career. The second is from stereotypes and views on it from the side and often from the side of men. That is, subjectively, a woman's career will depend on the social and cultural environment in which the woman rotates, and in which her personality and business environment are formed. As noted above, in general, assessments of the perception of women were the result of many factors—religious, political, social. The feminine principle was ontogenetically secondary and often subordinate to the masculine principle. In addition, it was the male sex who was the landowner and breadwinner, and this was also reflected in the legislation of that time. The birth of girls in the family was a painful and joyful event for the family and the financial conditions. The woman was completely subordinate to the man, both psychologically and economically.

However, over time, everything began to change. Nevertheless, the introduction of legal equality and a certain change in social roles could not completely distort the traditional patriarchal views. From the results, it seems that men continue to occupy top management positions, and women could be content only with grass-roots management. No one will deny the fact that a working woman is an everyday occurrence. However, the female leader sometimes causes some inhabitants some doubt and not many women manage to stand on the top of the career ladder. The reason for this difference is that female and male labor is evaluated differently, due to stereotyping. Perhaps with leadership, one must combine intuition, rigidity, and diplomacy, adhere to ethical standards and be philanthropic.

Gender features of the management style are very relevant issues in the psychology of management due to the fact that positive trends are currently emerging. When hiring a manager, they began to give preference to women, because, unlike men, they are characterized by a low level of empathy, communication skills, conservatism, and aggressiveness. Women not only unite employees, show sympathy, but also know how to motivate them to perform difficult tasks in critical situations (Gray, 2019).

Gender features of managerial activity are the characteristics of men and women leaders, manifested in the implementation of the main managerial functions, in the types and types of managerial decision-making, and the specificity of response to the impact of psychological factors of activity. Management style is a relatively stable system of methods, methods and forms of influence of a leader on subordinates in accordance with the goals of joint activities.

At the same time, in the analysis of managerial literature, the overwhelming majority of works clearly show latent discrimination against women. It is believed that the manager and specialist is necessarily a man, and the assessment of personality behavior, analysis of managerial situations, recommendations for the development of managerial decisions are given precisely from male positions. Moreover, the peculiarities of a woman's reaction to the external environment, the motivation of her actions, and personal characteristics are considered extremely limited. The reasons lie in the patriarchal views on the role of women, rooted in the mass consciousness. For centuries, a man raised the primary perception of a woman as the guardian of the hearth, the teacher of children, and the hostess in the kitchen. Each new appearance of a woman in management is presented as a sensation. At the same time, economic instability, periods of recessions, and booms predetermine the inevitability of a change in ideas about effective management.

It can be speculated that women quickly gain experience managing firms in situations of uncertainty. To counter stiff competition in modern conditions has become possible thanks to the involvement of women leaders practicing managerial style. This was mainly expressed in the development of more flexible forms of management orientation to an ever-changing situation. The introduction of a new mentality, style, methods inherent in the female management style into the renewed management has contributed to increasing the competitiveness of products through the search for the optimal combination of male and female management. Differences in the hierarchy of values, behavior, motivation between men and women are manifested in the desire to organize the management process in different ways. A woman is considered a more effective leader in the areas of staff motivation, communication, and decision-making processes. Speaking about the potential of women managers in management, it is important to note a number of features that confirm that the female management style is much richer. Firstly, a woman reacts more subtly to the moral and psychological climate in the team, relies on attention technology. Secondly, a woman is inclined to resolve a conflict situation, to experience the possible outcome of events.

The ever-changing change in social relations in the economy has led to serious problems in the employment of women, especially with regard to their career growth. Thus, the ongoing exclusion of women from the field of intellectual work, the employment of women in various sectors of the economy without formal employment, and discrimination against women in the workplace have determined the low level of women in the management sphere, and this despite the fact that working women make up a significant part of the working population. It is well known that professional activity is one of the main areas of personal self-realization. In professional

activities, a person reveals and shows his skills, communicative and professional qualities. It is this activity that allows a person to be a special individuality, to achieve recognition of their originality and originality, significance for other people, and the society as a whole.

A professional career should be considered as a process of self-realization of an individual in his main and socially significant sphere - in the form of a person moving from one professional status to another. This shows the special role of the individual and the mandatory coordination of the needs and capabilities of the individual with the competencies and qualification requirements of the profession. On the one hand, this means that a person was able to realize himself, and on the other, the fact that his activity was highly appreciated. In this regard, a caree—r is of great importance in the professional development of an individual. Career is an activity of conscious implementation of professional advancement, as a result of which a status appears that guarantees an acceptable level of social and professional recognition. The specifics of women's professional careers are the presence of sex-role stereotypes that affect the degree of manifestation of their career activity, as well as the personal characteristics of women, which result in the efforts made by them in the process of professional and career growth.

Moreover, these efforts are the main components of women's readiness to pursue a career. However, it is necessary to take into account the fact that not all women strive for leadership in the professional sphere. For some women, professional career and professional growth are in first place among life strategies and values, while for another part of women, work is supportive. This category of women does not seek to occupy a higher position, leadership positions, they self-actualize themselves in the family, they are quite satisfied with their position and salary. Thus, it is not possible to consider all women as a social group that has certain characteristics.

Modern employers prefer career-oriented women to work for them, and of course, it is not beneficial for them to have workers like mothers. The image of a housewife in society is supported mainly by men and is firmly fixed by the media. On the contrary, in professional activities, a woman overcomes a huge number of difficulties. These can be difficulties of both a socio-economic and political nature, such as a personnel management policy that limits the professional growth of women. This includes non-recognition of professional qualities by colleagues, unemployment, and fierce competition from men. Considering professional activity, it should be said about the self-realization of the personality, which is perceived as the realization of individual and personal capabilities of a person in their creative activity. A person realizes their own potential, a combination of knowledge, skills, creative abilities and abilities, as they realize their significance, goals of the activity, and methods of its implementation. The problem of professional self-realization is determined by the growth of requirements for professional activity and the growth of human attention to the expansion of their capabilities.

A professional career for men and women is built in different ways, therefore, it is necessary to determine the competitive qualities of women, the style of their leadership, and the urgent problems of women leaders. Currently, a woman has the right to choose the most attractive orientation to her family, professional or social

activities. However, women's leadership in real production continues to be quite low, due to some problems. Firstly, gender asymmetry has developed in the economy, with guaranteed equal rights for men and women in management, women, unfortunately, do not have equal opportunities with men to engage in leadership activities. On one hand, asymmetry is associated with objective difficulties in managing enterprises, and on the other, it is determined by patriarchal stereotypes of society.

Secondly, it is an entrenched patriarchal-conservative view of the leadership profession as a purely masculine one. It is worth paying attention to the fact that all the names of leadership positions are masculine and it becomes clear why a woman has to overcome a great many barriers to career growth in order to occupy the position of head of the organization. The modern world of business involves a masculine manner of behavior and lifestyle, and it is difficult for men to perceive women with power. Professionally independent women constantly come to grips with the male desire for excellence and the stereotypes that exist in society about female abilities. It turns out that women are forced to show their business qualities a hundred times more to be taken seriously. In this regard, the man himself is changing, with whom the fate of a prosperous wife is connected and there is a change in the principles for the redistribution of responsibilities in the household. Consequently, it can be stated that women have great difficulties in promoting their ranks. The success of a career in many respects depends on herself, on her personal qualities, on the ability to deal with stereotypical thinking in society. The reality is that women achieve success in work not as a result of copying the male management style, but through the use of their abilities, which provide a competitive advantage for women leaders over men.

One of the most important qualities is the industriousness of women is the ability to complete the work that has been started and to take responsibility, which is explained by the maternal instinct. Female executives might be better oriented towards users of the products of their enterprise, towards new services that the market needs (Aburayya et al., 2020; Al-Dmour et al., 2021; Al-Khayyal et al., 2021; Alshurideh et al., 2019; Alzoubi et al., 2020). The flexibility and diplomacy of women, combined with perseverance, allows them to more effectively build relationships with business partners and find mutual understanding and support. Femininity, charm, logic, developed intuition are often used by women leaders to solve the most complex and promising areas. Women managers can also be distinguished from men by greater democracy, willingness to cooperate, and collective decision-making with a skillful distribution of responsibilities between subordinates. Women leaders are probably more law-abiding, which leads to the establishment of constructive relations with authorities (Alshurideh, 2019; Alshurideh et al., 2016; Levitt, 2010; Svoboda et al., 2021). A detailed and thoughtful approach to solving problems, attention to detail, excellent friendship with numbers—all these qualities help female leaders to perceive and analyze details perfectly.
