Thus, modern working women need to make maximum personal efforts to create real competition for men in the managerial labor market. An important role in the promotion of a specialist in the career ladder is played by the style of his communication with colleagues, and in the future, the style of leadership over them. Researchers study the similarities and differences between male and female leadership styles,

and they often disagree (Gray, 2019). The traditional view is that women choose relationship-oriented leadership because they are more emotional in nature and male leadership is characterized by perseverance and determination. There are only some features of the male and female leadership styles, which are determined by the difference in the psychological structure of personality in men and women. A woman effectively implements both survival strategies and development strategies, determining more cautious relationships with her colleagues and partners and, most importantly, avoiding risk strategies. The success of a woman in her career almost always changes the psychological microclimate of the family, as her authority as a mother and wife increases.

The first and most significant advantage is the high educational potential of women. In terms of education, women can lead in both higher and secondary vocational education. Female intuition, combined with a tendency to double-check information through various sources, allows you to choose the most favorable from a variety of decisions, understand the partnership, and evaluate the prospects of starting work. Compared to men, women can be distinguished by greater organization skills, determination, and consistency, which provides female leaders with the opportunity to perfectly notice and take into account any trifles in their work. Sociability is expressed in the fact that female managers use feedback opportunities better than men, they tend to trust behavior, they quickly adapt to changing conditions.

6 Conclusion

In conclusion, it is highly important to understand that factors and challenges affecting women's performance and participation in management are comprised of a multitude of forces. These can include gender and sex-based discrimination, such as stereotyping, harassment, gender inequality, perceived incompetence, and organizational culture. Most industries either do not provide sufficient knowledge and training to women or do not allow them to reach the upper-management and supervisory positions.

The Relation Between Creative Leadership and Crisis Management Among Faculty Members at Imam Abdulrahman Bin Faisal University in Light of the Corona Pandemic from the Perspective of Department Heads

Saddam Rateb Darawsheh, Anwar Saud Al-Shaar, Muhammad Alshurideh, Nabila Ali Alomari, Amira Mansour Elsayed, Asma Khaleel Abdallah, and Tareq Alkhasawneh

Abstract The current study aimed to reveal the relation between the practice of creative leadership style and crisis management among faculty members at Imam Abdulrahman bin Faisal University (IAU), from the perspective of the heads of academic departments. A descriptive correlative approach was used by applying a questionnaire to a random sample of (100) Head of Department, during the second semester of the academic year 1442/1443. The findings revealed that faculty members practice both creative leadership and crisis management to a high degree. The study recommended holding training courses for faculty members, creating incentives systems and rewards, stimulating creative leadership among faculty members in universities, and spreading a culture of creativity.

1 Introduction

The educational and academic sectors as any other sectors in all countries are influenced by emergent crises. However, these crises differ in terms of their quality, severity, and consequences, necessitating the development of effective ways for containing and managing them (Khairullah, 2010). Indeed, since we live in a constantly changing era, the emergence of crises has become commonplace in all business sectors; as a result, being attentive and aware of the effects of these crises has become a prerequisite to successfully managing their positive and negative impacts (Al-Khamees & Al-Salihi, 2019; Joghee et al., 2021; Svoboda et al., 2021). In this context, it is critical for decision-makers in Saudi Arabian universities to prioritize crisis management during the planning and organizing processes, as well as to invest in creative leadership thinking to solve problems and make decisions that reduce the likelihood of crises (Ahmad et al., 2021a, b, c; Al Naqbia et al., 2020; Alshurideh et al., 2020a; Harahsheh et al., 2021; Kahwagi, 2015; Shah et al., 2021).

Several studies have dealt with the topic of creative leadership and crisis management, such as the study of Hamdi (2018), Al-Dhuhouri et al. (2020), Alameeri et al. (1261), AlShehhi et al. (2020), Madi Odeh et al. (2021), Allozi et al. (2021), which aimed to identify the impact of creative leadership on crisis management in Jordanian telecommunications companies. The study variables included (problem-solving and decision-making, changeability, initiative, and risk-taking, ability to communicate and motivate creativity) (Naqvi et al., 2021; Shah et al., 2020). The findings of the study revealed an impact of creative leadership on the employees' crisis management. The study recommended stimulating employees who can innovate and be creative in Jordanian telecom companies.

Also, (Abu Zaytoun, 2015) cited that the employees in the Jordanian Civil Defense Directorates in the North Region possess a highly creative leadership, in his study that aimed to identify the role of creative leadership in crisis and disaster management in the Jordanian Civil Defense Directorates in the North Region. It also revealed a statistically significant relationship between the Innovative leadership dimensions and indicators of crisis management.

According to Sohmen (2015), Al-Salami, 2012, Shakhour et al., 2021), creative leadership comprises the leader's ability to bring about managerial style growth;

Working by activating and utilizing current technologies that are appropriate for the educational environment, conforming to modern era language, and satisfying the demands of the beneficiaries (Al Kurdi et al., 2020a, b; Al-Hamad et al., 2021; Alshamsi et al., 2020; Alsharari & Alshurideh, 2020; Alshurideh et al., 2020, 2019a, b; Bettayeb et al., 2020; Leo et al., 2021). They also emphasized the leader's ability to use innovative work methods for change and improvement, as well as qualitative and quantitative development in the workplace; to solve problems, improve the workplace environment, serve the requirements of subordinates, and influence others (Al Kurdi et al., 2020c; Alshurideh et al., 2019b; Kurdi et al., 2020; Zu'bi et al., 2012). In addition to good manners in dealing with employees, motivating them, and investing their talents and mental abilities in achieving the goals of the organization.

Other scholars add that creative leadership is the idea or suggestion that contributes to increasing the productivity of the organization (Abbas, 2015; Al-Abdullah et al., 2019; Peterson et al., 2015; Shawish & F, 2018).

Al-Hayyaf (2015) proposed a program to develop the administrative performance of department heads in education departments in northern Saudi Arabia in light of their training needs. The results of the study indicated that the training needs of administrative performance of department heads in education departments in northern Saudi Arabia came to a high degree.

While in a study aimed at building a training program in creative leadership for deans of faculties and heads of departments in Jordanian universities in the light of reality and contemporary administrative trend, (Tawiqat, 2007) results revealed that the degree of availability of creative leadership characteristics in the respondents was generally medium. Based on this, a training program in creative leadership was designed for deans of faculties and heads of departments.

Some believe that educational institutions, especially universities, must work to reduce the severity and risks of crises and support creative leadership (Al-Hussein, 2018; Al-Mashaqbeh, 2018; Battah, 2016; Hamdouneh, 2012; Maqableh, 2019) by developing targeted plans that help to address these crises based on the capabilities, as well as the material and human resources that make up effective forces that work and participate in the plans' implementation so that they operate as an immune shield against crises.

It should be noted that, in terms of crisis management, the majority of studies conducted on university education in the Kingdom of Saudi Arabia recommended the establishment of a crisis management unit in university administration to predict the foreseeable future in terms of crises and plan to avoid the risks and effects that they entail.

1.1 Problem Statement

All sectors, including the academic sector, faced an urgent global crisis represented by the outbreak of the Corona pandemic. In fact, the world is still trying to control the consequences of this crisis and plan to reduce its risks, which affected all fields.

Regarding education fields, this crisis led to the closure of schools and to shift to distance learning, and its spread also resulted in governments taking preventive measures that had social and economic consequences. Among the most prominent negative consequences of this crisis are the cessation of learning, the unwillingness of parents for distance learning, the unequal access to educational platforms, the high economic cost, the high dropout rate, and social isolation (Obeidat et al., 2004) which was confirmed by the study of Nairokh (2020) as the results demonstrated the need to prepare for crisis management beforehand through future planning and support the capabilities of the unique faculty members to prevent its occurrence or mitigate its effects. Within the limits of the researchers' knowledge, there are no previous studies on the subject of the current study. Furthermore, the current study is one of several recent studies that have addressed an ongoing crisis.

1.2 Study Questions

The study seeks to answer the following questions:

1. What is the degree of creative leadership practice in crisis management among faculty members at IAU, concerning (originality, flexibility, problem-solving, fluency) from the point of view of department heads, in light of the Corona pandemic?
2. What is the degree of creative leadership practice in crisis management among faculty members at IAU, about (escape, confrontation, cooperation, containment) from the point of view of department heads, in light of the Corona pandemic?

1.3 Study Objectives

The study aimed to achieve the following main goals: To reveal the relation between the practice of creative leadership style and crisis management among faculty members at IAU, from the heads of academic departments' viewpoint in the light of the Corona pandemic.

1.4 The Importance of the Study

The importance of this study is stemmed from the significance of the topic it deals with. The results of the current study may add scientific facts regarding the relation between creative leadership and crisis management in educational institutions. Moreover, the results of this study may benefit faculty members in identifying the creative traits that could be practiced effectively during crises that could afflict or befall academic institutions.

1.5 The Study Limits

This study was limited to an attempt to conclude the relationship between creative leadership and crisis management among faculty members at Imam Abdul Rahman bin Faisal University from the point of view of department heads, during the second semester of the year 1442/1443.

1.6 Study Procedural Terminology

Creative leadership indicates the faculty members' ability to accomplish desired changes to overcome crises by engaging in decision-making and driving solution creation to attain excellence in goal implementation.

*Crisis Management i*medicates what the university's academic leadership and faculty members do in response to present and future crises, following particular preventive measures.

2 Methods and Procedures

2.1 Study Approach

The correlative descriptive approach was used in this study as it helps in studying the phenomenon or research problem and describing it scientifically, to reach logical explanations, which gives the researcher the ability to define the frameworks of the research problem and helps in deducing the research results.

2.2 Population and Sample

The study population consisted of all department heads at Imam Abdul Rahman bin Faisal University in 2020/2021. The study population was chosen from department heads because they are the backbone of the educational process, especially in the field of creative leadership and crisis management. Where the study sample consisted of 100 department heads, (80 males and 20 females), who were chosen through a simple random method from the study population.

2.3 Study Instrument

The researchers benefited from the theoretical literature and previous studies to design a questionnaire including two main axes to meet the study's goals. The questionnaire was composed of two sub-axes: the first axis was for measuring creative leadership, it included (24) items distributed over four domains: originality (7) statements, flexibility (5) statements, problem-solving (5) statements, fluency (7) statements. Where the second axis was concerned with crisis management, including (30) items distributed into four areas: the escape method (8) statements, the confrontation method (7) statements, the cooperation method (7) statements, The fourth area is the manner of containment (8) statements.

2.4 Instrument Validity and Reliability

To check the instrument validity, the correlation coefficients of the scale items with the domain to which it belongs were extracted. The scale items were also analyzed, and the correlation coefficient of each item was calculated. Cronbach's alpha reliability coefficient was applied to check the instrument reliability through the Likert scale. The reliability value of the creative leadership axis was (0.950) which indicates a very high degree of reliability. And the reliability value of the crisis management axis was (0.940) which also indicates a very high degree of reliability.

2.5 Procedures

1. Reviewing the literature on the subject, and previous studies.
2. Preparing the study tool as explained previously.
3. The questionnaire was examined by specialists and modified until it reached the final form.
4. The researchers selected the faculty members using the simple random method from the different faculties of the university.
5. Applying the questionnaire to faculty members in the second semester of the academic year 2020/2021,
6. Entering the questionnaire data into special tables for statistical analysis.
7. Extracting the results of the study and linking them with previous studies to answer the study questions.

2.6 Statistical Analysis

The Statistical Package for Social Sciences (SPSS) program was employed to analyze the data according to the study problem and its questions. The researchers used statistical methods, including arithmetic mean, standard deviation, and one-way analysis of variance (ANOVA).

3 Results and Discussion

3.1 Results of the First Question

'What *is the degree of creative leadership practice in crisis management among faculty members at IAU, concerning (originality, flexibility, problem-solving, fluency) from the point of view of department heads, in light of the Corona pandemic?*' Descriptive analysis was used to answer this question, including computing the mean, standard deviation, degree of consistency, and order, for each of the sub-domains of the creative leadership, and the overall axis as shown in Table 1.

Table 1 shows that the degree of faculty members' practice of creative leadership was high, where the mean of their responses on this axis was (3.65), with a standard deviation (0.85) and a (high) degree. The means of the responses of the faculty members on the sub-domains of the axis ranged between (3.58–3.67). The researchers attribute these findings to the faculty members' possession of the scientific and practical skills that qualify them to be creative in the field of academic leadership, and they also attribute this to their benefiting from the academic development provided to them in this area and to the academic freedom that allows them to be creative in the academically. These results are consistent with what was revealed by Al-Hussein (2018) study, which showed that the primary school leaders in the Hawtah Bani Tamim governorate practice all creative leadership processes, while it differed from the results of the study of Maqableh (2019).

Table 1 The degree of creative leadership practice among faculty members at the university ranked in descending order

Field	Mean	Standard deviation	Degree	Rank
Fluency	3.67	0.93	High	1
Flexibility	3.60	0.87	High	2
Originality	3.61	0.88	High	3
Problem solving	3.58	0.90	High	4
Creative leadership	3.65	0.85	High	

Licensed to (putm@utm.my)

Table 2 The degree to which faculty members practice crisis management

Field	Mean	Standard deviation	Degree	Rank
Containment	3.77	0.86	High	1
Cooperation	3.75	0.90	High	2
Confrontation	3.69	0.85	High	3
Escape	3.45	0.71	High	4
Crisis management	3.69	0.77	High	

3.2 Results of the Second Question

'*What is the degree of creative leadership practice in crisis management among faculty members at IAU, about (escape, confrontation, cooperation, containment) from the point of view of department heads, in light of the Corona pandemic?'* Descriptive analysis was used to answer this question, including calculating the mean, standard deviation, degree of consistency, and items rank, for each of the sub-domains of the crisis management axis, and the overall axis as shown in Table 2.

The practice of the faculty members in crisis management came to a high degree, as the mean of their total responses on this axis was (3.69) with a (high) degree, and the standard deviation was (0.77). Where the means of the responses of the faculty members ranged between (3.77–3.45). These results can be explained by the fact that the faculty members are aware of the academic crises that the university may face during the Corona pandemic, emergencies, and various problems that necessitate preparing for it and preparing the available resources. In addition to the respondents' and society's perceptions of the crisis's threats and the necessity to provide the requisite capacities to deal with them appropriately when they occur. The findings coincide with the results of Hamdouneh (2012), Al-Mashaqbeh (2018), Almazrouei et al. (2020), which revealed that school principals practice crisis management skills to a high degree, and they are also consistent with the study of Al-Khamees and Al-Salihi (2019), which showed that the application of secondary school leaders to decisions concerning managing school crises was high.

4 Recommendations

Considering the findings, the researchers recommend the following:

1. Holding training and development workshops for university faculty members that emphasize the importance of creative leadership and how it can improve members' abilities to manage and face crises.
2. Creating a system of incentives and rewards to encourage creative leadership among university faculty members and to establish a culture of innovation.

3. Developing educational technology, communication, and informatics infrastructure at universities to improve creative leadership and raise the likelihood of success in dealing with academic crises.

The Effect of Transformational Leadership Toward Organizational Innovation: A Study of Aerospace Manufacturing Industry in Malaysia

Mohd Fahmi Ahmad, Nurhanan Syafiah Abdul Razak, Musmuliadi Kamaruding, and Muhammad Alshurideh

Abstract This study objectives are to enhance the understanding of relationship between the transformational leadership on organizational innovation. This framework is proposing to identify the transformational leadership influencing effect in the organizational innovation. A sample of 120 respondent from one of the established Aero Composites Company at Malaysia participated in this research. The result of the study is expected positive support relationship between transformational leadership and organizational innovation. The result of the transformational leadership not only give a significant impact to the process innovation within the organization but in the same time the sustainability of the innovation in driven the better organization management in the competitive market. Only three transformational leadership is considered in the research project which is idealized influence, inspirational motivation, and individualized consideration in the context of aero composites industries generally. This quantitative study used SPSS method for the statistical analysis measurement.

Keywords Transformational leadership · Organizational innovation · Idealized influence · Inspirational motivation · Intellectual simulation

1 Introduction

In the era of dynamic environment with the high demand for new products and amenities almost company in the world are facing the tremendously pressure on sustaining the product, services, competitiveness in the market faced by rapid technology change, shortening product cycle life and globalization itself. The new borderless environment are created enforcement to leader become creative in managing the organization for sustainability, competing and growth the company in a good manner (Mumford & Gustafson, 1988). Innovation through creativity is essential for the success and competitive advantage of organizations as well as for strong markets leader in these new century.

Thus, this situation need creativity and innovation in leadership style (Shin & Zhou, 2003). This passion also facing at aero composite industry since the main player are limited to technology dependency and extensive research and development. Internal and external factor like COVID-19 pandemic also make contribution in today leadership style in managing crisis with digital transformation platform, spirit of changes and comprehensive financial analysis in managing the operation. Current situation shows the demand from aviation industry declining and give a tremendously pressure in the aero composites industries. The decreasing number of flights up to 20% from the world airlines give a big impact to the entire supply chain. In this case, the aero composite company are not excluding from this impact. The reduction of demand almost 40% from MYR945 to MYR540 million by the end of financial year 2020 need to be restrained to ensure the business sustainability. Even the future still uncertain the trend of world Passenger Load Factor (PLF) for commercial aircraft are increasing over the time as per (Fig. 1).

The increasing demand with the limited resource needs to mitigate, in managing these challenges, leader must be strategizing and clear direction to drive the organization sustainability. The unstable and complex future lead the aero composited industries into consideration of fracturing backlog of delivery to customer especially Airbus as a main player in commercial aircraft passenger industries. With the fragile

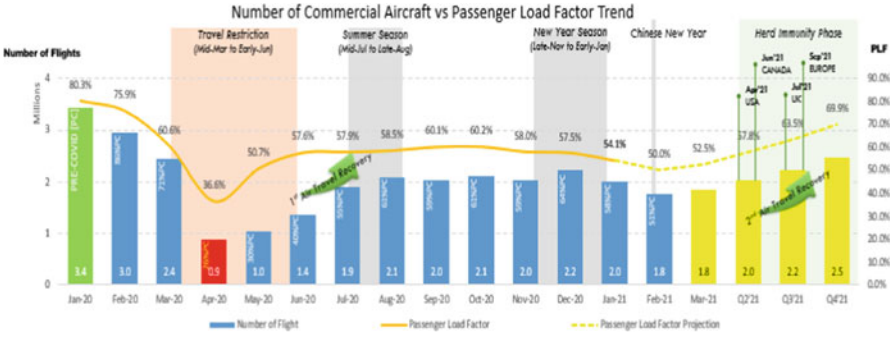

Fig. 1 Commercial aircraft demand and passenger load factor trend (PLF). *Source* (Airbus, 2021)

manufacturing environment, the recovery phases must be handled in a proper manner to make sure the customer need are materialized. The transformational leadership one of leadership style are proven can bring new ideas and possibilities into reality (Bass, 1985). Then, the organizational innovation aims to improve business outcomes by enhancing the current services, process or product to be success in the market (Scott & Bruce, 1994). It is also important for companies to constantly evolve in order to remain sustainable in the face of growing competition from businesses. However, further analysis about the connection between organizational innovation and transformational leadership are essential (Avolio et al., 1999). The strong literature influence and optimistic result of transformational leadership combined with the organizational innovation capability to respond on the demands in the changing of corporate world to makes sure this transformational leadership an attractive strategized in the future. Thus, this research hopefully can contribute additional understanding to the current literature on transformational leadership influencing to organizational innovation especially in the context of aero composite company in Malaysia.

2 Background

The new economic environment and the increasing demand from customer for varieties of product landscapes, services and quality are challenge the companies facing. This situation changes the way of respond and functionary of leadership. An innovation effort is required for organization to stay competitive in the industry. A part of that, organization need effective leaders to change the people. In order to manage the complex pressure, the leader need to come out the best strategies in ensuring business sustainability. The function of leadership as to determinant of organizational inspiration and innovation. This responsible become more important with the growing complexity of job and processes competitiveness in the market. The attribution of innovation as central to competitiveness has been driven by the technological advancement, emergence knowledge economy, competitive element and reliable service in the market. In fact, organizational innovation are more important than before in organization for survival, growth, competing, and remain relevant in the industry (Avolio et al., 1999). Thus, this required an organization to become innovative to gain and survive.

Transformational leadership is knowing as a major determinant of innovation. It can be defined as some or leader share vision and goal inspiring followers in an organization or unit. The leader functional as to challenge the sub accessor to become innovative, problem solver and develop the capability of follower to become a leader by talent development by coaching, mentoring, and providing the challenges and support in materializing the strategic overview (Bass, 1995). In others perceptive, leadership also involves communication among more than one member of a group that regularly engage in managing the situations, perceptions, and expectations of team members.

Innovation can be expressed as an execution of a concept, new item, service, process, marketing strategy, and organizational method. Organizational innovation is essential to current complex organization, this method result from the strategic decision that management has taken. In others words organizational innovation was define as the tendency of an organization or people to changes in developing a new product, services, process and improve it to the new level with its impact on economic development (Gumusluoglu & Ilsev, 2009). Moving forward, the organization must have unique approach to attract their customer, an innovation can play a significant role in this development model. Innovation must be adopted individually and in organizational level to succeed (Jung et al., 2003). Over the years, researchers explored the significant of leadership in influence organizational innovation and identified the related characteristics that significantly affect the organizational innovation (Shin, 1996). Previous studies recommend that transformational leadership has a resilient correlation with innovation both at the organizational level than the individual level (Rosing et al., 2011). Leader are key important roles towards the efficiency of organizational innovation by influencing secure strategic decisions, procedure and policies that are functional as change agent in supporting innovation (Prasad & Junni, 2016). Thus, the right type of leadership are important in driving the effectiveness of organizational innovation (Oke et al., 2009).

Among the empirical study the transformational leadership are most suitable leadership types to enhance the ability of group or organization to change in innovative and creative way in developing the new designs of solutions, organizational structures changes, processes improvement, system practicality and efficiency (Prasad & Junni, 2016).

This study attempts to magnify the understanding of transformational leadership influence of transformational leadership on organizational innovation through resource supply. There are requirement on additional empirical study to support the theoretical proposal analysis on the relationship between transformational leadership and organizational innovation especially on the mediating and mediator variable or determinant need to be examine systematically (Jaskyte, 2004). According to Choi et al. (2016), previous study findings indicate that further research is needed to explicitly focus on the relationship between transformational leadership and organizational innovation, include the limited factor to successes this both relationship. As a finding of previous studies on leadership and innovation have a many opinions and constraint and not drive a simple decision and come out with variation of result and findings. While different leadership styles are positively related to innovation, but most of study show a wide range of correlations based on the setup of moderating conditions. This are lead to arguments that the relationship between transformational leadership and organizational innovation are not always same understanding, which drive for discovering mediating and moderating variable between the theory in detail (Choi et al., 2016). The other studies also suggest, a leader with a transformational leadership style should focus on many areas of the innovation process, such as an overall supportive environment to enhance leader influences. This supportive environment is regarded as an organization's supporting contribution to its employees in order to increase engagement and improve performance (Choi et al., 2016). As a

result, through supporting processes inside the organization, it can encourage people to give their time and efforts to innovation initiatives (Amabile, 1998). Therefore, transformational leadership has a substantial positive relationship with organizational innovation, both directly and indirectly through the level of the organization's climate for innovation. Empirical study highlighted the importance of expanding and refining the measurement of organizational innovation because the variables in the study used need to be quantity in materializing organizational innovation were inadequate enough in generating the success outcomes (Gumusluoglu & Ilsev, 2009a). Hence enhancing this research has an significant contribution to understanding and more practicality systematic approach of the relationship between transformational leadership and organizational innovation (Jong & Hartog, 2007), in aero composites industries generally.

3 Literature Review

3.1 Organizational Innovation

Organizational innovation are refer to tendency or the organization to developed a new product or product improvement either in term of competitive price, good services and the successful in bringing value added products or services to the market (Gumusluoglu & Ilsev, 2009a).

It can be defined as the organizational capability to revamp ideas and understanding into new products, services or processes constantly for the benefit to the organization. Accordingly to the empirical research mention creativity as the production of inspired, valuable ideas, and innovation as the successful reality of innovative ideas neither in the group or organization, from the variance of study several researchers have rather defined organization innovation in concurrence with the individual creativity and recognizing individuals talent are the ultimate underpinning of new improvement (Shalley et al., 2004).

3.2 Transformational Leadership

There has innumerable definition of leader by different researcher in various aspect. According to empirical study leadership can be define as the process of providing a significant track or determination for collective exertion, encouraging and willingness to commitment in materializing the target. Based on previous research transformational leaders have been identified give an influence on innovation, which are the ability leader enhance the tendency to innovate within the corporate organization. Normally the transformational leader use inspirational motivation and intellectual

Licensed to (putm@utm.my)

simulation which are the most critical factor in influencing organizational innovation (Elkins & Keller, 2003). Transformational leadership style are proven effective through the managerial level (Howell & Avolio, 1993), working environment (Bass, 1985), national culture (Jung & Avolio, 2000), computer related setting (Sosik et al., 1998), innovative developmental environment (Howell & Avolio, 1993), and TQM programs (Sosik & Doinne, 1997). The transformational leadership characteristic are answer to the competitive business environment adaptive leadership is considered to be an important tool (Bass et al., 2003). These adaptive leadership behaviours are characterized as transformational leadership. The four component consist of idealized influence, inspirational motivation, individualized consideration, and intellectual stimulation (Bass et al., 2003). In this research only three main components are considered which are, idealize influence (II), inspirational motivation (IM), and intellectual simulation (IS).

3.3 Idealize Influence

Idealized influence is referred to the type of leader with trusted and well respect behaviour by the follower in the organization or group of people. Typically, this type of leader is stimulus to take a new risk and frequently show the act as role model. Another named of this type of leadership are known as known a charismatic. This type of leader is highly regarded on the moral and ethical value. Previous study showed the effect of transformational leadership characteristic among supporter's shows most of the enthusiast are able to take possibility risk after being organizing with transformational leaders. The confident personality and self-efficacy of such leaders in turn affect how the groups feel about their own capabilities (Bass & Riggio, 2006).

Even the idealized influence are was considered as the most important dominant component of transformational leadership style but this component does not be enough to measure the understanding of transformational leadership (Bass, 1995) individually.

3.4 Inspirational Motivation

Inspirational motivation main characteristic are including enunciating a convincing vision, articulating confidence in accomplishing goals, talking positively and passion about the future along with the desires to be accomplished (Jung & Avolio, 2000).

The functional of inspirational motivation are to enhancing and improve team understanding with the organization vision and mission. This technique will lead to increase group member or organization initiatives and awareness to perform beyond

the expectations. The supported levels of motivation is linked towards the higher levels of performance which likely to enhance organizational innovation (Shamir et al., 1993). In these technique leaders encounter followers in reminiscent ways and demonstrate commitment in attaining goals and shared visions. Apart from being consistently included in inspirational motivation in transformational leadership, the establishment of organizational vision and mission is also stated to have relationship in promoting organizational innovation.

As the previous article cited, the successful organization improvement are dependent on the preparation of the followers to achieve the vision through implementation change element, expressing optimism characteristic, confidence and passionate (Jung & Avolio, 2000).

3.5 Intellectual Simulation

An intellectual stimulation is define as a cause's emotion encouragement behaviour among resilient followers. These technique inspire the followers to be innovative and creative in handling problem solution, handling new challenges, and promoting the new way of thinking as a change agent (Jung & Avolio, 2000).

Intellectual stimulation refers to leader who are promotes the intelligence technique, knowledge and learning in developing innovation and solution in problem solving behaviour in materializing the organization improvement planning. These leaders will display environmental awareness and recognize innovation opportunities through cautious evaluation of environment impact (Conger & Kanungo, 1988). According to Woodman et al. (1993), the leader as a founder of different planning and own the obligation on the project by comprehensive strategic planning. At the same time react as inventors and visionaries who inspire team or group of people. The creation of competitive new products within an organization framework is the results of organizational innovation. Commonly, transformational leadership are related to a higher level of performance (Woodman et al., 1993). Transformational leadership have positive impact on employee performance in group and organization (Sosik et al., 1998).

Meanwhile at previous research study have confidence in transformational leadership influences the organizational innovation creatively, these also support by research on actuality and nature of this relationship (Mumford et al., 2002). Finally, the team factor such as intellectual simulation behaviour also influenced by transformational leadership (Waldman & Atwater, 1994).

3.6 Relationship Between Transformational Leadership and Organizational Innovation

From the selected previous research, transformational leadership can be define as the process of providing a significant track or determination for collective exertion, encouraging and willingness to commitment in materializing the target (Avolio et al., 1999).

Transformational leadership are recommended have significant impact in organizational innovation process by using the four element behaviour (Bass, 1995), in this study consideration which are:

1. Idealize Influence (II)—focus on leader charismatic action on value, mission, vision and belief.
2. Inspirational Motivation (IM)—the technique of the leader to gain up the follower in belief on future growth and determinant goal.
3. Intellectual Stimulation (IS)—refer to how the leader challenge their follower in materializing the improvement and creative thinking and solution will be implemented.

While the organizational innovation can be define as the organizational capability to improve the new idea and information in to a new product services or process enhancement continuously give beneficial to the firm (Gumusluoglu & Ilsev, 2009a) and tendency of organization to improve, develop, and sustain the product, process or services to the market (Damanpour, 1991). To relate the transformational leadership with organizational innovation the previous research shows the leadership style will affect the organizational tendency to innovate (Gumusluoglu & Ilsev, 2009a) and in the same time will drive the result beyond expectation by enhancing level of self-confident and motivation (Mumford, 2002). Thus the direct and indirect impact of transformational leadership have correlation to organizational innovation and drive the positive and significant relationship between the two constructions (Gumusluoglu & Ilsev, 2009a). Thus, the various definition of transformational leadership and organization innovation are shows at (Table 1) as summary of the various section overview.

The selection of variable for this research are:

1. Variable 1—Transformational Leadership (IV)
   Transformational leadership style is being used as independent variable (IV) in this research.
2. Variable 2—Organizational Innovation (DV)
   Organizational innovation process is being used as dependent variable (DV) in this research.

Previous empirical case study is had been used to understand the conceptual of the research as per below justification.

Study Title: Transformational leadership and organizational innovation: Moderated by organizational size.

Table 1 Various definitions of transformational leadership and organizational innovation

Definition	Source
The technique decision making units are structured within the organization, the way decision making, power, and skills are distributed within the organization and between decision making elements and the type of information and communication structures that are well organized	Greenan (2003)
Organizational innovation is the introduction of new organizational systems of work and collaboration	Mulej (2002)
Managerial innovations occur in the social system of an organization. It includes rules, characters, procedures and structures that are related to the communication and discussion among people and environment	Damanpour (1991)
Transformational leadership emerged to be effective across managerial levels	Howell and Avolio (1993)
Process of providing a significant track or determination for collective exertion, encouraging and willingness to commitment in materializing the target	Bass (1995)
The special characteristic of organizational innovation can be obtain as it's bring the change to the firm social system, while the change might be not technical and intangible but in the same time it might affect the technical aspects as well	Edquist et al. (2001)
The words of organizational innovation itself in general are applied by the organization by adapting the changing conditions of competition, technical innovation and business growth through introducing better products, techniques and systems	Utterback (1994)
The leader functional as to challenge the sub accessor to become innovative, problem solver and develop the capability of follower to become a leader by talent development via coaching, mentoring, and provision of both challenge and support in materializing the strategic overview	Bass (1985)
Transformation leader are able to bring change in their follower personal normal and encourage the organization performance beyond the expectation at the same time increased the level of motivation similarly with self-motivation	Jung and Avolio (2000)
Organizational innovation can be defined as the organizational capability to improve the new idea and information into a new product services or process enhancement continuously give beneficial to the firm	Bass (1995)

4 Summary

This case study emphasizes on the impact of transformational leadership on organizational innovation. A sample of 296 managers are used from the telecommunication sector at Pakistan. The average ages of participant used within 25 to 60 years.

Hierarchical regression models are used to demonstrate organizational size significantly moderating the relationship between transformational leadership. This study proof that organizational population size is moderated significantly the relationship between all aspects of transformational leadership and shows the positive impact with organizational innovation.

Keywords: Organizational innovation, transformational leadership, attribute charisma, organizational size, inspirational motivation, intellectual stimulation and individualized consideration, idealized influence (Khan et al., 2019).

Based on study model the construction of hypothesis development for this research are:

1. Hypothesis One—Idealize Influence
   H01—Idealized influences is not related to organizational innovation at Aero Composites Company.
   H1—Idealized influences is positively related to organizational innovation at Aero Composites Company.
2. Hypothesis Two—Inspirational Motivation
   H02—Inspirational motivation is not related to organizational innovation at Aero Composites Company.
   H2—Inspirational motivation is positively related to organizational innovation at Aero Composites Company.
3. Hypothesis Three—Intellectual Simulation
   H03—Intellectual simulation is not related to organizational innovation at Aero Composites Company.
   H3—Intellectual simulation is positively related to organizational innovation at Aero Composites Company.

5 Theoretical Framework

The dependent variable (DV) for this study is refer to the Contingency Theory (CT) initiated by "The work of Weber" (1947). Under the scope of contingency theory, the most suitable structure for an organization is the one that best matches a particular operational contingency, such as size of operation (Pugh et al., 1969), technology (Woodward, 1965) or environment. This theory underpins the knowledge of the interactions between nature, technology, environment, structure, and performance (Burns & Stalker, 1961). The demonstrated of differentiate technology and market environment in the perspective of rate of change and complexity will affect the organizational structure and innovation are shown in the (Box 1) (Burns & Stalker, 1961).

Box 1 Mechanistic and Organic Structures. *Source* Burns and Stalker (1961)

Bums and Stalker (1961) set out to explore whether differences in the technological and market environments affect the structure and management processes in firms. They investigated twenty manufacturing films in depth, and classified environments into 'stable and predictable' and 'unstable and unpredictable'. They found that firms could be grouped into one of the Wo main types, mechanistic and organic forms, with management practices and structures that Rums and Stalker considered to be logical responses lo environmental conditions.

The *Mechanistic Organization* has a more rigid structure and is typically found where the environment is stable and predictable. Its characteristics are:

(a) tasks required by the organization arc broken down into specialised, functionally differentiated duties and individual tasks arc pursued in an abstract way, that is more or less distinct from the organization as a whole;
(b) the precise definition of rights, obligations and technical methods is attached to roles, and these arc translated into the responsibilities of a functional position, and there is a hierarchical structure of control, authority and communication;
(c) Knowledge of the whole organization is located exclusively at the top of the hierarchy, with greater importance and prestige being attached to internal and local knowledge, experience and skill rather than that which is general lo the whole organization;
(d) a tendency for interactions between members of the organization to be vertical, i.e. between superior and subordinate.

The Organic Organization has a much more fluid set of arrangements and is art appropriate form to changing environmental conditions which require emergent and innovative responses Its characteristics are:

(a) individuals contribute to the common task of the organization and there is continual adjustment and re-definition of individual tasks through interaction with others;
(b) the spread of commitment to the organization beyond any technical definition, a network structure of control authority and communication, and the direction of communication is lateral rather vertical;
(c) knowledge may be located anywhere in the network, with this ad hoc location becoming the centre of authority and communication;
(d) importance and prestige attach lo affiliations and expertise valid in industrial and technical and commercial milieu external to the firm.

Mechanistic and organic forms are polar types at the opposite ends of a continuum and. in some organizations, a mixture of both types could be found.

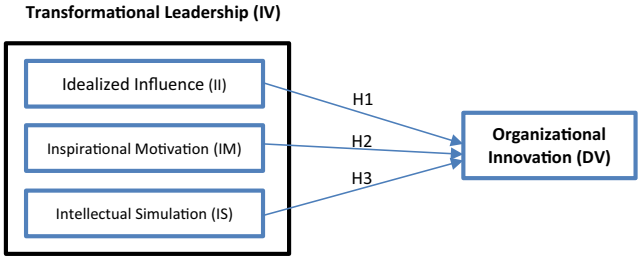

Fig. 2 Research conceptual framework

Discussing on theory of the study, the research framework is develop to demonstrate the relationship between the external determinant and internal determinant in transformational leadership style as the independent variable (IV) with the organizational innovation as dependent variable (DV) as per (Fig. 2).

6 Research Methodology

This research design used quantitative approach to support the hypothesis. The questionnaire will be used to pertaining the leadership style and to excess the full range of leadership scale, the influence factor and the relation with organizational innovation. The study will use data measurement Likert Scale. The scale weightage used logic numbers 1 through 5 with the format indicate (Armstrong, & Robert, 1987). The collection data by conducting an internet web survey trough SPSS application will be presenting the descriptive analysis which provide simple summaries about the sample and the measures. The analysis result will be present using simple graphics analysis in the basis of virtual. Every quantitative analysis of data as part of data analysis and measurement.

7 Conclusion

The ability to continuously innovate by implementing creative efforts as well as the necessary skills and attitudes is critical to an organization's competitiveness. Leadership become major determinant of an organization ability to innovate, with its significant impact on the creation of the organizational vision and the methods to achieve the goal, the benefits of transformational leadership in stimulating organizational innovation can be secure by organizational in the context that support innovation and increased the overall performance of the organization.

Entrepreneurial Marketing: An Approach-Based Paradigm Shift to Marketing

Hanin Damer, Shafig Al-Haddad, Ra'ed Masa'deh, and Muhammad Turki Alshurideh

Abstract This paper aims to augment the research field of Entrepreneurial Marketing (EM) as a concept and approach, and the substantial differences it holds in comparison to the prevailing giving of the marketing. In doing so, the research aims to explore and analyze the causes and drivers that resulted in the emergence of EM as a new school of thought and conceptualize the paradigm shift EM is providing to the prevailing giving of the marketing field. Grounded theory and logical argumentation based on the literature review including both qualitative and quantitative research, to develop the argument leading to conceptualizing the proposed approach-based paradigm. The research conceptualizes a proposed paradigm to formalized marketing with four main components comprising it: resilient management; scalable/gradual matter of sub-frames including multi-dimensional orientation effectual-causal, proactiveness-reactiveness; living strategic process, and Entrepreneurial Innovation. This paper represents the first bold proposal on the need for a paradigm shift to the prevailing marketing giving and introduces a frame for conceptualized paradigm. Specifically, does the body of literature in EM provide a base toward a paradigm shift of the prevailing of marketing giving or only a new school of thought?

Keywords Entrepreneurial marketing · Termed-labeled marketing · The paradigm shift

1 Introduction

Research in entrepreneurial marketing has developed since its inception involving the number of views, lenses, perspectives, theories and models. That aim at defining, investigating, understanding and even measuring and assessing validity and impact. And this holds the main themes of viewing EM. Along with this growth in research comes the notice of labeled or termed marketing, with the adjectives attached to marketing including "conventional", "conventional wisdom", "traditional", "standard", "administrative", "textbook marketing", "corporate traditional marketing" and others. Mostly in the context of explaining the difference between EM and labeled marketing, in addition to other notices on the critique side concerning being no longer suitable to address the changing of the business, economic and market landscape. This labeling of marketing is the result of the emergence of new definitions or models that differs noticeably from the giving of the formalized marketing discipline and curricula. And that proved to be more suitable in the current market landscape. The discipline is still there, but the approach to these elements developed noticeably with applied models differing from the current giving's. While "Marketing" remains as a discipline, this discipline had witnessed development until shaping the formalized principles and theoretical frames deriving the giving of the main textbooks. And it shall also be subject to continual development with the advancement and changes requiring a response. Moreover, research indicates a lag between this discipline as a research body and academia and the business and practice world, which raises the need for such evolvement rather than development.

This paper augments both the research in EM and critique to the formalized marketing to propose the concept of an approach-based paradigm shift in marketing. Arguing that this provides a basis and a call for a paradigm shift, which shifts the approach and concept interpretation providing a frame that, responds to the changes shaping the market, business and economy. In proposing so, this paper also aims to investigate the main drivers behind in link with those addressed in EM; environmental landscape, mindset, activities, resources landscape, etc. Noticing that all stress the need for a novel approach.

Although vast researches on EM indicates the insufficiency of the formalized market giving's to the Entrepreneurial Ventures (EV), SMEs and also on the general level with the changing in business and market landscape, none augmented on the body available to promote it concerning paradigm shift. Some tended to indicate the need for a new school of marketing thought (Abu Zayyad et al., 2021; Al-Dmour et al., 2020; Mort et al., 2012). Under this paper, we refer to the existing prevailing course of marketing as formalized market giving's indicating the standards, we refer to also to avoid muddling with terms used in labeling marketing in the reviewed papers. This covers the "marketing activities of planning, formal marketing research, design and

implementation of the marketing mix or program, that are the core of the traditional textbooks in marketing" including Brassington & Pettitt, Jobber and Kotler et al. as indicated in Amjad et al. (2020a), Alwan and Alshurideh (2022).

Still, marketing is evidenced to be a key to the success of new ventures (Mort et al., 2012; Al Kurdi et al., 1339). Furthermore (Miles & Darroch, 2006) argues that EMP could be leveraged in large firms as equal to SMEs to establish a sustainable competitive advantage. Especially in the context of dramatic changes on social and technological bases, where EM is seen as an approach toward establishing sustained customer relationships (Miles & Darroch, 2006).

2 Entrepreneurship and Marketing

This paper does not aim to provide a literature review for the two disciplines of Entrepreneurship and Marketing, however, below aims to review key definitions and concepts on these two disciplines. To establish the base for the argument and augmentation on research.

2.1 Entrepreneurship

The core focus of this paper is entrepreneurship in the business field. Moreover, this provides the base required, with the review of literature linked to it covering behavioral and activity perspectives of entrepreneurship. Thus, starting by the entrepreneur definition as proposed by Drucker as cited in, defining an entrepreneur from a behavioral and activity-based perspective as the person who looks for the change, but differs in being responding to the change in an innovative way, thus utilizing it as an opportunity (Alameeri et al., 2021; Mehmood et al., 2019; Stokes, 2000). Building on Drucker's ideas entrepreneur is defined from the process viewpoint as "a process, an action-oriented management style which takes innovation and change as the focus of thinking and behaviour" (Stokes, 2000). Morrish et al. (2010) indicates a definition for an entrepreneur as "engaging in opportunity creation or discovery, assessment and exploitation of attractive opportunities" from the perspective of what the meaning of being such.

Moving to firm context, the entrepreneurial firm is defined as "one that engages in product-market innovation, undertakes somewhat risky ventures, and is first to come up with proactive innovations" (Kraus et al., 2010). Attached to this definition is entrepreneurial management defined as "the process by which individuals—either on their own or inside organizations—pursue opportunities without regard to the resources they currently control" (Kraus et al., 2010). Phua and Jones (2010) considers that entrepreneurship is better to be understood from theoretical and practical views, to help to understand what actually in practice it is. Under this view, the authors adopt the process perspective definition of EM considered by Morris et al.

(2002), where the key elements composing the process are "the entrepreneur, the opportunity, and the acquisition and management of resources".

Also from a process view, entrepreneurship is defined as "the process of creating value by bringing together a unique package of resources to exploit an opportunity." Where it entails the activities required for opportunity identification, business concept definition, assessment of required resources and acquiring them, in addition to managing and harvesting the venture (Morris et al., 2002). Moving to the concept, the entrepreneurship concept is found to have three fundamental dimensions, "innovativeness, risk-taking/management, and proactiveness" (Morris et al., 2001). The author defines concept and process perspective as "Entrepreneurship is how firms discover, create or assemble resource assortments that allow them to produce valued market offerings".

From a firm contextual frame, (Collinson & Shaw, 2001) sees that the entrepreneurship area holds relevancy for large and small size firms as well. Explaining the cause behind being attached more to SMEs to two points: commonly visible more in smaller sized firms and with firms growing in size, the complex structure of management makes it more challenging to maintain an entrepreneurial focus. The authors continue to explain, most of the research in this field is around the SME, is due to the difficulty of spotting the true entrepreneurial large firms. However, the number of large-size firms developing this approach is increasing. The author states that the number of large firms through their approach to marketing activities can be entrepreneurial.

Even though literature relates EM to SME context, (Hills & Hultman, 2011) notes the discrepancy between EM and small business marketing that is reflected in a conceptual separation between both. Attaching the difference to the behaviors of the person running the firm; owner mindset running the business as opposed to the entrepreneur mindset. The note is valid, however, in this paper, the author relates SME to the EM in the commonalities of the organization context of size, constrained resources, newness in the market and other attributes. The same extends to the references reviewed that tackle SMEs from the same perspective. In this view, we attribute to the notion "A small business is not a little big one" observation of *Welsh/White*'s (Gruber, 2004) provides an insightful piece to shift the understanding of new ventures as in comparison to larger ones. Gruber (2004) identifies three main characteristics differentiating new ventures namely: newness, small size, Uncertainty, and turbulence.

Collinson and Shaw (2001) brings another perspective of defining entrepreneurship within the context of this paper with "entrepreneurial effort" linked with "entrepreneurial scenario" encountered with a focus on firm and management context. Where "entrepreneurial effort" is described to hold several characteristics demonstrated by the entrepreneur or those of the management team, these include "energy, zeal, commitment, determination, persistence, opportunity and focus". On the other hand, the "entrepreneurial scenario" is referred to as a level of risk encountered by the firm, along with resources available in addition to the need among individuals for "skills, knowledge, experience and personal independence". The consequence of these two factors is found to be affecting the degree of firms' development

and growth over (Collinson & Shaw, 2001). This explains why with the growth marinating the same level of "entrepreneurial effort" becomes more difficult, along with this challenge comes the tendency toward activities lowering risk levels.

2.2 Marketing

Marketing is considered by several researchers as one of the crucial elements of firm success (Alshurideh, 2022; Lee et al., 2022a, 2022b; Tariq et al., 2022). Where it is also considered as one of the vital pillars for the realization of both objectives and success (Franco et al., 2014). Definitions cover both scholarly work and textbooks of academia, with different views mainly of concept and process perspectives. As overall briefed definition marketing is viewed as, "meeting needs shortly" where needs refer to human and social needs and marketing to include identification of those needs (Kotler & Keller, 2016).

The recent revision for the definition of the American Marketing Association (AMA) dated 2007 defines it as" Marketing is the activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large" (Hills & Hultman, 2011). Continuing on concept level definition, five components are indicated to be included in any definition of marketing, these are "two or more parties, something that is given up by each party, something that is received by each party, some level of communication between the parties, and some mechanism to perform the exchange" (Morris et al., 2001). Stokes (2000) from an organizational point of view defines four components underlying the varied definitions of marketing including an imperative one represented by organizational culture and the three of the strategic process, tactical methods, and marketing intelligence. The integration of these components suggests the comprehensive definition of marketing as an "organizational philosophy of market orientation, guided by segmentation, targeting and positioning strategies, operationalised through the marketing mix and underpinned throughout by market intelligence" (Stokes, 2000).

More specifically at the process level (Morris et al., 2001) views it as "the process of planning and executing the conception, pricing, promotion and distribution of ideas, goods and services to create exchanges that satisfy individual and organizational goals". The authors indicate also four categories of interrelated linkages that are introduced in most definitions of marketing: "product", "price", "promotion", and "distribution", these four combined results in numerous scenarios of decisions each denoted as the "Marketing Mix". The mix decisions shall be designed to reflect the needs identified of targeted customers, allowing at the same time provision of the firm with sustainably based differentiation edge as compared to competitors.

2.3 New Approaches/Recent Approaches

In searching for new methods, that are more suitable for different business environments, new marketing approaches emerged in practice and academic literature. With adjectives terming these as new approaches to the marketing, among these main are "Environmental marketing management", "Subversive marketing", "proactive marketing", "expeditionary marketing", "guerrilla marketing", "Viral marketing", "radical marketing" and "disruptive marketing", and "viral marketing" (Morris et al., 2001, 2002). Some authors consider the emergence of these as an informal rise of entrepreneurial marketing, including the new models /methods /perspectives that emerged both in the trade and in academic literature. The common factor seen among these is being concerned about an entrepreneurial role for marketing in leading-edge companies (Morris et al., 2001).

Below provides a highlight on the key aspects of the main new approaches indicated earlier to provide the understanding of the difference between this and the formalized market giving and to provide the base for the next section on Entrepreneurial marketing (Table 1).

Assessment of these indicates the commonalities briefed by Morris et al. (2001) as including efficient marketing budgets, where with constrained resources extensive amount is conducted; different modes of resource leveraging, where people in charge capable of employing resources, not under ownership or control, refusal of "conventional approaches" to marketing variable management; continuing product/service innovation; leading customers along with the capability of affecting change in the

Table 1 Explanation of new approaches/models/perspectives to marketing

Guerrilla marketing: relies on bootstrapping, creative use of available resources, and a highly targeted mix of innovative communications techniques
Radical Marketing: describe a set of approaches that they argue challenge the status quo, or immutable laws, of marketing
Expeditionary Marketing" describes the "role of marketers in creating markets ahead of competitors
Subversive marketing: refers to the need for marketers to undermine company structure and process to implement innovative marketing practices
Environmental marketing management: where marketing theory explicitly adopts a proactive, entrepreneurial orientation to the management of environmental conditions
Proactive marketing: includes ongoing responsibility for redefining the product and market context within which the firm operates, identifying novel sources of customer value, and emphasizing unproven wants, new market segments, new technologies, and continuous innovation in all areas of the marketing mix
Viral Marketing encourages individuals to pass on a marketing message to others, creating the potential for exponential growth in the message's exposure and influence
Buzz marketing is the aggregate of all communication about a certain product that is propelled through grassroots activities among people at any given time

Source Adapted from Morris et al. (2001)

environment of context. Morris et al. (2001) argues that these different approaches and perspectives, advocate the base for an "alternative concept" of marketing. Supported by the point that these emerged with the changes occurring in the market and business environment and the need for new approaches to respond, in the light of insufficiency of existing ones.

3 Entrepreneurial Marketing

3.1 Marketing Within an Entrepreneurial Context

"In each small entrepreneurial firm, marketing is done" (Gross et al., 2014). Even if not through the involvement of the entrepreneur or the team in the formal or theoretical process of it, it remains to be practiced on a day to day with the intuition, formulation and implementation (Gross et al., 2014). Stokes (2000) notes the increased recognition of the marketing as practiced by entrepreneurs to be different than those concepts offered in what is referred to as conventional marketing textbooks and give the example of Kotler. Stokes and Stokes (2000) make the note that "a small firm is not simply a scaled-down version of a large firm" clarifying that not the same rule of large firms can presumably assume to be valid for new ventures. On the other hand (Collinson & Shaw, 2001) sees that EM is also valid for a larger firm, and provides the example of Virgin.

Entrepreneurial firms are deemed to be driving markets, through influencing the marketplace directly or indirectly and supporting shaping it (Morrish, 2011). Though celebrated as far different from conventional, small business holds several difficulties when it came to marketing, such as a slim customer base, marketing activities of both limited scope and impact, efforts of unplanned and diversified nature (Stokes, 2000). Marketing is considered among the utmost challenges faced in SMEs, yet it is also of crucial importance for the survival and success of SMEs (Franco et al., 2014). Although not all entrepreneurial firms are SMEs, (Becherer et al., 2012) considers marketing to have a higher significance in the context of the size of SMEs, where one customer lost or gained has a high impact on the survival of these firms. Becherer et al. (2012) confirms the same point and considers marketing to be a primary success determinant among all new ventures. Also within the entrepreneurial context, venture capitalist rates marketing as of extreme importance (Becherer et al., 2012).

Morrish (2011) proposed that EM firms still perform the processes of traditional marketing, but in a way that is influenced profoundly by the main attributes of entrepreneurs guiding the process from the core. These attributes are innovation, reactiveness, and risk-taking. Furthermore, (Morrish, 2011) views EM firms as having a twofold core of both customer-centric, being similar to AM and entrepreneur-centric. Providing the EM firms with the flexibility of navigating Market-Oriented strategy and Entrepreneurially Oriented strategy as deemed suitable for the different environments. Morrish et al. (2010) also suggests that EM could represent one of the

evolution stages of marketing sophistication within the firm. With the possibility of occurrence at the initial or last stages, implying the EM is still considered as "fully embedded by the traditional processes of marketing management and strategy". Morrish et al. (2010) is a support to this stage model of Kotler, proposing that EM could be very effective along all the stages of the model, at any time the organization is in a need of creating or discovering new and attractive opportunities and exploiting them. In proposing so, the authors see that marketing's core functions and processes remain the same. However, the difference occurs in the approach within which where these functions and processes are conducted while adapting an approach of an "entrepreneur/customer opportunity-driven" to the three elements of marketing namely: culture/philosophy, strategy and tactics. Affecting consequently the implementation of the process of segmenting, targeting and positioning.

This view sees the difference in EM being in the influencing attributes, while the process remains the same as the referred to "traditional marketing" or formalized marketing giving's. And appears to conflict with the mainstream literature on EM viewing it as substantially different in approach, strategy and process from the formalized marketing giving's such as (Gruber, 2004; Morris et al., 2002; Stokes, 2000). It also appears to have a sort of conflict with the stage model of Kotler dated 2003 adopted by the author in their definition of EM, (Morrish et al., 2010) concludes that EM organizations "have a core of AM [Administrative Marketing] functions, augmented by the entrepreneur's desires, needs and motivations [….], nested and overlayed by the multiple layers of EM processes". In indicating EM processes, the author defines a new set of processes other than those of AM, where at the same position sees that marketing core functions and processes remain the same, with the difference in the adopted approach to these processes.

Another point is attached to the notion of EM organizations having a core of AM functions, which comes in conflict with several works indicating that this function is not available at EV in most cases (Stokes & Stokes, 2000). This conflict is better understood within the perspective adopted by Morrish et al. (2010) focusing on the interrelationship among AM and EM. In addition, not the integrative perspective. Entrepreneurial marketing is defined as "the marketing of small businesses which grows through entrepreneurship" (Yadav & Bansal, 2002). This view limits the definition to the contextual practice rather than the concept-based definition.

3.2 Theoretical Foundation and Development

Collinson and Shaw (2001) draws three main focus areas in the development of EM seen as emerging from the two management disciplines of marketing and entrepreneurship, considered traditionally as two distinct areas of study (Stokes & Stokes, 2000). After which research evolved around the overlap between both, identifying the areas of similarity and differentiation while investigating the role of each in the other and how these can benefit from each other. The interface comes as research

advances, with the focus on the attempts to combine the two disciplines and provide an integrative area (Collinson & Shaw, 2001; Stokes & Stokes, 2000).

Uslay and Teach (2009) highlights the issue raised by other scholars on the fast emergence of the MEI, with the potential of becoming a "distinct marketing school of thought". Notwithstanding this, this remains insufficiently developed with segmented works, while a single paradigm has not been developed yet. EM (2012) concludes four main different approaches that were developed along the time of researching the field of EM, these are commonalities between the two main disciplines, "entrepreneurship in marketing" focusing on marketing framework within which entrepreneurship elements are introduced; third is "marketing in entrepreneurship"; and the fourth comes in opposite to the first approach in identifying what is unique about EM rather than similarities, arguing that combination of these two disciplines yields in a new distinctive thing. Collinson and Shaw (2001) sees three key areas of interface between marketing and entrepreneurship: both being change focused; both in nature are opportunistic, and both are innovative in approaching management. Another views build on the interface role and define EM research as focusing on exploring the interfaces of three disciplines and not only the two of marketing and entrepreneurship, with the addition of Innovation. Jones and Rowley (2009). This evolvement in the approach to understanding EM provides a rational sequence of approaching this field. It also on the other hand reflects an extent an implicit evolvement in the marketing discipline too, that is affected by this evolution. The fact that EM is viewed as the first approach of studying it under the commonalities between Entrepreneurship and marketing and later as the role of it in Entrepreneurship or the other way of role relationship provided a base toward the evolvement of marketing school of thought. While if EM is considered as integrative concept from the onset this would have seen limitations.

EM (2012) indicates the first emergence of EM to be dated 1982 at a conference at the University of Illinois. Later in 1987, the first formal research convention on Entrepreneurship and marketing was held at the (AMA), turning later on to the annual event of "Research at the marketing-entrepreneurship interface conference" (Amjad et al., 2020b; Stokes & Stokes, 2000). Amjad et al. (2020b) in researching the current development is "Entrepreneurial Marketing Theory" indicates that research in the EM witnessed rapid progress over the last decade, attributed to the effectiveness of EM in the uncertain conditions and markets of high competition. Figure 1 from the same study shows the first literature on EM to be in 1976, with slow growth following; and rapid one starting from 2000, specifically from 2010. Totaling of 160 articles were examined in their study between the duration of 1976–2018, among these 140 are in the ten years between 2008–2018.

Despite the progress in the research and the rapid one as shown in Fig. 1, the EM area is considered to be still substantially lacking theoretical and academic models (Amjad et al., 2020b). The author also indicates that EM is identified as a "much under-researched area" in a vast range of the literature, with interventions and practices in this area being sprinted away ahead of the work on in the research and development of theories needed to vindicate and explain (Amjad et al., 2020b). Despite this situation, new models are developed during the progress in the research in EM. These are identified by Amjad et al. (2020b) based on a systematic review and

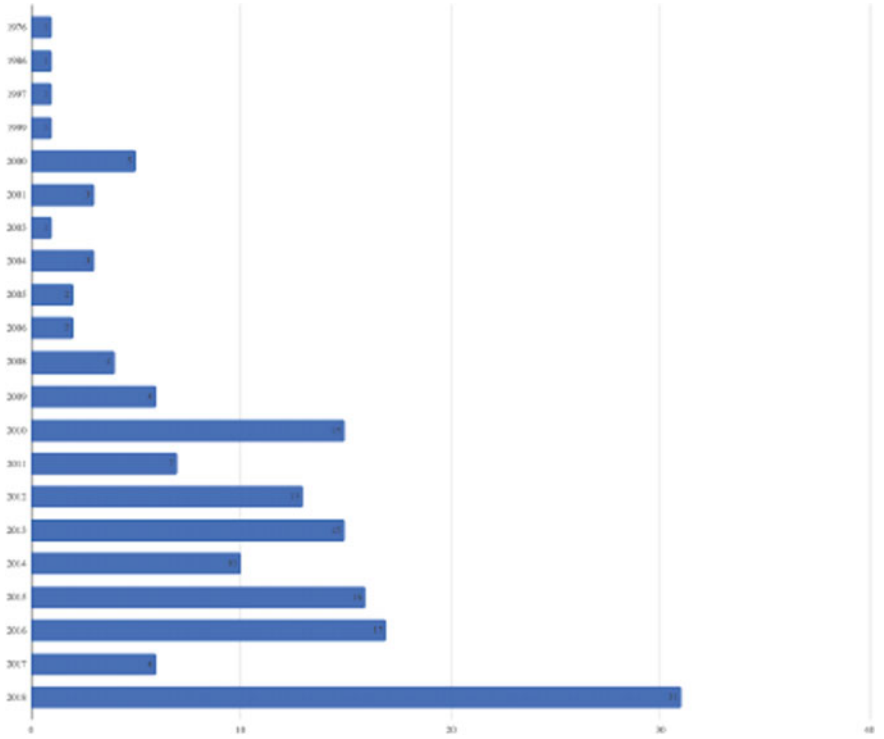

Fig. 1 Number of EM articles per year (Amjad et al., 2020b)

synthetization of all peer-reviewed literature in the period of 2008–2018, considered to be the era of much progress in the literature. These newly developed models, although provides further knowledge on the EM, are restricted by the controllers of the research behind them. Özdemir (2013) investigated the process of 'social value creation' in EM and presented a model of the whole process of creation. Furthermore, these represent only ten-out of the one hundred forty articles identified and examined-who have contributed to developing substantive models. This validates the viewpoints of this field to be substantially lacking theoretical models.

Another note made by the author on the models developed to be mostly based on deductive methods, where there is more need for inductive methods to support the development of fundamental theories and models that can stand as principles for the EM (Amjad et al., 2020b). Under the same state of art paper (Amjad et al., 2020b). Listed the varied theoretical lenses within which the EM has been examined in 20 articles from the 140 identified from 2008 to 2018. Among these lenses, two are shown to be of most frequently used, and thus tested. Moreover, are also referred to in some other papers to support the author's point of view. These are the Seven Dimension Model of Morris et al. (2002) and the EMICO framework by Jones and

Rowley, (2009). In building the seven dimensions, (Morris et al., 2001) suggests the EM to be particularly consistent with Resource-Advantage Theory.

These two lenses are tackling the dimensions of the EM, providing a brief on the nature of the EM phenomena and an explanation of the dimension comprising the theoretical lens/model. Thus, both are considered basic and descriptive. Amjad et al. (2020b) Seven Dimensions of Morris et al. (2002) are indicated to provide an overall primary model, while EMICO of Jones and Rowley (2009) are considered to be more comprehensive and inclusive of those of Morris et al. (2002). However, looking at the EMICO framework's fifteen dimensions, it is noticeable that some are more of functions and processes, such as understanding and delivering customer value, sales and promotion, research and development. The author indicates also that both do not cover the relationship between the dimensions. However, (Morris et al., 2002) indicates an overall frame for this relationship indicating that these dimensions are not independent and need not be available together to form the EM.

3.3 Multifaceted Understanding of EM

In this research, the author presents a multifaceted understanding of EM-based on the research development in supporting the explanation and exploration of EM. This multifaceted understanding is presented in the layering of EM as an Interface-influence between composing disciplines, as concepts and definitions, a Mindset, an Orientation, a Concept, a dimension, a strategy, and a process followed by a distinct view of marketing from the entrepreneur's point.

3.3.1 As an Interface—Influence

Franco et al. (2014) in their study on the exploration of the influence of the founder-entrepreneur and the role, this one plays in EM in SMEs and found that marketing is recognized as an important element for business growth and sustainability. However, the two cases studied showed that its role is not activated through the formal planning process, but rather through the informal and reactive process: mainly due to the restricted resources. A noteworthy conclusion claims that founder-entrepreneur have a high influence on the marketing in SMEs and is closely dependent on his/her decision. Being in charge of the whole business. Stokes and Stokes (2000) supports this view, highlighting that characteristics of the owner or manager have a dominant influence in SMEs. On the same point, (Martin, 2009) considers "the active role of an entrepreneur" as a factor distinguishing "formal' marketing from 'entrepreneurial' one in addition to the factor of "networks" that are considered to provide the link behind the phenomena.

Licensed to (putm@utm.my)

3.3.2 Mindset

Some studies suggest an alternative conceptualization, with EM understood as "marketing with an entrepreneurial mindset, irrespective of firm size or age" (Kraus et al., 2010). Adopting this mindset approach, they define EM as an "organizational function of marketing by taking into account innovativeness, risk-taking, reactiveness and the pursuit of opportunities without regard for the resources currently controlled", which compared to that provided on Fario, shows more toward entrepreneurship. The authors in presenting their definition indicate that it applies to large firms and shall not be limited to small ventures.

3.3.3 Orientation

EM as an orientation lies under the interface role of marketing in entrepreneurship and the other way. A stream of research is found to be focusing on orientation perspective with a focus on the marketing orientation and entrepreneurial orientation. These orientations also are considered based on the most frequently referred models of seven dimensions of Morris et al. (2002) and the EMICO of Jones and Rowley (2009). Morris et al. (2001) propose a relationship between the two orientations as "Coupling a market orientation with entrepreneurial values provides the necessary focus for the firm's information processing efforts, while it also encourages frame-breaking action, thus greatly increasing the prospects for generative learning". Morris et al. (2001) suggest another interpretation for this relation, where the authors consider that these two orientations may be "be part of a single, overriding organizational philosophy" and not only holding relationship among them.

3.3.4 As Concept and Definition

Yadav and Bansal (2002) indicates that the concept of 'Entrepreneurial marketing' emerged in 1982. In addition, since then this concept is defined from different perspectives and contexts. To define it, some tend to go in a straightforward position by describing it as "marketing carried out by entrepreneurs or owner-managers of entrepreneurial ventures" (Stokes, 2000). Kraus et al. (2010) views it from a mindset view and defines it as "the marketing activities with the entrepreneurial mindset". Franco et al. (2014) presents a description of its nature as being" informal and ad hoc in nature" and defines it as "a process with an Entrepreneurial Spirit".

Morris et al. (2001) could be considered as the first one introducing the term of entrepreneurial marketing as an integrative concept. That emerged as a response in the time of information intensity and the continuing change faced by the firms

in the environmental landscape within which they operate. Authors introduced this integrative concept, to conceptualize marketing within this context, and define it as "the proactive identification and exploitation of opportunities for acquiring and retaining profitable customers through innovative approaches to risk management, resource leveraging and value creation" (Amjad et al., 2020a).

This definition attributes to entrepreneurship from an activity perspective, with the similarities in the three main definition components if compared to the scale of Covin and Slevin on entrepreneurial activity, considered to be the most used one and is established about "risk-taking, innovation and proactive response" as the behavioral dimensions of the scale (Stokes, 2000). Some tend to view SME marketing as a synonym to EM. Franco et al. (2014) considers that Marketing in SMEs should be labeled as EM with attachment to similar contextual environments, making SME modeling an aggressive and unconventional approach, that enables the provision of the means toward success notwithstanding the limitation of resources. Although this contextual attachment holds relevancy, there are other main dimensions of entrepreneurial ventures that put limitations on this generalization, among these is the discard of resources when pursuing the opportunity, mindset, entrepreneurial activities, and others.

EM is defined by Becherer et al. (2012) as "effective action or adaptation of marketing theory to the specific needs of SMEs" and uses the term to describe the marketing process adopted by firms pursuing opportunities in an inexact circumstance of the market. As a contextual definition EM is used mostly in describing marketing conducted at firms of small and medium sizes, more often at the stages of the start-up or the following early growth one (Amjad et al., 2020a). These SMEs entrepreneurial ventures are mostly characterized by limitations on their human and financial resources, which as a response necessitates creative and innovative methods in marketing (Alshurideh et al., 2021, 2022; Amjad et al., 2020a).

Mort et al. (2012) adapts the seven dimensions of Morris et al. and defines EM accordingly as "the proactive identification and exploitation of opportunities for acquiring and retaining profitable customers through innovative approaches to risk management and resource leveraging for value creation". Morrish (2011) differs from the viewpoint of EM as a nexus between the two composing disciplines and tends to view EM as "an augmented process, where both the entrepreneur and customer are the core actors, co-creating value within the marketing environment". In this supporting, (Morrish et al., 2010) view of an entrepreneur being a central actor in the marketing process and equal to that of customer-defined as a focal point in traditional marketing.

EM is also viewed as "the Result of Entrepreneurial Interpretation of Information, Decision-making and Marketing Actions" (Hills & Hultman, 2011), where the entrepreneurial interpretation of the business environment influences the decision making and with actions, these are resulting in noticeable EM outcomes. Morrish et al. (2010) provides a definition for EM, that extends on (Morris et al., 2002) definition and incorporates AMA definition of marketing with "a spirit, an orientation as well as a process of passionately pursuing opportunities and launching and growing ventures that create perceived customer value through relationships by employing

innovativeness, creativity, selling, market immersion, networking and flexibility". This is seen as an attempt to define how an organization can adopt EM rather than conceptualizing EM.

Fiore et al. (2013) propose a comprehensive definition as "Entrepreneurial marketing is an organizational function and a set of processes for creating, communicating, and delivering value to customers and for managing customer relationships in ways that benefit the organization and its stakeholders, and that is characterized by innovativeness, risk-taking, proactiveness, and may be performed without resources currently controlled". Although this definition is provided as an extension to Morris et al. (2002) and the AMA definition. This stands as putting the two definitions together rather than defining it as a standalone one. Martin (2009) suggests the 4P's of: "person, process, purpose, and practices" as a frame better suited to understand marketing in entrepreneurial firms, where each of these new P's "is grounded in relationships and networks".

3.3.5 Dimensions

The most frequently referred work on the identification of the dimensions underlying the EM is Morris et al. (2002), proposing seven dimensions. These are namely, "Opportunity driven", "Proactiveness", "Innovation focused", "Risk Management", "Customer Intensity", "Value Creation" and "Resource Leveraging". The first four of these are based on the work of the number of scholars on the 'entrepreneurial orientation' of the firm and the following two on the market orientation, resource leveraging is relevant to entrepreneurship and marketing literature and the new marketing approaches. Although the concept of EM as introduced by Morris evolves around the role of marketing within the organization. The design and the seven dimensions of the new approach affects also the business represented by the organization/firm and their relationship with the marketplace (Morris et al., 2001).

The proposal of these seven dimensions provided a theoretical base and has been since then as the main underpinning theory used in several studies (Amjad et al., 2020b). Jones and Rowley (2009) built on these seven dimensions and number of "23 characteristics of EM" that are identified by Hills and Hultman (2011) and developed EMICO framework that evolves around the four of "entrepreneurial orientation (EO)", "market orientation (MO)", Innovation Orientation (IO)" and "Customer/Sales Orientation CO". The fifteen dimensions of EMICO are:" research and development, speed to market, risk-taking, proactiveness, market intelligence generation, responsiveness towards competitors, integration of business processes, networks and relationships, knowledge infrastructure, propensity to innovate, responsiveness towards customers, communication with customers, proactively exploiting markets, understanding and delivering customer value, and sales and promotion". Some views these to be more comprehensive than the seven dimensions, however these dimensions relate to function orientation more than dimensional one. Below further elaboration of each of the seven dimensions, clarifies further both the design of the concept and the new approach proposed for EM as an integrative concept (Table 2).

Table 2 Seven dimension of EM-(Morris et al., 2002)

Customer intensity" is proposed to "capture a sense of conviction, passion, zeal, enthusiasm and belief in where marketing is attempting to take the firm and how it plans to get there
Sustainable Innovation involves the ability at an organizational level to maintain a flow of internally and externally motivated new ideas that are translatable into new products, services, processes, technology applications, and/or markets
Strategic Flexibility: involves a willingness to continuously rethink and make adjustments to the firm's strategies, action plans, and resource allocations, as well as to company structure, culture, and managerial systems
Calculated Risk-taking involves a willingness to pursue opportunities that have a reasonable chance of producing losses or significant performance discrepancies
Environmental Proactiveness: redefine elements of the external environment in ways that reduce environmental uncertainty, lessen the firm's dependency and vulnerability, and/or modify the task environment in which the firm operates
Resource Leveraging: being not constrained by the resources currently controlled or owned

Morris et al. (2002) clarifies that these seven dimensions are not independent, where interventions in one of them affect the others. Furthermore, the operation of the whole of the seven dimensions together is not a condition for the EM occurrence, where EM could be in place with a number of these dimensions only. In stressing so, the authors clarify the gradation nature of EM, where the different amalgamations resulting from these seven dimensions show a degree of less or more EM. And when the combination considers these seven dimensions collectively, the resulting marketing does differ considerably from the formalized marketing giving.

Amjad et al. (2020a) proposed another dimension to be added which is 'legitimation'. Although this work is the first to introduce it as the eighth dimension, 'legitimation' is identified to be integral to entrepreneurial success in the study of Amjad et al. (2020a). Mort et al. (2012) identifies legitimacy as one among four key strategies identified for EM. Amjad et al. (2020a) defines legitimation from the perspective of EM as "legitimation exhibits the reliability of a firm/entrepreneur, which positively influences the trading decisions of the immediate audience". In advancement of Morris et al. (2002) work, (Fiore et al., 2013) provide scale validation for the seven dimensions in small firms, with proposed scale validated showing the influence of the entrepreneurial intentions on the EM and the role the latter plays on 5Ps and 4Es affecting the Brand distinctiveness.

3.3.6 EM as a Strategy

Three entrepreneurial marketing strategies are highlighted in Morrish (2011) and are concerning market driving approach under market-oriented overall one. These include deconstruction, construction and functional modification, and are applied by EV aiming to "reshape customer preference and behaviour" covering anticipation of future ones as well.

Mort et al. (2012) identify four core strategies for EM, where the authors find that it is through "purposeful strategy based on effectuation approach" that EM contributes to the outstanding performance in small firms. In their work, Mort et al. examined EM in "born global firms" or "International new venture INV" covering high- and low-tech industries, where this internationalization and globalization context within different industry profiles provides a wide perspective to examine the EM process and its impact on performance, leading to the understanding of EM strategies.

Core strategies of EM identified that are found to be contributing to the firm performance when applied strategically are "opportunity creation; customer intimacy based innovative products; resource enhancement; and legitimacy" (Mort et al., 2012). These core strategies when viewed from the concept and dimensional frameworks presented above are found to be augmenting on these. With the dominance of the key elements of opportunity, customer intensity, innovation, and resources (Table 3).

Morrish et al. (2010) under their viewpoint of EM as being both Customer and entrepreneur-centric, provides a frame for EM strategy suggesting "EM firms focus on the needs, desires and motives of both the customer and the entrepreneur to shape the firm's concept of strategy and its tactical processes". Swenson et al. (2012) suggests an entrepreneurial marketing framework that helps in creating opportunities from a competitive angle base. and that also supports marketing strategy development. Their framework provides a systematic approach for the evaluation and execution of the EM and is composed of 5 elements: Opportunity Creation; effect multiplication; relationships leveraging; process acceleration; and profit-making. Where opportunity creation is attached to the choices on competitive angles and is considered to be of importance in identifying losers and winners in the startup context. Competitive angles are composed of five facets (1) need to believe, (2) reason to believe, (3) blows away expectations, (4) quantifiable support, and (5) unique product claim (Swenson et al., 2012).

In a contrast to the research proposing EM as having a different strategy frame, (Phua & Jones, 2010) finds that entrepreneurs indeed use existing marketing tools in the daily management of their venture. They do also use marketing strategies in a notion to the exaggerated myth of the informality nature of planning activities in small firms. However, the authors stress the limitations of the study are based on four NES entrepreneurs and that cannot be generalized as a rule. And that this doesn't exclude informal marketing practices from being adopted. A notion on this is the pattern matching method used in matching the studies practices in the marketing strategy model adopted by the authors, which results in a tendency to a framed analysis of the activities within the model.

3.3.7 Process

Fiore et al. (2013) suggests that "EM is a complex process as well as an orientation for how entrepreneurs behave in the marketplace". The term Entrepreneurial Marketing Processes (EMP) is conceptualized by Miles and Darroch (2006) as the

Table 3 Core Strategies of EM from Concept and Process Relevance

Core strategies	Concept/dimensional relevance	Process relevance
"Opportunity Creation": where opportunities that do not previously exist are created actively. Rather than the identification of pre-existing ones and exploitation of them This is valid with the emergence of new challenges needed to be tackled An ongoing multifaceted process	Advancement on opportunity orientation, where opportunities are to be discovered	
"Customer intimacy based innovative products": the ability to develop marketable innovative products based on ongoing relationships with customers and intimacy	Nexus amid sustainable innovation and "customers intimacy", linking both in one strategic dimension	Contrasting the process of a new product (Mort et al., 2012) Advancing EM in empirical clarification of the Iterative process of customer intimacy and innovative product development
Resource enhancement: highly developed ability to identify and mobilize resources from external sources, enrich and extend existing internal resources and recombine these in a novel, elaborated ways with a strategic purpose	Extending on resource leveraging Mort et al. (2012) sees that (Morris et al., 2002) considers resource leveraging as a dimension as "the ability to use other people's resources" making them able to overcome the limitations, where they consider it as developing new combinations	
Legitimacy Strategies and tactics used to get marketing acceptance and trust for the firm and its products and services		

Source Author based on (Mort et al., 2012)

marketing processes emphasizing" "opportunity creation and/or discovery, evaluation and exploitation" (Kraus et al., 2010). Entrepreneurs are likely to have a different view of marketing. Stokes (2000) investigated the definition of marketing from the perspective of entrepreneurs and with a focus on the strategic level of process, his work is based on data from face-to-face interviews with forty entrepreneurial characteristics, along with following focus groups in two series. Results from this show that entrepreneurs tend to define marketing from the tactics component-third level in marketing after culture and strategy—with the goal of new business attracting.

His work also reported less awareness of the strategic and culture-related levels. In some parts, this is related to not being aware of the terminology, rather than ignoring it. Furthermore, focus groups show that considerable resources, effort and time are spared on marketing but are flagged by another name. His work defines the Entrepreneurial marketing process, through the differences between the "giving's of marketing theory", and insights provided by what successful small businesses and entrepreneurs do. This definition is better understood as a comparison along the four components composing marketing (concept, strategy, tactic and marketing intelligence) each compared between the two sides of conventional marketing and entrepreneurial marketing and resulting in four main aspects defining the EM.

At concept or cultural components, the key difference is in the orientation directing the new product or service development. "The idea comes first and the check for market acceptance second" (Stokes, 2000). Thus, under EM the process is more toward Innovation oriented, implying that that idea, intuition or competition pressures stimulate the process followed by finding the market. This stands as the other way, compared to the customer orientation in conventional marketing, where study, assessment, or research of market needs establish and commence the process of new product development. Stokes (2000) also indicates that under EM, customer needs remain as a key issue, but the core difference is that in most cases ideas or intuitions are transformed through innovation activity to new products or in some cases into defining total new markets in the case of disruptive innovation.

Under the strategic process component, a key difference is attached to the direction or route of strategizing. Entrepreneurial founders-manager, while developing strategies, lean toward a "bottom-up" direction, where a majority of marketing textbooks advise "top-down". Formalized Strategy involves processes toward attaining customers with applying segmentation, targeting and positioning sequentially ordered; segmentation is developed using different criteria to develop segmented profiles, followed by the assessment of these segments and their attractiveness to inform the selection of targeted one; position is then developed and communicated resulting in the differentiated offering.

Under EM "bottom-up", the direction is more of reversed one in process order, where targeting starts at a smaller scale base of customers and then widens up to attract more. This process is articulated in three main stages; market opportunities detection through non-formal, ad-hoc actions and intuitive based testing; initial customer base attraction, and through the regular contact with this initial base during this stage, entrepreneurs become more knowledgeable by their needs; followed by the extension of this base, with attracting more customers of similar profile that is confirmed in the prior stage. Also, this expansion is more of non-formal nature and involves methods such as word of the mouth (Stokes, 2000). The small-scale base at the initial stage and the regular contact enables a wider definition of customers, beyond the end-user, consumer, or the one who buys, to cover the whole network of supportive.

Under Tactical methods, a key variance lies in "4P's" versus "Interactive and Word-of-Mouth Marketing"; where the marketing mix of product, price, place, and promotion design the marketing program for the product or service, developed based on the understanding of the marketplace. On the Entrepreneurs' side, their activities

seem to have different methods of themes, focusing on 'interactive marketing' that comes in harmony with the "bottom-up" approach, and that involves direct interaction and development of personal relationships with their customer. This conversational relationship enables entrepreneurs to have a deep understanding of their customers, built through the process of listening and responding.

However, this is enabled with the small initial base of customers and could be of higher challenge to maintain with the expansion of this base while moving toward top level in their approach. Notwithstanding this challenge, this "meaningful dialogue" remains one of the key differentiators. To overcome this, these interactions are tied with "Word-of-Mouth" marketing that enables spreading the message and expanding the customer base. In addition, is defined as "Oral, person-to-person communication between a perceived non-commercial communicator and a receiver concerning a brand, a product or a service offered for sale" (Stokes, 2000). Finally, concerning Marketing intelligence "Market Research" versus "Networking" delineates the key difference, whereas in traditional marketing formal research and market intelligence inform the different stages of marketing such as market segmentation and targeting. Entrepreneurs tend for lateral and non-formal methods, where information is gathered through their contacts' network of those involved in the industry or trade (Stokes, 2000).

Although seems confusing to compare traditional marketing to EM on a concept versus processes base, it shows to be a valid comparison to understand and define. Where processes are referred to about the primary source of forty face-to-face and focus groups, aiming in a different method to identify the EM and define it from how Entrepreneurs see it and practice it through a process of a set of activities. Stokes (2000) propose a framework or entrepreneurial marketing process through the combination of four strategic processes differentiating it from the formalized giving of marketing. As a process, another dimension is the management of the EM. Collinson and Shaw (2001) identifies three themes differentiating management of EM. These are the process, the position of marketing within an organization and the approach. The process of managing EM is described to involve a shorter process of decision–making headed more often by minute formal planning. This differs from managing regular approaches to marketing, main reason lies in the contextual environment of EM with fluctuating and changing one, where time consumed for the regular planning process is not valid and may end in obsolete outputs with the change occurring.

Under the organizational position of marketing, this position is more often adopted as the guiding philosophy in entrepreneurial ventures. With the organizational activities orientating around marketplace and customer. This is valid, even though in most EVs no identified market section is in place, and no individuals are assigned responsible solely for this. Gearing the above two themes is the informal approach most often adopted for managing marketing in EV. Portraying this approach is the organizational-level commitment of grasping, foreseeing, and responding to the needs of a continually changing marketplace. This makes marketing activity under the ownership of the whole organization and managed by the whole, decreasing the

Fig. 2 Formalized Process of Marketing Giving's. *Source* Author contribution based on Collinson and Shaw (2001)

importance of managing it in a formal approach. The above allows for more flexibility, where formal approaches cannot hold this nature within the sequential order of process and the gates at each required to activate the others. The below graph illustrates the sequential order of formalized process of marketing gives (Fig. 2).

The key issue distinguishing EM is related to the effectual logic or frame. Within this logic of decision-making, entrepreneurs are found not to believe in the possibility of predicting the future, which explains why they do not attach great importance to set objectives as the case in the causation frame. Instead, they are found to be starting with the means and what they have "tangible and intangible assets", the things they can do "capabilities", and those whom they know "networks" and with these, they establish variant options of diversified ends (EM, 2012). In their work of investigating the EM in practice and from a social practice theory perspective, (Gross et al., 2014) notes that particularly in small firms, the activities of marketing extends beyond the mandate and scope of the marketing department designated, furthermore it is more likely not to have a dedicated role of marketing. In their work, they emphasize that firms adopting EMPs are "better suited to discover and create, assess, and exploit attractive entrepreneurial opportunities and that this enhanced level of corporate entrepreneurship enables the EMP firm to more effectively and efficiently create and renew competitive advantage" (Miles & Darroch, 2006).

4 Why the Paradigm Shift

The practice in marketing witnessed raising critique of various issues, with the main notion of on the criticism of traditional marketing related to the "one size fits all" assumptions of marketing theory (Martin, 2009). In addition to this comes "an over-reliance on established rules of thumb, encouragement of formula-based thinking [….] an emphasis on the promotion elements of the marketing mix [….] the tendencies to imitate instead of innovating and serve existing markets instead of creating new ones, a concentration on short-term, low-risk payoffs, and marketing as a silo with static and reactive approaches (Morris et al., 2002). Along with this comes

the notion of increasing evidence highlighting the insufficiency of "conventional marketing approaches" in addressing and tackling the needs of the firms working in contemporary environments with the changes these environments are witnessing. France et al. (2014) sees that this competitive paradigm witnesses continuous change. In reflection of current changes and mega trends, this is further forced with the issues of technological advancement and the fourth industrial revolution, competition on local, regional and global affecting new and emerging needs of the customers. The market is furthermore described as context-dependent by Morris et al. (2002), and nowadays more than before this context is continually changing, with multidimensional changes and a larger number of forces driving this change. Since 1999, suggestions on the need for a reconceptualization of marketing are proposed. Arguing that development of the discipline building on the extension of the existing theoretical frameworks possibly will not be enough to reflect the changes and shifts in the marketplace, and consequently guiding the practice in the new context (Morris et al., 2002). The same extends to academia and the gap in contribution to marketing practices.

In another strategic critique, (Miles & Darroch, 2006) noted that "Much concern has been expressed about the relationship of marketing to innovation. The marketing concept, it is argued, has contributed to the death of true product innovation in North America." Morrish et al. (2010) also, mark that entrepreneurship is needed for firms to grow. Along with this, EM emerged as providing a more effective and efficient model substituting the formalized marketing giving. The literature body in the EM is showing increasing consensus that EM differs substantially from the conventional one (Mort et al., 2012). This is supported by the works of Stokes (2000), Morris et al., 2002). Some scholars developed their work responding to the challenge made to EM scholars "to [more] fully develop EM as a school of marketing thought," (Mort et al., 2012).

Mort et al. (2012) indicates that noted contributions are provided to the 'emerging paradigm' of EM by several authors. With implicit propositions on the superior role of EM on value creation. The author also disagrees with the point of labeling EM as unplanned, rather they send the view of EM being non-linear activity in harmony with characteristics of effectuation proposed by Sarasvathy as indicated by Morrish (2011). This represents one of the key contributions of Mort et al. (2012), in the raise of EM being an effectuation rather than causal. Under effectuation (Mort et al., 2012) explains that entrepreneurial ventures have broad known goals however the ways to get to them cannot be approached in a logical process following causal setting. This causal setting seems to be more appropriate for the case of existing firms aiming at increasing market share in their existing markets (Morrish (2011) defines the effectuation processes as that which "take a set of means as given and focus on selecting any of the multiple possible outcomes or effects".

Collinson and Shaw (2001) identifies structured management and its impacts on the approach for marketing as one of the key issues making entrepreneurs apart from adopting it. With the preference for a more flexible, non-sequential approach. On the same point, the focus of most textbooks in marketing and management is focused around this structured and ordered approach. Morrish (2011) make a good referral on the omission of the marketing mix from the then-recent AMA definition, raising the

Licensed to (putm@utm.my)

point of the development of functional focus toward process focus with increasing the importance of this process and the network. Another force driving the change is the issue related to the changes at the consumer side, where studies show more focus on the characteristics of a contemporary consumer being more knowledgeable and discriminating, and the consumer tendency to focus on experiential and intangible factors (Fiore et al., 2013).

The paradigm shift is raised by Hill and Wright in a note that a "paradigmatic shift would allow for the full expression of the entrepreneurial personality in the management and marketing activities of the SME" (Martin, 2009). In their note Hill and wright bring up the argument that a new entrepreneurial paradigm of marketing could be created from the further complete adjoining of both marketing and entrepreneurship. Behind this, several scholars question the major elements of textbook marketing. Gronroos debates the high questionability of the usefulness of the general theory of the 4P's, while others raise the issue of missing the "fundamental point of marketing—adaptability, flexibility and responsiveness" with strict adherence to the 4P's" (Martin, 2009).

Hills and Hultman (2011) investigated the relation of EM to mainstream marketing, to the 'paradigm discussion' on the relation of EM to marketing discipline described as one of the EM's parents. In their analysis, they note that the U.S marketing stream dominating of the discipline for decades, with the AMA revisions for definition made in 1935,1982,2004 and 2007. These revisions reflect the evolution on the focus from the performance of business activities to the focus on the process of planning and executing, followed by the focus on marketing as an organization function, in addition, to set of processes, and recently on the comprehensiveness of activity, institutions, and process with the exchanging brought up as part of value creation. However, (Hills & Hultman, 2011) sees EM as a research field to be supplementing the market mainstream theories, however through focusing on marketing as done by entrepreneurs. Renton et al. (2015) notes the recognition in the latter literature in EM of entrepreneurs "doing" traditional marketing, but the form of doing this is not understood fully. Entrepreneurs are found to use practices that are recognized as traditional marketing but in a different approach and themes. They "do so in adaptive, intuitive, opportunistic and pragmatic ways, fitted to the needs of the business" (Renton et al., 2015).

With this in mind, the social practice theory emerges as a strong base, and with the emergence of the research stream of marketing-as-practice, that is focusing on the "actors, practical activities, performances, representations and tasks involved in the complex performance of marketing" (Gross et al., 2014). This provides a response to nature required. The social practice also provides the potential of investigating the "practical marketing practice (doing or praxis) of the firm, which is permeated and characterized by the behavioral and cognitive attributes associated with entrepreneurship" (Gross et al., 2014).

4.1 The Recent Business Environment and Drivers for a Shift

Morris et al. (2002) describes the business environment, which is still valid in parts of it in describing today's environment. Being consisting of "increased risk, decreased ability to forecast, fluid firm and industry boundaries […] and new structural forms that not only allow for change but also help create it" this fluid, rapidly changing nature is further augmented with the advancement in data and information, the fourth industrial revolution, global and regional market exposure and other issues. Amjad et al. (2020b) attaches specific importance to the economic and social challenges in developing countries, resulting in further uncertainty and higher risks compared to the conditions in developed countries. These conditions are among the main drivers for entrepreneurs toward EM, being more suitable at such conditions (Amjad et al., 2020b).

At the global level, entrepreneurship as a means for economic development represents a key concern (Amjad et al., 2020a). This concern has raised the importance of entrepreneurship role. However, this is challenged at the entrepreneur's levels with some issues they face in the field including market dynamics, rapid changes, competition, uncertainty and at the top of it is the pandemic caused (Amjad et al., 2020a). The market can no longer be considered as a "given" issue or place for transactions as considered by the positivist school of thinking. It is being shaped more toward "potential" things according to the constructivism school of thinking. Thus, it is more a process of socio-relational nature, where providers or producers and customers or consumers engage in a co-consumption and co-production of lifestyle, identity in addition to the product (EM, 2012; Al-Dmour et al., 2020).

4.2 Labeled-Termed Marketing

Labeling or terming of the existing principles of marketing is noticed along the course of the emergence of EM research and the new methods of marketing. This is evident with the various adjectives attached to marketing such as "conventional", "conventional wisdom", "traditional", "standard", "administrative", "textbook marketing", "corporate traditional marketing" in referral to the existing principles and the course of marketing textbook givings. This labeling is used to refer to the "formalized market giving's", that the author refers to -under this paper- to indicate the existing prevailing course of marketing. And this terming holds two folds first; the terming for comparison purposes with the EM or new approaches to identify the differences; the second one relates to the description and exploration of the mainstream and consequently understanding the reasons behind being no longer sufficient to respond and tackle the new shape of the environment. All papers studied under the work for this paper include this labeling/terming except for two of them that are (Kraus et al., 2010) and (Uslay & Teach, 2009). Where the most used labeling terms are found to be traditionally followed by conventional. And these are used interchangeably in most of the papers.

Morris et al. (2001) use the terms of traditional marketing and conventional marketing interchangeably and introduce a detailed comparison contrasting conventional marketing from EM. Traditional marketing is the one more used by Stokes (2000) and refers to as "marketing as presented in standard textbooks such as Kotler" the author also presents a comparison between the traditional marketing process and the EMP. The author also uses the term conventional marketing but less frequently than traditional. Amjad et al. (2020a) use the term traditional marketing, with the examples of "traditional marketing textbooks" to include "Brassington & Pettitt dated 2007, Jobber dated 2009 and Kotler et al. dated 2008". The same author (Amjad et al., 2020b) uses the term standard marketing about marketing in textbooks noting it"was originally developed for larger enterprises, and it widely ignores the marketing particularities of SMEs". Collinson and Shaw (2001) use traditional marketing indicating being operated in a consistent environment, characterized by continuous market conditions and clear satisfaction of perceived needs of customers. Morrish et al. (2010) use traditional, conventional, and administrative in addition to presenting a comparison between administrative marketing and EM on the strategy and tactic levels. EM (2012) use traditional marketing with a dedicated section comparing EM to it. The traditional market is described by the author as "exclusively customer-centric focused" also refers to it as administrative marketing.

Farsi et al. (2018), Fiore et al. (2013), Franco et al. (2014), Gross et al. (2014), Miles and Darroch (2006), Phua and Jones (2010), Stokes and Stokes (2000), Swenson et al. (2012) use the term traditional marketing. The latter also uses the term administrative marketing. Becherer et al. (2012), Mort et al. (2012), Renton et al. (2015), Yadav and Bansal (2002) use both traditional and conventional marketing interchangeably. While (Jones & Rowley, 2009) uses conventional only. Some authors use other less frequently used terms where (Martin, 2009) use the term corporate/traditional marketing (CTM) composed of the culture, strategy, and tactic. Morrish (2011) use the term traditional marketing wisdom in addition to administrative marketing. Hills and Hultman (2011) use the term traditional mainstream marketing. Gruber (2004) uses the more generic term of conventional wisdom referring to textbooks. This labeling/terming shows the growth of the views toward formalized market giving and the main textbook giving's as no longer sufficient, and lacking the tools and approaches required especially in the new ventures and SMEs. The literature also indicates that formality and over-reliance on given rules and methods resulted in lower levels of innovation and proactiveness.

5 An-Approach Based Paradigm Shift-Discussion

A paradigm shift is defined in the dictionary as "an important change that happens when the usual way of thinking about or doing something is replaced by a new and different way". The term is used for the first time by Thomas S. Kuhn in his writings between (1922–96), with the view of a paradigm shift as" a fundamental change in approach or underlying assumptions". Three main forces are defined to be driving

for a paradigm shift of the prevailing marketing giving, these are the critique of the giving and principles deemed to be no longer sufficient in the contemporary market; strong emergence of the EM as a field, and new marketing school of thought with the views toward EM as a concept valid for the large size firm as well as the new ventures and SMEs; nature of the landscape composing the market and business environment at the different levels with the rapidly changing and fluid boundaries being nature of this market rather than occurrences; change at customer side with the globalization and open markets making the customer more knowledgeable. All under the umbrella of information technology advancements and the fourth industrial revolution, raising disruption almost across all industries.

While marketing remains as the main discipline and one of the key issues of the success for any firm, of any size, within any context, across the full spectrum of industries and markets. These forces raised since the -90's in some of them- elevate the need for a bold evolution in the prevailing school of marketing. An evolution that builds on it but views it in other frames and theories to yield a novel one, and no extension of the existing ones to develop theories for new challenges. The extension of the existing theoretical frames is seen to be no longer sufficient in reflecting shifts in the market landscape (Morris et al., 2002). EM with the development in the research field provides a strong groundwork for this evolution seen as a paradigm shift. A shift on the approach-based layer or frame and not on the detailed levels of strategy, tactic, or process. As detailed levels do not allow for a comprehensive frame of revision, that addresses the paradigm at the school of thought. The frame for this approach-based paradigm is composed of the main four elements/dimensions, derived from the main forces calling for the change. These are resilient management; scalable/gradual matter of sub-frames including multi-dimensional orientation effectual-causal, proactiveness-reactiveness; living strategic process, and Entrepreneurial Innovation. This shape the approach-based paradigm to be resilience in taking and managing risks without severe impacts, dynamic with flexible scalability allowing for the activation and deactivation of the sub-dimension according to the landscape of operation, and with living strategic process that allows for smooth capturing of changes and seamless reflection on the processes all with entrepreneurial innovation that is also gradual but activated as deemed necessary for the growth of the firms. Ironically, marketing concepts are also considered to be about change, but different than entrepreneurial activity/process in a further methodical and structured way (Stokes, 2000).

Effectuation theory provides a supportive frame for resilience. Effectuation allows the changing goals and shaping and re-constructing them over time and making use of the contingencies arising over time (Hills & Hultman, 2011). The proposed paradigm, support deliberating the marketing as a discipline from being organizational or context defined and allow for a flexible frame instead that augments on the theories and practices of new approaches and models and provide a conceptual frame that overrides the different views supporting the formal or informal planning, sequential or fluid and the other various points on the sort of orientation better suited.

Another note is made on the conceptual nature of the paradigm proposed this links with the academia and the practice field. Where the definition and structure of the framework provide the understanding of the term or issue of study, while concept proposals allow for the overall perception and further case-level interpretation. This allows for increasing innovation that is not restricted in the structured forms or given order of thinking. Concepts shall give the overall understanding without putting rigid frames to enable flexibility required more than before in the current landscape, and also allow for more creativity and innovation in projecting these concepts under different contexts, contents, cultures, etc. this is the core of the proposed paradigm.

6 Conclusions and Future Work

The objective of this research is to augment the research field of Entrepreneurial Marketing as a concept and approach, and the substantial differences it holds in comparison to the prevailing giving of the marketing. In doing so the research aims to explore and analyze the causes and drivers that resulted in the emergence of EM as a new school of thought in addition to other new approaches, and how these are understood as better suited for the ventures in the contemporary market and the shifts the marketplace is witnessing. When compared to the formalized giving's of marketing referred to frequently with "traditional marketing" and "conventional marketing". It is noted that EM is viewed to be fundamentally different than formalized giving of marketing, with this difference examined at the different levels of concept definitions, mindset, influence, dimension, strategy, and process. With the recent tendency for addressing EM as suitable for large firms as well as EV and SMEs.

Along with the emergence of the EM, it is also found to have an emerging criticism for the formalized giving of marketing and the rules set. With the infer that these giving's requires development if to be sufficient in addressing the market shift needs in the long run. It is concluded that this is also implicitly rooted in the changing in the landscape of operation and the customer side. Covering market, business, and economic landscape. Augmenting on the above, this research proposes an approach-based paradigm shift frame for the formalized givings of marketing. The proposed paradigm responds to the drivers of evolution concluded in the study and expands on the evolution in the EM in defining the main dimensions conceptualizing this proposed paradigm.

The main contribution lies in the proposed paradigm linked with the driving forces for the need of the shift. However, this research also provides a contribution in the EM literature in exploring EM in a multi-faceted perspective integrating the advancement and development in the field. It also contributes under the labeled/termed marketing introduction, aiming to have a bold move toward responding to the change needed to the marketing discipline.

Limitations on the work are represented by the literature focusing on EM, while other new approaches require study to aid the development of the paradigm. In addition to the literature specifically on the critique of formalized giving's of marketing

to view other possible forces of change. This paper is a concept paper, proposing a conceptual paradigm. Where the proposed paradigm requires further work to develop and examine within inductive methods.

A Development of a Newly Constructed Model Related to the Impact of Entrepreneurial Motivation on Entrepreneurial Intention

C. Al Deir, M. Al Khasawneh, M. Abuhashesh, R. Masa'deh, and A. M. Ahmad

Abstract The current research developed a model which included Entrepreneurship Motivation (EM) as a higher order construct that consists of twelve first order indicators (need for achievement, need for autonomy, need for affiliation, need for power, subjective norms, attitude toward becoming entrepreneur, perceived behavioral control, governance motive, financial motive, economic motive, creativity and risk taking) and considered EM as an independent variable for Entrepreneurial Intention (EI). The current research methodology employed a quantitative approach, in which data were administrated and gathered via an online and face-to-face survey with entrepreneurs in Jordan; 221 surveys were collected, the data were later tested using a (SEM) via AMOS program. The findings of this research showed that need for achievement, need for autonomy, need for affiliation, need for power, subjective norms, attitude toward becoming entrepreneur, PBC, financial motive, creativity, and risk taking are considered as indicators for EM, whereas governance motive and economic motive were not indicators for EM.

1 Introduction

The significance of entrepreneurship as a contributor and supporter to venture creation, economic development, and innovation is widely recognized (Alameeri et al., 2021; Hopp & Stephan, 2012; Nabi & Liñán, 2011; Qandah et al., 2020). Therefore, it is essential to define Entrepreneurship as a concept. In particular, entrepreneurship is the creation and application of new opportunities in an uncertain and complex environment (Neck & Greene, 2011) that drives sustainability and growth in an economy (Rasmussen & Sorheim, 2006). In addition, it is considered as a phenomenon encompassing the action of humans; it means that the entrepreneurial process exists because opportunities are being exploited by individuals, and as similar, human roles cannot be overlooked (Shane et al., 2003). Taking this point further, starting a new business relies largely on intentions as suggested by a growing body of relevant literature (Bird, 1988; Liñán & Chen, 2009a; Schlaegel & Koenig, 2014). Several previous studies confirmed the aforementioned assertions by stating that the development of entrepreneurial intention is followed by entrepreneurial activities (Douglas, 2013; Shook et al., 2003).

Furthermore, it is important to be motivated to insist and continue until the work is done and goals are achieved (Farhangmehr et al., 2016). Hence, Entrepreneurial Motivation (EM) is viewed as observable and behavioral and is connected to the organizational growth, survival and origin (Bird, 1995). More specifically, EM represents relevant particular goals to which potential entrepreneurs believe and aspire they can accomplish with new ventures, and accordingly their beliefs will motivate them to implement an entrepreneurial action (Kuratko et al., 1997).

After examining the previous studies about EM, it is noted that these studies did not developed a comprehensive model to measure the indicators affecting EM. For that reason, this research aims to examine the indicators that affect EM, and the effect of EM on EI. In addition and based on reviewing previous studies, it is found that different theories were used to measure EM, where needs theory (McClelland, 1961) was used in various studies (Jayachandra, 2011; Lee, 1996; Sethi & Saxena, 2006), while theory of planned behavior was used in several other EM studies (Malebana, 2014; Solesvik, 2013). In addition to that, there was no agreement in the natures or the number of the indicators to measure EM, such as, some studies used the three needs theory (McClelland, 1961) to measure EM whereby four indicators were included (Sethi & Saxena, 2006), while seven indicators were examined in another stream of research (Jayachandra, 2011). Whereas the theory of planned behavior related studies examined EM with eight indicators (Malebana, 2014) and others with only three indicators (Solesvik, 2013).

For this reason, this study developed a model with an extended theories and variables from different studies to measure EM by adopting the needs theory (McClelland, 1961), and theory of planned behavior (Ajzen, 1991), in addition to other influencing variables as recommended in the existing relevant literature such as governance motive (Aziza et al., 2013), financial motive (Aziza et al., 2013; Hessels et al., 2008; Sarri & Trihopoulou, 2004) economic core motive (Aziza et al., 2013; Vijaya,

Licensed to (putm@utm.my)

1998) creativity (Estay et al., 2013), and risk taking (Estay et al., 2013; Jayachandra, 2011; Nishantha, 2009; Segal et al., 2005). Further, the current study will add to the current knowledge regarding the relationship between EM and EI by examining the influence of EM as a multidimensional construct on EI in the Jordanian context.

EM described briefly in this background discussion, and it focuses on the need of having deeper knowledge and understanding the indicators of EM and its effect on EI in a wide range approach with the following objectives:

(1) To understand the key dimensions of EM from a theoretical perspective.
(2) To understand the key dimensions of EM from a statistical perspective in the Jordanian context.
(3) To investigate the level to which EM influences EI in the Jordanian context.

2 Literature Review

To provide a comprehensive understanding of this research, an intensive revision of the relevant literatures related to EM and EI has been conducted. EM topic is very broad and explored by many researchers (Shane et al., 2003; Jayachandra 2011; Lee 1996; Malebana 2014; McClelland, 1961; Sethi & Saxena, 2006; Solesvik, 2013; Aziza et al., 2013; Antonioli et al., 2016; Batchelor et al., 2014; Fereidouni et al., 2010; Hackman & Oldham, 1975). EM is defined as the willingness and propensity to manipulate and control companies, thoughts and human beings as independently and rapidly as possible (Johnson, 1990). Previous research found that EM impacts the growth of small business (Delmar & Wiklund, 2008). On the other hand, a significant relationship was found between EI and EM (Achchuthan & Nimalathasan, 2013; Solesvik, 2013). Some researchers found that there is a link between EI, motivation and behavior in which they showed that since intentions cannot transform immediately into action, then motivation is considered as link between EI and actions; motivation will translate an intention into real action (Carsrud & Brännback, 2011).

2.1 Three Needs Theory

Various theories and indicators have been used to measure EM (Collins et al., 2004; Shane et al., 2003). For example, many studies have examined the Three Needs Theory developed by McClelland to measure the EM. Taking this point further, (McClelland, 1961) suggested that the high need for achievement was the personal characteristics common to entrepreneurs, in support to this, a numerous research has focused on entrepreneurs' characteristics (Churchill & Lewis, 1986; Shaver & Scott, 1991). In particular, by duplicating and extending the Three Needs Theory, several studies included this theory in their investigation such a study which was conducted by Lee (1996) to examine the indicators that influence the motivational needs of entrepreneurs. These indicators include need for achievement, need for

affiliation, need for autonomy and need for dominance and the results demonstrated that entrepreneurs will be motivated by a high need for achievement, a moderate need for autonomy and affiliation and a little high need for dominance. Moreover, it was found that entrepreneurs need a higher need for dominance and achievement than employees, and a significant difference in the needs for autonomy and affiliation (Lee, 1996). In contrast, another study used the same theory with the same variables but they found that need for achievement have a crucial role in EM (Sethi & Saxena, 2006).

Other studies have focused on investigating EM using psychological traits (Bygrave, 1989; Robinson et al., 1991). For instance, (Bygrave, 1989), developed a model and confirmed that need for achievement, tendency toward risk-taking, ambiguity toleration and inner locus of control act determinants of the entrepreneurial motivation. However, (Robinson et al., 1991) found in their study that the accomplishment, self-confidence and the locus of control are the most significant indicators that are predicting entrepreneurial behavior.

2.2 Theory of Planned Behavior

Other researchers have emphasized on examining and measuring EM using the Theory Planned Behavior (Ajzen, 2012; Malebana, 2014). This theory suggested that an individual's intention to perform or not to perform an action is the most important determinant of action (Ajzen, 2012). In particular, (Malebana, 2014) found that EM is a significant link between EI and entrepreneurial action; hence, it is suggested that the theory of planned behavior should be utilized to explore the determinants of EM and EI. Depending on the theory of planned behavior, there are several studies used this theory to determine the effect of the following three variables (attitude toward entrepreneurs, subjective norms, and PBC) on EM and their role in forming EI (Solesvik, 2013). These three particular variables were found to affect EM by mediating the relationship between EM and EI. While, (Locke et al., 2001) extended the Theory Planned Behavior theory in his research by adding five variables (EI, entrepreneurial role models, social valuation of entrepreneurship, knowledge of entrepreneurial support and perceived barriers to start a business) to determine their effect on EM. The findings showed that the attitude towards becoming an entrepreneur, entrepreneurial support, subjective norms, social valuation of entrepreneurship, EI and knowledge of entrepreneurial role models have a great influence on EM (Baum et al., 2001).

Various approaches and methods have been used to measure EM (Collins et al., 2004; Shane et al., 2003). For example, one of the studies suggested that need for achievement, locus of control, risk taking and goal settings are major indicators contributing to the formation of EM. While other studies measured EM with passion, independence and drive factors (Collins et al., 2004; Shane et al., 2003). In addition to that, other related studies to EM developed their models based on key previous studies within the EM context. For example, some researchers examined need for achievement, locus of control, vision, desire for independence, passion, drive, goal

settings and self-efficacy as an indicator that will impact EM (Baum et al., 2001; Hisrich, 1985; Locke and Latham, 1990; McClelland, 1961; Tracy et al., 1998). Whereas another study conducted by Nishantha (2009) measured EM including the following indicators: personality traits (internal locus of control, need for achievement, and risk taking), and socio demographic background (parents' occupation, gender, self-employment, and (Nishantha, 2009). One more research made their model as a comparison to determine where the focus should be to be motivated in order to start a business between psychological behavior variables, which includes achievement striving, social networking and optimism, with external environment variables which is the perceived importance of a favorable business environment (Alameeri et al., 2021; Taormina & Lao, 2007). They concluded that both were significant predictors, but the psychological factors influence was stronger on potential entrepreneurs, whereas the external environment was stronger for successful entrepreneurs (Taormina & Lao, 2007). Whereas the variable perceived importance of business environment was used in another study with other several variables. These indicators perceived importance of business environment, social status, and country external conflicts. They revealed that the perceived importance of business environment is the most important variable in predicting EM, while the perceived social status doesn't affect the motivation of an entrepreneur to start a new business (Abu Zayyad et al., 2020; Fereidouni et al., 2010).

A revision of other streams of existing studies concluded that the motivation of an individual is complicated and multi-faceted (Marlow & Strange, 1994; Shane et al., 1991) and relied moslty on push and pull theory. In particular, individuals who think they are able to create or to grow in a business are stronger and more motivated to create new venture and to develop in certain business successfully (Malebana, 2014). The push and pull indicators play a key role in EM, it helps in understanding why people decide to create a new venture. Pull indicators contain independence, achievement, personal growth and recognition, in contrast push indicators are lack of innovation and alternatives, insecurity of work and unemployment (Wickham, 2006). Individuals who depend on pull indicators perceive the entrepreneurial job opportunity more attractive, so they are considered as entrepreneurs, while others who depend on push indicators choose to follow entrepreneurship and decide to create new business just because the traditional work is less attractive (Malebana, 2014). Taking this point further, (Reynolds et al., 2002) suggested that individuals who are opportunity driven are more motivated to exploit opportunities for economic gain in order to achieve success, and those who are necessity driven are motivated just for the need of survival.

In conclusion, several indicators have been identified as determinants of EM within the EM literature and there was no agreement upon which theories most applicable to EM determinants and which are the most important indicators that affect EM. To address this gap in the entrepreneurship literature, the current study seeks to; firstly, present a theoretical model of the most important determinants of EM by incorporating variables synthesized from the EM and EI literature. Secondly, this study will empirically validate the model from the entrepreneurial perspective. The final result will be the development and empirical validation of a comprehensive model of determinants of EM and EI.

2.3 Research Model

Previous studies about EM have been examined, it is noted that most of the studies did not develop a comprehensive model to measure EM as the results showed that there are several indicators forming EM construct. In reviewing the existing relevant literature, several studies attempted to examine EM using various indicators separately such as; need for achievement (Antonioli et al., 2016; Begley & Boyd, 1987; Johnson, 1990; Lee, 1996; Nishantha, 2009; Rauch & Frese, 2000; Sethi & Saxena, 2006; Shane et al., 2003), need for affiliation (Lee, 1996; Sethi & Saxena, 2006), need for autonomy (Estay et al., 2013; Lee, 1996; McClelland, 1985; Oosterbeek et al., 2010; Sethi & Saxena, 2006) need for power (McClelland, 1985; Sethi & Saxena, 2006) attitude toward becoming an entrepreneur (Malebana, 2014; Solesvik, 2013; Segal et al., 2005; Ajzen, 2005; Fishbein, 1975; Linan 2004), subjective norms (Malebana, 2014; Segal et al., 2005; Solesvik, 2013) perceived behavioral Control (Malebana, 2014; Segal et al., 2005; Solesvik, 2013). Based on theory of planned behavior (Fishbein & Ajzen, 1975), creativity (Caird, 1991; Cromie & O'Donoghue 1992; Zhu et al., 2016), risk taking (Estay et al., 2013; Jayachandra, 2011; Koh, 1996; Nishantha, 2009; Segal et al., 2005) economic Core (Aziza et al., 2013; Vijaya, 1998) financial motive (Aziza et al., 2013; Hessels et al., 2008; Sarri & Trihopoulou, 2004) and governance (Audretsch, 2002; Stevenson & Lundström, 2001; OECD, 2010). Therefore, the current research proposed that all of these indicators may act as significant indictors to measure EM, as well as the impact of EM on EI (Liñán & Chen, 2009b).

The elements of this research are established based on preceding literature review either theoretically or empirically. Indeed, this study uses variables that are common Entrepreneurship Motivation and Entrepreneurial Intention literature. Figure 1 represents a model of the study that shows the independent variables (in which twelve indicators have been identified as the key indicators of EM as shown below in Fig. 1), the dependent variable and the proposed relationship between them.

2.3.1 Need for Achievement

Need for achievement is defined as an individual drive to exceed with respect to some settled arrangement of norms and standards (Lee, 1996; McClelland, 1985). Much of the literature have examined how entrepreneurs are motivated, by a higher need for achievement than employees (Lee, 1996; Nishantha, 2009; Oosterbeek et al., 2010; Sethi & Saxena, 2006). Taking this point further, individuals with higher need for achievement are more satisfied in jobs that have hard challenges and high skill levels (Eisenberger et al., 2005) and are more frequently demanded for a feedback on their advance towards goal fulfillment (Emmons, 1997; McAdams, 1994). Furthermore, individuals with high need for achievement are more likely to be motivated in order to become an entrepreneur (Antonioli et al., 2016; Lee, 1996; Nishantha, 2009). Therefore, based on the previous discussion this study supposed that, need for achievement is highly correlated for the higher-order construct EM.

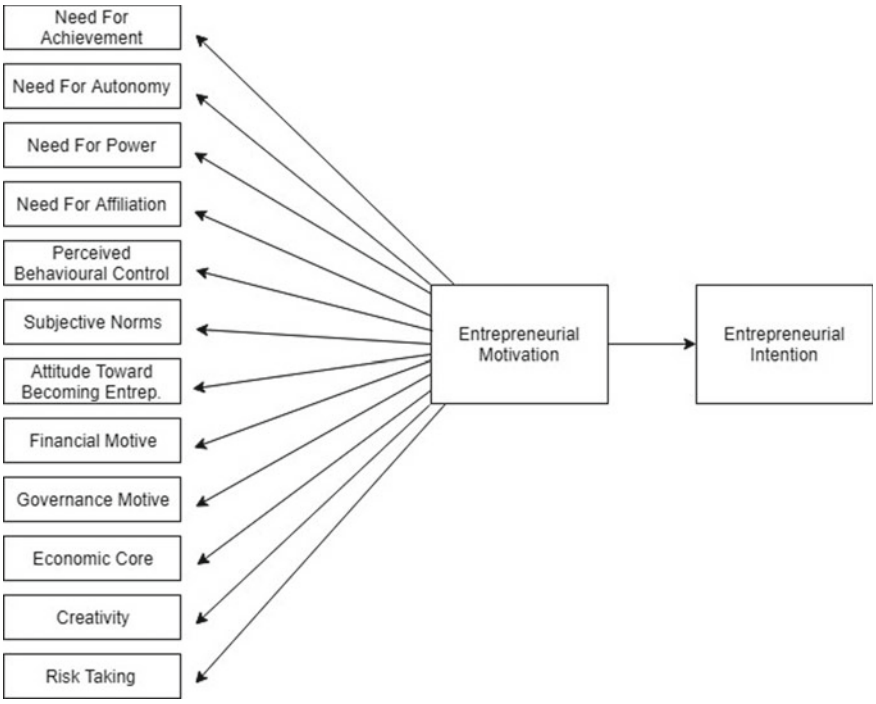

Fig. 1 Research model

2.3.2 Need for Affiliation

Need for affiliation is viewed as the desire to have warm, friendly relationships with others (Robbins, 2003; McClelland, 1985; Veroff, 1980). Several studies have applied need for affiliation in various fields such as entrepreneurship (Lee, 1996; Sethi & Saxena, 2006), and managemnet (Lee, 1996). Studies have shown that people with higher need for affiliation tend to be more successful managers and leaders (Lee, 1996). In addition to that, people with high need for affiliation were more likely to become an entrepreneur and it is highly correlated with EM (Lee, 1996; Sethi & Saxena, 2006). Therefore, this study supposed that need for affiliation is highly correlated for the higher-order construct EM.

2.3.3 Need for Autonomy

Need for autonomy is defined as a want for independence, (Sethi & Saxena, 2006) and to be able get things done without taking into consideration to what others may think and to avoid commitment and responsibility (Lee, 1996). Several studies indicated that individuals with high need for autonomy were more motivated to become an

entrepreneur and will influence EM (Estay et al., 2013; Lee, 1996; Sethi & Saxena, 2006). Therefore, this study supposed that need for autonomy is highly correlated for the higher-order construct EM.

2.3.4 Need for Power

Need for power is defined as individuals who look for position control that can constrain the activities of others (McClelland, 1985). In more recent studies, it was defined as the concern for affecting individuals or the conduct of others for moving in the direction that was chosen and achieving the envisioned goals (Sethi & Saxena, 2006). Much of the literature agreed that need for power is highly and positevely coorelated to EM (McClelland, 1985; Sethi & Saxena, 2006). Therefore, this study supposed that need for power is highly correlated for the higher-order construct EM.

2.3.5 Attitude Toward Becoming an Entrepreneur

Personal attitude defined as an individual's favorable or unfavorable estimation of a specific behavior (Ajzen, 2005), individuals evolve attitudes from the beliefs they hold about the results of performing the behavior (Malebana, 2014). In other studies, attitude characterized as the predisposition to reaction an unfavorable or favorable way with respect to the object of the attitude (Ajzen, 1982; Shaver, 1987; Rosenberg & Hovland, 1960). Taking this point further, attitude toward a particular object has been found to be positively correlated to motivation and behavioral intentions (Bauer et al., 2005). Attitudes have a great influence on EM (Fishbein & Ajzen, 1975, Linan, 2004; Malebana, 2014; Solesvik, 2013), for that reason we hypothesize that attitude is highly correlated for the higher-order construct EM.

2.3.6 Subjective Norms

Subjective norms refer to the perceived social compression to perform or not the behavior (Malebana, 2014). In other studies, subjective norms defined as the social pressure to implement the behavior being referred to, moreover subjective norms are a measure of social help of the behavior by significant others, for example, family, connections and other considered as role models and associates (Bauer et al., 2005; Segal et al., 2005; Yau & Ho, 2015). In reviewing the related literature, subjective norms were found to be positively related to student behavioral intention to use e-learning in their education (Park, 2009; Yau & Ho, 2015). Moving to the entrepreneurial context, it is found that subjective norms have a great influence on the intention to become an entrepreneur (Malebana, 2014; Segal et al., 2005; Solesvik, 2013), for that reason, we hypothesize that subjective norms are correlated for the higher-order construct EM.

2.3.7 Perceived Behavioral Control (PBC)

PBC refers to people's appraisals of how much they are able of performing a specific behavior (Chiou, 1998; Malebana, 2014; Segal et al., 2005). Several researches have examined attitude in many fields, for example, entrepreneurship context (Malebana, 2014; Solesvik, 2013) and behavioral intention (Ajzen, 2005). PBC will influence the behavior of intention when individuals possess the accurate resources and skills to implement it (Ajzen, 2005). In addition to that, PBC have a great influence on individual's intention to become entrepreneurs and start their own ventures thus it will influence EM (Malebana, 2014; Segal et al., 2005; Solesvik, 2013), For that reason we hypothesize that PBC is highly correlated for the higher-order construct EM.

2.3.8 Creativity

Creativity defined as evolving new methods instead of utilizing standard procedures (Estay et al., 2013). In other studies, creativity characterized as a method for seeing or doing things that described by familiarity; to create many ideas, adaptability; to shift point of view effectively, elaboration; to expand on others thoughts, and, originality; to imagine something new (Alvino, 1990; Cromie & O'Donoghue, 1992). Several researches have examined creativity in many fields such as management and marketing context (Caird, 1991; Cromie & O'Donoghue, 1992; Zhu et al., 2016) and entrepreneurship and technology (Estay et al., 2013). Creativity influences owner—managers higher than managers (Caird, 1991), moreover, creative entrepreneurs are more likely to be to create new ideas or developing existing ideas in order to create more value and to be more innovative (Cromie & O'Donoghue, 1992). Creativity was found to have a great influence on individuals to start their new ventures and become entrepreneurs (Estay et al., 2013; Jaillot, 2017). For that reason, we suppose that creativity is correlated for the higher-order construct EM.

2.3.9 Financial Motive

Financial motive is viewed as the desire to earn wealth (Brett et al., 1995; Doran et al., 1991; George & Brief, 1990). Several researches have examined financial motive in many fields, for example, in organizations (Burton, 2012) and in entrepreneurship (Aziza et al., 2013; Hessels et al., 2008; Sarri & Trihopoulou, 2004). Financial motive has a great influence on employees, in which employees who are compensated financially will be more motivated and their performance will be higher (Burton, 2012). Entrepreneurs begin their businesses in order to gain more money. In particular, financial motive is considered as one of the indicators of EM in order to become an entrepreneur and start a business (Aziza et al., 2013; Hessels et al., 2008; Sarri & Trihopoulou, 2004), and for that reason we suppose that financial motive is correlated for the higher-order construct EM.

2.3.10 Risk Taking

Risk taking is characterized as an individual tendency towards taking opportunities in uncertain decision-making contexts (Estay et al., 2013; March & Shapira, 1987; Nishantha, 2009). Several researches have studied risk taking in many fields, for example, management context (Crimmon & Wehrung, 1986; March & Shapira, 1987) and entrepreneurship (Estay et al., 2013; Jayachandra, 2011; Koh, 1996; Nishantha, 2009; Segal et al., 2005). It has been previously found that risk taking influences managers' willingness to take risks (Crimmon & Wehrung, 1986) in which they connect risk taking with the expectation of their work and it influences managers' decision making (Abuhashesh et al., 2019; March & Shapira, 1987). In particular, risk taking is considered as a trait to distinguish founders from non-founders (Abuhashesh et al., 2019). Risk taking is considered high for individuals and has an influence for individuals who are entrepreneurially inclined than non-entrepreneurially inclined (Koh, 1996). Individuals with high-risk taking have an influence toward entrepreneurship (Nishantha, 2009). Risk taking has an influence on EI, in addition to that, risk taking have a great influence on EM (Estay et al., 2013; Nishantha, 2009), and for that reason we suppose that risk taking is highly correlated for the higher-order construct EM.

2.3.11 Economic Motive

Economic motive is defined as the investigation of how people use knowledge to recognize resources and use these scarce resources to make, utilizing knowledge, and commodities and disseminate them among individuals (Ayers & Collinge, 2005; Khumalo, 2012; McConnell, 1969). Several researches have studied economic core, such as, entrepreneurship (Aziza et al., 2013; Vijaya, 1998) and economic development (Deaton, 2010). Based on these studies, it is noted that economic motive makes entrepreneurs more motivated when they feel independence and self-achievement (Vijaya, 1998). Furthermore, economic motive effects saving rates, in which saving rates are higher in rapidly developing and growing economies (Deaton, 2010). Economic motive considered as one of the indicators of EM (Aziza et al., 2013; Vijaya, 1998). Therefore, we hypothesize that economic motive is correlated for the higher-order construct EM.

2.3.12 Governance Motive

Governance is defined as the activity of political, economic and executive authority to deal with a country's affairs. It is the complex systems, procedures and establishments, through which citizens and groups express their interests, practice their legitimate rights and commitments, and arrange their differences (Lusaka, 2013). For the current research, governance is defined by Ha et al. (2016), as "the traditions and institutions by which authority in a country is exercised. This includes (1) the

process by which governments are selected, monitored and replaced; (2) the capacity of the government to effectively formulate and implement sound policies; and (3) the respect of citizens and the state for the institutions that govern economic and social interactions among them" (P. 517).

Many researches have studied governance in several contexts, such as, corporate governance (Albourini et al., 2020) and entrepreneurship (Aziza et al., 2013; Yalcin et al., 2008). Good corporate governance is a way to make market confidence and business integrity, which then will be basic for organizations that need access to value capital for long term venture (Albourini et al., 2020). Governance is considered as one of the indicators of EM (Aziza et al., 2013; Yalcin et al., 2008) suggested that specific government policies influence people's desire to be entrepreneurs. Bureaucracy, exaggerated taxation, and limited access to capital are considered as barriers to entrepreneurship. Alternatively, their study proposes that entrepreneurs' perception that business laws and regulations are ideal to begin and manage new businesses are positively related to entrepreneurial motives. Limited studies discussed the influence of governance on EM, so more knowledge is needed to examine such influence in the Jordanian context. Therefore, this research hypothesize that governance is highly correlated for the higher-order construct EM. Based on the previous literature, we have developed the following hypothesis.

H1: EM is a higher order construct that consist from twelve first order indicators (need for achievement, need for autonomy, need for affiliation, need for power, subjective norms, attitude toward becoming entrepreneur, PBC, governance motive, creativity, financial motive, economic core motive, and risk taking).

2.4 Entrepreneurial Motivation

EM is defined as the willingness and propensity to manipulate and control companies, thoughts and human beings as independently and rapidly as possible (Johnson, 1990). Several studies have discussed EM in the business context (Delmar & Wiklund, 2008), education context (Ferreira et al., 2007; Raposo et al., 2008) and entrepreneurship context (Achchuthan & Nimalathasan, 2013; Carsrud & Brännback, 2011; Ajzen, 2012; Malebana, 2014; Solesvik, 2013). Some researchers focused on the significance of entrepreneurship education in the advancement of the EM and EI. For instance, (Ferreira et al., 2007; Raposo & A. Pac¸o & J. Ferreira, 2008) asserted that education has the most significant impact on the tendency to be motivated to create a new business among students. (Delmar & Wiklund, 2008) found that EM impacts the growth of small business. On the other hand, a significant relationship was found between EI and EM (Achchuthan & Nimalathasan, 2013; Solesvik, 2013). Some researchers found that there is a link between entrepreneurial intentions, motivation and behavior, they showed that since intentions cannot transform immediately into action, then motivation is considered as link between EI and actions; motivation will translate an intention into real action (Carsrud & Brännback, 2011). While other

researchers have emphasized on examining and measuring EM using the Theory of Planned Behavior (Ajzen, 2012; Malebana, 2014). This theory suggested that an individual's intention to perform or not to perform an action is the most important determinant of action (Ajzen, 2012). In particular, (Malebana, 2014) found that EM is a significant link between EI and entrepreneurial action; hence, it is suggested that the theory of planned behavior should be utilized to explore the determinants of EM and EI. According to Solesvik (2013), his empirical result depending on the theory of planned behavior showed that the three variables (attitude toward entrepreneurs, subjective norms, and PBC) affect EM and they mediate the relationship between EM and EI. Therefore, EM will have a significance influence on EI: Based on the previous studies, we have developed the following hypothesis.

H2: EM has a significant positive influence on EI.

3 Methodology

3.1 Population and Sample of the Study

The aim of this study to develop and validate a newly constructed model related to the EM construct and its impact on EI in Jordan. This research utilized the survey questionnaire as the fundamental method for gathering information. Online self-administered questionnaires were created based on prior literature. As this research is considering the indicators of EM that influences EI. The population of the research comprises entrepreneurs running their businesses in Jordan. Therefore, it is important for individuals who aim to start a business in Jordan to understand the indicators of EM that will influence their decision to run a business. The current study adopted a non-probability sampling procedure in which a convenience sampling technique is used. Thus, convenience sampling is incorporated into the research, 221 surveys were completed. The data was collected with support from the business incubators which operates in Jordan (Zinc, Oasis 500, The tank, Adamtec VC, QRCE, Business development center, Business and professional women, Shaml start, Migretmena, Big, I park, Injaz, Intaj).

The survey composed of two parts; the first part is information about demographics characteristics, which include gender, age, level of education, size of the company and legal form. The second part consists of EM indicators: need for achievement, (Culp, 2015) need for Affiliation (Culp, 2015) need for power (Lee, 1996), need for autonomy (Broeck et al., 2010), PBC (Malebana, 2014) subjective norms (Malebana, 2014) attitude toward becoming an entrepreneur (Malebana, 2014), governance motive (Ahmed et al., 2021), economic motive (Ahmed et al., 2021), financial motive (Ahmed et al., 2021), risk taking (Perry, 2014), creativity (Ala'eddin Ahmed et al., 2021), and EI (Liñán & Chen, 2009b). The measures in the questionnaire were based on prior studies and used the five-point Likert scale, the extent from "1" for strongly

Licensed to (putm@utm.my)

disagree to "5" for strongly agree (Farhangmehr et al., 2016), The survey questions were pre-tested by 30 entrepreneurs and ten university professors to take their feedback. The order of some questions after the feedback were reorganized, the content and wording of some questions were changed, furthermore some questions were complex, so rewording has been done in order to make them easier to be understood. Based on their review, some questions were deleted.

4 Data Analysis

The research model was tested a structural equation modeling via AMOS. The reason for using AMOS is that the study model contains a high order construct that consists of first order indicators which makes AMOS as the most appropriate statistical technique to test the model.

4.1 Reliability Analysis

Cronbach alpha (α) was used to assess the reliability of each scale (Hair, 1995). Table 1 shows that the Cronbach alpha of the items of each scale was above the threshold of 0.35 and the Cronbach alpha of each construct was above the threshold of 0.70.

4.2 Model Validation

It should be noted that AMOS 23 was used to assess convergent validity and discriminant validity. To do so, a model of 12 first-order correlated variables was specified. However, two of the 12 variables namely (economic motive and governance motive) did not correlate with other ten variables, which indicate that they are not part of the construct of entrepreneurial motivation. Therefore, these two variables were omitted from the model. Their inclusion actually produced a bad model-fit: CMIN/DF (3.248), IFI (0.701), TLI (0.627), CFI (0.692) and NFI (0.619). However, after deleting the two variables, the model fit has become as follows: CMIN/DF (2.357), IFI (0.878), TLI (0.824), CFI (0.864) and NFI (0.848), which is within the acceptable range (see Table 2).

4.3 Convergent and Discriminant Validities

Average variance extracted (AVE) was calculated in order to assess the convergent validity of each scale. Table 3 shows that the values of the AVE of each scale was

Table 1 Construct reliability

Construct	Cronbach alpha
Need for achievement	0.848
Need for affiliation	0.844
Need for power	0.85
Need for autonomy	0.847
PBC	0.844
Subjective norms	0.845
Creativity	0.847
Risk taking	0.847
Financial motive	0.843
Economic core	0.851
Attitude toward becoming entrepreneur	0.844
Governance motive	0.849
Entrepreneurial intention	0.843

Table 2 Rule of thumbs of goodness-fit-indices

Type of fit indices	Cut-off point
CMIN (X^2)	p-value $\geq$ 0.05
Normed CMIN (CMIN/DF)	1.0 < CMIN/DF < 3.0
Normed Fit Index (NFI)	0.8 < NFI < 0.9 (acceptable fit)
	0.9 $\leq$ NFI > 1 (satisfactory fit)
	NFI = 1 (perfect fit)
Competitive Fit Index (CFI)	0.8 < CFI < 0.9 (acceptable fit)
	0.9 $\leq$ CFI > 1 (satisfactory fit)
	CFI = 1 (perfect fit)
Tucker-Lewis Index (TLI)	0.8 < TLI < 0.9 (acceptable fit)
	0.9 $\leq$ TLI > 1 (satisfactory fit)
	TLI = 1 (perfect fit)
Incremental Fit Index (IFI)	0.8 < IFI < 0.9 (acceptable fit)
	0.9 $\leq$ IFI > 1 (satisfactory fit)
	IFI = 1 (perfect fit)

above than the cut-off-point of 0.50. Discriminant validity is characterized as two variables, which are not, correlated with each other the items that measures each variable is poorly correlated with each other in the same model.

Table 3 Convergent validity and discriminant validity

	AVE	Financial motive	Need for affiliation	Need for achievement	Need for autonomy	Creativity	Power	Subject norms	PBC	Risk taking	Attitude	Entrepreneurial intention
Financial Motive	0.63	**0.794**										
Affiliation	0.585	0.284	**0.765**									
Achievement	0.534	0.465	0.573	**0.731**								
Autonomy	0.671	0.458	0.522	0.67	**0.819**

4.4 Model Testing

AMOS 23 was also used to test the thesis's hypotheses. To do so, a high order construct of entrepreneurial motivation that consists of ten first-order indicators was specified. The results of the hypotheses are reported below.

H1: EM is a high order construct that consist from twelve first order indicators (Need for achievement, Need for Autonomy, Need for Affiliation, need for power, Subjective norms, Attitude, perceived behavioral control, Governance, creativity, financial motive, Economic core, and Risk Taking).

This hypothesis was rejected as economic core motive and governance motive were deleted, which indicates the EM is a high order construct that consists of ten rather than twelve first order variables. These variables are Need for achievement, need for autonomy, need for affiliation, need for power, Subjective norms, Attitude, PBC, Creativity, Financial motive, and Risk taking.

The fit indices of this model are as follows: CMIN/DF (2.357), IFI (0.878), TLI (0.824) and CFI (0.864). Table 4 also shows the relative importance of each of variables in forming the construct of EM. All the variables were significant at (0.001), (***).

H2: EM is positively associated with EI.

This hypothesis is accepted ($\beta = 0.743$, $p < 0.001$). Additionally, the variance in EI that was explained by entrepreneurial motivation was substantial ($R^2 = 0.745$), All the results are reported in Table 5.

Table 4 Regression weights of each indicator

			Regression weights
Financial motive	←	EM	0.912
Need for affiliation	←	EM	0.436
Need for achievement	←	EM	0.49
Need for autonomy	←	EM	0.449
Creativity	←	EM	0.337
Need For power	←	EM	0.596
Subjective norms	←	EM	0.48
Perceived behavioral control	←	EM	0.838
Risk taking	←	EM	0.758
Attitude toward becoming entrepreneur	←	EM	0.716

Table 5 Regression weights of each indicator with EI

			Regression weights
Financial motive	←	EM	0.912
Need for affiliation	←	EM	0.436
Need for achievement	←	EM	0.49
Need for autonomy	←	EM	0.449
Creativity	←	EM	0.337
Need For power	←	EM	0.596
Subjective norms	←	EM	0.48
Perceived behavioral control	←	EM	0.838
Risk taking	←	EM	0.758
Attitude toward becoming entrepreneur	←	EM	0.716
Entrepreneurial intention	←	EM	0.743

5 Discussion and Conclusion

5.1 Discussion

The analysis results showed a strong evidence for the current research model. In particular, the research proposed that EM is a higher order construct, that consists from twelve first order indicators (need for achievement, need for autonomy, need for affiliation, need for power, subjective norms, attitude, PBC, governance, creativity, financial motive, economic core, and risk taking). The results of the data analysis showed that there is a correlation with the high order construct by these indicators in a descending order as follows; financial motive ($\beta = 0.912$); PBC ($\beta = 0.838$); risk taking ($\beta = 0.758$); attitude toward becoming entrepreneur ($\beta = 0.716$); need for power ($\beta = 0.\ 596$); need for achievement ($\beta = 0.490$); subjective norms ($\beta = 0.480$); need for autonomy ($\beta = 0.449$); need for affiliation ($\beta = 0.436$); creativity ($\beta = 0.337$), With a significance level of 0.000.

Concerning McClelland needs theory which consists of need for achievement, need for affiliation, need for autonomy and need for power, the current research added a significant contribution for the existing literature by enhancing our knowledge about the EM indicators. Some researchers found that entrepreneurs with high need for achievement are motivated more than employees (Lee, 1996; Nishantha, 2009; Oosterbeek et al., 2010; Sethi & Saxena, 2006). While according to Eisenberger et al. (2005) who indicated that individuals with higher need for achievement are more satisfied in jobs that have hard challenges and high skill levels. As well as need for affiliation, (Lee, 1996) found that people with need for affiliation tend to be more successful managers and helpers. As well as, need for affiliation has a significant influence onorganizational identification. Researchesrs found that individuals with need for autonomy are highly motivated to start a new ventures (Estay et al., 2013).

While people with high need for power influenced EM. However, people with high need for achievement, need for affiliation, need for autonomy and need for power influenced the decision to be an entrepreneur as well as EM (Antonioli et al., 2016; Lee, 1996; Nishantha, 2009; Sethi & Saxena, 2006; Shane et al., 2003). The results of the current research data analysis are consistent with prior researches in which McClelland Needs Theory variables considered as indicators of EM.

With regard to theory of planned behavior which consists of attitude toward becoming entrepreneur, subjective norms, and PBC, the current research found that variables related to this theory are considered as significant indicator of EM, which is consistent with the finding of Malebana (2014), Solesvik (2013), Segal et al. (2005), Fishbein and Ajzen (1975), Linan (2004) in which they found that the theory of planned behavior affects the EM. For Malebana (2014), found attitude toward becoming entrepreneur is significantly influenced EM. While according to Bauer et al. (2005), found attitude toward becoming an entrepreneur influenced the motivation and behavioral intentions. As well as, some studies found subjective norms as an influencer toward student behavioral intention towards e learning to be used in their education (Park, 2009; Yau & Ho, 2015). Others found that subjective norms affected the intention to become an entrepreneur (Malebana, 2014; Segal et al., 2005; Solesvik, 2013). In addition to that, (Ajzen, 2005) found that PBC influenced the behavioral intention when individuals possess the accurate resources and skills to implement it (Ajzen, 2005). While others found that PBC influenced the intention of individuals to be entrepreneurs in order to start their own ventures (Malebana, 2014; Segal et al., 2005; Solesvik, 2013).

The findings of this research showed that creativity is a significant indicator in EM, which is consistent with prior studies. For example, creativity has higher influence on managers (Caird, 1991). While according to Cromie and O'Donoghue (1992), found that creativity influenced entrepreneurs in order to create new ideas or develop existing ideas for creating more value and to be more innovative. Others found that creativity influenced individuals to start new ventures and become entrepreneurs (Estay et al., 2013; Jaillot, 2017). For Zhu et al. (2016) found that creativity is a significant influencer on EM. Based on the previous discussion, the current research is consistent with prior studies and it enhanced our knowledge by determining creativity as a significant indicator in EM in the Jordanian context.

Regarding financial motive, previous studies found an influence of financial motive on EM, for Burton (2012), found that financial motive have a great influence on employees, in particularly, employees who are compensated financially are more motivated and their performance are higher. Whereas others found that entrepreneurs begin their businesses to gain more money, in which they found that financial motive is considered as one of EM indicators that influenced individuals to become entrepreneurs and start new business (Aziza et al., 2013; Hessels et al., 2008; Sarri & Trihopoulou, 2004). For the current research it was found that financial motive is the most highly correlated indicator for the higher-order construct EM, this result was consistent with the previous discussed studies.

Concerning risk taking, for Crimmon and Wehrung (1986) found that risk taking influenced managers' willingness to take risks. Moreover, March and Shapira (1987)

found that risk taking is connected to the work expectations as well as, risk taking influenced the decision making of managers. Whereas, Nishantha (2009) found individuals that have high risk-taking influenced entrepreneurship. In addition, others found that risk taking have influenced the intention to become an entrepreneur and have influenced EM too (Estay et al., 2013; Nishantha, 2009). For the current research, it was found that risk taking as an indicator has a significant correlation towards EM in the Jordanian context, which was consistent with the previous literatures.

Regarding governance, previous studies found that governance in corporation influenced the confidence of the market and business integrity, in which governance is a basic need for organizations that need access to value capital for long-term venture (Albourini et al., 2020). Whereas, (Yalcin et al., 2008) found that specific government policies influenced people's desire to be entrepreneurs, they found that bureaucracy and limited access to capital are barriers to entrepreneurship, as well as they also found that business laws and regulations are ideal to begin and manage new businesses for entrepreneurs thus entrepreneurs are highly motivated. While according to Aziza et al. (2013), they found that governance influence EM. However, it is noteworthy to mention that limited studies have been done to the best of our knowledge, about governance and its correlation with EM. For the current research, it was found that there's an insignificant correlation with other 10 variables, which indicate that it is not part of the construct of EM in the Jordanian context. This result was inconsistent with the previous discussed studies. However, it should be noted that the current research was conducted in Jordan, while previous studies performed their studies in different countries, such as in China (Cullen et al., 2014) and in the Kingdom of Saudi Arabia (Salem, 2014).

Concerning economic core motive, (Deaton, 2010) found that economic core effects saving rates that are higher in rapidly developing and growing economies. According to Vijaya (1998), found that economic motive makes entrepreneurs more motivated when they feel independence and self-achievement. Economic core is one of the indicators of EM (Aziza et al., 2013; Vijaya, 1998). The current research found that economic motive did not correlate with other 10 variables, which indicate that it is not part of the construct of EM in the Jordanian context. However, Limited studies have been done to the best of our knowledge, about economic influence on EM. The result of this research is inconsistent with the previous studies. However, it should be noted that this research was conducted in Jordan, while previous studies performed their studies in Malaysia (Obaji, 2014) and in Nigeria (Oni, 2012).

Concerning the key findings of the higher order construct EM and its impact on EI, the standardized coefficients ($\beta = 0.743$), as well as, ($R^2 = 0.729$) and ($p < 0.001$). This research added a significant contribution for the existing literature by enhancing our knowledge about the influence of EM on EI. Some researchers found that entrepreneurship education have a great influence in the advancement of EM and EI, in which they discovered that education influenced students towards becoming motivated and creating new business (Ferreira et al., 2007; Raposo et al., 2008). According to Delmar and Wiklund (2008), found that EM impacts the growth of small

business. On the other hand, some researchers found a significant positively relationship between EI and EM (Achchuthan & Nimalathasan, 2013; Solesvik, 2013). Whereas, others found that there is a link between EIs, motivation and behavior, they showed that since intentions cannot transform immediately into action, then motivation is linked between EI and actions; motivation translated an intention into real action (Carsrud & Brännback, 2011). While other researchers have found that, an individual's intention to perform or not to perform an action is the most important determinant of action (Ajzen, 2012). In particular, (Malebana, 2014) found that EM connects EI and entrepreneurial action. According to Solesvik (2013), his empirical result showed that theory of planned behavior influence and it mediates the relationship between EM and EI. The results of the current research are consistent with previous literature, which showed that there is a great significance influence of EM on EI.

5.2 Theoretical Implications

The current research attempted to fill the gap in the literature, as well as, to develop a comprehensive model to measure EM and its impact on EI, also to detect the indicators of EM and to recognize its effect on EI. Previous studies have concentrated on a specific theories or variables in developing their model, while the current research has concentrated on developing a comprehensive model. The model consists of twelve indicators to measure EM, from a different previous studies, using theories and key variables, the current research used McClelland Needs theory (need for achievement, need for affiliation, need for autonomy, need for power), theory of planned behavior (PBC, subjective norms, attitude toward becoming entrepreneur) and key variables such as: financial motive, governance motive, economic motive, creativity and risk taking, in addition to that, the current study enhanced the understanding of EM construct through using rigorous statistical techniques. The developed model can be applied in other countries. This research aimed to provide better understanding related to the indicators of EM and its influence on EI.

5.3 Implications for Asian Business Contexts

The value of this research regarding entrepreneurship context can be applied in practice. It can be applied by schools and universities by developing for students an educational material for each indicator and provide them with training courses, or to make a mandatory course for them, thus, will lead to increase the number of entrepreneurs in the future. Furthermore, governance and economic motives are considered as entrepreneurial motivators in other countries, but when we implement the scale in the Jordanian context we found that they are not correlated to EM for Jordanian entrepreneurs, thus, these results suggest the need for Jordanian policy

makers, planners and economist to consider additional methods to improve governance motive (i.e., policies and regulations needed to run a business), and improve the economic motive (i.e., taxation, material cost and interest rate). In addition to that, Jordanian government can create favorable business laws, offer tax reductions to entrepreneurs, support entrepreneurs and be willing to give government loans.

5.4 Limitation

A number of limitations were found within this research, the research was conducted only in the Jordanian context, as well as this research was influenced by money and time constraints. Furthermore, it was not easy to access the business incubators, and it was difficult to differentiate between entrepreneurs and SMEs owner. As well as, this research found lack of interest for entrepreneurs in the scientific researches.

5.5 Future Studies

The current study examined the EM indicators and its impact on EI in the Jordanian context, for future researchers can examine the same model in other countries to see how entrepreneurs from different regions perceive the dimensions of EM and it impact on EI. In addition to that, mixed methodology can be used in future studies including quantitative and qualitative together such as focus groups or interviews, to further elaborate on key issues of such topic.

5.6 Conclusion

This research aims to examine the factors that considered as indicators of EM and the effect of EM on EI in a comprehensive model, based on previous studies, there was no comprehensive model used to measure EM. This current research contribution is to fill this gap in the literature, finding comprehensive model to measure EM and its impact on EI, Understanding EM indicators and their effect on EI, can be helpful for entrepreneurs and their SME's because it might influence the increase of percentage of succesfull businesess (Stefanovic et al., 2010).

The developed model for the current research included EM which is a high order construct that consists from twelve first order indicators (need for achievement, need for autonomy, need for affiliation, need for power, subjective norms, attitude toward becoming entrepreneur, PBC, governance, financial motive, economic core, creativity, and risk taking) and considered EM as an independent variable for the dependent variable EI.

A quantitative approach was used in this research; data were administrated via an online and face-to-face survey. Survey was filled by entrepreneurs in Jordan; the data were tested using a structural equation modeling via AMOS. The findings of this research showed that need for achievement, need for autonomy, need for affiliation, need for power, subjective norms, attitude toward becoming entrepreneur, PBC, financial motive, creativity, and risk taking are considered as indicators for EM, whereas, governance and economic core is not considered as indicators for EM in the Jordanian context. Furthermore, the research found that EM is a highly significant influencer of EI.

Exploring the Relationship Between Open Innovation, Procurement Sustainability and Organisational Performance: The Mediating Role of Procurement Agility

Nawaf Al Awadhi and Muhammad Turki Alshurideh

1 Introduction

Open innovation concept within the highly dynamic global socio-economic environment is based on the idea that corporate entities should take advantage of the various external and internal ideas for doing things differently in an organization (Almaazmi et al., 2020; Nuseir et al., 2021). Open innovation in this context should be understood to mean the utilization of combination of knowledge outflows and attendant inflows, to accelerate internal innovation while at the same time expanding opportunities for external utilization of innovation (Al Suwaidi et al., 2020; Alameeri et al., 2021). A robust open innovation model for any enterprise within the global socio-economic and political landscape should be rather strategic in managing the exchange of valuable information with is irrelevant to the boundaries of classic organizations (Alzoubi et al., 2022; Ghannajeh et al., 2015). Such exchange of information is critical to the growth of an enterprise, particularly because it is aimed at influencing and integrating individual corporate resources and related knowledge into the internal channels of an organization's innovative processes (Al Naqbi et al., 2020; Obeidat et al., 2021). In order to critically analyze the concept of open innovation in the modern business environment, it would be important to analyze how such an idea helps improve growth of typical enterprises (AlMehrzi et al., 2020; Odeh et al., 2021). Such an analysis would regularly span a discussion on the different mediators in the link between open

innovation and organizational performance. Of specific and extreme importance in the following discussion is an analysis on whether the concept of procurement agility is explored in any possible research as a critical mediating factor in exploring the relationship between open innovation, procurement sustainability and organizational performance. The two questions the research will attempt to answer are:

Q1: Does open innovation impact the achievement of procurement sustainability and effect organizational performance?

Q2: What is the influence of procurement sustainability on organizational performance?

2 Research Variables and Methodology

The following study will adopt a qualitative research methodology, primarily through exploration of the relevant literature on the link between open innovation and organization growth, while also taking into account the various possible mediating factor like procurement agility. A qualitative research study in this context involves the ability of a researcher to pursue an in-depth and deeper exploring of various factors affecting a phenomenon trough adopting a specific and focused line of questioning. By focusing through the available literature on the connection between open innovation and organization growth, the research study is prepared to gather evidence that will prove the existence of such a relationship or otherwise.

The key research variables in the ensuing research study include, organizational performance, procurement sustainability and the concept of open innovation. Other variables that will suffice in the research study will largely span the different mediating factors in the relationship between open innovation and firm growth with the modern global business environment. Open innovation as a key variable in the research study has been dissected by researchers such as Parveen et al. (2015) who averred that the use of invention and technology creates value and plays a major role in enhancing social well-being. Other authors such as Islam et al. (2017) argued that the concept of open innovation presumes that corporates apply an open system that is based on internal and external factors. The variable is termed as a distributed process founded on purposeful managed information that flows across institutions using non-pecuniary and pecuniary mechanisms (Parveen et al., 2015). **Open innovation** is defined as an approach for organizations to achieve sustainable growth. The second variable examined in the current research is **procurement sustainability**. The rise trend and incorporation of tenders within institutions has enhanced the need to achieve sustainable approaches in procurement methods. Markedly, the capacity to meet the requirements is founded on the level of innovation used to promote the process. Openness, accountability, and timing are critical factors while assessing the sustainability of the procurement process. As organizations strive to achieve their set future objectives, procurement plays a significant role in determining how they attain consistent growth (Starzyńska, 2019). The procurement process serves as a factor

facilitating innovation diffusion to reduce the risks of losses and exit from markets. The research defines procurement sustainability is the level where institutions incorporate environmental and social factors alongside the financial aspects of acquiring goods or services (Blind et al., 2020). It is therefore, an essential part of a business that ensures enhanced performance.

Organizational performance is the third variable examined in the report. According to Sethibe and Steyn (2016), it is an aspect measured in the operational and financial sustainability of a firm. The measures of institutional performance depend on the related question and correlate to the independent variables. In this report, organizational performance relies on the adoption of open innovation in procurement processes and the achievement of sustainability in the overall procedures. Therefore, it is a critical element within the institution that defines the success in business functions but relies on different factors. Also, Hameed (2018) investigated the main drivers of an archetypal firm's open innovation performance om small and medium entreprises in Malaysia. The study found that a decline in open innovation practices in Malaysian firms the potential to hamper overall performance. The study suggested a raft of measures designed to correct the anomaly through a cross-sectional study fo Malaysina firms. The research adopted a quantitative research design, and the subsequent research results collated using a 5-point likert scale from mail surveys. The study listed internal innovation, Research and Development (R&D), and external knowledge as critical determinant's of a typical enterprsise's open innovation performance. Moreover, Asha (2008) dissected the issue the impact of various styles of open innovation and sectorl organizational performance. The study found tow critical variables linked to the construct of open innovation that includes, an understanding of open styles innovation by firms, and the question as to whether the ability of a firm to discern open innovation design capabilities has a bearing on individual corporation's performance. The research study was largely distinctive particuallry because of its design and attendant conceptualization. The research tested the hypothesis from a vast cros-sectional data of 16,445 businesses across the United Kingdom, derived from the UK innovation suvey database. The study found that design capability is an important construct of open innovation practices, and thus managers should give it greater attention.

Stanisławski (2020) conducted a study on open innovation as a value chain for small and medium enterprises. The study mainly focused on the various determinants of the use of open innovation for firms in Poland. The study identified both internal and external determinats of open innovation. In this regard, the study found that larger entities are more poised to use open innovation than comparatively smaller entities. The study further asserted that both external and internal determinants of open innovation have a significant impact on the general application of open innovation concepts in companies across Poland. Also, Canh et al. (2019) conducted a study on the general impact of open innovation on firm performance and corporate social responbilities for firms across Vietnam. The study focused on individual and process innovation, and the manner in which such costructs interact with an entitys internal collaborations, and the attendant impact on corporate social responsibility and firm performance. The findinsg of the study were that consistent investments in open

innovation by entities have the potential to enhance firm performance. To add more, Durst and Ståhle (2014) conducted a study on the various critical success factors of open innovation. Through a systematic review of 29 studies on open innovation, the study identified a total of 9 themes deemed to be critical to the success of open innovation in manufacturing entities. Such themes include; provision of resources, leadership, culture, governance, relational aspects, strategy, process management, and the pepple involved in open innovation processes.

3 Review Approach

The current report uses a systematic review to assess and examine the relationship between open innovation, sustainable procurement, and organizational performance. The approach identifies, chooses, and critically appraises various researches as an approach to answer the formulated questions (Perényi & Losoncz, 2018; Al Mehrez et al., 2020; AlShehhi et al., 2020; Ahmad et al., 2021). According to Cooper et al. (2018), a systematic review incorporates searching studies to undertake a transparent report. It leaves a straightforward approach about how the studies were identified and how the researcher arrived at the findings in relevance to the research questions (Ahmed et al., 2020; Alkitbi et al., 2020; Alshamsi et al., 2020). The major advantage of using a systematic review in this report is to enhance reliability and transparency on the research findings in relation to how the variables correlate to each other (Al Khayyal et al., 2020; Almazrouei et al., 2020). The study focused on 35 articles that consisted the literature review. Out of the 35 articles that comprised the study, a total of 19 articles qualified for an indepth analysis. The initial article searches in the entire research study was more than 40,000 articles. Subsequently, the universe of the research article searches related to the study was cut down to 35 articles. A total of 16 articles were related to innovation, while 19 articles were related to procurement.

4 Main Finding Table

Articles	Related to innovation	Related to procurement	Total
Number	16	19	35
Variables	Open innovaition	Procurement sustainability	Procurement agility
	16	16	3
Dabase	Number of articles related to open innovation	Number of articles related to procurement sustainability	Number of articles related to procurement agility
Pro quest	7	4	2
Initial search	8,279	79	3
Google scholar	9	12	1
Initial search	37,000	497	30

5 Discussion

Research Q1: Does open innovation impact the achievement of procurement sustainability and effect organizational performance?

The review articles answer the question of how open innovation influences the achievement of sustainable procurement in organizations. The focus of the review centers on the application of innovation as a source of enhancing procurement processes within organizations. The study is centered on the research question and purpose to establish the relationship between open innovation and sustainable procurement. It is essential to acknowledge that few reviewed articles do not directly show the relationship but demonstrate the link between the two variables. Consistent with the question, the independent variable in this case is open innovation, while the dependent variable is sustainable procurement. There are positive outcomes in all the reviewed articles, with all the scholars agreeing with the concept that innovation has a major role in ensuring sustainable procurement practices. From the literature, it can be stated that open innovation is a tool introducing new technology in the procurement process, thus enabling firms to achieve high value.

Various studies examined in the research shows a significant correlation between open innovation, sustainable procurement, and organizational performance. According to Parveen, Senin and Umar (2015), open innovation is a strategic tool for enhancing sustainability within businesses. There are justifications to link open innovation to the attainment of an efficient and transparent procurement process within institutions from the seven reviewed articles. Rane et al. (2019) envision that the capacity of institutions to enhance efficiency is founded on the ability to attain procurement agility as a tool for managing the acquisition of goods and services. This stand is supported by Nyantakyi's (2019) study that exemplifies the role of innovation in enhancing sustainable practices. Acquisition of goods and services as a critical component of business growth has in the past decade been observed to lean on firm's innovation capabilities. A firm's innovation capability has the ultimate effect on the attendant supply chain agility. Iddris et al. (2014) define agility as the ability of an arceytpal firm to adapt, sense, perform and respond in light of an increasingly dynamic and competitive environment. Other scholars such as Cristopher (2012) defines agility as the technical capability of firms to match the demand of goods and services with the attendant supply, mediated by downstream and upstream supply chains. Iddris et al. (2014) avers that a typical firm's agility is a factor open innovation, technology, trust, with the ultimate goal of enhanced competitiveness. The principles of technology applied in acquisition processes play a major role in improving value for money. Prier et al. (2016) posit that procurement processes are considered to attain sustainability when they integrate criteria, specifications, and requirements that favor and align to protecting the environment and supporting constant growth (Yevu & Yu, 2019). This exemplifies the notion that open innovation is a critical factor while striving to achieve sustainable procurement in companies.

The review of past studies shows a significant similarity in establishing the relationship between open innovation and sustainable procurement. From the thirteen

reviewed articles, seven scholars agree that innovation significantly enhances efficiency in acquisition processes. With all articles having a positive relationship, it exemplifies the idea that adoption of technology has enhanced the achievement of procurement agility. With no conflicting findings from the review, it is evident that institutions consistently use open innovation to achieve sustainability and value to stakeholders.

Research Q2: What is the influence of procurement sustainability on organizational performance?

The systematic review involved six articles selected to examine the relationship between sustainable procurement and organizational performance. With respect to the research question, sustainable procurement is an independent variable, while organizational performance is the dependent variable. Few of the articles from the table do not give a direct link between two variables. Nevertheless, there are strategic assessments that correlate sustainable procurement to institutional performance. The review shows positive findings from all the sources used in the current report. This exemplifies the significant relationship between procurement processes and their ability to enhance performance. Also, Yevu and Yu's (2019) findings show that procurement has a significant role in enhancing institutional performance. A similar argument is illustrated by Vluggen et al. (2019) study that focused on examining the role of sustainable procurement in enhancing accountability. Findings from the studies show that for institutions to create an enabling environment characterized by reduced cost and responsibility, procurement agility must be achieved. Stritch, Bretschneider, Darmall, Hsueh and Chen (2020) affirm the role of sustainable procurement processes in enhancing efficiency and addressing the dynamic external and internal factors.

The six articles reviewed to assess the relationship between sustainable procurement and organizational performance show a positive correlation. None of the article's findings show a contradicting argument with respect to the two variables. This illustrates the idea that procurement agility has a mediating role of blending innovation as a tool for promoting organizational performance.

6 Summary

Open innovation is described as a critical aspect that ensures firms apply technology, processes, and inventions that satisfy the need for an economical cost. From the research, it is evident that innovation is an approach for organizations to create value for investment by ensuring consistent growth. Studies show that open innovation is a strategy to ensure firms adapt to the changing business environment, thus enhancing their ability to respond to shifting challenges (Hsueh et al., 2020). Adoption of technology encompasses the integration of critical development and business models, which enhance social responsibilities to stakeholders (Ibem et al., 2017). The application of open innovation in procurement mandates paradigm shifts

in focus, strategy and mindsets while assimilating the process's internal and external factors (Vluggen et al., 2019). While open innovation is a way of introducing new terminology, it plays a key role in enhancing institution's capacity to achieve sustainability (Romodina & Silin, 2016). Its adoption increases the possibility of attaining sustainable procurement processes within organizations.

The current business environment compels institutions to remain adaptive to the changing factors (Lenderinket al., 2020). Markedly, attaining sustainability in the procurement process is a critical aspect while creating value for stakeholders. Open innovation in the procurement process transforms the practice and makes provision for reduced costs, accountability, and efficiency while managing suppliers electronically (Lee et al., 2022a; Rane et al., 2019). Markedly, it exemplifies the mediating role of procurement agility in aligning technological advancement in enhancing institutional performance (Shakhour et al., 2021). It is imperative to state that there is a significant relationship between open innovation, sustainable procurement, and organizational performance (Stritch et al., 2020). Achieving institutional growth relies on the ability to attain effective procurement procedures while, in turn, depends on the invention adopted. This shows a linear relationship between the three variables, thus exemplifying the need for investing in technology as a way of initiating sustainable development in firms (Prier et al., 2016). Innovation streamlines the process of procurement which has a significant impact on performance and the ability to safeguard resources within public and private companies.

7 Research Limitations

The current findings are limited by the drawbacks of the research. The current study relies on secondary data from past researches to affirm the significant relationship between open innovation, sustainable procurement, and organizational performance. One of the drawbacks is the large nature of the search results, triggering a possibility of the researcher taking a different line form the main focus of the study. Similarly, there was no enough literature available on the mediator factor "Procurement Agility". The current report recommends the use of primary data as an approach to verify the findings.

8 Research Future Directions

Future studies are required to exemplify the relationship between open innovation, sustainable procurement, and organizational performance. This can be achieved through a preliminary study or an intense review incorporating data from various libraries and regions. Future studies should also deeply explore the impact of the

concept of procurement agility mediated by procurement sustainability or openinnovation. Or the impact procurement Agility could have on organization performance. There was very little literature availbe on this subject matter.

9 Conclusion

The mediating role of procurement agility is to align the benefits of open innovation as tools for enhancing organizational performance. The process of attaining sustainable procurement is driven by the need to improve institutional performance. Through the invention and adoption of technology, companies have promoted social responsibilities about procuring goods and services. From the current report, it is affirmed that innovation plays a major role in enhancing transparency and accuracy in procurement departments. Besides the limitations of the study, it is conclusive that the role of achieving procurement agility is to ensure new technology is strategically affiliated to address organizational challenges. Additionally, it is also conclusive that there is a positive relation between the variables open innovation, procurement sutainability and organizational performance.

The Effect of High Commitment Management Requirements in Achieving Strategic Entrepreneurship Through the Perceived Organizational Support in Iraqi Ministry of Health

Waleed Radeef Al-Janabi and Barween Al Kurdi

Abstract This study aimed at identifying the effect of the requirements of the administration of high commitment and its dimensions (normative commitment, career enrichment, job security) on achieving strategic entrepreneurship and its dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) through perceived organizational support in the Iraqi Ministry of Health. To achieve the objectives of the study, a questionnaire was designed and distributed to a sample of (181) of employees working in the Anbar Health Department / the Iraqi Ministry of Health. The descriptive approach was used to describe the analytical procedures, data collection, classification, processing, and analysis to find out the results, while the heuristic approach was used to analyse, interpret and draw conclusions based on the sample of the study. The results of the study showed that there is a statistically significant impact of high commitment and its dimensions (normative commitment, career enrichment, job security) on strategic entrepreneurship in its dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) through perceived organizational support. The study recommended to increase the level of high management commitment to develop organisational committeemen amongst the employees as this will lead to positive working experience.

Keywords Commitment management requirements · High commitment · Strategic entrepreneurship · Perceived organizational support

1 Introduction

Organizations are undergoing cultural, economic, environmental and political changes and challenges, as well as rapid technological changes in the light of the globalization of modern times. Modern technological developments are a motivation for increasing competition among organizations, especially hospitals, in achieving competitive advantage that contributes to increasing health awareness, which maintains growth, continuity and achievement of the desired goals.

The present rapid changes, technological and environmental developments have intensified competition between organizations, leaving many organizations exposed to real risks that have almost ended their life cycle or that of other organizations due to poor risk foreseeing and poor human resource management practices represented by poor polarization, selection, recruitment, incentives and other such practices.

The exposure of many organizations to a wave of rapid changes in various technological, economic and social fields has led them to the need to awaken the spirit of the strategic entrepreneurship within it. The public administration has had few contributions to entrepreneurial activity as an input to the development of organizations, at least if the individual identifies entrepreneurial activity as more than just an investment, as strategic entrepreneurship is linked to the overall strategy of the organization and you may see, for example, that it opens up new branches working on programs and systems with new modes such as e-government (Ghazi & Parvaneh, 2014).

High commitment management practices and perceived organizational support have a clear and important impact on the life of every individual working in the organization through their participation in the organization's policy-making in order to achieve goals and their participation in decision-making, Providing them with opportunities, training and developing them and distributing rewards fairly among them, all this improves performance and excellence in this performance (Said & Al-Nasrawi, 2016).

Hence this study aims at identifying the effect of high commitment management requirements in achieving strategic entrepreneurship through perceived organizational support as an intermediary in health department of Anbar/Iraqi Ministry of Health.

This research also comes as a response to several previous studies (Al-Nuaimi & Hamid, 2015; Said & Al-Nasrawi, 2016; Howard, 2013; Park et al., 2019) which recommended studying the requirements of high commitment management in achieving strategic entrepreneurship.

2 Problem of the Study and the Study Questions

The development of management thought has seen a lot of discussions generated by the requirements and conditions of the work environment and its challenges and dynamic change in the internal and external environment and the opportunities and

Licensed to (putm@utm.my)

threats it faces. Therefore, a constant change became a necessary characteristic attach to them. The problem of the study lies in the poor employment of high commitment management requirements. In order to achieve strategic entrepreneurship within the organizations, including Anbar Health Service, there are many competent human resources, but they lack the systematic support of the level of awareness on the part of the administrations. This compels these departments to adopt targeted practices in order to invest and develop these human resources to enable them to properly think about opportunities and commit themselves to confronting threats in a way that will lead to the strategic entrepreneurship of their organizations.

Hence, the problem of the study is reflected in the answer to the following questions:

Do the requirements of managing high-level commitment to its dimensions (normative commitment, job enrichment, job security) have any effect on strategic entrepreneurship in its dimensions (entrepreneurial leadership, entrepreneurial culture, taking risks) in Anbar Health Directorate/Iraqi Ministry of Health?

It gives rise to the following sub-questions:

The first Sub-question: Do the requirements of the high commitment management in its dimensions (normative commitment, job enrichment, job security) have an effect on the entrepreneurial entrepreneurship of the Anbar Health Directorate/Iraqi Ministry of Health?

The second sub-question: Do the requirements of the management of high commitment to its dimensions (standard commitment, job enrichment, job security) have an effect on the entrepreneurial culture at Anbar Health Directorate/Iraqi Ministry of Health?

The third sub-question: Is there an effect of risk taking on the requirements of high commitment management (standard commitment, job enrichment, job security) in Anbar Health Directorate/Iraqi Ministry of Health?

The second main question: Is there an effect of the requirements of high commitment management in their dimensions (normative commitment, job enrichment, job security) on the perceived organizational support in Anbar Health Directorate/Iraqi Ministry of Health?

The third main question: Is there an effect of perceived organizational support on strategic entrepreneurship in its dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) in Anbar Health Directorate/Iraqi Ministry of Health?

The fourth main question: Do the requirements of high commitment management (normative commitment, job enrichment, job security) have an effect on the strategic entrepreneurship (entrepreneurial leadership, entrepreneurial culture, risk taking)?

3 Significance of the Study

This study contributes in its attempt to fill the deficit of the Arab Research Group on the concept of high commitment management requirements in achieving strategic entrepreneurship, where most of the previous studies focused on studying the relationship between independent and dependent variable only. Whereas this study takes a third variable, which is the perceived organizational support medium variable which will add a cognitive accumulation to the previous studies and scientific libraries. The importance of this study is also reflected in the recommendations that will be proposed to the Anbar Health Directorate at the Iraqi Ministry of Health, which illustrates the effect of the requirements of high commitment management via focusing on their dimensions (normative commitment, job enrichment, job security), develop the inspection unit's understanding of the strategic entrepreneurship of the workers at department of health, and how to grow and develop it in the way that achieves the continuity, efficiency and effectiveness of the organization via the organizational support to all parties.

4 Literature Review

This aspect includes a presentation of the theoretical framework and literature related to the subject and variables of the study, through a review of Arabic and English previous studies related to the current study.

4.1 High Commitment Management

The concept of a high level of commitment in its various forms is one of the management practices that has received increasing attention from researchers. This interest has led to its widespread perception among managers and academics that a high level commitment represents a crucial element to link the organization with the individuals working in it. Harem (2004) indicates that the commitment of individuals to their organizations is an important factor in ensuring the success of those organizations.

Although more and more researchers are interested in the topic of high commitment, there is no agreement among them on a specific definition of this concept due to the multiplicity of perspectives and angles that researchers have looked at and the difficulty in defining this behavior input. Al-Sameeh (2010) defines it as an emotional connection between the organization and its values and goals. Al-Shayab and Abu Hammour (2014) focus on the psychological perspective of commitment and define it as the psychological bond that binds the individual to the organization, which leads him to integrate into work and to embrace the values of the organization. Qassimi (2011) defines it as "a strong belief and acceptance by individuals of

the organization's goals and values, and their desire to make a greater contribution to it, with the strong desire to continue its membership." Flayiah and Abdul Majid (2014) add that "The commitment is the positive feeling generated by the employee towards his organization, his commitment to it, his loyalty to it, his conformity with its values and objectives, his commitment to its survival through exerting efforts and favoring it from other organizations, and be proud of its effects, which enhances its success." According to the perspective of the authors of this study, the commitment is considered a mutual investment between the individual and the organization via the continuation of the contractual relationship between them, where the individual has the desire to give more in order to contribute to the success and continuation of the organization.

The previous studies have discussed three dimensions of high commitment: Normative commitment, job enrichment and job security (Howard, 2013; Al-Gharbawi, 2014; Al-Nuaimi & Hamid, 2015; Said & Al-Nasrawi, 2016; Park et al., 2019).

Concerning the concept of normative commitment, it refers to the individual's feeling of being committed to remain in the organization because of the pressures of others. Individuals with a strong normative commitment take into account what others will say if they leave the organizations in which they work, so these individuals don't want to make a bad impression on their colleagues by leaving their organizations, due to their literary obligation even if it is at the expense of themselves (Park et al., 2019).

On the other hand, career enrichment is what makes working individuals more responsible and independent in decision-making, and this, in turn, strengthens organizational commitment to work. Career enrichment is achieved through the workers' sense that the benefits of the organization also benefit them (Howard, 2013) because this feeling would strengthen their commitment to the organization. Some organizations are trying to do this directly through incentive schemes, particularly profit-sharing programs. Such plans and programs, if managed in a fair manner, will play an effective role in supporting individuals' organizational loyalty.

As far as the third dimension of high commitment is job security. This concept refers to the power of one's desire to remain in an organization because he believes that leaving would cost him dearly. The longer an individual lasts in the organization, the more likely an individual will lose much of what he or she has invested in overtime such as: (Pension plans, intimate friendships for some individuals). Many individuals are unwilling to sacrifice such things, and they are said to have a high degree of continuing loyalty (Howard, 2013).

4.2 The Strategic Entrepreneurship

There have been a number of definitions related to the concept and nature of entrepreneurship in recent times. Some definitions refer to leadership as the ability and desire to organize and manage related businesses, in addition to including some definitions on new concepts, innovation, innovation, and risk (Agostini & Nosella,

2017). Entrepreneurship was defined as the process of creating something a new and valuable thing by devoting the time and necessary effort by assuming accompanying physical, psychological, and social risks, and reaping the resulting financial returns (Oviat & McDougall, 2005). Mandel and Barnes (2014) defined it as "activities involving new product or processes, or entering new markets, or creating new enterprises". Seitovirta (2011) defined it as "the process of creating a new valuable thing via allocating the time, effort and money needed for the project, bearing the accompanying risks, and receiving the rewards for what happens when wealth is accumulated."

All in all, there is a consensus among researchers on the importance of strategic entrepreneurship and its role in developing and supporting the economies of countries, especially after the major shift in the capital economy to the knowledge economy, in the hope of achieving the economic stability that all peoples seek to ensure for themselves economic and political security (Sultan, 2016). The technological and scientific development in modern business organizations has helped to develop many entrepreneurial organizations in various sectors of business, especially with the increase of global competition and the emergence of other factors to make organizations more pioneering, and the exploitation of investment opportunities in the market through innovation and innovation, as well as the entrepreneurial processes that have become part of the strategic management of the work of these organizations (Plummer, 2016). Workers entrepreneurship is used to demonstrate innovators and inventors in all fields via showing their achievements and successes despite the lack of resources, capabilities and difficulties they have faced. In light of the ongoing and increasing economic globalization, the idea of entrepreneurship on the subject has become the focus of attention of leaders and managers, not only in their understanding of the subject, but also in the ability to develop strategies and appropriate planning for the success of organizations and the persistence of institutional excellence. Accordingly, entrepreneurship is one of the competitive advantages of today's organizations. In order for the organization to succeed, it must develop a vision that encourages growth through entrepreneurship (Ismail, 2010). Based on the above, it can be said that leadership plays a pivotal role in achieving success. It pursues the task of defining and articulating the goals and objectives of each phase of the implementation of the organization's strategy, which identifies the necessary resources, manages them and distributes them to the different business units and job areas of the organization.

4.3 Perceived Organizational Support

Business organizations are currently facing a complex and rapid set of global and local challenges. It is imperative that organizations address these challenges in all ways. To achieve this, the organization, represented by its management, has to undertake many planned and targeted activities that provide financial, psychological and social support to workers, reflecting its concern for human resources and

its interest in meeting their needs and motivations (Anomneze et al., 2016). Hence the importance of the concept of conscious organizational support, which refers to the level of moral and material support provided by the management to employees, through which the employees feel that the management appreciates and appreciates their efforts. In return, the Organization obtains high performance and commitment (Mansour & Ashour, 2016).The theory of organizational support (perceived organizational support) derives from the theory of social exchange and exchange values. According to the theory of social exchange, individuals who benefit from the actions of one party or another feel a commitment towards reciprocity in the form of certain patterns and responses (Drover & Ariel, 2015). A high perception of organizational support can, therefore, create a sense of commitment on the part of the individual that makes him/her feel that he/she needs not only to belong to the organization but also to feel that he/she has a commitment to reinstate the organization's affiliation by engaging in behaviors that support organizational goals.

4.4 Previous Related Studies

Researchers have drawn from many Arab and foreign references to formulate the study's assumptions. For example, Al-Nuaimi and Hameed study (2015) aims at clarifying the relationship between high commitment management activities and strategic entrepreneurship in Iraqi constructions activity. The study has found out a number of results, the most important ones are the effective relationship and a link between high commitment management and strategic entrepreneurship indicating that providing high commitment management requirements contributes to building strategic entrepreneurship in studied companies. In another study, Said and Al-Nasrawi (2016) aims at clarifying the nature of the relationship and the impact between the management of high commitment and organizational excellence et al.-Furat General Company for Chemical Industries. One of the most important results of this study is that the management of high commitment has a positive effect on the organizational excellence. On the other hand, Mansour and Ashour (2016) tested the mediating role of perceived organizational support between the High Containment Department and the company's organizational commitment. The results of this study indicated a positive and moral impact between global containment management and organizational commitment through perceived organizational support. In contrast, Khudayr and Ahmed (2017) conducted a study to examine the relationship between the perceived organizational support and professional compatibility and their effect on reducing organizational satire found that cognitive organizational support and professional consensus combined had an impact on reducing organizational satire. As for Al-Hawajira study (2018), it aimed at measuring the impact of the organizational entrepreneurship on the strategic success through business intelligence capabilities in universities and found that organizational leadership has an impact on strategic success, and that organizational leadership has an impact on business intelligence capabilities. Al-Tahan (2018) also conducted a research to understand the

impact of future vision on achieving the strategic entrepreneurship by organizations in the Egyptian telecommunications sector and found that it has a positive impact on looking ahead in achieving the strategic entrepreneurship by the organizations.

On the other hand, Farndale et al. (2011) study aimed at knowing the perceptions of workers on managing commitment, high performance, roles of justice and trust in the organization. The study community and its sample of workers consisted of four organizations in the United Kingdom. The most important finding of the study was that there was a correlation between the expertise of highly committed, high-performing, fair and trusting employees that influenced human resources management practices. Kraus and his colleagues' study (2011) aimed at organizing and synthesizing the current scientific work on the strategic entrepreneurship using the formation approach, finding that strategic entrepreneurship contributed to understanding how companies were creating a new enterprise that could be moved to the greater level of corporate strategies, whether small or medium. Howard (2013) in his study discussed the relationship between the high commitment to human resources management and the employee's well-being in three large organizations in South Africa and found a strong correlation between the human resources management content and the employee's well-being. The study also reached the most important recommendations on the need to have positive effects on organizations, human resources management activities and employees in order to achieve high commitment in organizations. The study of Ghazi and Parvaneh (2014) examined the different dimensions of strategic entrepreneurship as well as understanding the dimensions of strategic entrepreneurship from the theory to practice through the employment of many startup companies in Iran. The most crucial findings of this study are the emphasis on business leadership and innovation, capital mobilization, entrepreneurship and leadership management, the simultaneous attention to the strategic entrepreneurship, management and growth, and finally the profitability.

4.5 What Distinguishes the Current Study From Previous Studies?

Several issues exist that are important to highlight to demonstrate the merit of this study over previous studies. First, the objective of the study, it aims at measuring the impact of high commitment management requirements in achieving strategic entrepreneurship through the perceived organizational support in Anbar Health Directorate/Iraqi Ministry of Health. Most of the previous studies addressed only two variables, such as the study of (Al-Gharbawi, 2014), the study of (Al-Nuaimi & Hamid, 2015), the study of (Said & Al-Nasrawi, 2016), and the study of (Park et al., 2019). This study addressed a third variable, the organizational support that is aware of its impact on the relationship between the dependent and independent variable. Second, study variables: The study looked at the dimensions of their independent variable, the requirements of managing high commitment (normative commitment,

job enrichment, job security). Their dependent variable was strategic entrepreneurship, represented by dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) through their intermediate variants and perceived organizational support. Third: Study environment: Most of the previous studies that were examined varied in their environment, and the studies that were conducted were applied to address them. However, most of these studies did not take into account the Iraqi environment. The importance of this study results its attempts to add an in-depth understanding of the concepts of managing high-level commitment and strategic entrepreneurship in an environment that was not previously addressed in the researches.

5 Hypotheses of the Study

The following hypotheses have been formulated in the preceding paragraphs in terms of the object and importance of the study, and as an indication from previous scientific studies.

The first main hypothesis H01: There is no statistically significant impact at the level ($\alpha \leq 0.05$) of the requirements for managing the global commitment in its combined dimensions (normative commitment, job enrichment, job security) on strategic entrepreneurship in its combined dimensions (leadership, leadership culture, risk taking) in the Anbar Health Directorate/Iraqi Ministry of Health.

A number of sub-hypotheses emerge from this main hypothesis:

The first sub-hypothesis: H01-1: There is no statistically significant effect at significance level ($\alpha \leq 0.05$) of the requirements of the high management Commitment in its dimensions (normative commitment, job enrichment, job security) are placed on the entrepreneurial leadership of Anbar Health Directorate/Iraqi Ministry of Health.

The second sub-hypothesis: H01-2: There is no statistically significant effect at significance level ($\alpha \leq 0.05$) of the requirements of the high management commitment in its dimensions (normative commitment, job enrichment, job security), over the entrepreneurial culture in Anbar Health Directorate/Iraqi Ministry of Health.

The third sub-hypothesis: H01-3 There is no statistically significant impact at the level of the ($\alpha \leq 0.05$) of the requirements of the high management commitment in its dimensions (normative commitment, job enrichment, job security) on the risk taking in the Anbar Health Directorate/Iraqi Ministry of Health.

The second main hypothesis: H02: There is no statistically significant effect at significance level ($\alpha \leq 0.05$) of the requirements of the management of high commitment in its combined dimensions (normative commitment, job enrichment, job security) depend on the perceived organizational support at Anbar Health Directorate/Iraqi Ministry of Health.

The third main hypothesis: H03: There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of the perceived organizational support on the strategic entrepreneurship in all its dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) in Anbar Health Directorate/Iraqi Ministry of Health.

The fourth main hypothesis: H04: There is no statistically significant effect at significance level ($\alpha \leq 0.05$) for the requirements of high managing commitment in its combined dimensions (normative commitment, job enrichment, job security), focusing on strategic entrepreneurship in its combined dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) through the perceived organizational support at the Anbar Health Directorate /Iraqi Ministry of Health.

6 Model of the Study

To achieve the objective of the study, a special model was developed that was shown in Fig. 1 as the following (Table 1).

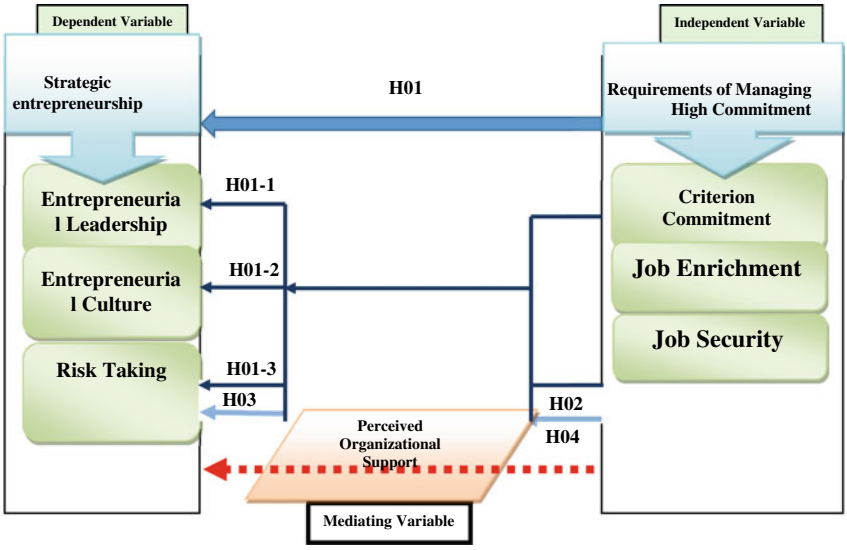

Fig. 1 Model of the study

Table 1 References and studies that support the model of the study

Variable	Studies depended on
Requirements of managing high commitment	Al-Gharbawi (2014), Al-Nuaimi and Hamid (2015), Said and Al-Nasrawi (2016), Howard (2013), Park et al. (2019)
Perceived organizational support	Al-Shanty (2015), Mansour and Ashour (2016), Khudayr and Ahmad (2017), Worku (2015), Gigliotti et al. (2019)
Entrepreneurial leadership	Al-Nuaimi and Hamid (2015), Al-Hawajira (2018), Al-Tahan (2018), Kraus et al. (2011), Ghazi and Parvaneh (2014)

7 Methodology

7.1 Method of the Study

To achieve the objective of the study which used the descriptive analytical approach, two approaches were used: The first approach is theoretical, and I use desk surveys to look at existing books, references, resources, and studies relevant to the subject of the study, to construct a theoretical background for the study. Concerning the second field approach, I used the study tool (the questionnaire), which was developed to collect data from the research category and to work on analyzing them statistically to achieve the study's objective.

7.2 Population and Sample of the Study

The population of the study consisted of all the approximately 347 employees working at various administrative levels in the Anbar Health Directorate/Iraqi Ministry of Health. Based on Sekaran and Bougie (2012), a random sample of employees was collected through the distribution of (181) questionnaires, of which (176) were retrieved, and (5) were excluded because the respondents did not complete the answers that the number of questionnaires subject to analysis was to (171), rated 94% of the total distributed questionnaires.

7.3 Instrument of the Study

In order to achieve the study's objectives, its questionnaire was developed as a study tool, and it was developed in a way that corresponds to the study variables by looking at previous studies related to the study topic. The questionnaire consisted of three

Table 2 Likert pentagonal graded scale

Mark	1	2	3	4	5
Agreement level	Strongly agree	Agree	Moderately agree	Disagree	Strongly disagree

parts: The first part aims at collecting demographic data for study sample individuals (age, education qualification, number of years of experience, job title), and the second part is related to the independent variable (requirements for managing high commitment) in its dimensions (normative commitment, job enrichment, job security). In order to develop this part, previous studies were made use of via using Al-Gharbawi (2014), Al-Nuaimi and Hamid (2015), Said and Al-Nasrawi (2016), Howard (2013), Park et al. (2019). The third part is the dependent variable (strategic entrepreneurship) in its dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) through the studies of Kraus et al. (2011), Ghazi and Parvaneh (2014), Al-Nuaimi and Hamid (2015), Al-Hawajira (2018) and Al-Tahan (2018). The intermediate variant (perceived organizational support), via using the Al-Shanty (2015), Worku (2015), Mansour and Ashour (2016), Khudayr and Ahmed (2017) and Gigliotti et al. (2019) studies. The study tool was developed via using the exploratory factor analysis and the confirmatory factor analysis.

A progressive Likert scale was adopted in the resolution to give more flexibility to the sample members in the selection as shown in Table 2.

Table 3 shows the related limits adopted by this study, when commenting on the arithmetic mean of the variables in the study model and determining the degree of approval, the researcher has determined three levels (high, medium, low) based on the following equation.

Length of period = (upper limit of alternative−lower limit of alternative)/number of levels.

(5–1)/3 = 4/3 = 1.33 so the levels are as follows:

A low approval score of 1-less than 2.34.

An average approval score of 2.34-less than 3.68.

A high approval score of 3.68–5.

Table 3 shows the measure in determining the level of fit for the arithmetic mean to be used when commenting on arithmetic means.

Table 3 Likert scale treatment

Mean	Degree evaluation
1. Lower than 2.34	Low
2. 34- Lower than 3.68	Middle
3. 68–5	High

Licensed to (putm@utm.my)

Table 4 Reliability coefficient of the study instrument

	Cronbach's alpha
Requirements of managing high commitment	0.773
Perceived organizational support	1000
Entrepreneurial leadership	0.841

7.4 Validity and Reliability of the Study Istrument

The study instrument was validated by presenting it in its initial form to a group of academic arbitrators with expertise and competence to verify the veracity of the contents of its paragraphs and to ascertain their validity to measure what should be measured and to ascertain the clarity of its paragraphs and the verbal and moral validity of their words. Their observations on the study instrument were taken and paragraphs were modified, deleted and added until the tool was finalized. Cronbach's alpha was also used to check internal consistency. It measures the consistency of the researchers' answers to the questions in the full scale, and its high value indicates a persistence between 0 and 1, acceptable at (0.60) and above. According to other Vogt study, the value of Cronbach alpha is acceptable if it is greater than (0.70) (Table 4).

8 Study Findings and Discussion

8.1 Description of Study Sample Properties

This part of the study aims at showing the frequency and percentages of demographic variables for respondents regarding the first section of resolution, in terms of age, gender, educational level, and number of years of experience. Table 5 shows the responses of the study sample.

Table 5 showed that the majority of study sample members were in the age group (35-under-45) at 63.2% (n = 108), followed by the sample members in the age group (25-under-35) at 18.1% (n = 31), and then the sample members were in the age group (45 years and older) at 16.4% (n = 28). Finally, the sample population was 2.3% (n = 4) in the age group (under 25 years). It also showed that (77.8) of the study sample were male and (22.2) of the study sample were female. This finding reflects the fact that the proportion of male health workers is higher than that of female workers. The data also show that the majority of the study sample had a bachelor's degree of 69.5% (n = 119), followed by those with a diploma score of 12.3% (n = 21). Then those with a master's degree of 11.7% (n = 20) and finally those with a doctorate of 2.9% (n = 5). This is an indication of the interest of the research sector in recruiting those with scientific qualifications. As for the number of years of experience, the data in Table 5 indicates that the majority of the sample members were 66.1% (n

Table 5 Frequencies and percentages of sample responses of the study based on their demographic variables

Variable	Group	Frequency	Percentage
Age	Lower than 25 Years	4	2.3
	25 Years–Lower than 35 Years	31	18.1
	35 Years–Lower than 45 Years	108	63.2
	45 years and above	28	16.4
	Total	171	100.0
Sex	Male	133	77.8
	Female	38	22.2
	Total	171	100.0
Academic qualification	Diploma or below	6	3.5
	Diploma	21	12.3
	Bachelor	119	69.5
	Master	20	11.7
	Doctorate	5	2.9
	Total	171	100.0
Experience period	Lower than 5 Years	3	1.8
	5 Years–Lower than 10 Years	14	8.2
	10 Years–Lower than 15 Years	41	24.0
	15 Years of above	113	66.1
	Total	171	100.0

= 113), whose years of experience ranged from (15 years and older), followed by those whose years of experience were 10 and younger than 15 years old by 24% (n = 41), those whose years of experience (5-less than 10 years) by 8.2% (n = 14), and finally those whose years of experience were less than 5 years by 1.8% (n = 3). This is an indication that researchers have reached the appropriate categories to answer the study tool's paragraphs.

8.2 Description of Study Variables Results

The mission of this part of the study is to describe the basic study dimensions according to the estimates of the study sample members, through their answers to the elements of questionnaire with their sub-variables.

First: Describing the high commitment management variable in its different dimensions: Normative commitment, job enrichment and job security

Table 6 shows that the arithmetic averages of responses of sample members to high compliance management requirements between (4.35 and 4.00) with a high rating for all dimensions ranked first after "standard commitment" with an arithmetic mean (4.35), second after "job enrichment" with an arithmetic mean (4.13), third after "job security" with an average of 4.00), and third after "computational average" with high compliance management requirements (4.16) with a high rating.

Second: Describing of the mediating variable: the Perceived organizational support

Arithmetic means and standard deviations were extracted for the responses of the sample individuals to the dimensions of the perceived organizational support, Table 7 shows this.

Table 7 shows that the arithmetic means of the workers' sample responses around the perceived organizational support variant ranged from (4.21–2.35), hence we note that the sample of workers gave consent to all paragraphs of the perceived organizational support variant. Paragraph 22, which reads: "management cares about

Table 6 Comparison of means, standard deviations, and level of significance of the dimensions of the requirements of managing high commitment

No	Item	Mean	Rank	Level of significance
1	Criterion commitment	4.372	1	High
2	Job enrichment	4.13	2	High
3	Job security	4.00	3	High
Requirements of managing high commitment		4.16	–	High

Table 7 Means, standard deviations, and of the sample responses of the perceived organizational support

Item no	Mean	Standard deviation	Rank	Level of significance
22	4.21	0.836	1	High
23	4.04	0.777	2	High
24	3.97	0.928	3	High
25	3.92	0.926	4	High
26	3.87	0.889	**7**	High
27	3.87	0.864	**8**	High
28	3.75	0.987	9	High
29	2.35	1.26	10	High
30	3.91	0.941	5	High
31	3.89	0.936	6	High

Table 8 Means, standard deviations, and significance level of strategic entrepreneurship dimensions

No	Item	Mean	Rank	Level of significance
1	Entrepreneurial leadership	3.78	3	High
2	Entrepreneurial culture	4.03	1	High
3	Risk taking	3.97	2	High
Requirements of strategic entrepreneurship		3.92	_	High

meeting my job needs and desires", gave the highest of the paragraphs on average (4.21) and with a standard deviation (0.836), and at a high level of importance, while paragraph (29), which states that: "I'm looking for another organization to work on seriously," at a minimum, with an average score of 2.35, a standard deviation of 1.26, and of average relative importance.

In general, the total sum of the means of this variable was 3.78, indicating that the relative importance of the perceived organizational support was high, with a standard deviation (539), which reflects a lack of dispersion and homogeneity of study sample responses to the study paragraphs.

Third: Description of the dependent variable: Strategic entrepreneurship in its various dimensions: entrepreneurship, entrepreneurial culture, and taking risks

Arithmetic means and standard deviations were extracted for the respondents' answers to the dimensions of strategic entrepreneurship, Table 8 shows this. The table shows that the arithmetic averages of the respondents' responses to strategic entrepreneurship between (4.03 and 3.78) with high score for all dimensions came first after "entrepreneurial culture" with an arithmetic average (4.03), second after "risk taking" with an arithmetic mean (3.97), third after "entrepreneurial culture" with an arithmetic mean (4.03), and the arithmetic average of strategic entrepreneurship (3.92) with high score.

8.3 Testing the Hypotheses of the Study

This part of the study pertains to the testing of the main study hypotheses and their sub-hypotheses, in order to arrive at the presentation of results and clarify the behavior of the relationships between the study variables.

Results of the main hypothesis (H01) test

There is no statistically significant impact at the level ($a \leq 0.05$) of the requirements for managing the global commitment in its combined dimensions (normative commitment, job enrichment, job security) on strategic entrepreneurship in its combined dimensions (leadership, leadership culture, risk taking) in the Anbar Health Directorate/Iraqi Ministry of Health.

Table 9 shows the statistical results of testing the first main hypothesis (direct effect) as follows.

Via extrapolating the results in Table 9, we note that the value of the marker (R2) is 658, which means that the high-commitment management requirements variant accounts for 65% of the variation in the dependent variable (strategic entrepreneurship). The results indicate a statistically significant effect of the high-commitment management requirements variant in strategic entrepreneurship, with beta (811.) and t (25.411) being less than 0.005.

Result of testing the first sub- Hypothesis (H01-1)

Table 10 shows the result of the test for the first sub-hypothesis from the first major hypothesis that there is a statistically significant effect of the requirements of the Department of High Commitment on leadership, with a beta value (0.757) and a t value (15.186) with a significance level (0.00) less than (0.05).

Result for testing the second sub-hypothesis (H01-2)

Table 11 Result of the test of the second sub-hypothesis from the first main hypothesis, showing statistically significant effect of the requirements of the management of high Commitment on entrepreneurial confidence, with beta (B) with value of (640.) and (t) with value of (12.220) with a significance level of (0.00) less than (0.05).

Table 9 Results of (SmartPLS) of measuring the effect of the requirements of managing high commitment on strategic entrepreneurship

R-squared value of the model	Beta value	Calculated T- value	Level of significance
0.658	0.811	25.411	0.000

* Statistically significant at ($\alpha \leq 0.05$)

Table 10 Results of (SmartPLS) of measuring the effect of the requirements of managing high commitment on entrepreneurial leadership

Beta value	Calculated T value	Level of significance
0.757	15.186	0.00

* Statistically significant at ($\alpha \leq 0.05$)

Table 11 Results of (SmartPLS) of measuring the effect of the requirements of managing high commitment on entrepreneurial confidence

Beta value	Calculated T value	Level of significance
640	12.220	0.00

* Statistically significant at ($\alpha \leq 0.05$)

Table 12 Results of (SmartPLS) of measuring the effect of the requirements of managing high commitment on risk taking

Beta value	Calculated T value	Level of significance
759	15.186	0.00

* Statistically significant at ($\alpha \leq 0.05$)

Result of testing the third sub-hypothesis (H01-3)

The result of the third sub-test derived from the first major hypothesis shows a significant effect of the requirements of the High commitment Management on the risk taking, with a value of beta (B) of (759) and a value of (t) of (15.186) with a significance level of (0.000) less than (0.05) (Table 12).

Results of testing the second main hypothesis (H02)

The second main hypothesis was tested which states that there is no statistically significant effect at a significant level of ($a \leq 0.05$) for the management requirements of high commitment in their combined dimensions (normative commitment, functional enrichment, job security) on the perceived organizational support in Anbar Health Directorate/Iraqi Ministry of Health.

Via extrapolating the results in Table 13, we note that the R2 coefficient is (563). (This means that the high commitment management requirements variant accounts for 56.3% of the variation in the median variance and perceived organizational support.

A statistically significant effect of the requirement management variant for high commitment management is evident in perceived organizational support, with a value of beta (B) of (730.) and a value of (t) of (18.805) with a significance level of (0.000) less than (0.05).

Table 13 Results of (SmartPLS) of measuring the effect of the requirements of managing high commitment on the perceived organizational support

R-squared value of the model	Beta value	Calculated T-value	Level of significance
0563	0.0730	18.805	0.000

* Statistically significant at ($\alpha \leq 0.05$)

Table 14 Results of (SmartPLS) of measuring the effect of the perceived organizational support on the strategic entrepreneurship

R-squared value of the model	Beta value	Calculated T- value	Level of significance
0.660	0.179	2.263	0.024

* Statistically significant at ($\alpha \leq 0.05$)

Results of testing the third main hypothesis (H03)

The third main hypothesis was tested, showing that "there is no statistically significant impact at the significance level $\alpha \leq 0.05$) of organizational support recognized for strategic entrepreneurship in all its dimensions (leadership, leadership, leadership culture, risk taking) in the Anbar Health Department/Iraqi Ministry of Health".

Via extrapolating the results in Table 14, we note that the value of the marker (R2) is (0.660), which means that the intermediate variant (perceived organizational support) accounts for 66% of the variance in the dependent variable (strategic entrepreneurship). A statistically significant effect show a statistically significant effect of the perceived variant, with a value of beta (B) of (179.) and a value of (t) of (2.263) with a significance level of (0.024) less than (0.05).

Result of testing the fourth main hypothesis (H04)

The fourth key hypothesis that there is no statistically significant effect was tested at a significance level ($\alpha \leq 0.05$) for the requirements of managing the high commitment in its combined dimensions (normative commitment, job enrichment, job security), on the strategic entrepreneurship in its combined dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) via the perceived organizational support of Anbar Health Directorate/Iraqi Ministry of Health.

There is a statistically significant effect of the perceived organizational Support variable, which is recognized in the relationship between the requirements of high commitment management and the strategic entrepreneurship in both courses:

First direct course: The direct course value of beta(B) is 672 and the direct course value of (t) is 9.748 with a significance level of (0.000) less than (0.05).

The second indirect course: The indication of beta values (B) in the indirect course are respectively (0.730) and (179), and (t) values, which were (16.805) and (2.263), with a significance level (0.000) for both courses, less than (0.05). These values indicate that the medium resulting from the perceived organizational variable is considered a partial medium, as the results demonstrated a direct effect of the requirements of the high commitment management without the intermediate variant. However, the effect is considered as the median variable, since the value of the marker (R2) before the intervention of the mediator (perceived organizational support) was (0.658) With regard to the first hypothesis, after the entry of the mediator, this percentage rose slightly by (0.02), which means that the variant of requirements for high commitment management in its combined dimensions refers to a value (66.0%) of the variation in the dependent variable (strategic entrepreneurship) (Table 15).

Table 15 Results of track analysis (Smart PLS) to measure the effect of the requirements of managing high commitment in their combined dimensions on the strategic entrepreneurship via perceived organizational support as a mediating variable

Direction	Beta value for indirect direction	Beta value for direct direction	The calculated T-value	Significance level
Requirements of managing high commitment -> The perceived organizational support		0.730	16.805	0.000
The perceived organizational support-> The strategic entrepreneurship		0.179	2.263	0.024
Requirements of managing high commitment -> The perceived organizational support-> The Strategic entrepreneurship	0131		2.234	0.000
Requirements of managing high commitment - > The strategic entrepreneurship		0.672	9.748	0.000

9 Results' Discussion

9.1 Discussing the Results of the First Main Hypothesis

That there is a statistically significant impact at the significance level ($\alpha \leq 0.05$) of the requirements for managing the high-level commitment to its dimensions on strategic entrepreneurship. The results indicate a statistically significant effect of the variant in the demands of managing high commitment in strategic entrepreneurship, reaching a beta value (B) (811) and a (t) value (25.411) with a significance level (0.000) less than (0.05). This finding was consistent with Howard study (2013) and Al-Naimi and Hamid (2015) studies in which it was stated that there is an effect of high commitment management requirements on the strategic entrepreneurship.

9.2 Discussing the Results of the Sub-hypotheses Arising from the First Main Hypothesis

1. Discussing the results of the first sub-hypothesis, which states that there is a statistically significant impact at the significant level of ($\alpha \leq 0.05$) of the requirements of the high Commitment management in its dimensions (normative commitment, job enrichment, job security) on the entrepreneurship in "Anbar Health Directorate/Iraqi Ministry of Health."

   As it is proved by the value of beta (ß), which amounted to (0.757) and the value of (t) which amounted to (15.186) with a significance level of (0.00) less than (0.05). This result is consistent with a study (Farndale et al., 2011), which concluded with some results that indicate that there is a correlation between the experiences of employees with commitment, high performance, fairness and confidence, which affect the activities of human resources management, and accordingly the researcher believes that the high level of commitment of working individuals helps entrepreneurial leadership in the Health office.
2. Discussing the results of the second sub-hypothesis, which states that there is a statistically significant impact at the level of significance ($\alpha \leq 0.05$) of the requirements of the management of high compliance in its dimensions (normative commitment, job enrichment, job security) on the entrepreneurial culture in the "Anbar health department/ Iraqi Ministry of Health."

   It is evidenced by the value of beta (B) of (640.) and (t) of (12.220) with a significance level of (0.00) less than (0.05). This finding is consistent with a study of Al-Hawajira (2018) which concluded that some findings suggest that enhancing a the entrepreneurial culture, linking it to strategy, goals and short and long-term performance outcomes, and attempting to transform the organizational structure from a bureaucratic one into a flat structure based on intelligence capabilities.
3. Discussing the results of the third sub-hypothesis, which states that there is a statistically significant effect at the level of significance ($\alpha \leq 0.05$) of the high commitment management requirements in their dimensions (normative commitment, job enrichment, job security) on risk taking in Anbar Health Directorate/ Iraqi Ministry of Health.

   As it is proved by the value of beta (ß), which amounted to (0.759) and the value of (t) which amounted to (15.186) at the level of significance (0.000) less than (0.05). The result is therefore considered compatible with a study of Said and Al-Nasrawi (2016).

9.3 Discussing the Results of the Second Main Hypothesis

There is a statistically significant effect at the significant level of ($\alpha \leq 0.05$) for the requirements of the high commitment management in all its combined dimensions

(normative commitment, job enrichment, job security) on the perceived organizational support in Anbar Health Directorate/Iraqi Ministry of Health. "the result of the second main hypothesis indicates that there is a statistically significant effect of the high commitment management requirements variable in perceived organizational support, with a beta value (ß) of (0.730). and the value of (t) which amounted to (18.805) with a level of significance (0.000) which is less than (0.05).

The results also showed that the R2 value is (0.563). This means that the high commitment management requirements variable accounts for (56.3%) of the variance in the intermediate variable perceived organizational support. This result is similar to the results of the studuies of Worku (2015) and Mansour and Ashour (2016), and in terms of the presence of a variable effect in the high commitment in the perceived organizational support.

9.4 Discussing the Results of the Third Key Hypothesis

There is a statistically significant effect at the significance level ($\alpha \leq 0.05$) of the organizational support that recognizes the strategic entrepreneurship in its dimensions (entrepreneurial leadership, entrepreneurial culture, risk taking) in Anbar Health Directorate/Iraqi Ministry of Health. "The outcome of the third major sub-hypothesis indicates a statistically significant effect of the organizational support variable in strategic entrepreneurship, with a beta (B) value of (0.179) and a (t) value of (2.263) with a significance level of (0.024) which is less than (0.05).

Besides the value of the marker (R2) is (0.860), which means that the median variant (perceived organizational support) accounts for 66% of the variation in the dependent variable (strategic entrepreneurship), and these results are considered supportive of the studies of Khudayr and Ahmed (2017) and Giglioti et al. (2019).

9.5 Discussing the Results of the Fourth Main Hypothesis

There's a statistically significant effect at the significance level ($\alpha \leq 0.05$) for the requirements of high commitment management in its combined dimensions (normative commitment, job enrichment, job security) on strategic entrepreneurship in its combined dimensions (leadership, leadership culture, risk taking) through perceived organizational support in the Anbar Health Directorate/Iraqi Ministry of Health. The results showed a statistically significant effect of the organizational support variable perceiving the relationship between the requirements of high commitment management and the strategic entrepreneurship in both courses.

The first direct course: The direct course value of beta (B) is (0.672) and the direct course value of (t) is (9.748) with a significant level of (0.000) which is less than (0.05).

Licensed to (putm@utm.my)

The second indirect course: The significant values of beta (B) in the indirect course are respectively (0.730) and (0.179) and (t) values are (16.805) and (2.263) with a significance level equal to (0.000) for both courses less than (0.05).

These values indicate that the mediation resulting from the perceived organizational variable is considered to be a partial medium, as the results demonstrated a direct effect of the requirements of the high commitment management without the intermediate variable. However, the effect of the intermediate variable is positive, since the value of the coefficient of determination (R^2) prior to the intervention of the mediator (perceived organizational support) was (0.658); after the mediator's entry this percentage rose slightly by (0.02) This means that the variant of the requirements for managing the high commitment in its combined dimensions has come to explain (0.66) the variation in the dependent variable (strategic entrepreneurship).

Hence, the result is considered consistent with a study (Mansour & Ashour, 2016) that found a positive and significant effect between high commitment management and organizational commitment through perceived organizational support. Therefore, the research company must work continuously to improve employees' outcomes, especially the level of organizational commitment due to its positive effect on the organizational performance.

10 Recommendations

Based on the findings, this study recommends the following:

1. Formulating a future vision with a leadership orientation of the department depends on the requirements of high commitment management and how to recruit in operations to attract, select and recruit people who are able to explore opportunities and expected threats with the results of performance analysis to recognize and strengthen strengths and weaknesses to overcome them.
2. The directorate uses the quantitative and qualitative methods and resorts to numbers and statistics to put a clear picture of the future of the directorate within a scientific and practical methodology aimed at adopting appropriate methodologies for its working environment to achieve strategic entrepreneurship.
3. The need to invest the research directorate for high commitment management practices to enhance the perceived organizational support of the employees in order to keep strengthening the strategic entrepreneurship and distinguishing it from other organizations. it should realize the experiences of the developed countries in applying these practices to benefit from them in the best possible form.
4. The high management in the health directorate should develop the capabilities and skills of the service providers, take the interest of the service providers, increase organizational support for them and meet the expectations of the employees about attention to their personal needs, self-esteem and work efforts.

Interdependencies and Integration of Smart Buildings and Smart Cities: A Case of Dubai

Mounir El Khatib, Gouher Ahmed, Muhammad Alshurideh, and Ahmad Al-Nakeeb

Abstract The literary meaning of the word 'smart' is bright, intelligent, high performing, which, by and large, is also true in the case of 'smart' buildings and cities. The present digital age (seems) to be a smart age and smart times, where everything is expected to be smart, including cities and their dwellings or buildings as living and working spaces. This study addresses Dubai, well known for its smart service initiatives, through Dubai Municipality (DM), and Dubai Electricity & Water Authority (DEWA). The Results reveal smart power and water management efficiencies and smart and effective delivery of civic services through the use of ICT. Dubai has plan to turn the sustainable city into power, water, infrastructure, information and communication efficient one by the 2021 Golden Jubilee year of the founding of UAE. The message of it is that the future is of smart dwellings and smart cities, and the concept of 'smart' in the case of ultramodern Dubai too should extend to the citizens.

1 Introduction

To start with, a smart city is a community in which citizens, business firms, knowledge institutions, and municipal agencies collaborate with one another to achieve system integration and efficiency, citizen engagement, and a continually improving quality of life (Al Batayneh et al., 2021; Al Shebli et al., 2021; Ghazal et al., 2021a). The term Smart Cities or Digital Cities are urban development, with the help/aid of implementing information and communication technologies. They are cities of the future which are forward-looking and resource-efficient providing a high quality of life, and are innovative in respect of infrastructure and homes, offices, business premises, besides being energy efficient and nature friendly (AlSuwaidi et al., 2021; Madi Odeh et al., 2021; Taryam, et al., 2020). They are made-up of new energy and transport system. Government and public Partnerships are essential for smart cities, and to make the cities to be smart and intelligent, decisions need to be taken at the strategic level to see the decision makers' commitment to smart city development implementations (Aburayya et al., 2020a; Alhashmi et al., 1153; Kabrilyants et al., 2021).

The concept of smart building is elastic and evolving in a constant way. This flexibility supports the facility to add and insert various functions and components to smart buildings and smart cities programmes. Smart buildings are generally kept to be flexible, energy efficient, interconnected and automated to enhance comforts of life (Aburayya et al., 2020c; Alshurideh et al., 2016; Al-Zu'bi et al., 2012). "Smart home refers to an intelligent home concept in which the user can work on sensors and devices to make the house respond in a way to stimuli". Smart buildings have been of scholarly attention for over thirty years. The phenomena are present in almost every smart materials, smart detectors, and smart constructs, with the aim of creating efficient buildings, making use of advanced and efficient building construction technologies, as the 'green' one (Alshurideh et al., 2019a; Joghee et al., 2021; Lazaroiu et al., 2018; Shishan et al., 2022).

This paper review Smart Cities as the future of urban settlements, with large populations that require, first, smart dwellings make-up good city to live-in buildings block of smart cities. Smart Cities has an average technology size, sustainable, comfortable and also secure (Lazaroiu & Roscia, 2012). Dubai, which has reputation as an ultra-modern city (Aburayya et al., 2020b; Ahmed, 2021; Alzoubi et al., 2021; Krane & Dubai, 2009), is taken as a case study of the problem. A comparison made of 'dazzling' Dubai with other smart cities, to see how they differ Dubai, a city state of the Emirate is in part of the 7- emirate of the United Arab Emirates (1971), which has come to be an up-to-date state of the world. The basic question addressed in the study is whether smart buildings lead to smart cities?

The research objectives are to (i) define the constituents of smart buildings from both international and local point of view, and also (ii) to see whether smart buildings are enough to build a smart city or not, and (iii) to study Dubai's initiatives in this regard. And the study is organized around the following questions: (a) What constitutes a smart building? (b) Are smart buildings milestones that lead to smart cities? (c) Are smart buildings the only key component that lead to smart cities? (d) What is Dubai government's strategy and future plan towards smart buildings?

2 Literature Review

2.1 Smart Building

The concept of Smart Building has been in existence for about two decades by now. Its definition, as well as implementation, has been evolving and varied in line with development of knowledge and technology over the years. (Kroner, 1997) asserts that the contemporary smart buildings are ones that have been enhanced electronically. Accordingly, Smart Buildings can be defined as buildings that are capable of enhancing the productivity of their occupants, optimize environmental performance, enhance satisfaction and safety by promoting comfort and adopting morbidity and health features.

Arkin and Paciuk (1997) have suggested that the smartness of a building is not only based on the sophistication of the technology used but the integration that occurs between different systems. According to Atif and Galasiu (2003), the factors that influence the increased use of Smart buildings in the world and more importantly in the United Arab Emirates, (UAE) are ensuring cost effectiveness through cost reduction measures and enhancing the technological capabilities that characterize them (Aburayya et al., 2020d; Allozi et al., 2022; Nuseir et al., 2021a). Other major drives include industry and government sustainability policies, the need for intense security, the changing market trends in real estate, the ongoing business pressures, the triple bottom line requirements for reporting, the needs to outsource the building services and the shifting nature of work environments (Al Naqbia et al., 2020; Al Suwaidi et al., 1261; Alameeri et al., 1261). (Amponsah & Ahmed, 2017a) and other researchers further note that it is vital to analyze the drivers to determine the applications of technologies that would yield more beneficial results.

2.1.1 Features of Smart Buildings

- *The buildings are flexible:* The buildings make use of information collected from different sources to prepare for future events. They can adjust to their operations and physical nature so that they can suit these surroundings. A smart building can account for people's different needs and changes in occupancy rates (Akram et al., 2016).
- *Smart buildings have control:* They are either automated or possess human control. The buildings regularly warn occupants of the current temperature and direct them to their comfort areas.
- *Environmental preservation:* They use the real-time environmental information to guide the house owners on ways to preserve the environment. The buildings also have good sewage systems that ensure efficient disposal of waste.
- *Possess an enterprising feature:* The buildings make use of information gathered to advise visitors on the nature of a house. This enterprising nature makes a tremendous potential for the buildings to provide a comfortable atmosphere (Buckman et al., 2014).

- *The buildings are comfortable:* According to Das et al. (2015), the buildings have advanced technologies, which make the life of the owners easy. They have a remote control which helps the owners to perform their duties comfortably.

Smart buildings in sum are airy, bright, energy and water conserving. It enabled, light but should rowed attention, and social and environment friendly, well maintained and clean and green.

2.2 Smart Cities

The literature on Smart Cities includes a broad spectrum of multidimensional components and a diversity of conceptual relatives, as "knowledge-based development," "intelligent city," and "skilled cities," to name a few (Nam & Pardo, 2011). The term smart city covers a considerable ground and includes a range of concepts related to urban development conflated under the "smart" label (Hollands, 2020).

Chourabi et al. (2012) focus on smart governance, ICT, and/or smart people, while (Caragliu et al., 2011) a smart city has a progressive economy and outlook, ICT infrastructure, an attitude toward positive development, a focus on creative solutions to management complexity, and the use of technology to streamline city services. Further, a smart city must contain "a smart economy; smart mobility; a smart environment; smart people; smart living; and smart governance." Moss Kanter and Litow (2009) claim that all of aforesaid systems must come together to create an "organic whole," so that all elements of the city must function as a single network.

By the way, literally 'smart' means *Stylish,* up to date, (Webster Dictionary) by which smart cities are Bright and Stylish cities. Of course, every city, with the passage of time, has to get updated. For example, compare Dubai of 1971 with Dubai of 2019, between which there is a sea of difference. The opposite of smart is Dull, Faded. Dubai is said to dazzle its ever-flowing tourist visitors, who come in millions, to see the wonder city of the twenty-first century and shop to their hearts full or over flowing satisfactory. There is no doubt about Dubai being a very Smart City. What is more, it is credited with Smart and forward looking leadership (Moss Kanter & Litow, 2009), without which cities cannot take a smart shape.

All smart city working definitions include most or all of the attributes of sustainability, advanced information communication technologies (ICT), smart/good governance, and human capital development (Khatib et al., 2019). According to the researchers, the four principal elements that operate in an integrated way in smart buildings are actuators, sensors, performance models and integrated information management system.

A smart city is not only technologically savvy, but also culturally and intellectually oriented. It is an integrated and holistic city in which people love to live and work and indulge in some creative activity (Amponsah & Ahmed, 2017b). It, in a way, is of advanced global city, as one can easily visualize. In this respect, Dubai is an

established and acclaimed Smart City with a smart and dynamic and sophisticated feel-at-home tourism industry (Khatib & Ahmed, 2018).

2.3 Smart Buildings and Smart Cities Relationship

The influence of smart buildings in contributing to development of smart cities is visible in the ability of these buildings to accommodate a high number of residents and creating sustainable real estate solutions. Urban populations are constantly growing, requiring the application of information and communication technology to develop buildings that will offer improved quality as well as interactivity of services in urban regions (Intel, 2016).

Buildings interact with other economic, social, and environmental aspects in the community. For instance, buildings consume approximately two-thirds of electrical energy, therefore through installation of appropriate sensors, control systems and actuators electrical energy could be saved and environmental preservation would be achieved (Morvaj et al., 2011). Smart buildings are hence a significant influence in development of smart cities. The key elements that create a framework for a smart city include energy, water, waste, infrastructure, public safety, education, green buildings, transportations as well as citizen services and buildings are associated with a majority of these elements, illustrating the potential that smart buildings have in creation of smart cities (Doherty xxxx).

2.4 Information Technology and Urban Growth

The translation of a smart building acknowledges the need for an integrated and universal model. They are structures which combine and consider business management, intelligence, and adaptability, so as to meet the directors of development. Smart cities are urban growth insights to combine the Internet of things (IoT) and IT uniformly to handle a town's properties (Deakin, 2013). These resources may include schools, power plants, hospitals, and community services amongst others. The cities utilize IT to improve their effectiveness, connectivity, quality of work, costs decrease, resources use, and enhance the contact between the state and its nationals. IoT is developing a new range of smart buildings which are more aligned with the organizations' strategies (Ghazal et al., 2021b; Krane & Dubai, 2009; Lee et al., 2022; Nuseir et al., 2021b). It allows operational processes to produce precise and sufficient information for enhancing functions and offers the best to its clients.

2.5 The IT Alignment with Smart City Strategy

Information Technology is gradually transforming the cities across the globe, making the cities digital cities with swing on-line transitions. The internet is modifying the conventional urban strategy design and compelling developers to consider the utilization of IT to enhance the mobility, administration, finances, and the overall environment of a city. Even from the definition of the smart cities, IT plays a vital function in creating a city that is adaptable to the modern needs of its inhabitants. Further, IT offers a technology and trade review of the latest trends in logistics, water supply, and energy in urban developments (Khatib & Ahmed, 2018). Thus, IT appears to be the vehicle propelling the development of Smart Cities.

In the vital and worrying energy sector, 'smart power' relates to the any type of energy, whose purpose is to decrease energy losses, enhancing provider services, raise effectiveness, and reduce wastage. The plans rely on the advanced IT facilities and services. Smart logistics target information-grounded traffic regulation and people. This sector depends on smart transportation processes for the checking and management of the fleet and traffic services on real-time data basis. Smart water relates to the programs that aim at encouraging water conservation and efficient use of energy in the water arena by the implementation of the machine-to-machine tech, and data review.

In a firm where IT and business strategies are aligned, the organization understands the goals and objectives of the IT department and ensures every change takes into account the influence it has on this department (Alshurideh et al., 2021a, 2021b; Leo et al., 2021). The IT manager comprehends the overall aim and objective of the firm and thereby acts according to its terms. The misalignment of IT and business plan takes place when the firm never incorporated IT into the planning or has slowly become disconnected as the company's requirements and priorities evolved. As the modifications take place, most managers update their plans but fail to incorporate the effect of these changes to IT.

The supply chain, sale, and marketing departments may have evolved over a period. However, these changes usually occur with no observation of what IT must change so as to support such modifications. Similarly, technology changes at a high rate. Firms notice the significant capital input they made in particular technologies and are cautious to leave out legacy processes so as to favour new and outsourced services due to the increased costs and difficulties. Consequently, in such firms the conflicts arise as the business plans change and IT strategies remain stagnant or even worse. Now it is time to take up Dubai and its plans of Development, to make the city a more renowned global metro or mega-polis.

Licensed to (putm@utm.my)

2.6 Dubai Plan 2021

Dubai 2021 plan aims at ensuring safety standards within the built environment of the city. The plan focuses on guaranteeing building safety for the residents and visitors living in the city by offering disaster management responses. It also plans to provide high-quality housing, to all socio-economic groups. The plan involves integration of new technologies that ensure optimum facilities, and also focus on optimum energy management and sustainability, in all matters of the city development to put the stellar city on a for-ever smart footing. The buildings are also to be made ecosystem friendly, to ensure a clean and healthy environment. To be able to achieve the 2021 plan, Dubai needs to make sure that the buildings have no negative impact on their surroundings and that they maximize economic benefits of the city. Dubai Plan 2021 is an example of keeping the reputed city dynamically smart pleasing in appearance and most efficient in functioning and administration.

3 Research Methodology

3.1 Research Design and Data Collection

This research is descriptive research that uses the qualitative method for data collection to identify, categorize publicly available information about international Smart Cities including, Dubai and some others to compare their smartness in terms of building and other standards. Data collection was done through interviews, and Surveys, concerning select Dubai civic bodies of DM & DEWA.

3.2 Interviews

Person-to-person interviews of the head of each department (IT & Strategy) in both DEWA and Dubai Municipality Sr. manager, manager, sr. specialist level in the know-how of the City matter's as their administrators, in their organizations. They had provided with required amount of information for the study being experts in the current state of affairs and the plans Dubai plan 2021, the Golden Jubilee Year of founding the United Arab Emirates (UAE), by which date the Emirates, intend to 'achieve, say a very 'smart' high and steady state of development. Three questions were put to the heads in both the organisations, they are (a) What is DM's/DEWA Information Technology strategy? Especially in smart building field. (b) Do DEWA forecast or predict for future technology? How? (c) How they utilize future technology in their plans/projects? giving a good deal of information/Data. It is significant, Dubai's urban/municipal organizations and authorities operate on a minute state of Information. So, 'Smart' in the matter of departmental information.

3.3 Online Resources

The study had drawn from the DEWA and Dubai Municipality official websites for the organizations' initiatives and real projects. Also, other related websites to collect more data about the specified topics, which had got buttressed by articles and researchers have been used and utilized to support the research.

Even as it is Dubai seems to be a smart global city by appearances, and functioning, which doesn't mean it doesn't have un-smart features like over per capita water consumption. In a desert city like Dubai, water has to be used with utmost care and ZERO or near zero wastage Water is the nectar of life, it is needless to say.

3.4 Sample Interviewed Organisations (DEWA & DM)

3.4.1 Dubai Electricity and Water Authority (DEWA)

In 1992, Dubai Electricity Company and the Dubai Water Department were merged by the Sheikh Maktoum bin Rashid Al Maktoum, Vice President & Ruler of Dubai, to be Dubai Electricity and Water Authority (DEWA), the main provider of electricity and water service in Dubai. DEWA is one of the authorities that has e-Government service which provides the online users with up to date information. In addition, DEWA has launched three initiatives programs to effort sustainable development in Dubai as a part of smart Dubai initiatives such as connecting solar energy to houses and buildings, Smart Applications & your Home and Infrastructure and Electrical vehicles charging stations. It is important that these initiatives were quite ahead of them in the Arab World, by and large, and elsewhere too.

3.4.2 Dubai Municipality (DM)

Dubai Municipality is a government organization which provides municipal services. It is a well acclaimed municipal body. It is made up of 34 units under six sectors (Sector's of Engineering and Planning/Environment, Public Safety and Control Sector/Environmental Services and Public Safety Sector/Institutional Support Sector/Public Support Sector/Communication Sector and Society) with multiple authorities & responsibilities. The municipality's vision is "Developing a happy and sustainable city", and the mission is to plan, develop and manage an excellent city that provides the essence of success and sustainable living.—Dubai Municipality is considered to be one of the largest governmental institutions in terms of the services it provides and the projects it carries out, in the Emirate of Dubai and UAE.

3.5 Limitations

In spite of researcher's best efforts and the respondent cooperative, the study may have some limitations, which however do impact upon the soundness and Results. (a) Difficulties to get the required answers from the organizations in Dubai as the majority of projects are not announced yet. (b) Time limitation. (c) The Variety of the criteria that define and measure the smart buildings all over the "Smart cities" made the comparison a challenge. (d) Lack of enough research in this field, as most of the research are based on smart building from an environmental aspect.

4 Analysis and Results

By interviewing people from Strategy department in both DEWA and DM, it was found that the important part of any project is the strategy used to achieve the organizations' goals. The strategy is to primarily facilitate positive energy and by doing this DEWA and DM have provided a positive and optimistic work environment. In return they expect to enhance the people's happiness, and the individual happiness leads to corporate efficiency.

Just to give a glimpse, they have incorporated a library, nursery, cafeteria, outdoor jogging track, and lots and lots of green spaces. In addition, DEWA and DM pride them self on the implementation of technology to reach their goals. For example, as of 2017, DEWA had adopted Microsoft's HoloLens technology, which is absolutely ground-breaking. Through this piece of technology, DEWA will be able to efficiently boost its operations, and greatly improve overall productivity and increase the process of innovation. By doing all this, they are able to provide services, with maximum potential to their customers. Through this, DEWA is able to assert its position at international level, as an efficient electricity and water dispenser of world repute. It is noteworthy, both the Dubai Emirates and the Emirates aim at international working standards for their organizations, of which both DM and DEWA have proved themselves to service organizational of global distinction.

The DEWA and DM belief is that future planning is a must to the success of any project or any of its related task. With this in mind, 2020 is likely to be a challenging as well as a great opportunity moment for the United Arab Emirates. DEWA and DM have programmes that lay the pathway for the achievement of a smartest possible city of Dubai. For instance, in 2016, DM had implemented a'10-week' programme, during which a number of technologies were undertaken and implemented to open further strategies. This programme was also called the ExO Sprint Programme, meaning a quick results program.

IT manager at DEWA had discussed about Al Sheraa or 'The Sail' project to be completed by 2019. DEWA had planned to design the building solely based on solar energy as the future un-bounded energy was planned to be shaped as a sail to capture solar energy. It had plan to build a 'net zero' type building where the energy used will

be much lesser than that of a normal building. It was calculated and found that the building will be utilizing about 70 kWh/sq. This helps DEWA to achieve the vision of an environmentally friendly approach and innovative planning.

DEWA and DM's primary concept is innovation, which form a greater part of their vision. In relation to it, they had recently entered into cooperation with a number of companies from India. All these companies operate in the energy sector. It was all a part of the 'Dubai Clean Energy Strategy 2050'. Through this cooperation, a number of projects are kept in order, which would transform the United Arab Emirates to be the leading and the most environmentally sustainable country. For example, Al Sheraa is a huge and ambitious project, to be implemented by DEWA. But there are other projects in place, which aims at sustainability, and integration with innovation. DEWA had initially planned a project called the 'Mohammed bin Rashid Al Maktoum Solar Park', which is planned to achieve 100% completion by 2020.

These are all 'smart' energy initiatives and plans which are to give Dubai a smart energy city image, as the solar energy is the cleanest and near to nature energy. The project is a part of Dubai Clean Energy Strategy. With this, the Al Sheraa project is also a sustainable related project, as, control centre would help keep track of all the building systems and switch off lights and AC, when they are not in use. Sustainability and innovations take part of each and every aspect of a project of DEWA projects.

The finding of it is that the entities in Dubai are involved and aware of Dubai vision, which is building up of a smart Dubai City that stands out in the country of global smart cities, through the medium of ICT. However, surprisingly, ICT was found not involved the premier organizations business strategy. It is however, a different that the researchers had not gone into the Question of Smart staff.

From the interviews it was found that, the organisations were still not involving the IT in their business strategies. And, without IT, smart organizations remain a distant dream, with IT standing for 'smartness' as the smart phones.

Al-Sheraa Building—The Smartest and Largest Government building around the world. Al- Sheraa, in Arabic means 'The Sail'. The name has a close correlation with the structural design of the building which shaped like a sail, and is covered with solar panels to produce over 3,500 kilowatt hours (KW/h). In addition, the building using technologies such as, the Internet on Things, Big Data and Open Data, and most importantly Artificial intelligence (AI). These robots are helpful in a lot of operations within the building. An application is given to the employees, which advises them on the traffic condition, and also assists in the process of booking meeting rooms and parking spots. The Al-Sheraa building is essentially a Zero Energy Building, which utilizes a way less energy as compared to other city structures.

4.1 Smart Water Management

As said, water is a very precious gift of mother nature, which however is in a declining supply Dubai being a desert land, the water problem is very acute, with the problem

compounded by a meagre annual average rainfall of 80–140 mm (Sherif et al., 2014). With this, the need is for the Smartest water management of the expanding City's water resources.

The DEWA is at the Job of smart management of the city's water resources, wherein the role of the citizenry is very vital, as they need to cut down their excess per capita water use, which is noted to be the highest of any country in the world. Smart cities, whatever they are supposed to be first of all, call for smart citizenry. This give reference point, however, is seldom come across in the smart cities' literature. As such, more than anything else, smart people in the sense of socially very responsible ones, is the first requirement of Smart Cities.

Al-Sheera is minutely managed with the latest technologies, the model of which should extend to homes, offices, businesses premises and the whole city. Dubai Municipality Smart Buildings exercise is quite an elaborative one and is mostly technologically driven. Dubai Municipality, which is reputed municipal body across the world, 'smartness' pervades all the big building initiatives (7) of the Dubai Municipality. Infrastructure, communications, energy, health, waste material, elevators, printers, building management, security and safety. From all buildings appear to be independent, yet inter-connected, building system. They are like little islands is the smart sea of municipality.

Smart Buildings mean energy, technology, and environmental benefits smart buildings are, say, the way forward to smart cities. Smart buildings confer, on the whole environmental health, economical, and technological advantages on Smart Cities and thus help building up of Smart Cities. In other words, it is a wider public perception in Dubai that Smart Buildings are akin to the bricks that go into the making of the edifice of smart city. In a word, public perception in Dubai is well in favour of Smart Buildings through which Smart Cities is presumed to be next step. Dubai is felt to be on the road to a smarter future.

4.2 Dubai's March Towards a Smart Future

Dubai is on the way to a large-scale digital transformation. The goal is possible through the adoption of the approaches of cutting-edge digital transformation, information, and communication utilizations. Adjustments, in the policies as well as regulations facilitate the adoption of prompt technological advancements which together with societal revolution, enable infrastructures for the internet-based businesses as well as the creation of a knowledge economy are being restored. Dubai city intends to expand the usage of innovative digital means to achieve sustainability in development, and enhanced governance, and growth as well as public well-being.

The ambitious endeavour of Dubai entails the creation of a "smartest" and "happiest" city by 2017 (Alshurideh et al., 2019b; Alzoubi et al., 2020; Sherif et al., 2014). The achievement of their vision relies on the maintenance of the digital-age entrepreneurial approach to leadership, networked and collaborative style of governance. Other indictors can be a positive sign to put Dubai in the right way towards

smart transformation ICT infrastructure and economic development and business. Such an achievement can lead to the minimization of the future barriers together with the expedite efforts that facilitate the attainment of their ambitious goals of a 'Smart'/Smartest and happier/happiest city of international distinction and standing.

The strategic plan of digital or smartest city transformation comprises of six dimensions that include Economy, Governance, Environment, Living, Mobility, and People, and the areas of concern include the quality of life, lifestyle, ICT, communications, information, infrastructure, services, and people, together with the social, environment, sustainability, Governance and administration, economy and finance and Mobility and transportation (Sherif et al., 2014).

4.3 Dubai Plan Toward Transforming into a Smart City

The findings from reading and analyzing is explained in this part. Dubai plan 2021 to transform the acclaimed city of Dubai into a smart city by achieving several accomplishments. The plan is an output of the forward-looking government of Dubai, headed by very concerned leadership, which intends to put their Emirate of Dubai in the first ranks of the developed countries. The plan is a model of smart-city development (Sherif et al., 2014).

Firstly, Dubai plans on building an infrastructure, which will support the economy and social life of the city. The infrastructure will be wholly integrated and connected, to ensure easy mobility for the people in the city have access to the economic and social sectors.

Incidentally, 2021 is the Golden Jubilee year (50th) of the founding the new Arab state of the United Arab Emirates (UAE) (1971), which has achieved many records of development, in which Dubai as the second largest Emirate after Abu Dhabi has a stellar tale.

Secondly, it plans on ensuring that the city uses the available resources sustainably. Sustainability means that it must pay attention to the future by providing sound management and use of renewable energy sources.

Thirdly, it plans on ensuring a healthy and clean environment, to ensure sustainability of the city in the long-term.

Lastly, it plans on managing safe and resilient built surroundings. The program aims at making Dubai stand it on par with the world-class cities, where there are high levels of efficiency and facilities for future growth.

4.4 Comparison of Dubai and Singapore

Singapore recognizes the influence of smart buildings in contributing to the development of smart cities and smart nations, and in this regard, the country highly prioritizes integration of technological as well as automated systems in buildings

to enhance control and monitoring, in addition to energy saving and improvement of human comfort. Comparison of efforts and plans of Dubai Municipality and the City Council of Singapore illustrates that both bodies are focused on transforming the public sector. One indicator is the degree(s) provided for various Smart buildings initiatives. For instance, governmental buildings are provided 15 points in Dubai regarding installation and the same holds for Singapore.

However, Singapore's total building degree for governmental buildings is higher at 100, compared to 95 in Dubai. The inference is that Singapore's efforts and resources allocated to this initiative would be higher. In 2016, the Building Construction Authority (BCA) in the country of Singapore was signed a partnership agreement with Microsoft aiming to integrate technological and automated systems in 30 commercial buildings (Sherif et al., 2014).

Singapore', allocation of a higher degree to Industrial Buildings have implications for Dubai's efforts, because Dubai may fail to achieve optimal outcomes. By allocating 25 to 'total building degree', Dubai fails to transform industrial buildings entirely and since these buildings often consume high energy amounts, they need to be monitored in the same capacity (perhaps even more) compared to government buildings, public buildings or other building types, most variables significantly receive the same degree in both Dubai and Singapore, including Energy Control Systems (15), Security and Monitoring Systems (10) and Water Control Systems (10). While both Dubai and Singapore invest significantly on tourism and hospitality, the degree provided to Hotels and Hotel Apartments is higher (at 100) in Dubai compared to Singapore which has provided a degree of 90 to this building type. The inference is that Dubai's popularity as a tourism destination encourages the municipality to improve human comfort through transformation of Hotels and Hotel Apartments into smart buildings.

As per the rankings stats, infrastructure from Table 1, Dubai is doing better in terms of ranking, the ranking has improved from 43rd out of 118 in 2020 to 29th out of 118 in 2021 when it comes to smart city ratings, Singapore is rated higher when compared to Dubai in terms of Population, HDI, GNI per capita. Dubai Ranks 'BB' in Smart City Global Rating and Singapore holds the top position with the 'AAA' in the year 2020 (IMD Smart City 2021 Index). Dubai has to rise over its under ratings in respect of health, utilities, education, and public safety in its journey towards an Emirates future.

As per the rankings stats, infrastructure from Table 2, Dubai is doing better than Singapore when it comes to the development of smart buildings, Singapore is rated higher in smart health care delivery. Adoption of smart transport is higher in Dubai than in Singapore while adoption of smart technology seems to be higher in Singapore as compared to Dubai. Dubai, nevertheless, is rated lower when it comes to electricity, education and public safety as compared to Singapore (KPMG Revenue (Annual Report), 2017). Dubai Ranks 45 in in Smart City Global Ranking and Singapore holds the top position with the 1st Rank in the year 2019 (Sherif et al., 2014). Dubai has to rise over its under ratings in respect of health, utilities, education, and public safety in its journey towards an Emirates future.

Table 1 Dubai and Singapore comparison

Component	Dubai	Singapore
Population	2,880,000	5,940,000
HDI (2019)	0.890	0.938
GNI per capita (PPP $)	67,462	88,155
Smart city ranking (in 2021)	29 out of 118 (43rd in 2020)	1 out of 118 1st in (2020)
Smart city rating (in 2020)	BB	AAA
Factor ratings (Structures) (in 2020)	BB	AAA
Factor ratings (Technologies) (in 2020)	BB	AAA

Smart city index (2021)–All ratings range from AAA to D.

Table 2 Ratings

Component	Dubai (%)	Singapore (%)
Smart buildings	70	60
Smart urban health care	50	75
Smart transport	75	65
Smart technology	70	70
Tourism	75	60
Utility	45	50
Education	60	70
Public safety	56	70

Source KPMG Revenue (Annual Report 2017)

5 Discussion and Findings

From the theoretical data and the collected information, a smart building is a construction that takes advantage of improved materials and technology in structural terms, electrical systems, HVACR, plumbing, and appliances. The compilation of all these factors enables such a building to achieve a considerable amount of energy saving. Certain elements of these type of buildings are true and tried, a familiar example being weatherization. Other elements include new technologies in lighting among other aspects that are new to the market. Some largely depend on the availability of renewable energy. Landscaping is also incorporated with the inclusion of green walls and green roofs. Advanced systems of control connecting these buildings are yet another major element, which is a way to optimize savings. A smart building uses information technology in the integration of every aspect.

Smart buildings are the key ingredients to the creation of smart cities. As such, constructing a smart building in any city is a sure way of improving the citizen's quality of life. Improved quality, in turn, is the base of creation of smart cities. Smart

buildings enable a city to efficiently and frequently collect utility data. An example of this is replacing the tallying of the bills with smart meters to do the collection. Doing this would make the identification of patterns of usage and effectively plan the usage of energy based on the amount of demand. An efficient city regarding service delivery translates into saving of energy, simplified processes and thus the city can identify the capital expenditure that is more helping without the risk of breaking the budget.

As for resident happiness, a smart city program enabled by smart buildings can improve the lifestyle of residents more than any other initiative tailored towards a smart city. In the long run, residents are empowered with better working conditions, safer environment, which entitles them to do more meaningful goals in life through efficiency, comfort, and safety of the systems around them. This is aside from the happiness induced by belonging to a sustainable city that practices fair distribution of capital income over other important aspects of life such as education systems and economic growth.

Is Dubai in the right way to be a smart city? The finding from the research is that a smart city must create a high quality of life and possess sustainable economic development. Smart buildings, good infrastructure, digital technologies, good governance, sustainable environment and well-educated residents, characterize a smart city. In the 2021 Dubai Plan, the city aims at building an infrastructure that supports economic development. It plans on creating a sustainable setting with a clean and safe environment, good governance, educated individuals and a vibrant and rich culture. It is evident that Dubai is in the right way to be a smart city since its plan is in line with features of a smart city. The program focuses on creating a high-quality lifestyle for the people of Dubai and building a sustainable economy, which are the key determinants of a smart city.

The government of Dubai has a plan known as "Smart Dubai Gov or SDG" the main aim of which is to create the happiest and smartest city in the world. The mission of the government is to create and deliver a city that is smart, and of the world class. This includes smart services and infrastructure, which comprise smart buildings. According to the government, their end goal is not technology, but rather to create an extraordinary life quality. The goal is to create sustainability among the citizen residents and ensure visitors are satisfied and happy. The city is benchmarking itself against other similar cities geographically, socially, economically, and culturally to compete to be a global leader.

Smart buildings are, no doubt, the key component to the creation of smart cities. For instance, the power use in such buildings enables the balancing of electricity demand and supply. The advancement in these buildings can be said to be like having a brain; that can reconcile and balance competing interests like occupant comfort, minimize energy and get grid stability. All these factors make smart buildings the only and best factor to the realization of smart cities anywhere in the world. They are efficient in every aspect, majorly solving most of the issues that are currently facing many cities. The best thing about such cities is that they are automatic and so will need minimal training to operate on the systems to get the cities up and running. From the data analysis, Dubai has the qualifications and the ability to be a smart

city which however may need more efforts in some phases but with government's commitment and knowledgeable people the city can step forward to start more smart initiatives with supporting innovations and provide the needed technology.

But, there are certain hurdles in the way of realisation smart city goals by Dubai, such as the over-use of water and electricity and excessively taking to outsource ownership and use. For after all, it is citizens who make homes, cities and states. Hence, there is a need, above all, for 'smart' or public and nature minded citizen behaviour.

6 Conclusion, Recommendations and Policy Implications

6.1 Conclusion

The field of the smart buildings has grown worldwide, including the United Arab Emirates and its constituent emirate of Dubai. There are several activities, initiatives and real projects that reflect the growing interest and awareness of smart buildings in Dubai. Dubai's experience in the field is still in its early stages. Evidently, smart buildings are considered to be the cornerstones for successful smart city program. But the smart city programs are driven home to re-integrated to be effective and wholesome, as no price meal approach to the problem couldn't be well paying.

The benefits of smart buildings tap into the fundamental necessities of human life, such as safety, health, and energy, that culminate in the happiness of a city. Smart cities do not come without, substantial or capital expenditure on infrastructure, environmental, etc., which is justified in terms of its many benefits. Above all, for reducing global warming, the starting points of which are cities and their dwellings in whom a behavioural change is to be brought over.

In sum, Smart Buildings and Smart Cities are tidy, neat and green, well- functioning and well governed and orderly, advanced technologically, economically well off in which the residents are happy to live in and work. Dubai is inching towards to be the world's smarter city. However, Smart Cities, have also been noted to suffer from some wicked problems as acute class and housing differences (Colding et al., 2019).

6.2 Recommendation and Policy Implications

In the light of the results of this modest but significant exercise, the following suggestions are put-forth with policy implications.

- To start with, smart buildings as suggested by very concerned scholars should be built with advanced materials which are nature friendly and nanotechnology for energy and water use efficiency (Sherif et al., 2014).

Licensed to (putm@utm.my)

- While many cities can easily be labelled as 'smart' for adopting new technologies, what is more necessary is that to truly establish the smart factor in every building, we must take the right approach towards the construction of new buildings and the transformation of the existing ones.
- Find and Set international features or standardized criteria to define and recognize the smart buildings and smart cities.
- The planners must learn how to overcome the barriers that hinder the progress of building Smart Cities. The common hurdles are the limitations of the infrastructure, gaps between the technological potential and the developmental requirements, public concerns, policymakers', technological determinism, obsolete regulatory frameworks, the government silos, resistance to change, and capacity deficit.
- Align the IT plan with the business strategy to start smart buildings. Make managers understand the features and the future of the IT and the technology supporting the smart building infrastructures, for which the IT involvement in planning smart cities instruction is important.
- Government and higher political involve leadership in Building Smart cities is essential.
- Citizens and people who get the beneficial from smart buildings should be involve as well through public awareness and more involvement via social media.
- Support and educational facility are important to encourage innovators that new ideas and creative touches to improve the smart initiatives in the cities are aiming to be smarter.
- Smart Buildings and Smart Cities movement should be a people's movement, involving all sections of the people.
- There are 'wicked' problems of Smart Cities like the demolition of poor dwellings for the purpose of the high-rise buildings for the rich and super rich.
- Not the least, Smart Cites call for socially responsible citizens who are active in the city affairs.

Dubai Smart City as a Knowledge Based Economy

Mounir M. El Khatib, Naseem Abidi, Ahmad Al-Nakeeb, Muhammad Alshurideh, and Gouher Ahmed

Abstract Innovation, emerging technologies and digitalization have significant impacts on personal, social, environmental, and business aspects. This study explores the initiatives taken by the United Arab Emirates (UAE) to accelerate its knowledge-based economy to ensure the best living experience for its people. Knowledge is the key factor in growth and labor market expansion where skills, knowledge, and experience possessed by individuals, are the driver of creativity and innovation, with dependence on information and communication technology (ICT) as an enabler. The UAE is moving towards a knowledge-based economy in order to maintain a diversified economy in line with "The Abu Dhabi Economic Vision 2030" which was launched in 2009. Through a systematic literature review, researchers have developed a perspective on transformation of economy and society through innovation, use of Information and Communication Technology (ICT), as well as government performance management frameworks. Theory of sense data, nomothetic explanations, predictive and prescriptive analytics, along with Smart Dubai as a case study, are used to assess the achievements, emerging trends and expectations of knowledge-based economy in the UAE. Smart Dubai is a unique example of a high-level quality system that strives towards making Dubai the happiest city on earth. Smart Dubai has been adopting many projects that enhance the life of people and support the

economy of the UAE. This study highlights the challenges related to the implementation of the Smart Dubai project. The study also provides a clear view of smart cities transformation into a knowledge-based economy and utilizes predictive and prescriptive analytics tools that can assist other researches in the future to improve and develop research regarding smart cities and gain a better understanding. Ten recommendations are made in this study, for the Smart Dubai to consider, in order to maintain high-quality performance and accelerate the transformation process of Knowledge-based economy.

Keywords Knowledge-based economy · Innovation · Analytics · Digitalization · United Arab Emirates · Sustainable development

1 Introduction

The OECD defines Knowledge-based economies as "economies which are directly based on the production, distribution, and use of knowledge and information" (OECD, 1996, p.7). In the Knowledge Economy (KE), possession, use, and transfer of knowledge is essential (Al Mehrez et al., 2020; AlMehrzi et al., 2020; Altamony et al., 2012; Shannak et al., 2012). So, it is imperative to combine and synergize people, knowledge and technology to facilitate enhancement of value addition at micro and macro-economic levels. Powell & Snellman (2004) defined knowledge economy as "production and services based on knowledge-intensive activities that contribute to an accelerated pace of technological and scientific advance as well as equally rapid obsolescence". According to (Powell and Snellman 2004; Obeidat et al., 2021; Alsuwaidi et al., 2020; Al Naqbia et al., 2020; Al-Dhuhouri et al., 2020), the main components of a knowledge economy include a greater dependence on intellectual capabilities than on physical inputs or natural resources, combined with efforts to integrate improvements in various stages of the production process, from the R&D lab to the factory floor to the interface with customers (Ahmad et al., 2021; AlSuwaidi et al., 2021; Harahsheh et al., 2021; Svoboda et al., 2021).

Technological advancements and Information and communications technology (ICT) largely effect the globalization and knowledge economy because of the imbalances, and instability (Aljumah et al., 2021; Alshurideh et al., 2014; Alyammahi et al., 2020; Alzoubi et al., 2020; Ammari et al., 2017; Suciu, 2004). Dahlman and Utz (2005) highlighted that a knowledge-based economy is successful when there is a link between industry, science and technology. The empowerment comes from increased lifelong and education learning with higher investments in software and research and development. The dissemination of knowledge and technology is important and requires the "knowledge networks and national innovation systems" (Chartrand, 2006). According to Brinkley (2006), knowledge economy is, when firms bring technology and talent to create wealth. Also, According to Ahmed and Alfaki (2013), a knowledge-based economy is wider than the new economy or high technology. The foundation of a knowledge-based economy is to create, disseminate

and use knowledge, and knowledge assets are given more importance than labor and capital assets. Social and economic activities reach to a very high level through the use of quality of knowledge.

The economic growth and competitiveness are added to the earlier definitions of knowledge-based economy (Huggins et al., 2014), which is the value addition to the science and technology, and also to the social, economic, and educational progress. In this context, (Skrodzka, 2016), suggested that the knowledge-based economy promotes innovation and entrepreneurship. Similarly, (Khanmirzaee et al., 2018), noted that science and technology parks play a major role in the development of technology and are able to boost the economic growth of countries. (Al-Gasaymeh et al., 2015, 2020; Assad & Alshurideh, 2020a; López-Cabarcos et al., 2020), study based on knowledge-based theory, organizational learning theory and dynamics theory, investigates how knowledge transforms into profitability, and their results show the importance of both tacit and explicit knowledge for achieving sustainable competitive advantages. According to LaFayette et al., 2019a, 2019b; Shah et al., 2021, 2020; Assad & Alshurideh, 2020b; Al-Jarrah et al., 2012), the world economy is passing through a major transformation from an industrial economy to a knowledge economy, rendering knowledge as a primary factor in the production.

This study presents the perspective of knowledge-based economy, predictive and prescriptive analytics, theory of sense data, and nomothetic explanations for Smart Dubai as a case study. The Smart Dubai case study was examined on three perspectives such as knowledge-based economy, the use of the analytical tools, and Dubai pulse initiative, and an insight was developed to examine the transformation of the UAE's economy to knowledge-based economy. Secondary sources data were collected from World Bank Report, Global Innovation Index Report, ICT-Global Competitiveness Index Report and websites of government of the UAE.

According to Snowdon (2015), 'Sense-data' is a modern term for a long-standing idea, earlier articulated in the language of 'ideas' and 'impressions'. "On the dominant use of 'sense-data' it stands for an entity present in perceptual (and other) experiences which fundamentally has a mental nature and possesses certain qualitative properties which the subject apprehends" (Snowdon 2015). Those authors who involved in the project use sense data to foresee challenges associated with the Smart Dubai project to make nomothetic explanations and to provide necessary recommendations.

Predictive analytics tools are used to analyze the current data available at the organization's databases to come up with certain conclusions that will assist the management to make decisions based on knowledge rather than speculations and assumptions. According to Gartner official website, predictive analysis "is a form of advanced analytics which examines data or content to answer the question "What is going to happen?" or more precisely, "What is likely to happen?", and is characterized by techniques such as regression analysis, forecasting, multivariate statistics, pattern matching, predictive modeling, and forecasting." (Gartner Glossary, 2019a).

Prescriptive analytics tools help to anticipate what will happen with the reason and the timing of the events in order to reduce future risks and make better decisions. According to Gartner official website "Prescriptive Analytics is a form of

advanced analytics which examines data or content to answer the question "What should be done?" or "What can we do to make it happen?", and is characterized by techniques such as graph analysis, simulation, complex event processing, neural networks, recommendation engines, heuristics, and machine learning (Gartner Glossary, 2019b).

Prescriptive tools applied for two approaches, optimization model and rules model. The optimization model chooses the best alternative or decision to maximize/minimize objective function under constraints. Optimization model is done through an analytical code using a software with constraints to optimize the planning, scheduling, and assigning limited resources to minimize the cost. For example, deciding on the best route for oil-transporting vehicles from the depo to the petrol station, the model will be based on many constraints like vehicle size, petrol type, destination, distance, driver and the expected traffic. The second approach is the rules model. This model uses the inputs, judgment and business rules to assign the best action. For example, providing customers with certain treatments or offers (Gartner Research, 2015).

2 Rationale and Objectives

UAE desires to maintain a diversified economy in line with "The Abu Dhabi Economic Vision 2030" which was launched in 2009 (Ahmed & Alfaki, 2013). It is obvious that the UAE is moving towards knowledge-based economy (Aswad et al., 2011). Accordingly, the Government of the UAE aims to build a knowledge-based economy with sustainability that will include process, product, and distribution technologies to meet the needs for the UAE economy diversification while overcoming any challenges or conflicts and acquiring all opportunities available during a knowledge-based economy transformation (Mina, 2014). There is a need for the use of the analytics tools to ensure that a knowledge-based economy adds value to the economy of the UAE.

Considering the initiatives taken by the government of UAE to transform its traditional oil-based (resource-based) economy to a knowledge-based economy, the main objective of this research paper is to assess the achievements, emerging trends and expectations of knowledge-based economy. It is also an objective to review the Smart Dubai project as a case study to foresee challenges and make recommendations to accelerate the process of its knowledge-based economy.

3 Knowledge Economy in Brief

Literature has outlined key characteristics of knowledge economy with a common thread that knowledge plays an important role in it. According to Karlsson et al. (2009), the Knowledge Economy's main characteristics are continuous increase in

knowledge investments such as education and knowledge production, and widening application of Knowledge for development, production, distribution, and use of goods and services. White et al. (2013) proposed open innovation, education, knowledge management, and creativity as characteristics for the knowledge-based economy. Similarly, Tapscott (2014), puts forth that knowledge is the basic production factor, knowledge economy is a digital economy and visualization plays an important role in the knowledge economy as major characteristics of the knowledge economy.

The particular nature and high quality level of the knowledge-based economy provides new prospects for companies, countries and local communities to create a proper environment for a sustainable development (Sirbu et al., 2009).

Knowledge-based economy and sustainable development are targeted by many economies worldwide. "Knowledge-based economy can promote sustainable development through innovation sustained by economic growth" (Jednak & Kragulj, 2015).

Researchers accept that knowledge economy includes the advancement of knowledge creation, diffusion and the positive effects on economy; hence, there is a need to measure the knowledge economy at the global level. To measure the knowledge economy, the World Bank has Knowledge Management assessment methodology, which is based on 109 items, and is used in 146 countries for performance measurements based on 4 pillars (Debnath, 2002; The World Bank, 2012).

The four pillars are grouped into two indexes: Knowledge Index (KI), which includes Education Index, Innovation Index and ICT Index and Knowledge Economy Index (KEI), which comprises of Economic and Institutional Regime Index and Education Index. These two KI and KEI are based on a scale from 0 to 10, whereas the 10 is the highest level (Chen & Dahlman, 2005; Sundać & Fatur Krmpotić, 2011). According to Parcero and Ryan (Parcero & Ryan, 2017), the four pillars of a knowledge-based economy are (1) information and communication technology, (2) education, (3) innovation, and (4) economy and regime.

4 UAE Economy

After its independence in the year 1971, the economy of UAE was mainly driven by oil and global finance for over three decades. Early in the twenty-first century, UAE started initiatives to diversify its economy to reduce its dependence on oil. One of the national priorities of UAE is to become a competitive knowledge economy, driven by innovation (Khatib & Ahmed, 2019). In 2014, H.H. Sheikh Mohammed bin Rashid Al Maktoum, Vice President and Prime Minister of the UAE and the Ruler of Dubai, launched the 'National Agenda' to guide efforts towards the country's Vision 2021, which is aimed to position the UAE among the best countries in the world by the Golden Jubilee of the Union in 2021. The agenda specified a wide-range of work programs centered around 6 national priorities and 52 National Key Performance Indicators (NKPIs). The third national priority of UAE is "Competitive

Knowledge Economy driven by Innovation", and the government is putting all its efforts to achieve it under vision 2021.

The UAE is known as a 'trailblazer' in the Arab World, setting pace to economic development in the Arab region through innovations and excellence, which is the watch-word of the country in any economic domain (Aburayya et al., 2020a; Ahmed, 2021; Amponsah & Ahmed, 2017a, 2017b). In fact, the UAE seems to be a Renaissance Arab State, standing for the Arab World's resurgence (Ahmed, 2018). The incredible economic development of the UAE is greatly due to its eminent leaders at the helm of the affairs of the state and their exemplary leadership (Aburayya et al., 2020b; Alzoubi & Ahmed, 2019; Khatib et al., 2019; Taryam et al., 2020).

The Nations vision 2021, in the golden jubilee year, intends to take the economy far to the ranks of the developed countries and world-class in every respect. The UAE had a population of 9.63 million and commanded a GDP worth of US$ 414.18bn in year 2018 from its $2 billion in year 1971, and mobile phone subscription of 208 per 100 people with around 99% internet users (The World Bank, 2019). It seems a fairy tale-like transformation, attracting tourists and shoppers not only from the Arab region but also across the world.

The UAE's economy has a dynamic change in all the indicators from 1990 to 2018, except the agricultural sector which is less than 1% of GDP and the fertility rate has decreased drastically from 4.5 to 1.5 births per women, which is due to the women participating in the UAE work force and the UAE's government encouragement towards the Emiratization. GDP has increased to about 8 times from 1990 to 2018. At present, the UAE is the third largest economy in the MENA region, after Saudi Arabia and Iran (The World Bank, 2019).

5 UAE Knowledge Economy

If KEI rankings of Middle East and North Africa (MENA) countries are compared in 2012 with respect to their ranking in the year 2000, it can be observed that 10 countries of the region have risen upward, whereas KEI rankings of 13 countries fell back. On the knowledge economy index, UAE stood the second-best ranked country in the MENA region after Israel, which slipped down 8 ranks in the past 12 years. Its leading position reflected strong performance on the pillars of innovation, education and ICT. Apart from the UAE, Oman, Saudi Arabia, Azerbaijan, Algeria and Tunisia had good performance on the KEI, as Oman climbed 18 positions, Saudi Arabia 26 positions and Azerbaijan 15 position, Algeria 14 positions and Tunisia 9 positions as compared to 2000. Since World Bank stopped publishing KEI ranking from 2012, the authors considered Global Innovation Index (GII) report to gauge the progress of UAE on knowledge-based economy.

The GII ranks the innovation performance of nearly 130 economies around the world. Since 2011, Switzerland has ranked 1st in the GII ranking every year. UAE was ranked 47 in the year 2015 and has improved to 36 in the year 2019. In North America, U.S and Canada ranked No.1 & No.2, in Europe Switzerland, Sweden and

Licensed to (putm@utm.my)

Netherlands ranked 1, 2 and 3, whereas in Northern Africa and Western Asia, Israel, Cyprus and the UAE ranked 1, 2, and 3 respectively. The UAE achieved good success in knowledge utilization due to availability of technological infrastructure and moved up 6 points towards knowledge-based economy (Dutta et al., 2019), as it had one of the strategic goals to expand in the non-oil sector with diversification strategies for competing with emerging markets (Mehmood et al., 2019). Furthermore, it has also been observed in the report that the UAE produce lower level of output relative to their innovation inputs and comes under below expectations for level of developments under high income category.

It can be noted that, UAE needs to focus on improving its ranks on business environment, knowledge workers, knowledge creation and knowledge impact, which are key pillars of knowledge-based economy.

6 Case of Smart Dubai

Smart Dubai was first established in 2000 and was known as Dubai e-Government until 2013 when H.H Sheikh Mohammed Bin Rashid Al Maktoum changed its name to Smart Dubai government department. The vision of Smart Dubai is aligned with the vision of H.H Sheikh Mohammed bin Rashid Al Maktoum to make Dubai the happiest city on Earth and since then Smart Dubai has been pioneering smart city solutions and has been focusing on transforming and empowering Dubai through disruptive innovative initiatives, large scale projects by collaborating with the public and private sector, leading technological projects and many other initiatives (Smart Dubai, 2019d).

Smart Dubai has several initiatives that made a big impression regionally and even globally.

- Dubai Paperless initiative targeted towards the environmental sustainability aspect to preserve the environment by making Dubai a fully paperless government where governmental departments will no longer issue or ask for any papers or printed documents to be handed over across all operations (Smart Dubai, 2019c).
- Artificial Intelligence Ethical toolkit that includes the guidelines, self-assessment tool for developers, ethical considerations and common agreements. This initiative is targeted toward government entities, private sector, and individuals (Smart Dubai, 2019a).
- Dubai Blockchain Strategy project, which is a joint initiative between Smart Dubai and the Dubai Future Foundation that will lead the introduction of the blockchain technology in Dubai which is expected to "unlock 5.5 billion dirhams in savings annually in document processing alone" according to smart Dubai official website (Smart Dubai, 2019b).

Smart Dubai had a particular initiative called Dubai Pulse, which is a platform designed to provide all stakeholders, including government entities, private sector,

and entrepreneurs, access to one location of shared open data. This initiative includes core analytical services as well as big data services that can be used by various entities to enhance the living conditions and the economy in the UAE by promoting the vision of making Dubai the smartest and happiest city on earth.

The following insights are developed from the Smart Dubai Case Study;

1. Smart Dubai is supporting the knowledge-based economy through empowering the government entities with the technological tools and the reliable infrastructure of data sharing, storage, processing, and visualization. This enables the government entities to make better knowledge-based decisions in order to serve the society more efficiently and effectively.
2. Smart Dubai is focused on building collaboration between the public and the private sectors to achieve several targets like smart transportation, smart society, smart economy, smart governance, and smart environment.
3. Smart Dubai has released the data law in 2015 "Law No. (26) of 2015 on the Organization of Dubai Data Publication and Sharing" (Data, 2019), which makes Dubai the first city globally to release a Law to state guidelines for sharing data between government entities and the open data available for the public.
4. The Dubai Data initiative will benefit the city by "increasing efficiencies in spending, job creation and innovation investment enhancement through creating new products and services and raise the level of citizen engagement. These benefits promote government transparency and the ultimate happiness of Dubai residents and citizens" (Pulse, 2016).
5. The main challenge that Smart Dubai is facing with building a knowledge-based economy, is the culture as people relay on printed papers and the usual routine to perform tasks. Providing tools that can replace people jobs can make some people feel uncomfortable.
6. Smart Dubai vision is to make Dubai the happiest city worldwide, although it may seem simple but it is rather a large scope and challenging vision as stated by Hamarneh (2019).
7. The Artificial Intelligence (AI) initiative by Smart Dubai that is considered as a predictive analysis project, which is used by Smart Dubai. According to Hamarneh (2019), this tool can be used in so many ways like:
    a. An AI service that will match children to schools, so it will make it easier for parents to choose the right school for their children, and reduces the burden of this task on parents.
    b. Another AI application is at Dubai Customs where thousands of containers are arriving to the port every day. AI will help them to decide what to inspect and why and when by analyzing the volume, history and country the container came from.
8. The AI can be of a great use in reducing or automating the repetitive tasks, like validating customer papers or the inserting of forms information or detecting certain trends that will enable the government entities to perform better.

9. Smart Dubai does not apply the prescriptive analytics tools, although (Hamarneh, 2019) mentioned that applying these tools can be of a great benefit to the government and help them in making better decisions that will lower the cost, and enable them expect the demand through supply and demand mathematical modules.
10. Dubai pulse is an initiative provided to all stakeholders to make different analytical tools by the different data sets available for the use of the public that are regulated through Dubai data law. Many government entities are participating in this platform like Dubai Customs, Dubai Municipality, Dubai Silicon Oasis Authority, Department of Dubai Economic Development, Roads and Transport Authority (RTA), Dubai Health Authority and many other departments.
11. Dubai Pulse provides different data views like city flow, property land distribution, people flow, and property buildings distribution. These data views are available to provide stakeholders with insights through interactive displays to enhance the stakeholder's decision-making process and create business value. Therefore, building a better knowledge-based economy (Pulse, 2019).
12. Smart Dubai project is basically an Information Technology enabled Services (ITeS) to stakeholders and need to be examined on its sustainability. The project needs to be viewed on six indicators to measure e-environmental sustainability performance of ITeS organizations, based on consumption rather than cost as suggested by Yadav et al. (2017).

Therefore, it is obvious that Smart Dubai is a unique example of a high-level quality system that strives towards making Dubai the happiest city on earth. Smart Dubai has been adopting many projects that enhance the life of people and support the economy of the UAE (Aburayya et al., 2020c; Al Batayneh et al., 2021; Al Shebli et al., 2021; Taryam et al., 2020). One of the main projects that Smart Dubai has initiated is the Dubai pulse project which is a platform to gather different data and visualize it in data views. This project is considered as a descriptive tool of data analytics, which can later be used for predictive and prescriptive analytics to assist in the decision-making process of the various stakeholders. Another project is the Artificial Intelligence and machine-learning project, which is a form of the predictive analytics tools, this project aims to eliminate any repetitive tasks and optimize the resources in order to provide better services for the citizens. As the use of the analytical tools can aid in the decision-making process on different managerial levels, hence establishing better services for the citizens and building a knowledge-based economy. Smart Dubai has successfully established a collaborative data platform but still needs to establish projects that will have the different forms of the analytical tools like regression analysis, predictive modeling, pattern matching, data mining and machine learning.

6.1 Challenges

The implementation of the tools in the government can encounter many challenges concerning infrastructure as well as the issue of technological compatibility. Some of the key challenges related to the implementation of Smart Dubai project are;

- Successful implementation of the tools depends on purchasing and deploying software for analytics. It also requires the engagement of the right people and processes to leverage, implement, maintain, and govern the models and tools.
- Government data is scattered across many departments making the gathering process a challenging task for the smart government. Furthermore, it can also be challenging to decide on what is actually important from the massive amount of data.
- Government data can consist of unneeded and redundant data and, therefore, cleaning and reconstruction of data will be required.
- The data available can consist of different data formats or still manual paper information or even scanned documents with no stored fields making it hard to rely on for analytical tools.
- The models that are generated from the analytical tools must be embedded in the operations and in the decision-making process to utilize their benefits.
- Testing and validating the models, based on different scenarios, can be time consuming and strenuous.
- Changing the culture and mentality of the people also can be considered as a challenge. Shifting from the regular decision-making process to advanced analytics tools can be challenging and requires a lot of change management.
- A systems approach to management of innovations in supply chains has two categories (value chain and supply chain) and has six levels. These levels of innovations are interlinked with different actors in the supply chain and different functions of value chain. The role of each actor in the supply chain for respective levels of innovations needs to be identified, incubated and managed professionally to utilize the benefits for growth and success (Gupta, 2013).

6.2 Global Cases

The advanced analytics tools are still considered as a new technological advancement; however, many governments and companies have decided to add the use of the tools to their strategies. The following cases can be compared with the case of Smart Dubai.

- A successful implementation of the advanced data analytical tools at US Immigration and Customs Enforcement (ICE), to manage the overseas offices effectively. The ICE manages more than 60 field offices in 45 nations. Until 2014 the decisions of choosing the ICE international offices were made based on subjective evidence or periodical surveys. However, in 2015 they decided to use the data of

the workloads and the activities of the offices to decide on where to expand or where to shut offices without affecting the mission performance (Kelkar et al., 2016).

- Another case to benchmark with is the Virginia state case in building an integrated system for benefits eligibility of medical assistance. The offices that processed those applications were often understaffed and overloaded with work. However, in 2015, Virginia Department of Social Services (DSS) decided to take a different approach in addressing this problem. The information was gathered and analyzed by the use of the analytical tools to identify issues in processing the applications and, therefore, enabling the DSS to provide better social services to the citizens. (Kelkar et al., 2016).

7 Recommendations

Insights developed in the case study in the field of smart cities, may help and support other cities to become smart, discuss the conflict, challenges and opportunities of knowledge-based economy and add value to their economies. It also provides a clear view of smart cities transformation into a knowledge-based economy in addition to using predictive and prescriptive analytics tools that help other researchers in the future to improve and develop studies regarding smart cities and get a better understanding. The following recommendations are made to the Smart Dubai to consider in order to maintain the high-quality performance and accelerate the transformation process of a Knowledge-based economy:

- It is important to establish an information system and a collaborative platform of data for digital transformation of a smart city.
- Increase the utilization of technology in order to improve the economy.
- All stakeholders should be engaged in the transformation to smart city and the building of the platform for analytical tools.
- Create a roadmap to have a successful use of the analytical tools by monitoring, experimenting and implementation of these tools.
- Increase investments in education, technology and communication in order to achieve competitive advantages against other economies regionally and globally.
- Focus on training programs for employees to develop, improve and enhance their skills and experience.
- Train the government sector leaders on the new data analytics and how it can boost and sustain the economy.
- Identify the obstacles that are preventing the government from using the full potentials of the disruptive innovations.
- Establish a policy and a foundation of security, and accountability that protects privacy and promotes digital ethics.
- Identification of the most important data relevant to the decision-making process and the elimination of redundant and unneeded data.

8 Conclusion

Due to strong competition between cities and economies worldwide, Dubai's economy is perceived to be an exemplary example. His highness Sheikh Mohammed Bin Rashid Al Maktoum Vice President and Prime Minister of UAE, and Ruler of Dubai, envisioned economy of the UAE to be transformed from oil-dependent economy to a knowledge-based sustainable economy with the use of innovation and technology, and the creation of knowledge. Several initiatives in the UAE in general, and particularly in Dubai, made the economy of UAE stable and more flexible. The strategies of His Highness attracted some of the best and largest organizations, from different industries worldwide, to invest in Dubai in order to make it the best city in the world as well as the happiest city on earth by leveraging emerging technologies such as Blockchain, Artificial Intelligence, along with harnessing Data Science capabilities (Alshurideh et al., 2020, 2021; Alzoubi et al., 2021; Dubai, 2021; Ghazal et al., 2021; Joghee et al., 2021; Naqvi et al., 2021; Nuseir et al., 2021a, 2021b). Since the world bank stopped publishing reports on knowledge economy index, countries performance on KE parameters are now gauged from other international reports and indices. The UAE is ranked 36 globally, in the Global Innovation Index (GII) report in the year 2019, 2 ranks above from its position in the year 2018. UAE enjoys the first rank globally in the rate of mobile-broadband subscriptions, rate of the population covered by a mobile-cellular network, as well as the population covered by at least a 3G mobile network as per the Global Competitiveness Index, published by the International Telecommunication Union (ITU) in the year 2018. The UAE also ranked second in Mobile-cellular subscriptions, fourth in the rate of households with a computer, seventh in rate of households with Internet access at home, and eighth in internet users globally (TDRA, 2018). The UAE with such an excellent ICT infrastructure and, over 90 percent of expatriate population from all over the world as users and contributors to the economy, is an ideal setting that should to be utilized for accelerating knowledge-based economy with the use of predictive and prescriptive analytics tools and strong support from the government.

To accelerate the transformation process of knowledge-based economy, the UAE needs to improve its ranking on business environment, knowledge workers, knowledge creation and knowledge impact.

of managers via email. This study was conducted using structural equation modeling (SEM) to test hypotheses. The results show that interaction with external environment has the highest positive impact relationship on service quality. Upon study findings, the researcher recommends managers and decision makers to invest the human element continuously by involving them in the decision-making process to acquire administrative skills along with technical skills they already have.

Keywords Organizational learning capabilities · Service quality · Islamic banks · Jordan

1 Introduction

Organizations operating in the local and global fields of all sizes and activities face great challenges in a competitive world, and the rapid change of the client's wants (Al-Hawary & Al-Syasneh, 2020). Organizations tended to race to invest in information technology in order to enable and enhance the organization's ability to learn, in order to reach and satisfy customer expectations; the thing which is reflected in achieving the organization's goal and then survival and stability in a rapidly changing environment (Al-Hawary & Ismael, 2010; Al-Hawary & AlDafiri, 2017; Al-Hawary et al., 2018; Al-Hawary & Al-Hamwan, 2017). Learning is an effective tool to achieve strength and survival for organizations in light of the information revolution that the world is witnessing, and it is a basic requirement for the success of any organization nowadays (Al-Hawary, 2015; Al-Hawary & Aldaihani, 2016). Lukas (1996) shows the importance of organizational learning by saying that "Organizational learning is the key to future organizational success". Therefore, organizations need to increase the pace of organizational learning to be able to keep pace with the massive changes in the contemporary business environment, and to achieve this, it needs more modern ideas and concepts (Al-Hawary & Al-Namlan, 2018; Al-Hawary & Alwan, 2016; Al-Hawary & Nusair, 2017). It also needs to innovate products and modern techniques in training the human resource and encourage innovation and creativity during work, and organizations are now dealing with human resources as mental and intellectual energy, a source of information and knowledge, and innovation and creativity (Alshurideh et al., 2019a, 2019b; Al-Hawary et al., 2020; Al-Hawary & Al-Rasheedy, 2021; AlHamad et al., 2022; Alshurideh et al., 2022; Shamout et al., 2022).

With the continued fierce competition in the market, the quality of service has become an essential factor in maintaining competitive advantage (Alzoubi et al., 2020; Alshurideh, 2022; Hasan et al., 2022) in addition, it is an urgent and necessary need to establish and maintain customer satisfaction. And according to Mansour the quality of service is an essential approach to total quality management. Service quality has become the focus of many organizations due to the increased intensity of competition, especially between service organizations, and because the purchase

R. I. Mohammad
Ministry of Education, Amman, Jordan

decision has become more complex (Aburayya et al., 2020a; Alshamsi et al., 2020; Alshurideh et al., 2019a, 2019b; Zu'bi et al., 2012). Despite the importance of service quality, there is a difficulty in evaluating service quality compared to goods (Parasurainan et al., 1985) because it varies with different people and times, in addition to the fact that the service is intangible. Therefore, this study came to test the impact of job satisfaction between organizational learning capabilities and service quality in telecommunications companies in Jordan.

The issue of service quality is one of the topics that preoccupied researchers in accessing practical and conceptual models through which organizations can reach an actual reality of quality commensurate with market requirements, as there are many models for measuring quality that differ according to the environment and activity (Metabis & Al-Hawary, 2013; Alshurideh et al., 2017; Alolayyan et al., 2018; Al-Nady et al., 2016; Al-Hawary & Metabis, 2012; Al-Hawary & Hussien, 2017; Al-Hawary & Harahsheh, 2014; Al-Hawary & Abu-Laimon, 2013; Al-Hawary, 2013a, 2013b). Moreover, the increasing in intensity of competition is a result of globalization and the rapid development of information technology, and the huge diversity in the number and methods of providing the service, the thing that reflected in the organizations' abilities to strive towards continuous improvement in the quality of their services, to reach a high level of the quality of their services, which is reflected in their abilities to improve the level of their customer satisfaction, in order to maintain their customers and increase their market share (Abbad & Al-Hawary, 2011; Abu Qaaud et al., 2011; Al-Hawajreh et al., 2011; Al-Hawary et al., 2012; Al-Hawary, 2012; Al-Hawary, 2013a, 2013b; Al-Dmour et al., 2021; Alzoubi et al., 2022).

2 Theoretical Framework and Hypotheses Development

2.1 Organizational Learning Capabilities

Learning carries multiple factors of human activities, these factors prompted researchers to discover what is called organizational learning in contemporary organizations. Like any system, learning is a vital process that helps the growth and development of the organization and increases its organizational abilities; accordingly, learning refers to the organized transformation in the behavior of organizational groups from old procedures to others with competitive priority.

Researchers and practitioners have been paying close attention to the topic of organizational learning since the end of the 1970s, this revealed to the research the organizations' interest in new competitive methods that help them to survive in the markets and adapt to environmental changes in order to perform their work related to information technology and modern knowledge. Communication in the learning process is the main source of sustainable competitive advantage in light of the changing environment conditions (Al Kurdi et al., 2020; Alshurideh et al., 2020; Ashal et al., 2021). If the organization wants to raise its level of performance, and

accordingly, organizations will not be able to achieve that goal except through human staff capable of learning and willing to learn, only then will they be able to succeed and adapt to the renewable environment variables.

How can the organization today achieve competitive advantage? In light of the great competitive challenges faced by organizations, the answer is the organization's ability to learn enables it to achieve competitive advantage, therefore learning is an effective tool that gives strength and survival to organizations, it also is one of the basic requirements for the success of any organization these days, Lukas (1996) says that organizational learning is, according to many researchers, the key of organizational success for the future, emphasizing the importance of organizational learning.

Organizational learning is one of the dynamic capabilities of the organization, through which human resources can absorb strategic knowledge in a way that enables them to improve their conditions and competitive position. Organizational learning capabilities represent the organization's ability to extract knowledge to implement strategic actions and then benefit from that knowledge when needed in order to adjust the organization's strategy. (Thite, 2004) confirms that organizational learning is a tactic aimed at learning dynamic capabilities, and (Garcia et al., 2006) confirms that implementing organizational learning processes provides the organization with a series of mechanisms that lead to many benefits such as outperforming organizational performance and increasing its competitiveness. (Berghman, 2006) said that organizational learning leads to an Increase in the dynamism of organizations and increase strategic innovation initiatives.

Learning capabilities have developed to become one of the most important managerial topics, The term organizational learning capabilities is influenced by a number of fields such as: organization theory, production management, strategic management, and management science (Beheshtifar et al., 2012). The learning capabilities encourage the organization and organizational process to learn effectively (Ahmed et al., 2011), it also increases organizational knowledge.

Researchers addressed the concept of organizational learning in different ways, and according to researchers and the models used, the concept of organizational learning differed among them, and by reviewing the management literature, the researcher did not find a unified definition of organizational learning capabilities, although many studies have dealt with this term, researchers didn't agree on a specific definition, Yueh defined organizational learning as: a process an organization undertakes to acquire and develop knowledge, this process has four basic components that are: getting knowledge from its sources, distributing information to those who deserve it, translating information into useful sentences, and finally storing it in the organizational memory. Tohidi and Mandegari (2012) referd to organizational learning capabilities as organizational and managerial characteristics that facilitate the process of organizational learning and allow the organization to learn, while Bahadori et al. defined organizational learning abilities as a set of tangible and intangible resources and tasks necessary to achieve competitive advantage, (Rashidi et al., 2010) considers organizational learning capabilities as an evidence that confirms the

organization's ability to create and integrate ideas in a distinctive way and the ability to communicate with organizational boundaries using creative management methods.

From the previous argument, a definition of organizational learning capabilities can be deduced which is a group of managerial and organizational components (tangible and non-tangible) that plays an important role in the organizational learning process and encourages the organization to learn greatly. Organizational learning capabilities play an important role in helping an organization learn, and therefore improve the organization's performance, and helps it to achieve a sustainable competitive advantage, plus a lot of reasons, Bess et al. (2011) pointed that organizational learning capabilities can be measured in seven dimensions represented by knowledge sharing, dialogue, participation in decision-making, managerial commitment, expertise and openness, knowledge transfer, and risk, as every one of indicated (Alegre & Chiva, 2008; Goh & Richards, 1997; Jerez-Gomez et al., 2005; Onağ et al., 2014).

The organizational learning capabilities are represented in eleven dimensions, which are: Openness and interaction with the external environment, experimentation, managerial commitment, participative decision making, empowerment and leadership commitment, clarity of purpose and vision, knowledge transfer and integration, work teams, dialogue, risk taking, and systems perspective. While Chiva and Alegre (2009) pointed out that organizational learning capabilities are represented by five dimensions, which are interaction with the external environment, experience, participation in decision-making, dialogue, and risk-taking. External environment, experience, participation in decision-making, dialogue, and risk-taking.

Experimentation: Many researchers have relied on experimentation as a dimension of organizational learning capabilities (Nevis et al., 1995), Alegre and Chiva defines it as "the extent to which suggestions and new ideas are presented and how to deal with them." Researchers assured that experimentation guarantees that the organization comes up with new ideas, clarifies how things work, helps to make changes in work procedures, and suggests innovative solutions to problems, based on the use of clear methods and procedures (Garvin, 1993). Mat and Razak (2011) sees that experimentation results in ideas flow and proposals that guarantee a change in the existing system, so that experimentation is a symptoms of the creative environment. Accordingly, management should encourage and support freedom to conduct experiments using new and innovative methods of work (Garvin, 1993; McGill & Lei, 1992).

Risk Taking: Taking risks is one of the organizational learning capabilities dimensions, as many researchers addressed (Onağ et al., 2014). Risk taking is the degree to which ambiguity, uncertainty, and error are tolerated (Chiva & Alegre, 2009). And Liles defined risk taking as futile probability outcome due to different procedures. The business organization is supposed to encourage risk taking and accept mistakes (Rafiq et al., 2011).

Interaction with the external environment: interaction with the external environment dimension represents one of the organizational learning capabilities dimension that many researchers have included in their studies (Bess et al. 2011; Onağ et al., 2014; Alameeri et al., 2020) and Chiva and Alegre (2009) defined interaction with

the external environment by the extent of which organization's interact with the environment and its adaptation to changes and the ability to influence the environment requirements." Environmental characteristics affect the learning process relationships therefore communication with the organizations external environment are important, especially with changing environments.

Dialogue: Researchers such as Bess et al. (2011) and Alegre and Chiva (2008) saw that dialogue as organizational learning capabilities dimension and a tool to provide communication and collective learning within the organization and between groups, dialogue has become an important process in business organizations as an aspect of understanding difficulties and possibilities of learning and change (Gear et al., 2003). Organization good communication network enhances learning as it provides an entrance to the appared knowledge, which in turn leads to new knowledge. Communication between management and workers allows for knowledge development and increase experience within the organization.

Participative decision making: Participation in decision-making is one of the organizational learning capacities as discussed by researchers (Alegre & Chiva, 2008). The process of giving employees the opportunity to participate in decision-making contribute to improve quality of the decision (Cotton et al., 1988). As it is considered as an incentive for employees, and involves achieving job satisfaction and employees organizational commitment (Daniels & Bailey, 2012).

2.2 Service Quality

Due to the competition intensity between service organizations and the fact that the purchase decision has become complicated, in addition to the increase of technological development that has helped organizations to provide electronic services with traditional service, organizations has increased its interests in service quality concept. Despite the service quality importance, there is a difficulty in evaluating it compared to goods (Parasurainan et al., 1985) because it varies according to people, time and place, in addition to the fact that the service is intangible (Al-Hawary & Al-Syasneh, 2020; Al-Hawary et al., 2017; Al-Hawary & Al-Menhaly, 2016; Al-Hawary et al., 2011)). There are many definitions of the concept of service quality; Where Gefan (2002) defined service quality as customer's subjective comparison to find the differences between the wanted service characteristics and the actual provided service. Parasuraman et al. define service quality as the comparison made by the customer between the current experience of receiving the service and the previous experiences of obtaining similar services. Also, Lehtinen and Lehtinen (1982) emphasized that service quality got three dimensions: physical quality, which focuses on the organization equipment and buildings, interactive quality, which result from organization employees and customers interaction that provide services, and organization quality, which is similar to organization image dimension that we referred to earlier. On the other hand, Parasurainan et al. (1985) detailed ten dimensions of service quality:

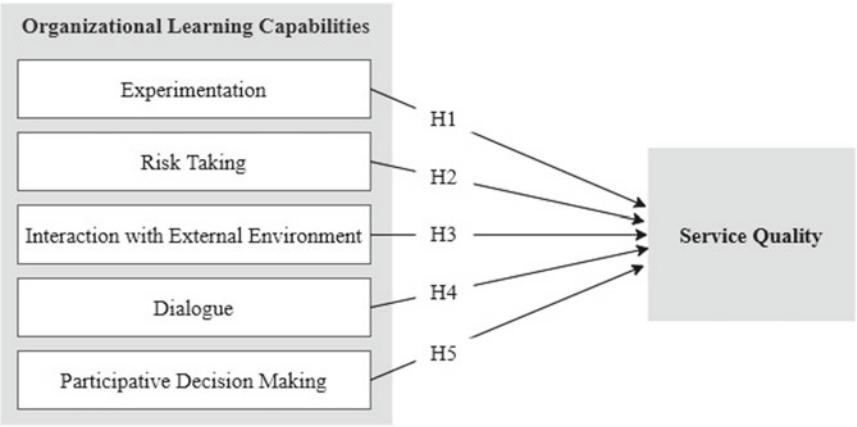

Fig. 1 Conceptual model

reliability, empathy, responsiveness, credibility, access, communication, courtesy, safety, tangibility, and the ability to understand the consumer.

Parasuraman et al. developed a 22-item tool to measure service quality, and when filtering service quality determinants, it now includes only five dimensions: tangible things, credibility, response, safety, and empathy, which is the individual care and attention that the organization shows towards its customers.

3 Research Model

See Fig. 1.

H1: There is a statistically significant impact of Organizational Learning Capabilities on Service Quality of Islamic banks operating in Jordan.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of Impact of organizational learning capabilities on service quality. Therefore, it focused on Islamic banks operating in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to

a purposive sample of managers via email. In total, (392) responses were received including (17) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (375) responses suitable to analysis requirements, where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (21) items to measure organizational learning capabilities based on (Alegre & Chiva, 2008; Bess et al., 2011). These questions were distributed into dimensions as follows: five items dedicated for measuring experimentation, four items used for measuring risk taking, four items for measuring interaction with external environment, four items for measuring dialogue, and five items dedicated for measuring participative decision making. Whereas the second section included eight items used to measure service quality according to what was pointed by Aburayya et al. (2020b), Al-Hawary and Al-Menhaly (2016), Al-Hawary and Al-Smeran (2017), Al-Hawary et al. (2011), Al-Khayyal et al. (2020).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.637–0.831), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6
1.EXP	**0.717**					
2.RTA	0.428	**0.739**				
3.IEE	0.406	0.331	**0.737**			
4.DIA	0.527	0.468	0.442	**0.759**		
5.PDM	0.397	0.528	0.439	0.578	**0.731**	
6.SEQ	0.681	0.609	0.655	0.661	0.624	**0.728**
VIF	1.894	2.667	1.530	2.472	3.015	–
Loadings range	0.682–0.761	0.671–0.791	0.642–0.803	0.724–0.792	0.637–0.822	0.644–0.831
AVE	0.514	0.547	0.542	0.576	0.535	0.530
MSV	0.483	0.328	0.439	0.451	0.397	0.499
Internal consistency	0.835	0.826	0.822	0.841	0.847	0.881
Composite reliability	0.840	0.828	0.825	0.845	0.851	0.900

Note EXP: experimentation, RTA: risk taking, IEE: interaction with external environment, DIA: dialogue, PDM: participative decision making, SEQ: service quality, Bold fonts express to square root of AVE

model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approachis based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown

in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in Figs. 1 and 2.

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.173, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.068, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that interaction with external environment has the highest positive impact relationship on service quality($\beta = 0.708$, $t = 29.10$, $p = 0.000$), followed by experimentation ($\beta = 0.672$, $t = 27.20$, $p = 0.000$), then dialogue($\beta = 0.614$, $t = 23.48$, $p = 0.003$),then participative decision making($\beta = 0.562$, $t = 20.81$, $p = 0.005$), and finally the lowest impact was for risk taking(β

Note EXP: experimentation, RTA: risk taking, IEE: interaction with external environment, DIA: dialogue, PDM: participative decision making, SEQ: service Quality, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

$= 0.493$, $t = 18.45$, $p = 0.02$). Thus, all the study hypotheses were supported based on these results.

6 Discussions and Recommendations

Study results showed that there is a significant impact of organizational learning capabilities (experimentation, risk taking, interaction with the external environment, dialogue, and participation in decision-making) on the service quality of Islamic banks operating in Jordan. this result is rational, as skills, knowledge and human resources optimal availability and the existence of learning work environment enables company to create and integrate ideas effectively and communicate with various organizational boundaries to improve knowledge sharing through communication and interaction and create an appropriate environment through which human efforts gather in order to create creative ways contribute in improving service quality level. This result agree with Darwaza et al. who concluded that there is an impact of organizational learning on the elements of quality culture, this also agree with Ajilat, who assured the impact of learning orientation on technical creativity, as well as the study of Mat and Razak (2011), which found a relationship between organizational learning capabilities dimensions (participation in decision-making, Experimentation, interaction with the external environment and risk) on the technological product innovation successful implementation.

Upon study findings, the researcher recommends managers and decision makers to invest the human element continuously by involving them in the decision-making process to acquire administrative skills along with technical skills they already have. It's better for organizations to work on consolidating the relationship with the external environment to facilitate linking it with the internal environment and to provide a greater opportunity for workers to learn from competitors' experiences, and learn more about the latest developments in their sector technology. In addition meeting employees annually to open dialogue and discussion with them, listening to them, and arguing them to reach executive solutions that suit both parties

Impact of Knowledge Management on Administrative Innovation of Software Companies in Jordan

Riad Ahmad Mohammed Abazeed, Mohammad Fathi Almaaitah, Ayat Mohammad, Doa'a Ahmad Odeh Al-Husban, Ibrahim Rashed Soliaman AlTaweel, Sulieman Ibraheem Shelash Al-Hawary, Nida'a Al-Husban, Abdullah Ibrahim Mohammad, and Rana Ibrahim Mohammad

Abstract The major aim of the study was to examine the impact of knowledge management on administrative innovation. A qualitative method based on a questionnaire was used in this study for data collection and sample selection. Therefore, it focused on of Software Companies in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a

purposive sample of managers via email. Statistical program AMOSv24 was used to test the study hypotheses. The study results show that the highest impact on administrative innovation was for knowledge generation, followed by knowledge applying, then knowledge storing, and finally the lowest impact was for knowledge dissemination. Researchers recommend decision-makers to pay attention to the tacit knowledge and experiences of employees, and turn them into tangible ideas and methods that contribute to the development of work performance, and to refine the personalities of their employees by supporting their ideas and suggestions and activating their role in solving problems.

1 Introduction

There have become challenges facing organizations in general worldwide; Because of the developments and changes that occur rapidly, organizations must keep pace with these developments and work to find the best ways to ensure their survival, and their continuity to achieve goals such as increasing profits, which led to the organizations' interest in managing the knowledge represented by the tacit and explicit knowledge that individuals have to take advantage of that knowledge, and employ it to achieve administrative creativity (Al-Hawary, 2015; Al-Hawary & Al-Hamwan, 2017; Al Mehrez et al., 2020).

The current era is described as the era of knowledge, as knowledge is the real capital that outweighs in its importance and values other natural resources (Al-Maroof et al., 2021; Al Mehrez et al., 2020). This era is also characterized by intense interest in the human resource and his development and investment of his mental abilities, and considering it the basis for achieving any progress in the effectiveness of the organization, as well as interest in the integration of the knowledge sources, organizing and development (Al-Hawary & Al-Namlan, 2018; Al-Lozi et al., 2017; Al-Nady et al., 2013; Metabis & Al-Hawary, 2013). Knowledge has become the highest percentage in the composition of the gross national product of the economically, technically and cognitively advanced countries, and for the importance of knowledge in building and developing individuals, groups, organizations and countries (Al-Hawary et al., 2016). The managements have interested in building programs for the development and employment of knowledge to achieve continuous improvement in the main and supportive operations and activities of the organization. The management also pointed out the importance of distinguishing between the latent or self-knowledge of the individual and the external knowledge that comes to him from environmental sources, and the need to mix them, as one is indispensable to the other (Al-Hawary & Alwan, 2016).

R. I. Mohammad
Ministry of Education, Amman, Jordan

The need to pay attention to the human element and work to invest in it positively began, as human societies do not advance or develop, without the presence of creators and innovators in various fields who are considered basic pillars in the structure of the human society as they work to produce, and develop, they represent the hope of solving problems that hinder civilized and human progress (Alhalalmeh et al., 2020; Al-Hawajreh et al., 2011; Al-Hawary et al., 2012, 2020; Mohammad et al., 2020). Creativity in all fields has become an urgent and essential necessity, so that society, including individuals and institutions, is able to keep pace with the times, which is characterized by the nature of technical progress, knowledge explosion, the abundance of inventions and the multiplicity of cultures, each of them is trying to impose itself on the other in the era of globalization. Today, we live in a world characterized by complexity and problems that explode day after day, so that creativity and innovation are the solution that makes the individual and society able to keep pace with the requirements of this era (Ghannajeh et al., 2015; Al-Hawary & Aldaihani, 2016; Almaazmi et al., 2020).

Many researchers have revealed that humans invent, create and innovate, since the inception of creation until now. Most human civilizations, throughout the ages and time, have cared for their children and worked to develop them and increase mental abilities in all fields (Al-Hawary & Al-Rasheedy, 2021; Al-Lozi et al, 2017). Creativity is important in the modern era because it is the real bridge on which the theoretical ideas of peoples and individuals cross to the righteousness of practical creative works, in addition to that creativity is an effective and practical test for measuring excellence because it is easy to see and evaluate the works of creators accurately. (Al-Hawary & Alwan, 2016).

2 Theoretical Framework and Hypotheses Development

2.1 Knowledge Management

Knowledge is one of the most important resources of the most interest in business organizations, and the most important fact is that development and progress in advanced economic societies has become dependent on knowledge and intellectual capital (Al-Hawary & AL-Zeaud, 2010; Al-Hawary, 2009; Al-Hawary & Shdefat, 2016; Al-Hawary & Nusair, 2017), and the exploitation of intellectual assets as is the case in other assets and with the same degree of importance, but rather in some sectors that depend heavily Directly on the intellectual assets in the nature of its business. The abilities, experiences and skills of humans are not equal among them, there is a group of them that possess the mentioned components more than others (Allahow et al., 2018; AlHamad et al., 2022; Alshurideh et al., 2022).

Knowledge has become one of the critical driving forces for business success regardless of the nature of its work, whether commercial, industrial or service, organizations have become more knowledge-intensive, and the belief of most managers

to achieve their strategic goals has become the extent of their possession of knowledge (Aldaihani & Ali, 2018, 2019; Alshura et al., 2016), so they relied on minds more than hands and the need to benefit increases of the value of knowledge, and as a result knowledge has been treated systematically and considered as an important resource like capital and other tangible resources (Al-Hawary & Metabis, 2012).

Many organizations are exploring the field of knowledge management in order to improve their competitiveness, and sustainability, which increases company returns, employee satisfaction and loyalty, and improves the competitive position by focusing on intangible assets (Al-Hawary & Hadad, 2016; Al-Hawary & Ismael, 2010), which necessitates the need for a more systematic and in-depth study concerning the critical success factors for the implementation of knowledge management is critical, organizations must be aware of the factors that will affect the success of the knowledge management practice.

Knowledge is one of the old renewable terms, and interest in it has been since ancient times, and in the present time, organizations have come to view knowledge as an effective basis for achieving competitive advantage and creativity, as it has become the competitive tool for many organizations in various sectors, so knowledge is one of the most important factors that organizations need. To achieve success, and keep pace with the changes that the world is witnessing from a technological revolution as a result of the development in the field of technology and communications and its use in the field of obtaining knowledge and sending information (Al-Hawary & Aldaihani, 2016).

Knowledge is the key to outstanding competitiveness, better customer service, and faster access to markets, performance development, innovation and creativity (Allahow et al., 2018; Alshurideh, 2019; Alshurideh et al., 2020). This necessitated the need to organize and manage that process to take advantage of it to reach the goals and help these organizations in making the appropriate decision. Knowledge management has become one of the solutions used in organizations to face the risks and challenges that these organizations may be exposed to, and therefore the knowledge balance of those organizations must be invested (Al-Hawary & AL-Zeaud, 2010; Shannak et al., 2012; Al-Hawary & Nusair, 2017). The use of ICT is one of the important factors that helped and stimulated knowledge management. The challenge is no longer limited to finding information for the organization, but rather how to search for it through the information available in the organization to employ it and enhance its competitive position (Allahow et al., 2018). In the following, we will mention some of the definitions of knowledge management (see Table 1).

Through the previous definitions, knowledge management can be defined as a set of operations and activities by the management of the organization aimed at identifying and finding the required knowledge and following different administrative methods in order to help in investing it well to achieve a competitive advantage that is unique from other organizations and gives it an opportunity for survival, continuity and development. Knowledge is the set of processes and activities that begin with the dissemination of knowledge among individuals and groups in the organization to achieve the goals of raising the level of performance, making decisions, solving problems and survival. Researchers noted that knowledge management measures varied,

Wiig (2013)	A set of clear and well-defined approaches and processes aimed at discovering Knowledge, both positive and negative, of various types of operations, managing them, defining new products or strategies, enhancing human resource management, and achieving a number of other objectives
Laudon and Laudon (2007)	That process that provides knowledge to workers in various sectors by providing information and disseminating knowledge and information

Table 2 Knowledge management measures in previous studies

Author	Dimensions
Parisa (2015)	Knowledge production, knowledge sharing, knowledge development and continuous improvement
Bognar and Bansal	Knowledge generation, knowledge building, knowledge efficiency
William et al. (2008)	Knowledge generation, knowledge acquisition and sharing Knowledge, knowledge transfer
Nasiruzzaman and Dahlan (2013)	Explicit knowledge and tacit knowledge

due to the different methods and visions of researchers about knowledge management and its objectives. Table 2 is illustrated knowledge management measures as mentioned by researchers:

Knowledge acquisition: The process of obtaining knowledge is the first stage of learning at the individual and collective level in the organization and it is the cornerstone of this process (Marquardt, 1996). Knowledge is gained and obtained through internal and external sources. Examples of external sources are: marketing intelligence, industry and academic research, as well as from mergers and acquisitions and through the recruitment of new employees. As for the internal sources of knowledge, they are represented by dialogue sessions and communication between group members, in addition to the availability of basic data such as the financial and economic data of the company.

Knowledge Sharing: Sinkula emphasized that communication between the departments of the organization is necessary and is one of the most important dimensions of organizational learning (Sinkula, 1994; Argyris & Schön, 1996; Teo et al., 2006). Whereas, the communication between the departments will lead to the dissemination of knowledge among them, and makes the knowledge available throughout the organization. Workers share it, which leads to an increase in their experiences, and the transfer of tacit knowledge inside their minds to their colleagues. This was confirmed

by Herschel, who said that the process of transferring productive knowledge requires transforming it from tacit knowledge to explicit knowledge (Herschel, 2000). Heisig and Rorbeek (2000) indicated that there are several methods for distributing and disseminating knowledge such as internal information networks (intranets), training by old colleagues, experience teams, learning circles, and knowledge circles. These methods provide knowledge throughout the organization, which helps to increase effectiveness, access to new technology, and identify the factors in the organization's surrounding environment, and over time it becomes a culture in the organization (Teo et al., 2006).

Knowledge Implementation: At this stage, the greatest benefit is evident from all previous stages, as knowledge moves into application and benefit from what has been learned to reflect on the performance of the organization, and allow its employees to solve the problems they face through the knowledge that has been acquired, and thus becomes the knowledge acquired and spread in all parts of the organization have meaning and value. The use of knowledge spread in the organization in all its forms of documents, procedures and databases leads to an increase in the experience and capabilities of employees. This helps the organization to innovate, which will eventually lead to the continuation of the organization and increase its competitiveness.

Knowledge storage: The acquired knowledge is stored in repositories and knowledge stores within the organization, and the aim is to preserve the acquired knowledge so that all members of the organization can access and benefit from it, especially the knowledge that was used as a way to solve previous problems, to try to solve the current problems in the same way or avoid the failed attempts that were previously used to solve it. Knowledge can be stored in several ways, including organizational memory, which contains existing knowledge in its various forms, including written documents, and information stored in electronic databases. Human knowledge is stored in expert systems as well as tacit knowledge gained by individuals and business networks. Knowledge repositories constitute an essential technology in knowledge-based learning organizations, as they are keen to manage their knowledge content to meet the opportunities of future changes using the necessary supporting technology.

2.2 Administration Innovation

Today, the world is witnessing a lot of changes and developments in various fields of economic, social, cultural, political, technical, and information life, which prompted organizations, whether public or private, to seek to develop internal working methods, on a permanent and continuous basis, so that these organizations can keep pace with the tremendous knowledge developments that occur in today's world, and achieve this by investing the energies of innovators within them to the fullest extent, and benefiting from them so that these innovators can perform the roles entrusted to them to the fullest (Al Suwaidi et al., 2020; Al-Hawary & Aldaihani, 2016).

Administrative innovation is an important basic means for the growth and development of organizations, for their sustainability on the one hand, and in order to achieve the desired goals on the other hand, as an organization that does not innovate or develop is destined to decline and decay, but may be demise. Administrative innovation helps organizations adapt to various changes, and helps them to face challenges, whether political, economic, technical or informational, and thus achieve the goals of the organization that it seeks to achieve, and creativity leads to renewal and innovation, which makes the organization ahead of other competing organizations, it guarantees them access to advanced positions in the competition (Allahow et al., 2018; Alameeri et al., 2021; Alzoubi et al., 2022). Because of the importance that innovation achieves, it is necessary to provide the appropriate atmosphere for work in addition to allocating the necessary means for developing innovation by following stages and strategies that enable the organization to reach the highest levels of administrative creativity, which leads to an increase in the efficiency of the human element as the main factor for increasing productivity within organizations (Altamony et al., 2012; Alameeri et al., 2020; Al-Hawary & Al-Rasheedy, 2021).

Administrative innovation is divided into incremental innovation and radical innovation based on the size of the change it causes. Radical innovation the amount of change is large, in other words, "innovation can be embodied in a new technology that leads to changing the current structure of the market" (Claver et al., 1998; Alyammahi et al., 2020) and contains new products and services that did not exist previously. Incremental innovation includes gradual change, is not significant, such as developing the current incentive system and not completely abandoning it. There are clear differences between the two types. Incremental innovation is related to exploitative learning, which is the acquisition of new behavioral capabilities, but within the same current visions of the organization. On the other hand, radical innovation is related to exploratory learning, which occurs when the organization acquires new behavioral capabilities that lead to changing the current visions of the organization and forming new ones (March, 1991; AlShehhi et al., 2020; Agha et al., 2021; Batayneh et al., 2021; Kurdi et al., 2020; Nuseir et al., 2021).

It is not permissible to talk about administrative innovation without the availability of its basic elements and components, as the importance of the elements and components of innovation is to define and measure it at the level of the group, the individual and the organization. Accordingly, management scholars and researchers unanimously agreed on the existence of the following elements of innovation:

Originality: This is intended to be renewal or singling out with ideas. The innovator person has an original thinking, that is, he moves away from the ordinary or the common. He does not repeat the ideas of others. It also refers to the ability of the innovator to produce original ideas with few repetitions within the group to which he belongs and the criterion for judging the idea as original. It is not subject to circulated ideas and out of the ordinary (Al-Hawary & Al-Rasheedy, 2021).

Fluency: It is intended to produce the largest number of synonyms, ideas or uses when responding to a specific stimulus, and the speed in generating them, and it also means the ability to recall the largest possible number of ideas for a particular

situation within a relatively short period of time, and also means the multiplicity of ideas that can come with it. The innovator individual, characterized by its suitability to the requirements of the real environment (Al-Hawary & Alwan, 2016).

Flexibility: It means the diversity of ideas that the innovator individual brings, and his ability to change or transform his thinking or his point of view according to the requirements of the situation. The degree of ease with which the innovator changes a certain position or mental point of view, and it also means looking at things from several angles (Al-Hawary & Al-Rasheedy, 2021).

Dealing with risks: It means how brave the innovator individual is in exposing himself to failure or criticism, making a lot of guesses, working under ambiguous circumstances, and defending his own ideas. It also means taking the initiative to adopt new ideas and methods and studying for solutions and at the same time being the individual is capable of bearing the risks resulting from the work he undertakes, and he is ready to face the responsibilities.

Sensitivity to problems: the ability to sense problems and realize their nature and identify them and the innovator person notices that there is something wrong that others do not notice (Allahow et al., 2018).

2.3 Knowledge Management and Administrative Innovation

Knowledge is the key to outstanding competitiveness, better customer service, faster access to markets, performance development, innovation and creativity (Al-Hawary & Alwan, 2016; Alshurideh, 2022). The use of knowledge spread in the organization in all its forms of documents, procedures and databases leads to an increase in the experience and capabilities of employees, which helps the organization to innovate, which will eventually lead to the continuation of the organization and increase its competitiveness. Hajir notes that there is a significant positive impact of knowledge management infrastructure on innovation. The results strongly increase from previous studies, which reveal that the dimension of knowledge management infrastructure has the greatest impact on innovation. The results of the current study have several managerial implications for organizations. If mobile telecommunications companies in Jordan wish to enhance their innovation capabilities, they must work to maintain an effective knowledge management infrastructure that invests mainly in information technology. Ling also showed that the effectiveness of knowledge acquisition has a significant impact on managerial innovation. Accordingly, the study hypothesis can be formulated as follows:

There is a statistically significant effect of knowledge management on administrative innovation.

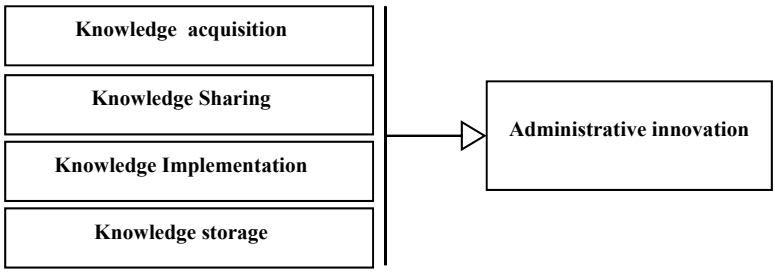

Fig. 1 Theoretical model

3 Research Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of knowledge management on administrative innovation. Therefore, it focused on of Software Companies in Jordan. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of managers via email. In total, (148) responses were received including (13) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (135) responses suitable to analysis requirements, where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure knowledge management based on (Al-Hawary & Aldaihani, 2016). These items were distributed into dimensions as follows: fiveitems

dedicated for measuring knowledge generation (KG1-KG5), fiveitems dedicated for measuring knowledge storing (KS1-KS5), five items dedicated for measuring knowledge dissemination (KD1-KD5), and five items dedicated for measuring knowledge applying (KA1-KA5). Whereas the second section included seven items developed to measure administrative innovation (AI1-AI7) according to what was pointed by Al-Hawary and Alwan (2016).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 3 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 3 shows that the standard loading values for the individual items were within the domain (0.657–0.857), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested

Table 3 Results of validity and reliability tests

Constructs	KG	KS	KD	KA	AI
KG	**0.791**				
KS	0.517	**0.760**			
KD	0.467	0.614	**0.773**		
KA	0.539	0.468	0.544	**0.769**	
AI	0.715	0.705	0.721	0.734	**0.760**
VIF	1.674	2.197	2.371	1.937	–
Loadings range	0.668–0.857	0.681–0.824	0.657–0.843	0.693–0.827	0.673–0.817
AVE	0.625	0.577	0.597	0.591	0.578
MSV	0.514	0.497	0.502	0.535	0.473
Internal consistency	0.890	0.869	0.876	0.873	0.901
Composite reliability	0.892	0.872	0.880	0.878	0.905

Note KG: knowledge generation, KS: knowledge storing, KD: knowledge dissemination, KA: knowledge applying, AI: administrative innovation, Bold fonts indicate to square root of AVE

the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approachis based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 3 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 3 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 2.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.468, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.038, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 4.

The results demonstrated in Table 4 show that the highest impact on administrative innovation was for knowledge generation ($\beta = 0.579, t = 24.21, p = 0.000$), followed by knowledge applying ($\beta = 0.521$, $t = 22.96$, $p = 0.000$), then knowledge storing ($\beta = 0.462$, $t = 19.88$, $p = 0.003$), and finally the lowest impact was for knowledge dissemination ($\beta = 0.388$, $t = 17.38$, $p = 0.008$). Thus, all the research hypotheses were supported based on these results.

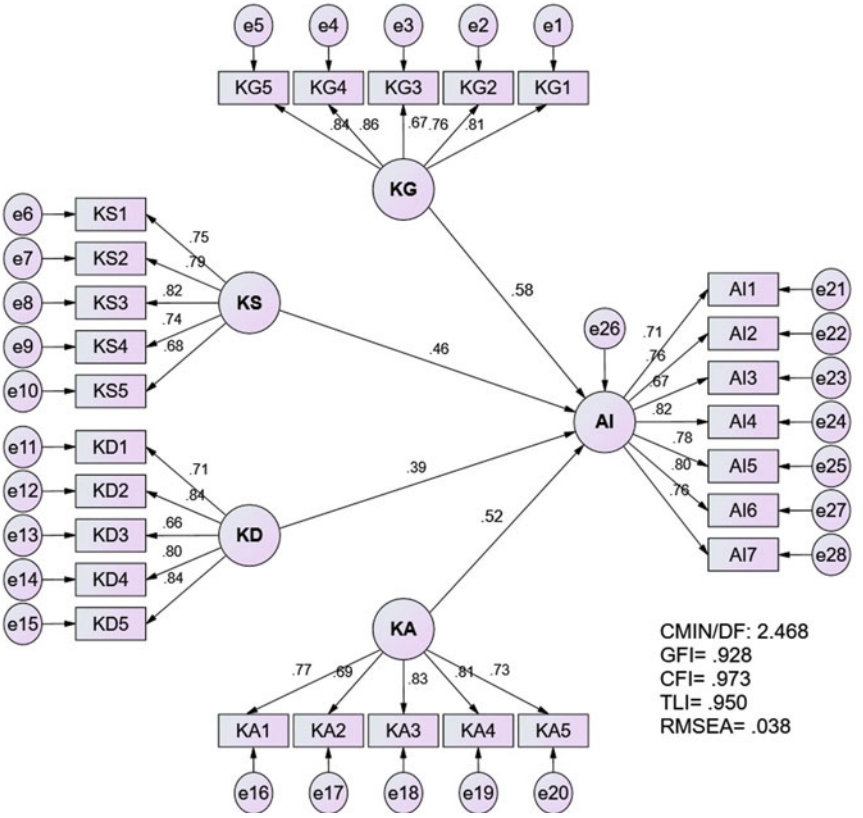

Fig. 2 SEM results of the knowledge management effect on administrative innovation

Table 4 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	KG → AI	0.579	24.21***	0.000
H2	KS → AI	0.462	19.88**	0.003
H3	KD → AI	0.388	17.38**	0.008
H4	KA → AI	0.521	22.96***	0.000

Note KG: knowledge generation, KS: knowledge storing, KD: knowledge dissemination, KA: knowledge applying, AI: administrative innovation, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

6 Conclusion

The study results showed that the study population adopts strategies that contribute to achieving the maximum benefit from all intellectual and information resources through the collection and sharing of ideas and information among all work-related

parties, including employees, administrators and various business partners, on the other hand, providing all the needs of technology and equipment that enable workers to increasing their stock of various information and knowledge that helps them to develop their skills and abilities to accomplish various work tasks and duties, and provides them with a flexible environment that enables them to unleash their creative ideas which contribute to inventing advanced ways and methods of work, and motivates them to participate in developing solutions to the problems that hinder the performance of work as required, and provides their employees with tools and equipment that help them to retain all information and data related to work, and enables them to refer to it when needed, and motivates them to share ideas and information, and provides them with modern communication channels to receive and send all work-related activities between them. It also gives workers complete freedom in how to perform their work, which enables them to take the approach and method as required by the current stage of work in accordance with its policies in performing work activities, which leads to their possession of capabilities and skills that enable them to analyze problems which affect work, and what are the appropriate solutions to them.

7 Discussion

The results of the study showed that there is an impact of knowledge management on administrative innovation, the researchers attribute this result to the importance of the role played by knowledge management by putting forward ideas and methods that enable employees to accomplish their work in innovative and modern ways which affect the work better, on the other hand, increasing the ability of management to discover all the talents and skills of employees. In addition, the workers possess the skills, expertise and experience related to work by creating information that enables them to devise advanced methods and methods to perform work activities and tasks, and provide a system of incentives for each individual who presents ideas and suggestions that will contribute to the development and prosperity of work, and their keenness to provide tools which enables them to keep all suggestions and constructive ideas that serve the objectives and policies of the work in an appropriate manner, and which enables all employees to easily and quickly refer to them when needed through the use of an advanced system of information systems and databases. Also, providing all the means and capabilities that help them implement their ideas and knowledge, and supervise them by specialists to ensure that they are applied in the correct and appropriate manner. On the other hand, workers are provided with the ability to study and analyze the implementation mechanisms, requirements and expected obstacles, enabling them to apply their knowledge without falling into problems or errors.

8 Recommendations

Researchers recommend decision-makers to pay attention to the tacit knowledge and experiences of employees and turn them into tangible ideas and methods that contribute to the development of work performance, and to refine the personalities of their employees by supporting their ideas and suggestions and activating their role in solving problems, which makes them able to be creative and innovative in accomplishing work tasks. In addition to keeping pace with technological developments by providing modern equipment that enables them to create ideas and information, preserve and distribute them in ways that enable employees to make optimal use of knowledge, and pay attention to supporting the positive qualities of workers and administrators represented in their feeling that they are rewarded for their work, and play a major role in solving problems and maintaining the survival of and business boom. And finally, attention to individuals with outstanding creative abilities, providing them with the appropriate atmosphere and conditions, and motivating them through an appropriate reward system.

https://doi.org/10.1007/978-3-031-12382-5_93

distributed to a purposive sample of senior managers via email. Structural equation modeling (SEM) was used to test hypotheses. The study results showed that the highest impact on competitive capabilities was for structural capital, followed by intellectual capital, and finally the lowest impact was for human capital. In light of the findings of the study, researchers recommend paying attention to intellectual capital by paying attention to scientific competencies and preserving them by all means, providing the appropriate atmosphere to support talents and providing opportunities for ideas that are put forward by workers and put into practice.

Keywords Intellectual · Capital · Competitive capabilities · Firm · ASE

1 Introduction

The importance of information escalated with the emergence of the technology and computer revolution, so that information and knowledge became a source and basis for information technology, and the importance of knowledge based in the minds of individuals, focusing on individuals' skills and abilities to innovate and creativity (Allahow et al., 2018; Mohammad, 2020; Al-Hawary & Obiadat, 2021; Al-Hawary & AlDafiri, 2017; Bebba et al., 2017), generated the concept of intellectual capital (Al-Hawary et al., 2020; Alshura et al., 2016; Metabis & Al-Hawary, 2013; Mohammad et al., 2020). And it enjoys great and growing interest from the managers and leaders in organizations that seek to develop and succeed in an era which has become characterized by speed, technological development and intense competition between business organizations (Al-Hawary & Al-Syasneh, 2020; Al-Lozi et al., 2018; Al-Nady et al., 2016). Thus, the organizations looked at the concept of intellectual capital after the physical capital was dominant and whoever owns it owns the organization. The one who owns the knowledge becomes the one who owns the organization, and the organizations are now more accommodating of knowledge and more using it in an attempt to achieve their goals, satisfy customers and distinguish between their competitors (Al-Hawary & Nusair, 2017; Al-Hawary & Shdefat, 2016).

It has become necessary for organizations to work on evaluating their intellectual capital, and to work on developing it and transforming it into gains and a competitive advantage that distinguishes it from others, he higher the value of human resources, the greater the value of the organization (Al-Lozi et al., 2017; Al-Hawary et al., 2011; Mohammad et al., 2020; Al-Hawary, 2015; Alhalalmeh et al., 2020; Al-Hawary, 2013). Human capital has become the real capital and is responsible for the process of renewal and innovation in the organization, and since the current era is characterized by openness, rapid development and globalization, business organizations, if they want to live in this environment, must possess the strength that enables them to grow, continue and survive, this strength is represented by intellectual capital (Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Alajmi, 2017; Al-Hawajreh et al., 2011; Al-Hawary & Al-Namlan, 2018; Al-Hawary et al., 2013a, 2013b). Therefore, the organization must realize the importance of intellectual capital and try to realize it

and work with it in order to achieve its goals and mission, and therefore it needs workers who have knowledge and are good and always strive to provide what is best, and seek to find an internal organizing to perform work flexibly and effectively, which must be built a distinguished intellectual capital that serves it in achieving its strategy and guarantees it continuity in the work performance of its work (Al- Quran et al., 2020; Al-Hawary & Al-Kumait, 2017; Al-Hawary et al., 2011). Contemporary organizations live in a highly competitive environment, an environment characterized by speed and technological change, and these organizations are trying to catch up with technology and competition between companies and try to gain an advantage over other organizations (Al-Hawary & Batayneh, 2015). Leaders, management and workers in these organizations are accused of neglecting the issue of intellectual capital and not delving into it and realizing its importance despite its role in making them strong competitive organizations in the era of speed and technological change, which is the force that enables them to achieve what they aspire to. This study seeks to identify the impact of intellectual capital on competitive capabilities.

2 Theoretical Framework and Hypotheses Development

2.1 Intellectual Capital

With the emergence of globalization and the increasing importance of information and knowledge, and in light of the challenges and economic changes, organizations' interest in intellectual capital increased, and these organizations realized that the human element is the most important type of investment and that all its physical assets are useless if there is no human element that has the capabilities, abilities, and the necessary advanced and renewable knowledge to manage these assets (Al-Hawary & Ismael, 2010; Al-Hawary & Metabis, 2012). Thus, the focus of organizations shifted to intangible assets and considered them a source of wealth. Intellectual capital became the indicator of the organization's possession of a competitive advantage, but its value depends on the extent of interest in it, its development and its effective management (Al-Hawary & Haddad, 2016; Al-Hawary & Al-Hamwan, 2017).

Ungerer (2004) stated that researchers, analysts, and managers became increasingly interested in intellectual capital in the 1980s when intangible assets often emerged as a major determinant of company profits. Since the concept of intellectual capital appeared and its importance increased, many definitions of it have been put forward (Al-Hawary & Hadad, 2016).

Fen et al. (2012) argues that intellectual capital is only evidence that an organization is operating effectively or not. Auer described it as: "The difference between the market and the book value of the company, and there is no doubt that the intellectual capital represents the most important stock of knowledge on an organized basis, this value is usually not announced in the annual reports and does not appear in the analysis of traditional models." Bounfour and Edvinsson (2005) see it as a process of

integrating human capital with strategic structural capital to obtain additional results for the future performance of employees. Rehman et al. (2011) see that human capital is the skill and experience of employees that increase with training and the higher the efficiency of the employees, the higher the efficiency of the organization. Leaniz and Bpsque (2013: 266) defined it as "knowledge that can be turned into profits in the future comprising resources such as ideas, inventions, technologies, designs, processes, and information programmes".

The subject of measurement is one of the most important topics that take into account when mentioning intellectual capital. Its importance stems from the importance of the subject it measures. Villanueva states that valuation of intangible assets is an important process for evaluating the quality of performance. Abdel Moneim believes that modern methods of measuring intellectual capital depend on the present and the future in measuring the value of the company and focus on quality, while traditional accounting methods focus on the past in the measurement process and on the results of previous transactions. There is a great difference between researchers about the ways in which intellectual capital is measured, and the reason for this difference is due to the intangible nature of intellectual capital and therefore difficult to measure and identify.

Stewart Model is the most common model in measuring intellectual capital. Stewart (1997) classifies intellectual capital into human capital which represents the knowledge, experience and skills possessed by workers, the ability to be creative and everything that distinguishes workers in the organization from others. Structural capital represents systems, procedures, culture, patents, copyrights, and anything that remains in the organization when employees leave. And relational capital represents the rate of loyalty and relationships with allies and suppliers.

Human capital: Human capital is the most important component of intellectual capital. Whatever the organization possesses of material assets, it still needs human minds to manage these assets, benefit from and maximize them (Alkalha et al., 2012; AlHamad et al., 2022; Alshurideh et al., 2022). Hence the importance of human capital stems from the knowledge that workers possess of skills, experiences, and the ability to innovate and deal with problems, looking to the future and predicting it, the value of this knowledge increases with development and training (Al Kurdi et al., 2021; Shamout et al., 2022a, 2022b). Banany believes that it is one of the most important production tools that contribute to raising the level of quality of services provided to customers and thus lead to a competitive advantage in the market, which increases the value of the company. As for Joia (2007), he saw it as abilities, skills, knowledge, and ability to solve problems, ability to be creative, work with the group, ability to learn, influence others, and ability to adapt to changing circumstances.

Structural capital: Everything that remains in the organization after the employees leave it and forms the infrastructure of the organization such as policies, procedures, databases, equipment, buildings, trademarks and copyrights (Alshurideh et al., 2015; Alameeri et al., 2020; Al Kurdi et al., 2020a, 2020b). Despite the importance of the human element, physical assets are also important for organizations (Alsuwaidi et al., 2020; Al Shebli et al., 2021). When minds create, they work to develop and benefit

from these assets and add values to them (Aburayya et al., 2020; Alshurideh, 2022; Taryam et al., 2020). Luthy (1998) also mentions that infrastructure that supports and enables human capital to function, is owned by the organization and remains in the organization when employees leave and includes hardware, software, buildings, processes, patents and trademarks. Roos and Mcdonald (2003) defines it as "consisting of administrative processes, information systems, organizational structure, intellectual property, and any intangible assets owned by a company that do not appear on balance sheet."

Relational capital: The organization is always interested in its external relations, whether it is with customers, partners or suppliers, and from here the importance of relational capital has grown as an important part of intellectual capital (Lee et al., 2022a, 2022b; Shamout et al., 2022a, 2022b). It is the value that results from the level of customer satisfaction, allies, suppliers and all external parties that the organization deals with Alshurideh et al. (2012), Al-Dmour et al. (2021), Alzoubi et al. (2022). Luthy (1998) defined relational capital as the extent of loyalty to customer relationships. As for Mazlan (2005), he worked on identifying the components of relationship capital and defined it as "all the relationships that link the organization with its stakeholders such as suppliers, government agencies, investors and customers, distribution channels, and strategic alliances that the organization establishes."

2.2 Competitive Capabilities

In recent years, the topic of competitive capabilities has received great attention from researchers as a result of rapid developments, economic changes and the emergence of technology, which intensified competition between companies and increased organizations' interest in competitive capabilities (Al-Tarawneh et al., 2012; Al-Hawary et al., 2013a, 2013b; Al-Hawary, 2011a, 2011b; Al-Nady et al., 2013; Al-Hawary & Aldaihani, 2016). For great opportunities that make it compete and rise in the labor market over its competitors, and then it must maintain these capabilities and develop them continuously through creativity, innovation and continuous renewal (Alameeri et al., 2021; Almaazmi et al., 2020; Nuseir et al., 2021). Covin et al. (2010) see that competitive capabilities may be considered as a specific feature or set of advantages that an organization possesses and distinguishes it from other organizations and that the basic work of any organization does not depend only on the process of producing and providing products, but in the ability to continue production and satisfy the continuous, changing and different needs of the market as well. Stevenson (2007) considered competitiveness as the firm's ability to discover and use new methods of production and to develop new products as well.

2.3 Intellectual Capital and Competitive Capabilities

Intellectual capital is one of the most important recent topics that have begun to focus and pay attention to it because of its great importance in increasing the competitive capabilities of organizations (Altamony et al., 2012; Obeidat et al., 2021). Al-Hawajrah (2010) defined intellectual capital as "a group of intangible assets that enable the organization to perform its functions according to a competitive advantage." Both Al-Rousan and Al-Ajlouni (2010: 44) believe that intellectual capital is the most important source of wealth for the organization, as it constitutes a competitive advantage that distinguishes it from other organizations in an environment in which competition has become based on knowledge and skills. Al-Hamdani and Ali (2010) see that intellectual capital as "the value extracted from transforming the tacit knowledge, information, experiences and skills that employees have into tangible forms that can be traded (copyright) and that enable the organization to build a mental stature and distinct relationships with beneficiaries with the aim of competitive advantage." From the point of view of Sharabati et al. (2013) they are organized intangible assets and knowledge of value or those that are used to create value. Guthrie (2001) sees that all the individual capabilities that characterize a specific number of employees in the organization enable them to contribute to increasing the productivity of the organization and raise the level of performance compared to its competitors. The importance of intellectual capital lies in the fact that it enables the organization to possess competitive capabilities that enable it to face competitors. It helps the organization to innovate, achieve what is always better and keep pace with continuous changes in an era characterized by change and rapid development. Based on the above, the hypothesis of the study can be formulated as follows:

There is a statistically significant effect of intellectual capital on competitive capabilities.

3 Study Model

See Fig. 1.

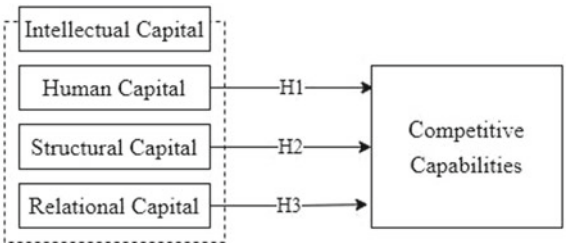

Fig. 1 Research model

Licensed to (putm@utm.my)

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of intellectual capital on competitive capabilities. Therefore, it focused on industrial firms listed in ASE. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of senior managers via email. In total, (167) responses were received including (21) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (146) responses suitable to analysis requirements, where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (14) items to measure intellectual capital based on Stewart (1997). These items were distributed into dimensions as follows: (HC1-HC5) items dedicated for measuring human capital, (SC1-SC4) items dedicated for measuring structural capital, and (IC1-IC5) items dedicated for measuring intellectual capital. Whereas the second section included seven items (CC1-CC7) developed to measure competitive capabilities according to what was pointed by Al-Hawary and Hadad (2016).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor

Table 1 Results of validity and reliability tests

Constructs	HC	SC	IC	CC
HC	**0.769**			
SC	0.625	**0.752**		
IC	0.538	0.498	**0.749**	
CC	0.712	0.703	0.724	**0.787**
VIF	2.418	1.946	2.044	–
Loadings range	0.674–0.835	0.653–0.844	0.698–0.801	0.642–0.883
AVE	0.591	0.566	0.561	0.620
MSV	0.502	0.518	0.497	0.537
Internal consistency	0.875	0.834	0.862	0.916
Composite reliability	0.878	0.838	0.864	0.919

Note HC: human capital, SC: structural capital, IC: intellectual capital, CC: competitive capabilities, Bold fonts indicates to square root of AVE

analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.642–0.883), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.443, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.033, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that the highest impact on competitive capabilitieswas for structural capital ($\beta = 0.543$, $t = 22.96$, $p = 0.000$), followed by intellectual capital ($\beta = 0.477$, $t = 19.65$, $p = 0.002$), and finally the lowest impact was for human capital ($\beta = 0.396$, $t = 18.12$, $p = 0.006$). Thus, all the minor hypotheses of the study were supported based on these results.

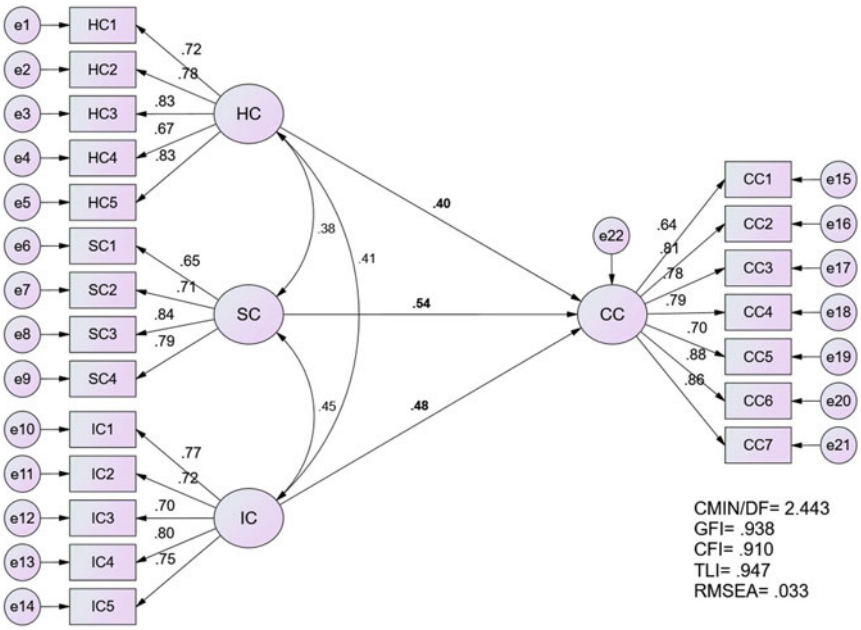

Fig. 2 SEM results of the intellectual capital effect on competitive capabilities

Table 2 Hypothesis testing

Hypothesis	Relation	Standard Beta	*t* value	*p* value
H1	HC → CC	0.396	18.12**	0.006
H2	SC → CC	0.543	22.96***	0.000
H3	IC → CC	0.477	19.65**	0.002

Note HC: human capital, SC: structural capital, IC: intellectual capital, CC: competitive capabilities
* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

6 Conclusion

The results of the study indicate the management interest in structural capital through paying attention to developing its managerial processes, paying attention to its organizational structure and its continuous maintenance of infrastructure, which provides a suitable environment for employees to perform work in the best way, which is reflected in the overall performance of the organization. It also indicates that the management pays great attention to its managerial operations and works to develop them, and information systems and databases which are characterized by their integration and development. The management interest in maintaining its infrastructure was appropriate, which means that employees are not sufficiently satisfied with the infrastructure provided by the organization, despite the importance of providing a good infrastructure and maintaining it on an ongoing basis, and thus providing the appropriate environment for work, which encourages workers to perform their work effectively. The organizational structure is appropriate, and this Reflects on the nature, flow and flow of information, which affects the level of performance. The interest came in setting specific standards of performance and comparing the actual performance of employees with these standards, which confirms the poor awareness of the importance of this point and its impact on the level of progress and the level of performance as a whole. The management also has clear and explicit systems that enable it to respond to rapid changes, and the management cooperate with external parties as well to benefit from its expertise when such expertise is needed. Also, the ability to provide part of the budget for scientific research and the ability to reduce costs led to its high competitive capabilities.

7 Discussion

The study reached the acceptance of the main hypothesis that indicates the existence of an impact of the components of intellectual capital on competitive capabilities. This is due to the administration's focus on embodying the dimensions of human capital and its realization that knowledge makes the difference between competitors, and its members have the ability to be creative at work and solve problems effectively, which supports meet human capital requirements, the company's policy

has also contributed to encouraging employees to acquire skills through rotation and development programmes, and thus employees have a great deal of skills and experience, and this is reflected in their competitive capabilities. It was found that there is an impact of structural capital on competitive capabilities, due to the interest in the field of information systems and databases that provide the necessary information at the right time, which supports the decision-making process. It also seeks to adopt policies, procedures, and methods that facilitate the implementation of operations efficiently and effectively and works to continuously review and evaluate its managerial operations to increase the effectiveness of the company. It adopts a flexible organizational structure that improves the performance of operations and individuals and enhances its competitive capabilities. It was also found that there is an impact of relational capital on competitive capabilities, due to the company's interest in its external relations, establishing relations with other organizations, and exchanging information and knowledge with them, which is beneficial and raises its competitive capabilities.

8 Recommendations

In light of the findings of the study, researchers recommend paying attention to intellectual capital by paying attention to scientific competencies and preserving them by all means, providing the appropriate atmosphere to support talents and providing opportunities for ideas that are put forward by workers and put into practice. In addition to the interest in structural capital, it is considered the supporting infrastructure for the organization through the provision of all modern technologies, the continuous development of information systems and databases, and the continuous maintenance of the infrastructure. If the organization has a flexible and strong organizational structure, this enhances its performance to obtain good outputs. Constant keenness to support human capital through the establishment of training and development programs, encouragement of teamwork and the exchange of knowledge, and the appointment must be according to the efficiency standard to reach the desired goals. And strengthening the relational capital, by paying attention to cultural activities, and providing the opportunity to establish human relations between the organization's family, establishing development and communication centers between the organization and the local community, consolidating the relationship between the organization and other organizations working in the same field, exchanging experiences among them, and training workers on technology and means different contact.

developed a questionnaire consisting of (35) items. The study population consisted of all (directors of departments, deans of colleges, department heads, administrative staff, and faculty members), where the study followed the simple random method. The results showed a statistically significant effect of knowledge management on total quality management. The study recommended the necessity for universities to organize meetings to exchange knowledge, opinions, experiences and ideas, address problems facing them at work, and promote a culture of openness, sharing, teamwork and dialogue, in a manner that ensures benefit and learning from each other to improve and implement quality programs.

Keywords Knowledge management · Total quality management · Private universities · Jordan

1 Introduction

At the end of the twentieth century, the world witnessed a great momentum in knowledge that led to rapid progress in science and technology, and it was called the fortune of information and communication technology (Alhalalmeh et al., 2020; Allahow et al., 2018; AlTaweel & Al-Hawary, 2021; Al-Nady et al., 2013). After that, knowledge became a necessity rather a strategy because of its impact on human life (Al Mehrez et al., 2020; Shannak et al., 2012). Because of the growing interest in knowledge management and the speed of its application in universities, as it is the most productive for knowledge and the challenges it faces and motivation to reach the competitive advantage (Al-Hawary & Alwan, 2016; Al-Hawary & Al-Hamwan, 2017). Universities tended to follow Total quality management, which is considered as a mechanism to improve organization and individual performance and enhance competitive advantage (Al-Hawary, 2015). It also enhances customer and employee satisfaction, and most importantly, its constant focus on continuous improvement (Abbas, 2019; Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Batayneh, 2010).

The need for knowledge management has recently emerged as a way to address the problem of knowledge and information explosion to use it in solving problems. The ability of organizations, including Jordanian private universities in the northern region, faces a real challenge in gaining and maintaining a competitive advantage, which requires continuous improvement in all its operations and services, aiming to achieve the maximum satisfaction of the requirements and needs of students and employees which forced universities to follow the Total Quality Management along with knowledge management, which will help it achieve a high level of services. Many studies, including Berrish (2016) and Kahreh et al. (2014), have indicated in their recommendations that there is a strong correlation between knowledge management and total quality management and the impact of this integration on improving the performance of services provided in universities.

Looking at the previous theoretical literature, the researcher found many studies that recommend more studies that examine the issue of knowledge management and total quality, especially in the university sector. Thus, this study contributes to enrich the managerial literature with more studies; the results of the study may help universities to identify what is applied in terms of knowledge management, total quality, and what needs to be applied, as well as to benefit from the results in order to provide them with the best services (Al Kurdi et al., 2020a, 2020b; Al-Maroof et al., 2021; Alshurideh et al., 2021). Hence, this study came to focus on knowledge management and total quality management as one of the modern intellectual advances and modern perspectives as it helps the institutions, they follow to create the required development and improvement, as well as raise the effectiveness and efficiency of their various activities (Aljumah et al., 2021; AlMehrzi et al., 2020; Altamony et al., 2012). In order to answer the study's question, what is the impact of knowledge management on total quality management in Jordanian private universities?

2 Theoretical Framework and Making Hypothesis

2.1 Knowledge Management

Contemporary institutions, such as higher education institutions, witness a flow of rapid developments in the world today most importantly the information and technological revolution that relies on scientific knowledge and the best use of information which resulted from the great development in the Internet. Because of these developments, knowledge has become the strategic source in creating advantage and the most powerful and effective factor in the success or failure of the institution (Schwandt & Marqurdt, 2003).

Organizations have proactively engaged in knowledge management in the hope of improving performance through better management of what they know and possess (Miković et al., 2020). Knowledge management discusses a systematic and integrative procedure that helps organizations find, organize, distribute and transfer important evidence, knowledge, and experiences that are essential to actions such as problem solving, self-motivated education, strategic planning, and decision-making to achieve organizational goals (Danish et al., 2014; Lawson, 2013).

Al-Hawary (2015) defined knowledge management as the process of capturing, coordinating and preserving information and experiences of individuals and groups within an organization and providing it to others. Knowledge management has also been defined as a policy of giving the right knowledge to the right people at the right time to help people share that knowledge and put it into practice, in ways that attempt to expand the performance of the organization (Al-Hawary & Al-Namlan, 2018; Al-Hawary et al., 2020; Al-Lozi et al., 2017, 2018; Tayal et al., 2015).

Kor and Maden (2013) defined knowledge management as a process that allows the organization to create new knowledge and facilitate the use of existing knowledge

when needed. Moreover, Knowledge management was defined by Obeid and Rabay'a (2016) as the processes that help the organization to acquire, organize, generate and share knowledge, as well as transfer important relevant information to various managerial activities by the organization such as decision-making, problem solving, learning and strategic planning. It was also defined as a process that allows individuals within the organization to obtain the correct data and information at the right time and coordination (Bolisani & Bratianu, 2018).

Knowledge management includes a set of sub-processes that help the organization in acquiring, developing, organizing, applying, sharing and transforming the knowledge, information and experience into management activities that improve the decision-making process, strategic planning and competitive advantage. In addition, it aims to improve the efficiency and effectiveness of the productivity and performance of managers, achieve organizational goals and enhance the competitive position of the institution (Al-Qatawneh, 2019).

Knowledge management practices or processes help organizations to use internal knowledge and take advantage of external resources, which leads to create value and improve innovative performance (Ferraris et al., 2017). Briefly, we assume that knowledge management has its own life cycle and processes, and therefore we need to manage it according to the stages of this cycle (Mikovic, 2019).

Knowledge management processes or practices are originally defined as the application of a systematic approach to the activities of obtaining, structuring, and managing and sharing knowledge throughout the organization in order to achieve faster and better work (Alameeri et al., 2020; Nonaka & Takeuchi, 1995). Many previous studies have attempted to define and classify knowledge management practices, as (Alavi & Leidner, 2001) classified knowledge management processes into four dimensions, which are knowledge acquisition, knowledge storage, knowledge sharing and knowledge application. (Becerra-Fernandez and Sabherwal, 2014) indicated that knowledge management processes include four dimensions, which are knowledge discovery, knowledge acquisition, knowledge exchange and knowledge application. (Malkawi & Abu Rumman, 2016) used six dimensions to describe knowledge management practices, which are knowledge acquisition, knowledge innovation, knowledge storage, knowledge exchange, knowledge application, and finally knowledge protection. According to Ramadan et al. (2017) it includes five processes, which are knowledge acquisition, knowledge innovation, knowledge sharing, knowledge application, and knowledge documentation. In this study, four dimensions were used (knowledge acquisition, knowledge sharing, knowledge storage, and knowledge application).

Knowledge Sharing: The process of knowledge sharing refers to the stage of transformation or productivity that ensures the dissemination and record of knowledge (Akour et al., 2021; Wong & Aspinwall, 2005)**.** Knowledge sharing also refers to the process through which individuals, experiences, and information are shared together; thus, this increases the organization's resources and reduces the waste of time in tries and errors. In addition, (Birasnav, 2014) said it is a process by which explicit or tacit knowledge is transferred to other people through the communication that occurs between them.

Knowledge Application: Knowledge application is the vital element in knowledge management processes, as it is considered an output aspect in knowledge management. The process of knowledge application can be defined as the process of implementing knowledge for the beneficiary of the facility. The perspective which is based on knowledge considers the process of applying knowledge the last step that attempts to solve problems and achieve a comparative advantage over competitors (Alshurideh, 2016; Choi et al., 2010). Moreover, it is considered as an activity that can enhance the application of knowledge of a new scenario and learning from it.

Knowledge Storage: It is not enough to generate and acquire new knowledge for decision-making purposes, as mechanisms are needed to store and retrieve it when necessary. So, we can define knowledge storage as storing existing and acquired in properly indexed knowledge. According to (Obeidat et al., 2016), it is the process of identifying new information as it is relevant and necessary for current and future use, as well as store it in reasonable forms to be easily accessible in the organization.

Knowledge Acquisition: Al-Sa'di et al. (2017) defines knowledge acquisition as the process through which the organization obtains knowledge from internal and external sources, which is the process of taking knowledge from different people such as suppliers, customers, employees, etc. for continuous improvement in operations, products and services (Johnson et al, 2019).

2.2 Total Quality Management

Because of technological, social, political and environmental changes that have occurred over the past few years, the ability of the organization to gain and maintain a competitive advantage has become a real challenge (Al-Hawary & Hadad, 2016; Al-Hawary & Ismael, 2010; Al-Hawary & Obiadat, 2021; Mohammad et al., 2020). These changes have not only led to more choices for customers, but also led to a change in their preferences and demands (Al-Hawary, 2013; Al-Hawary & Aldaihani, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary et al., 2013, 2017; Alolayyan et al., 2018; Alshurideh et al., 2017; Metabis & Al-Hawary, 2013). Hence, total quality management has been identified as a mechanism that has the ability to improve organization and individual performance, and strengthen competitive advantage (Alzoubi et al., 2021; Li et al., 2018).

Total quality management is one of the many quality-based methods, which began in Japan after World War II and spread to the United States of America in the eighties, mostly in American manufacturing companies that face competition from Japan. Moreover, total quality management is a management view that seeks to integrate all organizational purposes from marketing to finance, design, engineering, production and customer service to emphasize all customer needs and organizational goals (Alzoubi et al., 2020; Obeidat et al., 2016). In addition, Wang et al. (2012) said that it is a continuous procedure for the development of individuals and the entire

organization, and the continuous development of processes inside organizations to provide greater value to customers and meet their needs. It also includes company processes that focus on acceptance, participation and response to customers through the concept of marketing.

Bouranta et al. (2017) defined total quality management as a science that depends on a set of rules, methods, equipment and theoretical methodologies. Modgil and Sharma (2016) defined it as a philosophy that aims to change for the better and protect the quality of the commodity and the process on an ongoing basis. This continuous improvement is the outcome of the he committed work of senior management and the participation of suppliers, customers and employees. As well as, it is considered the management philosophy that focuses on continuous improvement for all operations of the institution. Marefal and Fraidfathi said that it is a customer-based philosophy in which the sourcing business, business processes and institution culture are managed and blended in a good way to ensure customer satisfaction.

Wang et al. (2012) defined it as a consistent measure of development for individuals and the entire organization. Total quality management can be defined as a philosophy or a tool aims to increase the quality of products, services and process, as well as achieve competitive advantage and align quality with the company's mission, vision and goal through the application and commitment of senior management, employee empowerment, continuous improvement, resource management and customers.

2.3 Knowledge Management and Total Quality Management

A few researchers have recently expressed their interest in the relationship between total quality management and knowledge management, but they did not agree on the perception of this relationship. Some researchers consider knowledge management as a facilitator for Total Quality Management (Stewart & Waddell, 2008), at which from one perspective, knowledge management is identified as an activator of total quality management. Stewart and Waddell (2008) stated that expanding the concept of quality to product and service specifications as a quick response to customer needs clarifies the relationship between knowledge management and Total Quality Management.

The acquisition and sharing of knowledge also lead to finding a quality culture which create an understandable framework according to quality and knowledge management programs (Al-Salti & Hackney, 2011; Alshamsi et al., 2020; Alshurideh, 2022). On the other hand, there are many approaches assume that total quality management agree with knowledge management. Lin and Lee (2005) introduced ISO9000 processes based on knowledge management system, which support the flow of knowledge in the organization. In a case study revealed that Total Quality Management practices are factors that facilitate knowledge acquisition and sharing. Choo et al. (2007) presented a conceptual framework based on quality and knowledge management programs. Based on this study, quality programs are effective

factors for knowledge management. Jayawarana and Holt (2009) analyzed the relationship between knowledge creation and transformation in the context of research and development; and based on their case study, they concluded that total quality management practices improve knowledge creation and transformation. In addition, Molina et al. examined the relationship between total quality management and knowledge transformation.

According to Hsu and Shen (2005), the relationship between total quality management and knowledge management as management practices appears close, as they share some processes such as results direction, people-based management, leadership and customer satisfaction; whereas similarities form the interactive relationship between the two practices (Leonard & Mccadam, 2001). Ooi et al. (2010) conducted an empirical study to measure the impact of total quality management on knowledge management. The results showed that total quality management is highly associated with knowledge sharing. Moreover, the results showed that there is a positive relationship between training, teamwork and financial analysis with knowledge exchange among middle management employees (Alshurideh et al., 2019a, b; Al Kurdi et al., 2020a, b). In addition, (Zwain et al., 2011) evaluated the relationship between the basic elements of total quality management and knowledge sharing. They also stressed that there is a positive relationship between the elements of total quality management and knowledge sharing, and that the basic elements must be implemented entirely and not individually to obtain the best results by sharing knowledge (Aburayya et al., 2020; Al-Khayyal et al., 2021; Zu'bi et al., 2012). Based on the above, the hypothesis of the study can be as follows:

There is a statistically significant effect of knowledge management on total quality management in private universities in Jordan.

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of knowledge management on total quality management. Therefore, it focused on Jordan-based universities operating in the north region. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed

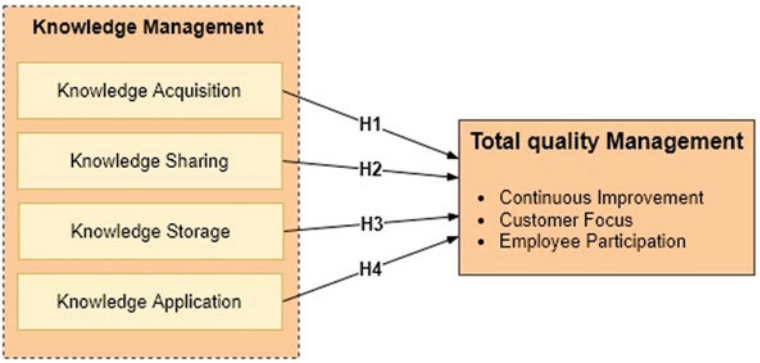

Fig. 1 Research model

to a random sample of (520) employees via email. In total, (331) responses were received including (28) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (303) responses suitable to analysis requirements that were formed a response rate of (58.3%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure knowledge management based on (Al-Hawary, 2015). These questions were distributed into dimensions as follows: five items dedicated for measuring knowledge acquisition, five items dedicated for measuring knowledge sharing, five items dedicated for measuring knowledge storage, and five items dedicated for measuring knowledge application. Whereas the second section included (15) items developed to measure total quality management according to what was pointed by (Al-Hawary & Abu-Laimon, 2013). This construct divided into three first-order constructs. Continuous improvement was measured through five items, customer focus was measured by five items, and employee participation was measured using five items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.654–0.891), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approachis based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (de Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in (Figs. 1 and 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.973, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90.

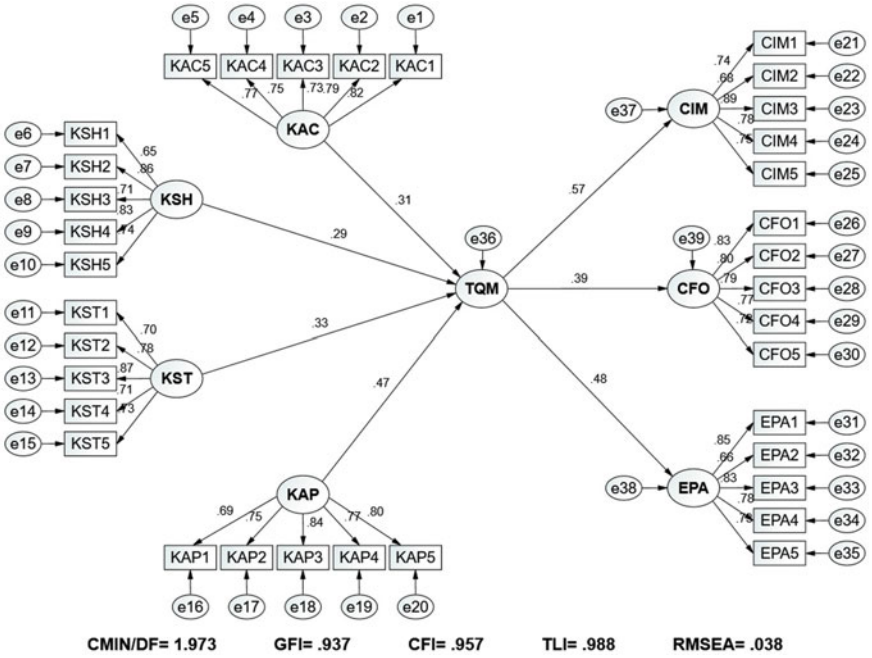

Fig. 2 SEM results of the knowledge management effect on total quality management

Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.038, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019).To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

Table 2 Impact of knowledge management dimensions on total quality management

Hypothesis	Relation	Standard Beta	*t* value	*p* value	Result
H1	KAC→TQM	0.312	10.395	0.000	Supported
H2	KSH→TQM	0.297	8.103	0.000	Supported
H3	KST→TQM	0.335	11.902	0.000	Supported
H4	KAP→TQM	0.468	17.212	0.000	Supported

Note KAC: knowledge acquisition, KSH: knowledge sharing, KST: knowledge storage, KAP: knowledge application, TQM: total quality management
* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

The results demonstrated in Table 2 show that knowledge managementhas a positive impact relationship on total quality management. Moreover, the results indicated that the highest impact was for knowledge application ($\beta = 0.468$, $t = 17.212$, $p = 0.000$), followed by knowledge storage ($\beta = 0.335$, $t = 11.902$, $p = 0.000$), then knowledge acquisition ($\beta = 0.312$, $t = 10.395$, $p = 0.000$), and finally the lowest impact was for knowledge sharing ($\beta = 0.297$, $t = 8.103$, $p = 0.000$).

6 Discussion

The results of the study showed that there is an impact of knowledge management on total quality management in Jordanian private universities. This result is consistent with what was stated in the studies by Hashem and Jaradat and Honarpour et al., which indicated that there is an impact of knowledge management on total quality management. Also, this result is in line with, who confirmed that the practices of Total Quality Management and knowledge management are corresponded to each other; the reason is that university employees have benefited from knowledge management in supporting university administration decisions and encourage them to present their suggestions and opinions, improve the process of managing internal documents and provide them to beneficiaries, share knowledge inside and outside the university and make qualitative improvement in the educational process because of its great importance for improving work; this is because total quality is a flexible participatory process.

The results indicated that there is an impact of the acquisition of knowledge on total quality management, so that universities integrate the components of knowledge they have with knowledge they acquired from abroad, which led to an improvement in the quality of knowledge provided to students and satisfy their educational requirements. The university's interest in motivating creative and innovative employees led to accept and interact with the wise ideas proposed by the employees after evaluating and implementing these proposals, which contribute to the process of continuous improvement in the university. The university also provides programs that simplify and facilitate the provision, development and improvement of services that create an advantage over other competitive universities. The results indicated that there is an impact of knowledge storage on total quality management in Jordanian private universities in the north region, whereas university workers can easily access the information and documents stored in the university databases, and document the acquired knowledge of each project they accomplish. In addition, reliance on electronic documents led to the ease of finding documents, completing transactions, and taking appropriate procedures at the right time, making it easier for workers to improve the quality of services in a high and correct manner.

The results indicated that there is an impact of sharing knowledge on total quality management in Jordanian private universities in the North Region, as the university employees share information related to their work because there are valid and easy communication ways between the various sites and departments, which leads

to finding appropriate solutions to the problems they face and taking preventive immediate procedures constantly. The results indicated that there is an impact of knowledge application on total quality management in Jordanian private universities in the north region. University workers use their knowledge in their work field which leads to improve the efficiency and effectiveness of their work quality. Moreover, the university administration discussing ideas and the outcomes of its work in formal meetings leads to involve employees at all levels, express their opinions, focus on students' satisfaction and respond quickly to their requirements, listen to their comments and complains which will help the university avoid shortcomings and increase the efficiency of their work. This will enhance student satisfaction as they are the core of the university's work.

7 Recommendations

Based on the results of this study, the study recommends Jordanian private universities to pay attention to the application of knowledge management and total quality by reviewing the best international practices in their application, and benefiting from that in improving and developing the quality of services they provide. It is also preferable for universities to organize meetings between them and the employees to exchange knowledge, opinions, experiences and ideas, address problems they face at work, promote the culture of openness partnership, teamwork and dialogue in order to ensure benefit and learning from each other to improve and implement quality programs. Moreover, it should establish a rapid mechanism for responding to the requirements of total quality and continue working on meeting the needs and requirements of students in the best way.

study population consists of all (Managers of departments, Directors of directorates, Heads of departments and staff), who perform their duties in Social Security Corporation in Jordan. The number of employees was about (435) employees. Where the study followed the method of comprehensive survey to withdraw the sample study. The study reached there is an effect of the process of creating knowledge on organizational innovation in the Social Security Corporation in Jordan. The study recommended that knowledge management should be adopted as an input to improve the levels of individual and organizational innovation, through the establishment of an independent department in Social Security Corporation in.

Keywords Knowledge creation process · Organizational innovation · Social security corporation · Jordan

1 Introducing

The current era is characterized by rapid changes in globalization, information and communication technology, which presents many opportunities and challenges for all organizations in order to obtain the competitive strength to survive, continue to work efficiently and effectively to face these changes (Allahow et al., 2018; Al-Hawary & Al-Syasneh, 2020; AlTaweel & Al-Hawary, 2021; Al-Maroof et al., 2021). Perhaps it is distinguished by the emergence of the power of knowledge; so whoever can use it well possesses the competitive power that enables him to survive in light of these changes and challenges, and in the same context, the concept of the rule of the era of knowledge led to increase its role and importance by providing information and thinking about it (Al-Hawary et al., 2020; Al Mehrez et al., 2020). Therefore, the administrative thought focused on knowledge processes and their management to ensure that the organization achieves its desired goals, responds to continuous changes and adapts easily. In addition to training, developing and motivating human resources as it is considered an effective and important factor to enhance levels of organizational innovation, production capabilities and excellence of organizations, as the priority occupied by human capital in the knowledge economy has led to an intense struggle for the talented, the creative, and the brilliant minds (Al-Hawary & Alwan, 2016; Kabrilyants et al., 2021; Tariq et al., 2022).

Organizational innovation is considered a goal for organizations that are interested in knowledge management and its operations, due to the intensity of local and global competition in most fields (Al-Hawary, 2015; Al-Hawary & Aldaihani, 2016; Al-Hawary & Al-Namlan, 2018; Al-Hawary & Nusair, 2017; Al-Lozi et al., 2017, 2018; Alzoubi et al., 2022). And because the value of organizations lies in the available human resources, this prompts them to pay attention to their knowledge to reach the creativity they seek. As developed countries have made progress and superiority through talented and creative minds where their abilities, skills and energies have been utilized; so the specialists in measuring the progress of countries are based on the number of scholars and thinkers, as well as the resulting degree

of knowledge and creative accumulation (Jawad et al., 2006; AlHamad et al., 2022; Alshurideh et al., 2022).

The most prominent problems that public organizations in Jordan suffer from are the lack of an appropriate climate, an appropriate work environment, and a culture that supports knowledge management as well as its operations that contribute to support and improve levels of organizational innovation in them. Moreover, these organizations face many challenges such as the difficulty of strategic prediction for their future, mission and goals. In addition to the financial pressures, bureaucratic complications, regulations and laws they face, and all of the foregoing severely impede the effective implementation of knowledge management initiatives and operations, looking for an increase in the levels of innovation, which is a vital and effective element in Raising the performance levels of employees, thus achieving success and excellence.

In light of the foregoing, the General Organization for Social Security in Jordan needs a comprehensive knowledge management system because of its importance, as it plays a vital and effective role in making public administration jobs more efficient by raising the levels of innovation among employees, it also contributes in supporting social goals for the public sector through searching for opportunities and large projects that allow society to flourish, progress and prosperity, in addition to enabling organizations and their members to work at high levels of performance, in order to improve the quality and quality of community life. Therefore, this study is a starting point for future training and development programs, the results and recommendations also help in interpreting the results of previous researches that dealt with some aspects of the subject, and use the findings of the research to support its results, as well as providing researchers with documented information derived from the field study, in addition to trying to attract the attention of researchers to direct their future research towards the variables of this study. So, this study came to test the impact of the knowledge creation process in achieving organizational innovation.

2 Theoretical Framework and Creating Hypotheses

2.1 Knowledge Creation

Nonaka (1994) pointed out that the process of creating knowledge lies mainly in the difference between tacit knowledge and explicit knowledge, as it made available and expanded entirely new knowledge by individuals, as well as that it had formed and documented knowledge with the knowledge of the organization; despite the formation of ideas in the minds of individuals, the interaction among these individuals plays an important role in its development, and this indicates that close cooperation and coordination between individuals within groups or work teams contributes to the expansion and development of completely new knowledge that extends across the borders of the organization. Toyama et al. (2000) added, it is a process by which

the individual excels himself by transcending his old ideas, thinking more broadly and with a holistic thought to move to new ideas in order to acquire new content that keep pace with the changes and developments at the local and global levels. Gottschal (2008) stressed that this process leads to the creation of valuable ideas that contribute to solving problems and offering opportunities for development and superiority, as it includes developing new content or replacing the available content with new content through the processes of cooperation, consultation and effective coordination between individuals or groups; In addition, creativity is the basis in the process of creating knowledge.

Many researchers point out that creating and sharing knowledge is not a natural and automatic act, because knowledge often exists in the minds of individuals, but they face difficulties in transferring and sharing it with others, especially when facilities and support are not available from the management of the organization (AlMehrzi et al. 2020; Shannak et al., 2012). Magnier-Watanabe et al. (2011) and Elinfoo (2005) emphasized that the essence of knowledge management processes focuses on the process of creating and forming knowledge by employing the existing knowledge accumulation in the organization to create new knowledge or taking advantage of the organization's employees' interactions with its markets and competitive environment to create new knowledge.

Researchers in the field of knowledge management were interested in studying and analyzing the mechanisms of creating and forming organizational knowledge through the interaction of individuals, work teams, and groups in the internal environment of the organization, or in the external work environment or both, where they presented several models for the transformations of knowledge and the stages of its creation, formation and development. (Nonaka and Takeuchi) model for the process of creating and creating knowledge remains one of the most important and influential models on the development of the literature of knowledge transfer and management.

Therefore, this model is considered one of the most prominent models used in the process of creating knowledge, and it is called the Nonaka spiral, and it includes four stages of transformation of knowledge: (Socialization, Externalization, Combination, and Internalization), to represent a model designed to understand the dynamics of creating and forming knowledge in organizations through the availability of two types of Knowledge, which is tacit knowledge and explicit knowledge, as well as the dynamic interaction between them within three main levels of interaction, namely individuals, groups and the organization (Al-Hawary & Alwan, 2016; Alshurideh, 2022; Alzoubi et al., 2021). It is worth noting that Nonaka et al. (2000), presented a description of each stage of the four knowledge creation process as follows:

- **Socialization**: It is the stage at which new tacit knowledge is created through the exchange of experiences, ideas and technical skills between individuals. Socialization appears in human relationships at work, outside work or both, where mental and theoretical models are produced to the world.
- **Externalization**: It is the stage, at which tacit knowledge is highlighted and transformed into explicit knowledge, and it happens through oral communication using language in discussions and collective thinking, as the transformation of tacit

knowledge into explicit knowledge is logically and systematically crystallized to be easily shared.

- **Combination**: It is the stage at which explicit knowledge is transformed into more complex and systematic explicit knowledge, such as: (conducting research and preparing reports), where explicit knowledge is collected from a variety of different sources, and then combined, organized and coordinated to form new explicit knowledge, to be shared between many groups through the means and methods of distributing and sharing written documents, and electronic publishing.
- **Internalization**: It is the stage at which explicit knowledge is self-characterized, and transformed into tacit knowledge, where knowledge is understood by all members of the organization, and this is done in several ways such as: (training, experiments, and repeating the performance of tasks).

2.2 Organizational Innovation

Innovation is a vital and important element for organizations, because the skills and abilities required for their survival and to perform their role to the fullest, will be different from what they were in the past, as organizations at the present time and in the future will face a wave of many challenges and opportunities, as well as rapid and sharp changes, and this requires them to respond quickly and find appropriate ways and methods to adapt to them in a flexible manner (Almaazmi et al., 2020; Al Suwaidi et al., 2020; Alameeri et al., 2021; Nuseir et al., 2021). Therefore, perceptive organizations will seek to employ talented individuals and groups, in order to find ideas and creative solutions that will elevate the organization and raise its levels of performance and ability to exploit opportunities and face various challenges and threats (Al-Nady et al., 2013, 2016; Alshurideh et al., 2017; Alolayyan et al., 2018; Al-Hawary & Alhajri, 2020; Mohammad et al., 2020; Alhalalmeh et al., 2020; Al-Hawary & Obiadat, 2021).

Organizational innovation, it is a process through which the organization uses all its knowledge, skills, and technical systems in order to develop completely new goods or services or to improve and develop its operating systems and programs to raise the level of response to the needs and desires of the beneficiaries and to gain their satisfaction and loyalty to them (Jones, 2001). Guilford (1959) defined organizational innovation as a set of preparatory features that include (fluency in thinking, flexibility, sensitivity to problems and authenticity), as well as redefining the problem and clarifying it in detail.

The researchers differed on defining the elements of administrative innovation, but they agreed on a group of them (Altamony et al., 2012; Allahow et al., 2018). Fluency, means the individual's ability to present or produce a large number of synonyms, alternatives, uses or ideas, when confronting and responding to a specific event, situation or stimulus, as well as speed in generating it. Flexibility, means the ability of the individual to present various and different ideas in addition to his ability to change or transform his point of view, vision, or path of thinking according to the

course and requirements of the event or problem, and sensitivity to problems; it also means the individual's ability to discover various problems, weaknesses and gaps in the problem, the issue or situation. Internalization means the individual's ability to present or produce something unconventional, unusual, amazing or rare and unique in the long run, where scientists point out that the idea is not completely original and new unless no one preceded it and was unfamiliar and far-reaching.

2.3 Knowledge Management Processes and Organizational Innovation

The basics of the knowledge creation process (Socialization, Externalization, Combination, and Internalization) affect innovation in the organization, so organizations must focus in their main activities on learning and knowledge management processes, and then use knowledge theory to find a specific direction to coordinate activities related to transformation and knowledge creation processes, in order to prove the value of brilliant minds for the active and continuous existence in society (Rowley, 2000). Chapman and Magnusson (2006) pointed out that knowledge is an essential component of all forms of creativity, as well as it is a widely accepted principle of innovation management. Stacey (2000) emphasizes that knowledge is one of the most vital assets as it is the main source of innovation and excellence, but there is no simple and generally accepted definition of knowledge, as knowledge differs from data and information, but it is related to both, unlike data and information, where knowledge emerges from human interpretations and their complex interactions. Rahimi et al. (2011) explained that the knowledge creation process can be seen as a spiral or ascending process from the individual level to the group level, then to the organizational level, and sometimes to the inter-organizational level; but innovation is the basis of problem solving, and to occur, it must not be limited to the exchange of knowledge only, but must be used and recombined, and sometimes the distinction between the creation and use of knowledge appears to be particularly reflected when confronted with complex systems such as innovation because it is the result of a combination of existing and new knowledge, and therefore the process of compiling new and current knowledge depends largely on the creation and use of knowledge; and in the next generation of knowledge management the importance of knowledge creation and use has been greatly emphasized to create value and became critical factors in the creative process. Alberto (2000), points out that the relationship between knowledge management processes and organizational innovation is of great importance to the success of competitive organizations, as well as its impact on the formulation of competition strategies, because the development of knowledge is linked to the characteristics and capabilities of individuals, and this supports the innovation of the organization and its competitive capabilities. Awad and Ghaziri (2004) noted the relationship between knowledge management processes and organizational innovation, which lies in the fact that the knowledge

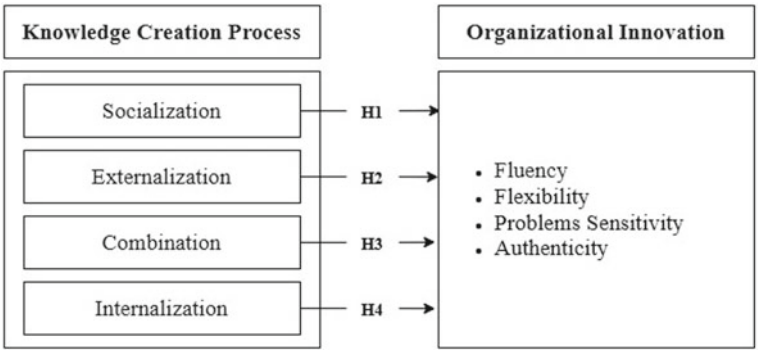

Fig. 1 Research model

capabilities of organizations have turned into processes that allowed them to create new products and services very quickly, or to modify and develop them quickly as well, in addition to their speed in providing them to beneficiaries in a distinctive way; this is because knowledge management processes, especially the process of creating knowledge, play an important role in influencing and advancing the levels of organizational innovation, as innovation cannot take place without it, especially in the current era, as it supports and provides individuals with new knowledge that will enhance their creative ideas in various fields, as well as It lights their way to original and unique ideas. Accordingly, the study hypothesis can be formulated as follows:

There is a statistically significant effect at the significance level ($0.05 \geq \alpha$) of the knowledge creation process on organizational innovation in the Public Institution for Social Security in Jordan.

3 Study Model

See Fig. 1.

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of knowledge creation process on organizational innovation. Therefore, it focused

on Jordan-based social security corporation. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to all employees at general administration of social security corporations via email. In total, (379) responses were received including (32) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (347) responses suitable to analysis requirements that were formed a response rate of (79.8%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (24) items to measure knowledge creation processbased on (Chatterjee et al., 2018; Li et al., 2018; Al-Adamat et al., 2020; Prompreing & Hu, 2021). These questions were distributed into dimensions as follows: seven items dedicated for measuring socialization, six items dedicated for measuring externalization, five items dedicated for measuring combination, and six items dedicated for measuring internalization. Whereas the second section included (23) items developed to measure organizational innovation according to what was pointed by Silva and Cirani (2020). This variable was a second-order construct divvied into four first-order constructs. Fluency was measured through five items, flexibility was measured through six items, problems sensitivity was measured by six items, and authenticity was measured using six items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.537–0.945), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7	8
1. SOC	**0.784**							
2. EXT	0.387	**0.764**						
3. COM	0.485	0.527	**0.732**					
4. INT	0.594	0.439	0.521	**0.723**				
5. FLU	0.625	0.511	0.618	0.438	**0.763**			
6: FLE	0.581	0.637	0.594	0.494	0.374	**0.748**		
7. PSE	0.499	0.552	0.541	0.567	0.439	0.492	**0.769**	
8. AUT	0.614	0.482	0.558	0.634	0.552	0.502	0.513	**0.725**
VIF	1.624	1.513	2.334	1.504	–	–	–	–
Loadings range	0.684–0.846	0.642–0.945	0.681–0.775	0.657–0.774	0.622–0.841	0.713–0.791	0.537–0.882	0.674–0.781
AVE	0.614	0.584	0.536	0.523	0.583	0.560	0.591	0.522
MSV	0.554	0.429	0.374	0.415	0.502	0.487	0.515	0.497
Internal consistency	0.905	0.889	0.848	0.864	0.871	0.880	0.892	0.865
Composite reliability	0.917	0.892	0.852	0.867	0.874	0.884	0.894	0.867

Note SOC: socialization, EXT: externalization, COM: combination, INT: internalization, FLU: Fluency, FLE: flexibility, PSE: problems sensitivity, AUT: authenticity, Bold fonts refers to $\sqrt{\text{AVE}}$

of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in (Figs. 1 and 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.287, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.045, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all knowledge creation process dimensions have a positive impact relationship on organizational innovation except externalization which has no impact on organizational innovation ($\beta = 0.031$, $t = 0.498$, $p = 0.624$). However, the results indicated that the highest impact was for combination ($\beta = 0.338$, $t = 5.657$, $p = 0.000$), followed by socialization ($\beta = 0.285$, $t = 4.781$, $p = 0.000$), and finally the lowest impact was for internalization ($\beta = 0.196$, $t = 3.735$, $p = 0.000$).

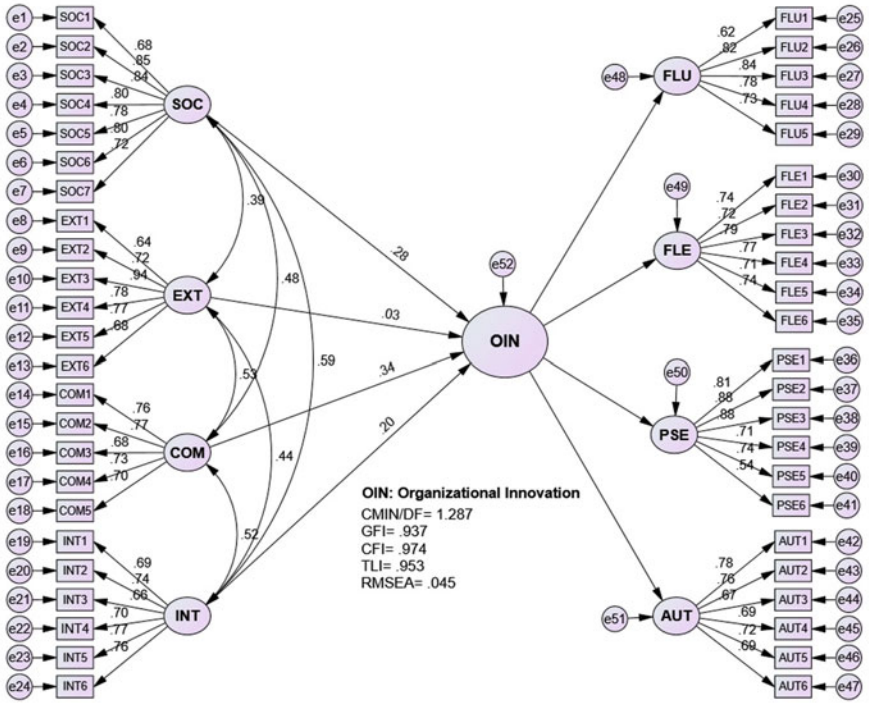

Fig. 2 SEM results of the knowledge creation process effect on organizational innovation

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	Socialization→Organizational Innovation	0.285	4.781	0.000
H2	Externalization→Organizational Innovation	0.031	0.498	0.624
H3	Combination→Organizational Innovation	0.338	5.657	0.000
H4	Internalization→Organizational Innovation	0.196	3.735	0.000

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

6 Discussion

The results showed the interest of the Social Security Corporation in the availability of experts in knowledge to train its employees on new knowledge to use in their work, in addition to giving them opportunities to think about what was discussed and support it with ideas and creative proposals, and to encourage everyone who supports knowledge with practical additions that can be benefited from and improved in work, in addition to the institution's interpretation of knowledge results obtained and saved in a comprehensive knowledge base so that everyone can access it to benefit from

Licensed to (putm@utm.my)

it in his field of work. The results of the study also showed that the institution's work environment and culture encourage the sharing of information and experiences among its employees, in addition to the institution encouraging its employees to participate in meetings and discussions when ideas and information are needed to accomplish various work, as well as providing material and moral incentives in a way to motivate and support its employees. Moreover, the results confirmed that the institution is interested in providing expert teams and technological systems to help its employees organize their ideas, present them and share them with everyone, in addition to encouraging them to review new knowledge related to work to benefit from them and achieve more understanding; as well as the institution evaluating the quality of knowledge and updating it from time to time; the institution also supports its employees with practical examples to help them explain and clarify their ideas when they cannot express them, in addition to involving them in decision-making by supporting their creative ideas and proposals, but in return the institution must work to overcome the difficulties that limit the ability of its employees to express their ideas regarding work and its development. The results also confirmed the ability of employees to defend their ideas with argument and proof, when they presented the largest number of ideas and quick solutions to confront work problems, in addition to their ability to retrieve previous ideas and information to solve the problems they face at work, in addition to the realization of most employees who always find that work procedures need a continuous development process, as well as the employees' quest to discover new things; moreover, their abilities to accomplish the work assigned to them in a renewed manner. The employees also showed the high ability to propose solutions to face work problems after knowing the shortcomings or weaknesses in the work they do. In addition to their medium ability to discover problems experienced by others and plan to solve them, as well as sometimes predict them before they occur, and their ability to make some changes in work methods from time to time, in addition to their medium ability to adapt to new work variables, see things from different sides and think quickly about working conditions and requirements.

The results of the study showed and found an impact of the knowledge creation process on organizational innovation in the Social Security Corporation in Jordan, because the Social Security Corporation is interested in (socialization) through the process of sharing experiences and information in order to create tacit knowledge such as mental models and joint technical skills; (Combination) through a process of systematically compiling and organizing the explicit knowledge that is available with explicit knowledge related to the work of the institution; (Internalization) by transforming explicit knowledge into tacit knowledge; (Personality) through training and repeating the performance of tasks, taking suggestions and ideas and supporting them, so that explicit knowledge becomes assimilated as tacit knowledge. But on the other hand, there is a clear weakness and less interest from the institution in (Externalization) through the process of accurately identifying and improving the tacit knowledge related to the work and then transforming it into explicit knowledge through interviews, discussions and meetings, and this result agreed to some extent with the studies by Young, Berraies and Chaher, and Huang and Wang.

7 Recommendations

In light of the results that have been reached, the study recommends the need to adopt knowledge management as an entrance to improve the levels of individual and organizational innovation, through the establishment of an independent department in the Public Institution for Social Security in Jordan, under the name (Knowledge Management) appearing in the organizational structure; and the necessity for the Social Security Corporation in Jordan to provide systems, methods and ways that support the process of sharing and exchanging tacit (personal) knowledge related to work among its employees, Which would enhance their innovation levels, thus raising the level of their performance at work; as well as the necessity of adopting the Public Institution for Social Security in Jordan, strategies that contribute to supporting employees and opening the way for them to express their ideas and creative proposals related to work and its development with ease. As well as providing specialized technological systems and tools to help its employees organize their information, ideas and suggestions, display them in exemplary ways, and share them with their colleagues, in addition, the institution train them on these systems through expert teams.

The Effect of Marketing Knowledge on Competitive Advantage in the Food Industries Companies in Jordan

Faraj Mazyed Faraj Aldaihani, Ali Zakariya Al- Quran, Laith Al-hourani, Mohammad Issa Ghafel Alkhawaldeh, Abdullah Matar Al-Adamat, Anber Abraheem Shlash Mohammad, Sulieman Ibraheem Shelash Al-Hawary, Muhammad Turki Alshurideh, and Barween Al Kurdi

Abstract This study aimed to identify the impact of marketing knowledge practices on the competitive advantage of the food industries companies in Jordan. In order to achieve the objectives of the study, the questionnaire was used to collect primary data, whereby the study population consisted of (160) administrators of all levels (senior management, middle management) and who numbered (16) food industry

companies. The questionnaire was distributed to the study sample, which included (160) administrators, and the researcher approved the sample the comprehensive survey and the descriptive analytical approach as it is appropriate to achieve the objectives of the study. One of the most important findings of the study is that there is a positive effect of marketing knowledge on the competitive. The study recommended the management of foods industries companies to provide the ability to process and analyze the information they possess in order to correctly forecast market demands, as well as employ delegates to study different markets, and worked to increase cooperation with suppliers and customers to follow up new developments in the market.

Keywords Marketing knowledge · Competitive advantage food industries companies · Jordan

1 Introduction

Business organizations use many factors of power in the context of facing the external environment variables, which are changing rapidly, and among these factors is knowledge, where organizations of all kinds can perform their work in a way that achieves competitiveness and entrepreneurship and is ahead of competitors in the field of activity that the organization is engaged in (Altamony et al., 2012; Al-Hawary & Al-Syasneh, 2020; AlTaweel & Al-Hawary, 2021; Obeidat et al., 2021). Marketing activity is the basis on which the organization relies to serve its markets appropriately, and this can only be achieved through the possession of those who carry out this activity with sufficient knowledge of market factors and variables from competitors and customers (Al Mehrez et al., 2020; Al-Hawary et al., 2011; Alshurideh, 2022; Alshurideh et al., 2017). Knowledge enables business organizations to understand the market, and how to deal with competitors by meeting the needs and desires of customers, which made there a need for marketing knowledge that enables the appropriate identification of the target market sector in light of the increasing competitiveness among business organizations, and thus directing the marketing mix that suits these sectors, which leads to enhancing the target market share (Al-Hawary & Alwan, 2016; Al-Lozi et al., 2017; Alshurideh, 2019; Alshurideh et al., 2020; Sweiss et al., 2021).

Competitive advantage expresses the organization's central characteristics, capabilities and efficiency, and also identifies the aspects in which the organization excels from other organizations. Dimensions of competitive advantage include improving internal efficiency, customer orientation, alliances and response to customers, cost reduction, awareness, flexibility and creativity (Al-Nady et al., 2016; Allahow et al.,

B. Al Kurdi
Department of Marketing, Faculty of Economics and Administrative Sciences, The Hashemite University, Zarqa, Jordan
e-mail: barween@hu.edu.jo

2018; Alhalalmeh et al., 2020; Al-Hawary et al., 2020; Mohammad et al., 2020). Business organizations can achieve and maintain competitive advantage in the presence of high competitiveness through innovation, improvement and development through continuous dynamic processes and not through individual events.

Marketing knowledge is an effective pillar in formulating various marketing plans that will achieve a competitive advantage, and given the many great challenges facing business organizations that stand in front of their aspirations to achieve development and growth, this imposes the need to fortify the competitive position of these organizations through the knowledge they possess with all competitors, customers, as well as suppliers who deal with these organizations, and knowing the current and future needs of the market so that these organizations can keep pace with what is happening in the market according to a new vision derived from its accurate diagnosis of the current reality (Al-Hawary & Alhajri, 2020; Al-Hawary & Obiadat, 2021; Al-Maroof et al., 2021). From the reality of the researcher's work in one of the food industries companies, he found that these companies lack appropriate marketing knowledge to enable them to know the market and the needs of customers, which creates several challenges for these companies to achieve competitive advantage (Al Kurdi et al., 2020a, 2020b; Khasawneh et al., 2021; Alzoubi et al., 2021). Therefore, this study comes to reveal the impact of marketing knowledge on the competitive advantage in food industries companies in Jordan.

2 Literature Review and Hypothesis Development

2.1 Marketing Knowledge

In light of the rapid changes in the movement of markets worldwide, marketing takes great importance at the level of work of business units in organizations, as without effective marketing strategic planning, companies cannot achieve the desired goals of marketing strategies, except by relying on knowledge that is characterized as a the only resource that builds up cumulatively and is used to generate and develop new ideas. Recent studies have shown the multiple role of knowledge in all fields, and the conviction of individuals and organizations of the importance of knowledge has increased. Hence, industrial companies seek to obtain knowledge from its sources, arrange, classify, store, and make it available in an easy and easy way to benefit from it (Alshurideh et al., 2012; Al-Hawary, 2015; Lee et al., 2022a, 2022b; Shamout et al., 2022).

There are several definitions of knowledge, Al-Hawary and Alwan (2016) defined knowledge as "the individual's ability to recognize and distinguish things" or "the ability that the individual possesses and stores in his mind in the form of cognitive maps". Al-Benaa and Qassem (2012) indicates that there are several approaches to clarify the concept of Knowledge, some of them focus on the economic approach, considering the intellectual capital owned by the organization, and others focus on

the information approach, considering that knowledge is the extent of the ability to deal with information to transform it into permanent knowledge in the organization in order to employ it to achieve goals, while the technical approach considers them as technological capabilities that enable the organization to achieve excellence, and finally portrayed by the social approach as a social structure based on communication between individuals**.**

Al-Hawary et al. (2020) focused on creating, collecting, organizing and storing this knowledge for dissemination and exploitation by transforming knowledge into collaborative knowledge that can be shared within the organization. In order to implement it correctly, knowledge management and its processes within the organization must be properly adopted through an integrative, cumulative process that consists over long periods of time to become available for application and use in order to address specific problems and conditions. Organizations rely on knowledge to interpret the available information about a particular case, and to make a decision about how to manage and treat this case (Allahow et al., 2018; Alshurideh et al., 2021; Alwan & Alshurideh, 2022).

Macintosh (1998), Laudon and Laudon (2015), Becerra-Fernandez and Sabherwal (2014) and Campeanu-Sonea and Sonea (2016) dealt with several definitions of knowledge management, most of which were based on the fact that it is a discipline that focuses on analyzing the knowledge that can be obtained so as to link the knowledge assets (explicit and implicit) in all its internal and external operations, as knowledge management is based on the discovery, acquisition, sharing and application of knowledge in all units, in order to ensure the achievement of organizational goals. From here, we find that knowledge management is an essential aspect in permanent learning companies, as this supports the mechanism of sharing and reusing the knowledge of individuals or companies' knowledge through information technology such as the document management system, work groups, e-mail, and various databases that make up the knowledge sharing system integrates with additions of individuals and teams who use this system (Al-Hawary et al., 2013; Al-Dhuhouri et al., 2020).

Marketing knowledge management is based on being one of the most important skills for companies to acquire, create, retain and share knowledge based on the marketing environment, in order to build an information base on competitive market variables and identify target markets for use in making strategic marketing decisions (Alaali et al., 2021; Al-Hawary et al., 2017). Al-Hawary and Al-Namlan (2018) believes that the management of marketing knowledge in the organization is largely based on knowing all the information about the market, what are the movements of competitors, what are the desires and needs of customers, and the changes that have occurred, all of which prompted an attempt to integrate marketing activities into an organizational framework that leads to the human dimension which is represented in the tacit and explicit knowledge of employees, and linking this to information technology to form basic pillars in creating a marketing knowledge management system and promoting participatory, which enhances the accumulation of knowledge, retains and develops it, and enhances knowledge sharing among workers at all managerial

Licensed to (putm@utm.my)

levels, and thus develops the skills of workers, this, in turn, affects the support of the relationship with the customer and the identification of his desires and needs and how these needs and desires can be satisfied, which leads to achieving the competitive advantage of the organization in the target markets that it aspires to reach.

To enable the company to focus on the markets; You must generate information about customer needs, and the factors that influence customers, by collecting and responding to information by designing and implementing products and services that meet customer needs (Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Harahsheh, 2014; Al-Hawary et al., 2017; Al-Lozi et al., 2018; Zebal & Others, 2019) indicated that marketing knowledge represents a graphic knowledge "know-what" that exists independently and must be distinguished and known from marketing skills or procedural knowledge "know-how". In the same direction, indicated that marketing knowledge represents both the codified information in the marketing databases of companies and the development of research skills that allow the application of this information for the benefit of the company. It is not only the codified information that managers possess, but also the refinement of personal skills for finding, evaluating, and using this information.

Marketing knowledge enables organizations to link better with existing customers, and to define the target customer more accurately. The dimensions of marketing knowledge in this research are indicated according to the following classification. First: Knowledge of the market: Knowledge of the market enables business organizations to identify the needs and desires of customers, their characteristics and interests about the nature of the products and services provided to benefit from them when designing the marketing mix for various products and services. Second: Knowledge of Suppliers: Knowledge of suppliers is important, as it includes knowledge of organizations that equip and provide the organization with the necessary resources that are important in producing goods and providing various services. Third: Knowledge of the customer: Knowledge of customers is based on understanding the needs and desires and discovering them in a renewed way by interacting with him and tracking his behavior, providing the value that satisfies him and acquiring the value that satisfies the organization, which includes knowledge from the customer and knowledge about the customer and knowledge of the customer, and the success and continuity of the company depends on accurate understanding For the customer as he is the cornerstone of the marketing process at the present time, so the organization must find many channels of mutual communication with him to identify his needs and desires and work to produce and provide goods and services of high quality, the lowest price, the greatest benefit and the safest and to align it with his needs and desires in a way that achieves his satisfaction to improve the image of the organization in his mind. Fourth: Product knowledge: Product knowledge includes clarity of the characteristics of the products that customer's desire and those characteristics that the organization desires to present, so that the organization can satisfy the needs of customers and the market." Fifth: Knowledge of competitors: Knowledge of competitors represents the source of the ability to confront competitors, and although competitors seek to make

their knowledge difficult to imitate, however, competitors' businesses, products, and services provide opportunities for organizations to learn by analyzing their strengths and weaknesses (Alolayyan et al., 2018; Al-Dmour et al., 2021).

2.2 Competitive Advantage

The concept of competitive advantage emerged as one of the important topics in the field of business management, and the competitive advantage refers to the organization's ability to formulate and apply strategies that achieve distinction in front of competing companies, which operate in the same activity of this organization, and this can only be done through an optimal exploitation of the capabilities and resources of the organization; Financial, technical and organizational, in addition to the capabilities of competencies and knowledge of workers in this organization, through which they can apply and design competitive strategies, and this concept is related to the concept of perceived value to customers, and the extent of the organization's ability to achieve distinction among other organizations (Munizu, 2013). Competitive advantage has been defined as: "a set of factors that have a direct and indirect relationship to the organization's stability in the market, which includes the organization's effective participation in economic fields that affect stability and the development of profits, by actively employing material and human resources (Baroto et al., 2012). Al-Nady et al. (2013) defined competitive advantage as the most appropriate management that aims to discover new, innovative and creative ways to produce and provide goods and services more effectively than those offered by competitors in the market, where it is able to embody these methods on the ground, creating a innovative process that outperforms its competitors.

The competitive advantage of companies expresses their ability to attract customers, build a good image for them, improve their satisfaction and add serious value to their products (Baah & Jin, 2019). There are two types of models related to competitive advantage: the resource-based model, and the market-based model. These two models complement each other, and each of these two models includes variables, as the competitive advantage model that is based on the market includes variables such as differentiation, cost, effectiveness and evaluation of competitors, and the risks and threats facing the organization, while the model of competitive advantage, which is based on resources, it includes All the resources owned by the organization are material, financial or human, so that the movement and development are from within the organization (Korankey, 2013; AlHamad et al., 2022; Alshurideh et al., 2022; Hasan et al., 2022).

Due to developments and environmental changes and the changing needs and desires of the customer over time, the competitive dimensions have changed and developed. Thus, the success of the organization depends on determining the appropriate dimension on the basis of which it competes, which directly affects the organization's strategy and its entire performance. These are the main factors that achieve the organization excellence and superiority over competitors in the long term through

its ability to identify the needs and desires of its target market and the possibility of satisfying these needs and desires in a way better than its competitors. The organization works on translating those needs and desires into certain indications that constitute the dimensions on which the organization will compete, and these dimensions constitute the competitive advantages (Al-Nady et al., 2013). The researchers differed in defining these dimensions, some of them identified them with five dimensions, and some identified them with six or more. However, they mostly agreed in four dimensions; delivery, quality, cost, flexibility (Al-Hawary et al., 2011; Alzoubi et al., 2021).

2.3 Marketing Knowledge and Competitive Advantage

Marketing knowledge has been studied by many researchers, Munyoro and Nyereyemhuka emphasized that the culture of customer relationship management leads to better performance, with strategies that use the needs and expectations of customers as a way to create a continuous culture to manage customer relationship. According to Abubakar and Mohammad (2019), companies looking for ways to improve the quality of decisions to improve their production lines in order to enhance competitive advantage. While Zebal and others: made five main proposals for business organizations to take advantage to improve the performance of their business in the markets, by adopting the internal and external approach to the management of tacit and explicit knowledge. In an attempt to understand market orientation to accelerate market innovation, define competitive advantage, and build performance**.** Na et al. (2019) researched marketing innovation, sustainable competitive advantage, and performance and confirmed that functional coordination of market cultural orientation increases product innovation, according to Hasniaty, Asram and Basmar (2018), improving marketing performance improves competitive advantage; as efficiency, innovation, information technology, facilities and infrastructure improve the company's performance and in terms of new products from which a competitive advantage can be built.

Husseini et al. (2018) refered to the existence of a relationship between efficiency, product quality, innovation and new product development. Competitive advantage may be achieved as a result of developing a new product strategy, and marketing knowledge management may create a sustainable competitive advantage because there is a positive role for marketing knowledge management to improve performance and reach a sustainable competitive advantage (Rezaee & Jafari, 2015). Marketing knowledge can also be used to improve the marketing communications of retailers in small and medium-sized businesses to obtain appropriate knowledge from customers and feedback to meet their needs and help win new customers (Marcek & Mucha, 2015). As knowledge management can affect the competitiveness of projects, knowledge management can help to make the company in a better position in terms of the effectiveness and efficiency of its activity, and thus enable the company to achieve a competitive advantage with the need to harmonize all characteristics of marketing

knowledge depending on the environment and activity of the company (Semaskiene & Stancikiene, 2014). Based on Based on the above theoretical literature, the study hypothesis can be formulated as follows:

There is a statistically significant effect at the significance level ($\alpha < 0.05$) of marketing knowledge on the competitive advantage of food industries companies in Jordan.

3 Study Model

See Fig. 1.

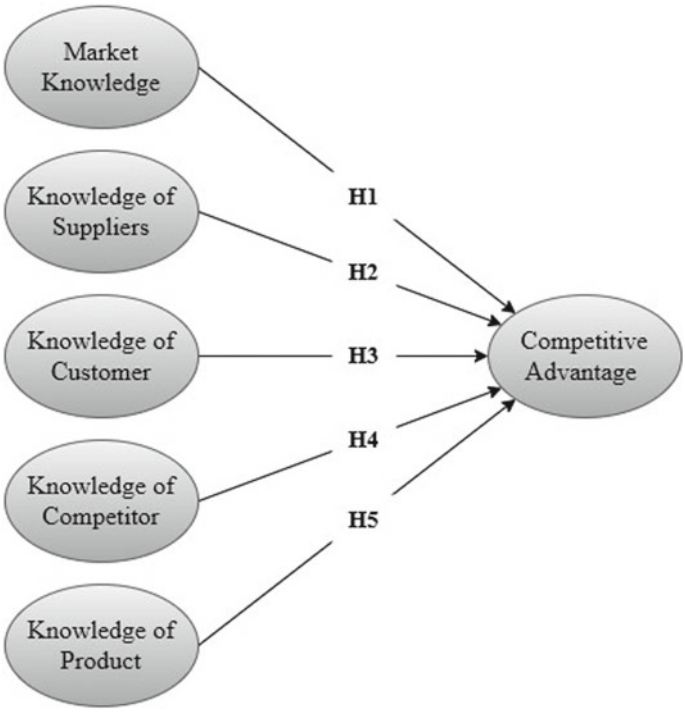

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of marketing knowledge on competitive advantage. Therefore, it focused on Jordan-based companies operating in the food industry sector in Abdullah II Ibn Al-Hussein Industrial City. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a purposive sample of managers at high and middle levels via email. In total, (160) responses were received including (10) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (150) responses suitable to analysis requirements that were formed a response rate of (93.7%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (26) items to measure marketing knowledge based on (Al-Hawary & Alwan, 2016). These questions were distributed into dimensions as follows: five items dedicated for measuring market knowledge, five items dedicated for measuring knowledge of suppliers, five items dedicated for measuring knowledge of customers, six items dedicated for measuring knowledge of competitors, and five items dedicated for measuring knowledge of products. Whereas the second section included eight items developed to measure competitive advantage according to what was pointed by ((Distanont & Khongmalai, 2018; Yasa et al., 2020).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021; Al-Adamat et al., 2020; Al-Gasawneh et al., 2020). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that **the** standard loading values for the individual items were within the domain (0.673–0.854), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6
1. KMA	**0.755**					
2. KSU	0.527	**0.752**				
3. KCU	0.374	0.438	**0.743**			
4. KCO	0.422	0.527	0.502	**0.734**		
5. KPR	0.502	0.498	0.496	0.449	**0.774**	
6. COA	0.624	0.597	0.602	0.625	0.597	**0.761**
VIF	3.727	1397	2.311	2.646	2.648	–
Loadings range	0.681–0.825	0.718–0.831	0.682–0.802	0.685–0.792	0.687–0.837	0.673–0.854
AVE	0.570	0.566	0.553	0.538	0.599	0.579
MSV	0.418	0.502	0.468	0.513	0.484	0.511
Internal consistency	0.866	0.861	0.857	0.872	0.880	0.911
Composite reliability	0.869	0.867	0.860	0.875	0.882	0.916

Note KMA: market knowledge, KSU: knowledge of suppliers, KCU: knowledge of customers, KCO: knowledge of competitors, KPR: knowledge of products, COA: competitive advantage, Bold font indicates to root square of AVE

values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (de Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in (Figs. 1 and 2).

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.514, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.036, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019).To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that marketing knowledge dimensions had a positive impact relationship on competitive advantage except knowledge of customers ($\beta = 0.054$, $t = 0.267$, $p = 0.092$). However, the results indicated that the highest impact was for market knowledge ($\beta = 0.363$, $t = 2.418$, $p = 0.001$), followed by knowledge of products ($\beta = 0.251$, $t = 2.161$, $p = 0.003$), then knowledge of suppliers ($\beta = 0.190$, $t = 2.209$, $p = 0.002$), and finally the lowest impact was for knowledge of competitors ($\beta = 0.102$, $t = 1.474$, $p = 0.041$).

6 Discussion

The management of food industries companies is keen to deliver their products at a specific time to achieve financial return and gain customer satisfaction and loyalty, and to ensure quality and the ability to control activities and optimal use

of its available resources to reach the largest segment, and to ensure that tasks are completed at the specified cost, and its ability to reduce prices and speed to respond to customers' requests, flexibility, simplification of transactions, and speed of response

to customer requirements, which may create a competitive advantage over competitors. The results of the study showed that there is an impact of marketing knowledge on the competitive advantage in food industries companies in Jordan. It is clear to the researcher the impact of marketing knowledge on the competitive advantage, and that this effect stems from the keenness of the food industry companies to review, develop and constantly improve knowledge of the market, suppliers, customer, competitor, and product because of their conviction that these improvements with knowledge will benefit them in improving competitive advantage through accuracy of delivery, quality control, cost reduction and flexibility. This view is supported by Al-Mardini, Karthikeyan, Razaee and Jafari (2015). According to the results of the study, food industries companies in Jordan, through their officials, recognized the importance of providing effective channels of communication with the customer in the success of delivery and quality control of the various procedures. The keenness and commitment of the food industry companies to work with high efficiency reduce costs and achieve flexible procedures without delay.

7 Recommendations

Based on the findings of the study, researchers recommend managers and decision makers in food industries companies to provide the ability to process and analyze the information they possess in order to correctly predict market demands and study different markets. It also recommends to increase cooperation with suppliers and customers to follow up on new developments in the market. And maintain a database on suppliers and competitors for the purpose of constantly analyzing their environment and information. The study also recommends the need to train workers with multiple skills and abilities that make them able to perform multiple tasks, and work on continuous change in the design of production processes.

questionnaire was distributed via (Google Forms) and shared by talent managers at Jordanian telecommunications companies, and 257 responses were valid for statistical analysis. After conducting a statistical analysis, the study reached the presence of a statistically significant effect of talent management has a statistically significant effect on Organizational Innovation in Jordanian Telecommunications companies. The study recommended giving attention to talent management, as it represents the first driver of all work activities.

Keywords Talent management · Organizational innovation · Mobile communications companies · Jordan

1 Introduction

Talent management as one of human resources field seeks to build and develop the idea and concept of focus on talent culture as a major competitive advantage source, as companies that possess talented and distinguished work force can develop their organizational culture to be an attractive place to work, a source of employees' pride, build loyalty and trust between existing employees (Abuhashesh et al., 2021; Odeh et al., 2021). Talent is an organizational important issue, as organizations are competing to include distinguished talent in light of the supply of job seekers increase and talent in qualitative terms scarcity (Al-Lozi et al, 2017; Al-bawaia et al., 2022). The human element, talent, was one of the main organizational characteristics that influence innovative behaviors and capabilities in service-oriented organizations (Almaazmi et al., 2020; AlTaweel & Al-Hawary, 2021). These talents include all the acquired skills that employees display from all of their training experiences (Al Suwaidi et al., 2020; Nuseir et al., 2021). Talent management represents the energy that moves and pushes talents towards creative and distinguished work and increases organizational attractiveness. Organizations' adoption of talent management leads to building of employee's capabilities, and at the same time, effective performance that builds competitive advantage depends on the competence and capabilities of these individuals (Al-Hawary & Nusair, 2017; Al-Hawary & Al-Namlan, 2018; Mohammad et al., 2020). Organizations strive to excel constantly, and this requires them to continuously improve their capabilities to suit their client's needs and expectations (Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Obiadat, 2021; Al-Hawary et al., 2013; Alolayyan et al., 2018; Alshurideh et al., 2017). This improvement requires skilled, distinguished, trained and talented human resources, in addition to the presence of specific strategies that help them complete their work, which indicates talent management strategies importance in high levels

Department of Management, College of Business, University of Sharjah, 27272 Sharjah, United Arab Emirates

A. A. S. Mohammad
Faculty of Administrative and Financial Sciences, Marketing Department, Petra University, P.O. Box 961343, Amman 11196, Jordan

of achievement, which is positively reflected on the organizational innovation and its members in order to achieve high levels of strategic creativity in the short and long term (Alhalalmeh et al., 2020; Cappelli, 2008; Al-Hawary & Al-Syasneh, 2020; Al Kurdi et al., 2020a, 2020b; Alshurideh, 2022).

The researcher noted the discrepancy in telecommunications companies provided services quality and consequently the diversity processes involved in providing the service, and because the telecommunications sector targets all segments of Jordanian society, the circumstance must find human cadres with high flexibility capable of dealing with all the conditions created by the surrounding environment and finding the best ways to reach excellence at the level of service delivery and operations. In view of the fierce competition between Jordanian telecom networks, they strives to own what distinguishes them and makes it unique, whether it is a customer service that represents a superior response and meets the needs or a distinct process that achieves the customers value. Or strategies that are difficult for competitors to imitate. Therefore, we will start here to see the impact of talent management on the organizational innovation.

2 Literature Review and Hypotheses Development

2.1 Talent Management

The term "talent" has different definitions according to different fields of study. Nurhadi and zahro (2016) define a set of different definitions of "talent" such as mastery of abilities and skills, individual ideas to generate creative ideas, set of values, intrinsic endowment, and cognitive skills or enhanced competencies that allow employees to perform in an excellent manner. The term talent management is defined as the process of attracting, selecting, developing and retaining talent for the best employees in a strategic organizational position (Scullion & Collings, 2011). As Cunningham (2007) says that talent management typically means high performance and a resource that must be managed mainly according to performance levels, therefore talent individuals must be sought, appointed and rewarded differently, regardless of the special roles they play or even organization special needs.

As Bhatnagar (2007) points out that talent management is the priority for rapidly attracting organization attention across the world, talent management is primarily designed to improve individuals recruitment and development process in order to meet the current organizational needs as the various characteristics of talent management are recruitment and selection Supervision, performance management, career development, leadership development, planning alternatives, excellence and reward. talent management importance appears in what it achieves for the organization, as it is considered a source of business organizations excellence, and the organizations' practice of talent management processes from attracting, developing, motivating and sustaining talented employees helps in achieving the organization's current and future

goals, in addition to talent management importance appears in its ability to provide departments and sections needs of human resources who working responsibly, flexibly and quickly in decisions making. (Alameeri et al., 2020; AlShehhi et al., 2020; Grapragesem et al., 2014).

As indicated by Jones (2010) that talent management aims to build a culture that helps generate commitment and build the capabilities and competencies necessary to possess the integrated talent, using the distribution and development process that aligns with organizations objectives. Researchers have differed about talent management dimensions due to the multiplicity of views on this concept, as Stahl et al. (2007) sees that it includes talents recruitment, succession planning, training and talents development, and talent retention, while Collings and Mellahi (2009) indicates that it includes identifying vital jobs, develop and grow the talent pool, create a structure of diverse human resources, to measuring talent management Kumari and Bahuguna (2012) relied on several dimensions: identifying vital job positions, aggregating talent, attracting talent, managing talent performance, developing talent, disseminating talent, and retaining talent. Buthelezi (2010) identified several dimensions: Manpower planning, talent attraction and selection, career path management, performance management, talent development, reward and recognition.

As for this study, the study relied on a set of dimensions to measure talent management: talent attraction, talent education and development, talent training, talent performance management, and talent retention. Attracting talents: the process of identifying and selecting talent requires the use of multiple techniques to collect data on talented individuals, including the central assessment methodology, psychometric tests, talent data integration, and finally talent maps that represent the result of the talent identification and selection process (Al-Hawary, 2011; Egerova et al., 2013). Talent training: training refers to achieving the competency, information, and ability needed to carry out activities through training (Al-Hawary, 2015; Kum et al., 2014; Shamout et al., 2022; Alshurideh et al., 2022). It is evident in the literature that organizations that invests in talent training, talent development and continuous learning programs is more likely to attract and retain employees through its intent to eliminate employee turnover, it also has an economic and performance advantage from these employees. Talent education and development is the high potential individuals and future senior managers' development for what it wants from its senior leaders in the future, talent performance management (Al-Hawary et al., 2020; Alshamsi et al., 2020; Metabis & Al-Hawary, 2013). This step refers to performance measurement, that is, the process of planning, managing and evaluating employee's performance over time. This step is important in a talent management system for simple reason that management does not want to promote people whose current jobs are not performing effectively, in order to maintain credibility (Al-Hawary & Alajmi, 2017; Alkitbi et al., 2020). Finally, retaining talents by organizing an encouraging environment for talented people to present their suggestions through holding seminars, exchanging creative ideas and innovative skills, and forming development plans to support employee performance. It helps create a stronger working relationship between the employee and his manager that enhances loyalty and retention.

2.2 Organizational Innovation

Innovation refers to the ability to find new things that may be ideas, solutions, products or services, or useful ways and methods of work (Alameeri et al., 2021; AlTaweel & Al-Hawary, 2021). "Innovation is the ability to provide unique answers to posed problems and exploit opportunities." Organizational innovation becomes the main factor in the existence of the company in a competitive environment where the successful introduction of new products is the lifeblood of most organizations (Al-Hawary & Aldaihani, 2016; Tohidi & Jabbari, 2012). The importance of organizational innovation appears in that it helps the organization work well by improving coordination, internal control and the organizational structure (Alzoubi et al., 2022; Ghannajeh et al., 2015). It also leads to facilitating administrative processes that enable the organization to continue its work and find creative solutions to the problems it faces efficiently and effectively, and to bring positive changes in the institution's and its administrative processes, and helps it adapt and interact with all the surrounding environmental variables, improve its productivity, raise its performance levels and employees performance, and find discoveries, proposals and ideas for the development of new, innovative and creative systems, regulations, procedures and work methods, which results in the emergence of programs and services outside the main enterprise activities, improving the products and services quality provided to customers benefiting from the service, and increasing its financial input (Al-Nady et al., 2013; Allahow et al., 2018; Alzoubi et al., 2020). Organizational innovation is an integral part of the culture of any organization that seeks success, as it occupies the heart of its activities and operations (Al Naqbi et al., 2020; Al-Hawary & Alwan, 2016). "Innovation in organizations creates the appropriate climate that enables the organization to be able to develop new products to satisfy customers' needs in the market on the one hand, and the ability to achieve the growth goals sought by the organization on the other hand."

According to Walker (2008) organization innovations are innovations in structure, strategy and managerial processes. While Afuah (1998) classified organizational innovation into three categories: The first is technological, including products, services, and processes. The second is the market including product, price, place and promotion and the third is organizational and managerial including strategy, structure, systems and people. This research is based on the use of the following dimensions of organizational innovation, service innovation, which is new idea introduction that focus on services that provide new ways to provide benefit, new service concepts, or new service business models through continuous operational improvement (Enz, 2012).

Product innovation: introducing a new product, introducing new functions, improving performance, or adding new features to existing products; Consumers do not know it (Susman & Warren, 2006). Process innovation is new production methods introduction, management methods and techniques that can be used to improve production and management processes. And managerial innovation, which

is often specifically related to strategies, structure, policies, or people within the organization (Popadiuk & Choo, 2006). It is a set of clear and well-defined approaches and processes aimed at discovering and managing knowledge functions, in various types of operations, identifying new products or strategies, strengthening human resource management, and achieving a number of other goals to be achieved.

2.3 The Relationship Between Talent Management and Organizational Innovation

Many studies have emphasized the relationship of talent management and organizational innovation. Attracting talent is one of the important things that determine organizational performance, and thus attracting talent has a significant positive impact on organizational performance. Abou-moghli (2019) emphasized that innovation strategies contribute significantly to enhancing organizational competitive advantage. Talent management is a catalyst for organizational performance improvement because the process of innovation, retention and attraction is a significant influence on organizational effectiveness. Retention, participation, and attraction influence the innovation process and organizational effectiveness. The investment in talent management and development enriches the intellectual capital, which is a great balance of competitive advantage and organizational creativity (Abd El Rahman & Farghaly, 2019). Mohammed et al. (2018) confirmed with his study on talent management that there is great competition between organizations in modern technology area, which has led to an increase in knowledgeable employees in addition to huge changes in the market. Consequently, academic institutions have begun to rethink their procedures and policies to best attract, develop and retain these employees. Olaka determines the extent of the relationship between talent management and creativity, and the results of his study showed that there are positive relationships between the variables of talent management and the variables corresponding to creativity. The researcher adds that the proper identification, development, use and retention of talent is likely to translate into higher innovations in terms of services, processes, marketing and products and this will also lead to improved organizations performance and profitability. Based on the foregoing, study hypothesis can be formulated as follows.

There is a statistically significant effect of talent management on organizational innovation of Jordanian telecom companies.

3 Study Model

See Fig. 1.

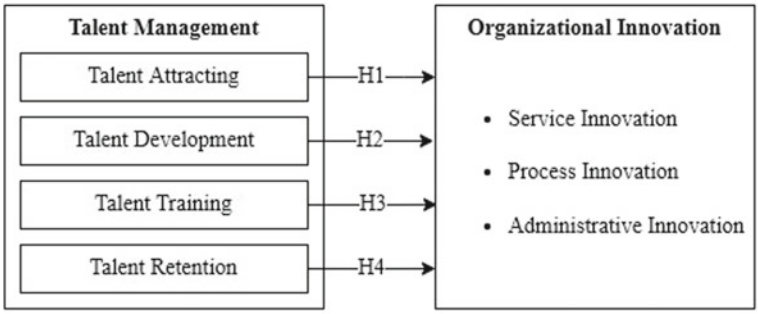

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of talent management on organizational innovation. Therefore, it focused on Jordan-based companies operating in the telecommunications sector. Data were primarily gathered through self-reported questionnaires creating by Google Forms which were distributed to a purposive sample of (370) HR managers via email. In total, (282) responses were received including (25) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (257) responses suitable to analysis requirements that were formed a response rate of (69.4%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure talent management based on Al-Lozi et al. (2018). These questions were distributed into dimensions as follows: five items dedicated for measuring talent attracting, five items dedicated for measuring talent development, five items dedicated for measuring talent training, and five items dedicated for measuring talent retention. Whereas the second section included (18) items developed to measure

organizational innovation according to what was pointed by Al-Hawary & Aldaihani (2016). This second-order construct was divided into three first-order constructs. Service innovation was measured by six items, process innovation was measured through six items, and administrative innovation was measured using six items.

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Al-Adamat et al., 2020; Al-Gasawneh & Al-Adamat, 2020; Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.651–0.901), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5	6	7
1. Talent attracting	**0.777**						
2. Talent development	0.517	**0.769**					
3. Talent training	0.497	0.471	**0.783**				
4. Talent retention	0.438	0.442	0.502	**0.754**			
5. Service innovation	0.628	0.588	0.556	0.567	**0.766**		
6. Process innovation	0.678	0.625	0.637	0.598	0.671	**0.779**	
7. Administrative innovation	0.597	0.567	0.697	0.684	0.662	0.604	**0.744**
VIF	1.763	2.357	1.746	2.156	–	–	–
Loadings range	0.681–0.881	0.705–0.835	0.651–0.901	0.693–0.827	0.683–0.864	0.662–0.897	0.655–0.825
AVE	0.604	0.591	0.614	0.569	0.586	0.607	0.554
MSV	0.502	0.472	0.513	0.520	0.483	0.516	0.409
Internal consistency	0.881	0.875	0.884	0.866	0.892	0.899	0.878
Composite reliability	0.883	0.878	0.887	0.868	0.894	0.902	0.881

Note Bold fonts in the table refer to the square root of AVE

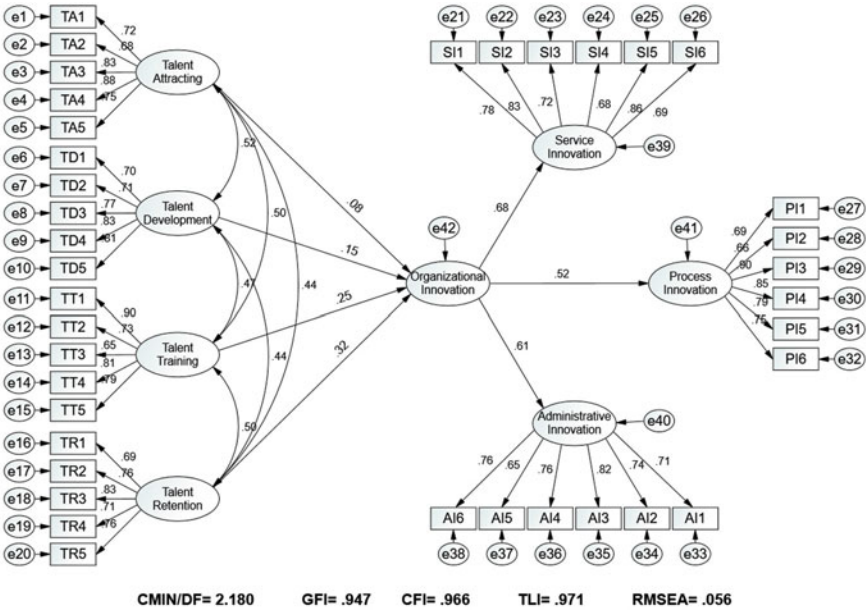

Fig. 2 SEM results of the talent management effect on organizational innovation

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 2.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.180, which is <3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.056, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019).To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all talent management dimensions had a positive impact relationship on organizational innovation except talent attracting ($\beta = 0.081$, $t = 1.302$, $p = 0.195$). However, the results indicated that the highest impact was for talent retention ($\beta = 0.316$, $t = 6.045$, $p = 0.000$), followed by talent training ($\beta = 0.248$, $t = 5.368$, $p = 0.000$), and finally the lowest impact was for talent development ($\beta = 0.148$, $t = 3.235$, $p = 0.040$).

Table 2 Hypothesis testing

Hypothesis	Relation	Standard Beta	*t* value	*p* value
H1	Talent Attracting → Organizational Innovation	0.081	1.302	0.195
H2	Talent Development → Organizational Innovation	0.148	3.235	0.040
H3	Talent Training → Organizational Innovation	0.248	5.368	0.000
H4	Talent Retention → Organizational Innovation	0.316	6.045	0.000

Note $*p < 0.05$, $**p < 0.01$, $***p < 0.001$

6 Discussion

It has been evident from the study results that the company under study is keen on developing, improving and training talents through its continuous endeavor to encourage talents to present ideas and proposals, involve them in educational workshops and conferences, and provide a distinctive training environment. Telecom companies seek to retain what they have of talent by providing material and moral incentives and opening doors for career development. study results also confirmed that company management concerned with talent management is not aware of the of attracting talent importance that they have not clear strategies for attracting employees and evaluate them carefully to discover and exploit their strengths. The results showed the interest of telecommunications companies in supporting talents to provide a high quality service that satisfies customers. This results agreed with the study of Emmy & Hillary, which showed that there is a significant positive impact of the variables (talent attraction and its dimensions are selection and polarization, employee promotion, job security) on job performance. And it appeared that Jordanian telecom companies are interested in supporting talents to present new ideas related to improving service delivery by automating procedures, modifying and improving their processes, and finding innovative ideas to reduce the operational cost of operations while raising their outputs. This result agreed with Al-Hiyasat study, where the study showed an impact of the talent management strategy (talent attraction, talent investment, talent development, talent development, talent retention) in achieving the competitive advantage. Study results showed that supporting, developing and retaining talent contributes greatly to innovation and creativity in presenting work methods, in addition to creating distinctive and renewable administrative policies. So that Jordanian telecommunications companies constantly seek to involve talented people in the decision-making process related to work goals. This result agreed with the study of Abou-Moghli (2019). The results showed an important and positive impact of the innovation process, retention and attraction on organizational effectiveness. In addition, the study found a positive and significant role in moderation of retention, engagement, and attraction in the innovation process

and organizational effectiveness. Talent management in Jordanian telecommunications companies pays attention to the human resource for innovation and creation of creative ideas to provide high quality services. Talent management role is enhanced by attracting, developing and retaining talent in finding innovative and unique ways to enhance its competitive strength.

7 Recommendations

Based on the results, the study recommends that Jordanian telecommunications companies adopt clear employment strategies to attract talented people internally or externally and place them in the right place to increase creativity and enrich companies with unique and distinctive ideas. Encouraging talented people who are able to think innovatively by providing practical suggestions for creating new services, improving new services, and a new process. Emphasis on the education and development of talents and their development to enhance their creativity, allocate a budget to develop the capabilities of the gifted, and involve the gifted in educational workshops or conferences dealing with enhancing the quality of services and operations provided. As well as following up on employees strengths and weaknesses to fill the knowledge gap at all levels and qualify them to participate in presenting distinctive and unique ideas.

Running Head: Impact of Smart Buildings on Accounting and Management Control

Ala'a Yahya Ahmad, Nedal Fawzi Assad, and Muhammad Turki Alshurideh

Abstract This study investigates the impact of smart buildings on accounting and management controls. By analyzing the innovative building structures, this study will find out the accounting and management controls patterns and their solutions or help improve management control or reduce costs. Studying different articles for this study hardly find any relevant article or research paper on this study, but some documents are available on management and controls and intelligent buildings. So, the research gap of this study is that no investigation was done on this topic. As earlier, no research was done on this topic, so my analysis will be based on primary qualitative or exploratory research. Based on this, some previous papers will be analyzed and based on that information; thematic solutions will be provided.

1 Introduction

An intelligent building should provide its occupants and owners with a wide range of high-value features and benefits. However, after some time, expectations for a building shift while the structure itself is at risk of deterioration and degeneration. To ensure that intelligent buildings meet all their requirements throughout their lifecycle, careful attention to detail is required. In addition to thorough planning throughout the construction and execution phases, the building's operating term needs high-quality administration and upkeep. All the way through, the facilities manager is a

key actor. The contemporary building of the twenty-first century must show a high degree of adaptability and usefulness in addition to good architectural, technical, and environmental characteristics. Keeping an eye on all these features is essential. As a facilities manager, you may be responsible for installing and analyzing building monitoring systems. As the level of relevance of building optimization grows, so does the number of solutions available for improvement. As a result, the best chances of successful project implementation are found in the early stages of project planning. It is estimated that up to 80% of all operating expenses are established at this point, just before construction begins. At most, only around 20% of a building's operating expenditures may be modified throughout its life (while 80% of the overall costs are regularly attached to the operational phase). Although it is not common practice in many countries, the participation of facility managers in the early stages of building design should be the norm. As a result, existing buildings may be reconstructed or altered without compromising the integrity of the original design. When designing smart buildings, having a facility manager on board is essential. This means that the facility manager is tasked with representing the interests of both the investor (the future owner) and the building's future occupants. For example, suppose a facility manager assumes control of an already-completed construction project. In that case, they will have only a limited number of alternatives for improving the long-term cost-effectiveness of the building. For a facility manager devoted to their profession, such practices are difficult to bear. As a result of the inability of both the building owner and potential tenants to complete critical optimization efforts that affect operating expenses, this has happened in this instance. A significant deficiency in the building's use phase is that the concept of planned (preventive) maintenance has not yet been adequately extended. There is still a great deal of building and equipment maintenance done out of necessity rather than a genuine desire to address the root causes of any given manifestation or issue. As a result, both the frequency of repairs and maintenance costs have increased. Preventative maintenance may save you up to four times the cost of repairs if you don't undertake it. In addition, uncoordinated interventions in building management and necessary disturbances to the facility's functioning harm building users' well-being. In the context of smart buildings, this is an absolute no–no. Instead, facilities managers must work with other components (such as suppliers of innovative technologies) to mitigate such risks and prevent such eventualities.

2 Literature Review

2.1 Smart Building Policy

Building owners and users' needs are the core emphasis of "smart building," which may be defined in various ways. The primary focus is on how technology, services, and system solutions can be leveraged to meet these needs. Operational costs and

energy usage, the interior atmosphere, and the preservation of the building's technical condition and market value are all factors that must be taken into account to accomplish this. To suit the growing demands of both owners and users, subgroups of criteria must be established for each of these factors (Stamatescu et al., 2019). This implies that the building's inherent intelligence must be preserved by not changing its qualities through time but rather by improving its quality. All kinds of buildings, from residential to administrative to public, may benefit from this approach, which considers the unique purpose for which they were designed. Some of the demands made by owners and renters of intelligent buildings are compatible, while others are at odds. Owners prefer the following alternatives:

- minimizing acquisition costs.
- minimizing operating costs.
- minimizing energy costs.
- minimizing repair and reconstruction costs.
- maximizing the return on investment of the building.
- continuous conservation or increase in construction value (investment protection).
- optimizing the level of security of the building and its users.

It was evident from this review that the financial demands of buildings are of crucial importance. However, although the user owner's) interests are vital, the owner does not need to interfere with those interests.

- The flexibility of leased spaces.
- The quality of the indoor environment that contributes to achieving the desired comfort of use or to increasing work productivity.
- Maximizing security level.

Renting out the interior of a building to satisfy tenants' demands is a frequent practice for building owners. The owner's expenditures throughout the building's construction, existence, and operation should be monitored less for "minimization" and more for "optimization" in light of the three requirements of the building. While the facility is being utilized, the facility manager's role is to keep an eye on and safeguard the interests of all parties involved throughout the planning, projection, and final realization phases. Many vendors and suppliers often give particular technologies or even partial facets of the building's intelligence as part of its implementation or upkeep. However, whatever technology is utilized to administrate sub-groups or to manage the building's general operational management must run smoothly at all times. Therefore, certain technologies are allocated to sub-groups to satisfy the building's specific functional demands. For example:

- optimization of energy management.
- power system management, heating, ventilation, cooling, air conditioning, lighting, shading technology, external sources (weather forecasting, etc.).
- fire safety of buildings and users—fire safety system, ventilation, lighting, lifts, security system, power system control.

- user safety—security system, person entry system, indoor CCTV circuit, charges, lighting.

The BMS (Building Management System) platform is used to regulate all of the building's systems and offer real-time access to information to establish an integrated multi-operating structure. BMS keeps track of individual technologies and raises warnings when something out of the ordinary occurs while archiving any intermediate data. The operator has to be subservient to the facility management to respond to the data supplied (Gonçalves et al., 2020). Human variables like security and cleaning, in addition to the BMS platform's technologies, must be managed by facility managers to guarantee that the intelligent building works optimally for its owners and users. Starting with the design phase and continuing throughout the life of the building, BIM (Building Information Modeling/Management) should be an integral part of any innovative building project. Stanford University's Center for Integrated Facilities Engineering studied 32 BIM-based projects. The design and implementation duration were significantly reduced because of the contributing components' more effective data management and coordination. The reduction of collisions throughout the pre-implementation and implementation phases saves up to 40% off-budget and 10% of total expenses. For intelligent buildings, BIM's financial advantages are anticipated to be far more significant.

2.2 Facility Management in Smart Buildings

In today's building management paradigm, facility managers perform a wide variety of tasks (in the case of smart buildings). The administration of technological assets, coordination, and integrated management are often included in these packages (Dong et al., 2019). Therefore, FM may be divided into two primary divisions that do not have a clear border, based on the demands of the client and the needs of the company:

- **Space and Infrastructure**—so-called "hard services", i.e., space management, space utilization, management and optimization of the workplace, technical management of buildings, energy management, waste management, indoor and outdoor cleaning.
- **People and Organizations**—so-called "soft services", i.e., health, hygiene, safety and security, internal services (boarding, receptions, meeting rooms, secretarial services, etc.), ICT, internal logistics (archive services, internal mail, mail service, transport services, car service, etc.).

Management of facilities is defined by the International Facility Management Association (IFMA) as including operations management, design and architecture, and the arts and sciences. All systems in the building must be functional and efficient, as well as the structure's interior space must be efficiently used to guarantee the building's long-term survival (Dong et al., 2019).

To summaries, the ultimate purpose of facility management is to provide a high-quality interior environment while also maximizing the building's energy and resource efficiency. Whether it's a single structure, a collection of buildings, or a complex, the basics remain the same. Effective use of client assets is crucial to provide the most excellent possible support for the client's primary business activity. As part of the design team, a facilities manager should accept these requirements throughout the planning phases for a new building or restoration of an existing structure (Ostadijafari et al., 2019). However, smart buildings have higher operational system accountability than traditional buildings. This is why they provide more advantages than conventional buildings, such as more flexibility and usefulness, better interior environment quality, and higher operational efficiency. More than a hundred different technologies exist for these features, and their network is far more extensive and better connected than a conventional building's. But if technology fails, the structure's functionality and security are damaged, which is not necessarily fatal for a typical installation. Non-financial ramifications, such as a sullied reputation, might accompany the financial ones. Competent building facilities managers are not one person but rather a team of experts who are directly responsible to building owners or CEOs. There is a good chance that an intelligent building's management staff and its owners will have conflicting interests (Ostadijafari et al., 2019). This means that in addition to having an excellent professional name, the facility manager must also have the ability to speak up for the owner's interests and convey their own opinions.

2.3 Management Controls

The conceptual framework from Balaji et al. (2018) addresses the limitations of researching MCS in organizations. Additionally, the model provides an overview of the many controls, enabling complete investigation since each regime has its research path. This approach and attitude are increasingly used in research (Le et al., 2019). MCS is called "systems" because they are "systems for regulating team member behaviour, not systems simply utilized to obtain information for decision-making" (Balaji et al. 2018). This description does not include accounting systems used for decision support, which instead emphasizes behaviour. To be considered an MCS, cost accounting must also align team member behaviour. Managerial control may be used for various purposes, including but not limited to team member behaviour.

- **Cultural Controls**: Clans, crests, and customs are all part of the package. In an informal form of command and control, a company's culture influences the behaviour of its employees. As an informal control, it is challenging to study culture.
- **Planning**: Malmi and Brown do not consider long-term and action planning forms of control (2008). To control employees, you must have them actively participate in

the process. Individuals and organizations may use it to set goals and measure their progress. Budgeting and planning are inseparable and should be done together.

- **Cybernetic Controls**: Financial and non-financial metrics and a mix of both are all subject to the same level of scrutiny under this system. Measurements may be used to hold employees or organizations responsible for their performance. They are the foundation of MCS, and every firm relies on them. Cybernetic systems may be classed as either information systems or control systems, depending on their function.
- **Reward and Compensation**: They might be used as a control to inspire individuals or groups. Cybernetic controls, team member retention, and cultural control promotion are all part of this strategy. Business plans must be aligned with incentive schemes (Epstein et al., 2010).
- **Administrative Controls**: The organization's structure and design, governance, and rules and procedures are examples of administrative controls that may affect team member behaviour.

To ensure that changes are gradual, cultural controls have been placed at the top. Thus, they provide a framework for other authorities to operate in. Commands begin with planning, followed by measurement both during and after the process, and then possible reward and pay based on performance. There are three sequential controls. To exert authority, one must first establish a base. We can see a significant difference in the design and use of rules (Liew, 2019). MCS may now be studied in more depth, thanks to (Pašek & Sojková, 2018). Two primary topics may be found in this chapter. The setup of an MCS package will be the first step. Only a limited amount of research has been undertaken on the combined effects of these two factors. More evidence from MCS packages that have been deployed in practice is needed to understand better the most crucial systems and the contents of containers. This section focuses on the way systems interact with one another and how it influences their results. As part of the intelligent environment projects, environmental sustainability is a primary focus for each of the five control kinds. Therefore, an interview model is utilized to organize and analyze and summarise the results when conducting interviews (Wei et al., 2018). MCS package design is the most critical factor in determining what controls the city will apply in its MCS package. As a collective, respondents are more inclined to discuss controls than individual controls while answering the survey's questions.

> *One of the world's fastest-growing developing countries, the United Arab Emirates is no exception. One of the critical reasons for Dubai's rapid development is that the government started to plan for a smart city and gradually reflected on other emirates to promote Dubai's future city of Dubai.*

The need of constructing a long-term, ecologically friendly environment could not be overstated. Another motivation to create a green metropolis is the UAE's reputation as one of the world's most polluting countries. According to WWF's Living Planet Report 2014, the United Arab Emirates has the third-largest Ecological Footprint per capita in the world. That's why it's essential to the government that the physical environment, rules and public awareness all undergo significant changes (promoting

sustainability assessment methods, like LEED and ESTIDAMA, with stakeholders who are the decision-makers). The already-existing New York University Abu Dhabi campus was chosen for this study. The institution has 15.4 ha of property. Saadiyat Island in Abu Dhabi, the capital city of the United Arab Emirates, is home to the campus (Zou et al., 2018). On the property, you'll find classrooms, labs, and other resources for academic pursuits. In addition, students and lecturers can both find housing in the area. The building's structure is supposed to adapt to its surroundings, creating a setting that stimulates user-to-user contact. Because of its creative arrangement, the campus's many components, including the buildings themselves, interiors, and exteriors, form a unified whole. Students, faculty, staff, and administrators worked together to build a cooperative institution. This was reflected in the building's physical design and the school's academic offerings another noteworthy characteristic of the site in its landscape design that connects the many institutions on campus. For the ESTIDAMA sustainability accreditation, the NYUAD campus has been created to meet all of the requirements for its creation. Consequently, the case study will incorporate the interior and outside of campus characteristics to emphasize and analyze the components of the outside campus. The sustainable attributes of the contemporary building are divided into two categories:

- Outdoors features: Based on observed site visit.
- Interior Features: Based on a questionnaire survey with staff and students.
- Internal side streets are relatively narrow and shaded by the surrounding buildings.
- Use of local plants/palm trees and water channels that do not require excessive water while offering a soothing atmosphere during summertime and pleasant scenery for the people.
- The High Line is a must-see since it is the campus's most recognizable icon. The High Line is a system of bridges and stairways on the second level of every university campus that enables visitors to move between buildings freely. As seen in, a green canopy above the High Line works as a heat insulator. The advent of the High Line has made the university's campus more dynamic and exciting. In addition, students, instructors, and staff will be more likely to stroll between buildings if the walkway is well-designed. Because of the gardens and vistas from the tops of the buildings, students were more likely to walk between campuses. All across the school, solar panels have been installed on the roofs.

3 Thematic Results

3.1 Impact of Smart Buildings

To keep up with the growth of "smart buildings," facilities management must give way to real estate management. However, the smart (intelligent) building is a drawback because of the increasing reliance on embedded technology. In addition, the building's general operational performance and usability are harmed, putting the

productivity and health of its inhabitants in danger and raising operating costs. Owners are responsible for ensuring that their facilities are adequately maintained by appointing a top-notch facility manager (Gholamzadehmir et al., 2020). Technical and non-technical abilities are necessary for a facilities manager's work, but so too is the ability to analyze, interpret, and apply massive volumes of data to real-world circumstances. We should reasonably expect significant technical progress over the next 80 years, given the expected lifespan of buildings. The development of these systems requires continuous updates and integration with the building's central management system to meet the changing needs of the building's owners and users. There is a trade-off between the flexibility, investment protection, convenience of presenting traffic information, and freedom of decision-making that comes with both BMS platforms and building owners through facility managers. This is the fundamental difference between conventional approaches and individual attention to the demands of each structure and its residents. As a result, the procedure has been judged to be useless. They deliver superior customer service by integrating a variety of systems into a cohesive whole. An example of this is SEC and LS integration, a security and access control system. Providing smart access to multiple university departments via a single card is comparable to delivering smart cards and smart access to all students everywhere (library, classrooms, parking. etc.). The smart card may also be used by teaching staff to access classrooms in their department. Energy management and automation provider Schneider Electric cooperated with the University of West England in the United Kingdom to demonstrate a successful building integration. There will also be Schneider Electric's integrated security system on campus, in addition to new departments. Schneider Electric's Andover Continuum building management system and Juniper switch systems were used for both heating and lighting (Gholamzadehmir et al., 2020).

3.2 Management Controls

Planning for a city involves several steps, each of which takes a significant amount of time to accomplish. An essential consideration in the planning phase is the project's budget. The same holds when it comes to finding a business partner.

3.3 Cybernetic Controls

As required by the, the city keeps track of CO_2 emissions to keep tabs on the progress of the city's climate action plan. Nevertheless, this analysis falls short since it fails to account for all relevant factors. Moreover, the city can only have a limited impact on these traits since they are more than simply its boundaries. It is hoped that a dashboard would allow progress toward Liège 2025's strategic objectives to be tracked and

shown. Unfortunately, there was just a brief written account of the progress made at the time of the research, with no mention of the results or an overview of how well the objectives were met (Ramon-Jeronimo et al., 2019). Transversal strategic plan aims include the establishment of a dashboard, increased focus on a formal evaluation, and environmental effect measurement implementation in administration.—There must be a way to track progress toward goals and convey this information internally, as well as externally. According to individuals questioned, the city is working toward these goals and has a strong belief in the benefit of having more information available to residents. The alderman's goal is to have the scorecard in place by 2021. This dashboard may be used to keep tabs on and assess how far you are in achieving your objectives (Ramon-Jeronimo et al., 2019). If necessary, the project might be redirected during or after completion. Nevertheless, evaluating the long-term impact of many programmers is difficult since actions like spreading knowledge and teaching people are challenging to track. Objectivists may also benefit from the information. For example, they educate the public to make more informed decisions and get political support for their initiatives. In addition, real-time data management might help the city improve itself daily. Trash management already had a cleanliness dashboard in place, but it was marked as a work in progress. This dashboard displays data on things like resource use and rubbish collection by neighborhood. This information came from sensors and other sources (Neves et al., 2020). After never having attempted something like this, everyone in the city of Liège had to modify their mindsets. According to one responder, performance evaluations should improve performance, not detract from it. Keeping track of the city's finances is another critical cybernetic control. As a limited but vital resource, money is a primary cause of stress for the city's budget. To request a budget, there is a set procedure. The creation of an annual budget necessitates preparing one year in advance. To go forward, approval is required from the city council and the city financial supervisor (Neves et al., 2020). As a consequence, creating a budget is going to take some time. Nevertheless, the project must be finished on schedule to minimize financial losses at the end of the year. The transversal strategic plan states that enhancing budget management efficiency is a priority.

3.4 Reward and Compensation

For environmental activities in the Belgian city of Liège, there are no extra financial incentives or payments. However, other non-financial considerations were also listed to motivate people in the workplace. For example, workers' self-motivation was considered one of the essential variables in inspiring employees. However, the selection procedure did not include this as a consideration. Internally, the city sought to make its employees' jobs meaningful and express that it was improving people's lives due to this initiative. For this reason, employees are also trained and made aware of the company's impact on sustainability. Motivating and winning support for projects

may be achieved in part via team member engagement. It has been established that reducing the workload negatively impacts team members well-being, which is critical for a motivated workforce.

3.5 Administrative Controls

This section explains the major essential components of the city's organizational structure without going into depth. The political body comprises the mayor, older persons, and cabinet members. In contrast, the administrative body includes the remainder of the city council members and their staff. As a link between the people and the government, the elected body acts as a conduit for the people's will. For the most part, the tasks of these politicians fall outside the purview of other governments. It is the responsibility of the administration to implement the government's policies and provide critical services to the people. Organizations like these have boards of directors, managers for each area of responsibility and regional heads for each sector or neighborhood. Between the two entities, the alderman and his cabinet serve as a vital point of contact, monitoring the progress of many projects and objectives (Parker & Chung, 2018). Officials from both parties meet regularly to examine the progress of environmental programmes and see whether they are accomplishing their aims. The alderman claims that the two organizations work together in harmony. There is an ecological department. However, it must coordinate with every other municipal division. Managing data is a vital IT department responsibility, for example, in intelligent environment efforts like the Internet of Things. Different departments may call upon the environmental expert. When working with others or making purchases, the government must use public procurement. This method entails drawing up the project's specs, issuing an RFP, and comparing at least three offers. It's not only the project's budget that expands inexorably; the legal procedure that governs it does, too. For example, environmental issues may be considered when the city decides, and the transversal strategic plan have the reform of public procurement as a goal. Include ethical, social, and environmental clauses in contracts is the goal of this project as previously said, budgets play a crucial role in this strategy.

3.6 Cultural Controls

Our conversation focused on culture and environmental sustainability since culture spans various themes. They believe that a plethora of little gestures may have a significant impact. Various sectors and generations need different strategies to promote interdisciplinarity but creating a feeling of togetherness is necessary. It is possible to make individuals feel more responsible for their behaviour by informing them of the environmental repercussions. Also, it attempts to emphasize the need of including all essential stakeholders. The city uses eco-teams as role models for its personnel.

There is an intranet, a letter called "info perse," and a quarterly journal sent internally in addition to the intranet. You may use these methods to get the word out about new projects or other departments.

3.7 Accounting

Some of the demands made by owners and renters of intelligent buildings are compatible, while others are at odds. As a general rule, it's pretty rare for owners to wish to lower their out-of-pocket expenditures in these four areas: acquiring the building at the lowest price, operating it at its most efficient level, and minimizing the amount of money they have to spend on repairs and rebuilds. Financial demands on structures are essential in this case. However, even though the user owner's interests are vital, the owner does not need to interfere with those interests. improving production, maximizing safety, and providing more adaptability in leased facilities are all examples of a company's "internal environment quality (Haseeb et al., 2019)."

4 Conclusion

To keep up with the growth of "smart buildings," facilities management must give way to real estate management. However, the smart (intelligent) building is a drawback because of the increasing reliance on embedded technology. In addition, the building's general operational performance and usability are harmed, putting the productivity and health of its inhabitants in danger and raising operating costs. Owners are responsible for ensuring that their facilities are adequately maintained by appointing a top-notch facility manager. Technical and non-technical abilities are necessary for a facilities manager's work, but so too is the ability to analyze, interpret, and apply massive volumes of data to real-world circumstances. We should reasonably expect significant technical progress over the next 80 years, given the expected lifespan of buildings. The development of these systems requires continuous updates and integration with the building's central management system to meet the changing needs of the building's owners and users. There is a trade-off between the flexibility, investment protection, and convenience of presenting traffic information, as well as the freedom of decision-making that comes with both BMS platforms and building owners through facility managers. This is the fundamental difference between conventional approaches and individual attention to the demands of each structure and its residents. As a result, the procedure has been judged to be useless.

Predictive and Prescriptive Analytics Tools, How to Add Value to Knowledge-Based Economy: Dubai Case Study

Mounir El Khatib, Moza Abdalla Al Shamsi, Khalid Al Buraimi, Fatima Al Mansouri, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract Innovation and technology continue to be the driving force of growing economies. The need for constant change and improvement is driven by competing economies fueled by a more educated workforce and backed by proper governance structures. Dubai which has earned immense wealth in the petroleum industry is now venturing into these industries. Smart Dubai was open in 2000 as a smart city solution as an innovative initiative, large scale project for collaboration of private and public sector. These initiatives of Dubai Pulse which involves all stakeholders and entrepreneurs in accessing and sharing of data. It is having been touted for its analytical services. It will be instrumental to the future of uncovering Dubai from the veil of oil money. Dubai banks on technology and innovation particularly predictive and prescriptive analysis. The research study was conducted with the goals of analyzing the usage of both predictive and perspective analysis in the knowledge-based economy. The study also hopes to understand the value created through the use of predictive and perspective analysis in Smart Dubai and DEWA. The study raises conclusions on why the smart city project should be considered a success. Furthermore, there are areas that have been attributed to this success. The information was primarily collected through an interview with employees who heads the

data analytics department at Smart Dubai and employees in the middle management level at DEWA. The feedback from the interviews were elaborate and thorough to the research being gathered. The interview was divided into three concerning knowledge-based economy, use of analytical tools and Dubai Pulse Initiative. The use of the interview arises from the fact that the subject of study needed to be informed by firsthand knowledge. However, this primary source was complemented by other secondary sources. The data from Smart Dubai and DEWA were analyzed to determine the opportunities that the use of the analytical tools will have along with the challenges and benchmarking with global successful cases. Then the recommendations part provides similar governments with the roadmap of how to implement the analytical tools and overcome the challenges.

Keywords Predictive · Prescriptive · Analytics · Knowledge based economy · Smart Dubai · UAE

1 Introduction

UAE desires to maintain a diversified economy with "The Abu Dhabi Economic Vision 2030" and it was launched in 2009 (Ahmed & Alfaki, 2013). It shows that the UAE moves towards knowledge-based economy (Alshurideh et al., 2020a, 2020b; Aswad et al., 2011; Nuseir et al., 2021a, 2021b). Accordingly, the Government of the UAE aims to build a knowledge-based economy with sustainability that shall include process, product and distribution technology with the need for UAE economy diversification while overcoming any challenges or conflicts and acquiring all opportunities available during a knowledge-based economy transformation (Aburayya et al., 2020a, 2020b; AlMehrzi et al., 2020; Mina, 2014). There shall be need for the use of the analytics tools to ensure that a knowledge-based economy adds value to the economy of the UAE and that will be done in this study (Al-Maroof et al., 2021; Leo et al., 2021; Mehrez et al., 2021).

In this research study, literature review will be presented across two perspectives, the first one is the knowledge-based economy, then the analytical tools definition and how it can add value to the economy. Secondly, the research methodology and the data analysis will be presented based on the data gathering and analysis. The analyzed data then will be compared to the literature to identify gaps and opportunities of improvement. By the end of this research, we will conclude and make recommendations. The main objective of this assignment to analyze the usage of both perspective and predictive analysis tools and determine how it adds value to the UAE's knowledge-based economy. In order to meet this research objective, the research questions are the following:

1. How can the usage of perspective analysis tools and value to knowledge-based economy in Dubai?
2. How can the usage of predictive analysis tools add value to knowledge-based economy in Dubai?

2 Brief About the Organizations

2.1 Smart Dubai

Smart Dubai was first established in the year of 2000 but back then it was known as Dubai E-Government till 2013 when H.H Sheikh Mohammed Bin Rashid Al Maktoum changed its name to Dubai Smart government department. The vision of smart Dubai is aligned with the vision of H.H Sheikh Mohammed bin Rashid Al Maktoum to make Dubai the happiest city on earth and since then Smart Dubai has been pioneering smart city solutions and has been focused on transforming and empowering Dubai through disruptive innovative initiatives, large scale projects by collaborating with the public and private sector, leading technological projects and many more (Ahmad Aburayya et al., 2020a, 2020b; Taryam et al., 2020; Al Shebli et al., 2021; AlSuwaidi et al., 2021; Digital Dubai, 2022b).

To name a few, Smart Dubai had several initiatives that made quite an impression across the region and globally.

- Dubai Paperless initiative targeted towards the environmental aspect to preserve the environment by making Dubai a fully paperless government where the governmental department will no longer issue or ask for any papers or printed documents to be handed over across all operations (Digital Dubai, 2022d).
- Artificial Intelligence Ethical toolkit that includes the guidelines, self-assessment tool for developers, ethical considerations and common agreements. This initiative is targeted toward government entities, private sector, and individuals (Digital Dubai, 2022a).
- Dubai Blockchain Strategy project, which is a joint initiative between Smart Dubai and the Dubai Future Foundation that will lead the introduction of the blockchain technology to Dubai that is expected to "unlock 5.5 billion dirhams in savings annually in document processing alone" according to smart Dubai official website (Digital Dubai, 2022c).

This report will highlight a particular initiative called Dubai Pulse, this platform is designed to provide all the stakeholders including government entities, private sector, and entrepreneurs to access one location of shared open data. This initiative includes a core analytical services as well as big data services that can be used by various entities to enhance the living conditions and the economy in the UAE by promoting the vision of making Dubai the smartest and happiest city on earth (DubaiPulse, 2022).

2.2 Dubai Water and Electricity Department

Dewa was first established in 1992 as a result of the merge of Dubai Electricity Company and Dubai Water Department. DEWA provides its services to about

882,000 customers across Emirate of Dubai as the solo provider of electricity and water. DEWA has maintained a high customer happiness rate at a remarkably 95% in 2018 (Government of Dubai, 2022). DEWA strategy consists of five main pillars infrastructure, legislation, funding, building capacities and skills, and having an environmentally friendly energy mix. These pillars were supported of many innovative initiatives to transform Dubai to be the smartest city in the world (Government of Dubai, 2022).

3 Literature Review

3.1 Predictive and Prescriptive Analytics Tools

Predictive analytics are tools that are used to predict the future events through multiple techniques like data mining, statistics, modeling, machine learning and artificial intelligence. Those tools can help analyze the current data available at the organization's databases to come up with certain conclusions that will assist the management into making decisions based on knowledge rather than speculations (Abid et al., 2020; Alnazer et al., 2017; Alshurideh et al., 2020a, 2020b; Alzoubi & Ahmed, 2019; Mehmood et al., 2019). According to Gartner official website, predictive analysis "is a form of advanced analytics which examines data or content to answer the question "What is going to happen?" or more precisely, "What is likely to happen?", and is characterized by techniques such as regression analysis, forecasting, multivariate statistics, pattern matching, predictive modeling, and forecasting" (Gartner, 2022).

Moreover, prescriptive analytics are tools that helps the organizations to anticipate what will happen with the reason and the timing of the events in order to reduce future risks and make better decisions. According to Gartner official website "Prescriptive Analytics is a form of advanced analytics which examines data or content to answer the question "What should be done?" or "What can we do to make it happen?", and is characterized by techniques such as graph analysis, simulation, complex event processing, neural networks, recommendation engines, heuristics, and machine learning" (Gartner, 2022).

Prescriptive tools can be done by following two approaches, the first approach is by using the optimization model. This model chooses the best alternative or decision by running through a maximum objective function (Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b; Joghee et al., 2020). This model is done through an analytical coded model using a software with many constraints to optimize the planning, scheduling, assigning limited resources to minimize the cost. For example, deciding on the best route for oil transporting vehicles from the depo to the petrol station, the model will be based on many constraints like vehicle size, petrol type, destination, distance, driver and traffic expected. The second approach is by using the rules model. This model uses the inputs, judgment and business rules to assign the best action. For example, providing customers with certain treatments or offers (Al Batayneh et al., 2021; Kart, 2015; Odeh et al., 2021).

3.2 The Value Added from the Use of the Analytics Tools

CIOs consider Data analytics as a "game changing" tools where it can unleash so many opportunities in fraud detection, analysis on transactional data, decision making process, reduce uncertainty and eliminate risk. The analytics tools vary in the process of decision making and the input they provide. As shown in the graph below the different analytics tools leads to better decision making with minimizing the human input (Fig. 3).

The use if the analytics tools can aid in the different layers of decision making, starting from the strategic, tactical, and operational level. Strategic decision happen less frequently but often has a wide range of impact, for example, building of a new school, a construction of a bridge, a drilling of oil location. These decisions often have a great amount of uncertainty, hence the application of the analytical tools specially the perspective tools can reduce the uncertainty and lead the government to make better decisions that will affect the citizens and the overall economy (Alshurideh, 2022; Hamadneh et al., 2021a, 2021b; Kart, 2015).

Another level of decisions is the tactical layer, these decisions often happen more frequently like on a daily, monthly, quarterly, or annual basis. The use of the analytical tools can lead the government to allocate the resources and the time properly therefore reducing cost and risk. An example of an approach of application is capital planning to allocate resources across tasks (Alaali et al., 2021; Alkalha et al., 2012; Kart, 2015).

The last level of decision is related to the day to day operations and translate the tactical decisions to actionable tasks. These decisions often carry less risk and the analytical tools can be of less impact here.

3.3 Combining of Predictive and Prescriptive Tools

To enable organizations to make optimum decisions, they must be quick, accurate in assisting complicated and time sensitive matters. Although making accurate predictions through the use of the predictive tools is essential but to truly add value the organizations must go even further by making decisions that can affect the predicted outcome through analyzing the likelihoods of a certain solution by the use of the prescriptive tools (Hasan et al., 2022; Herschel & Idoine, 2016).

Bringing together forecasts (predictive) with optimizations (prescriptive) lets an organization explore how changes to different variables are likely to change the outcomes or alter the relative trade-offs. It gets to the heart of the task of adding business value, of proactively making decisions that drive action and influence the future course of an organization.

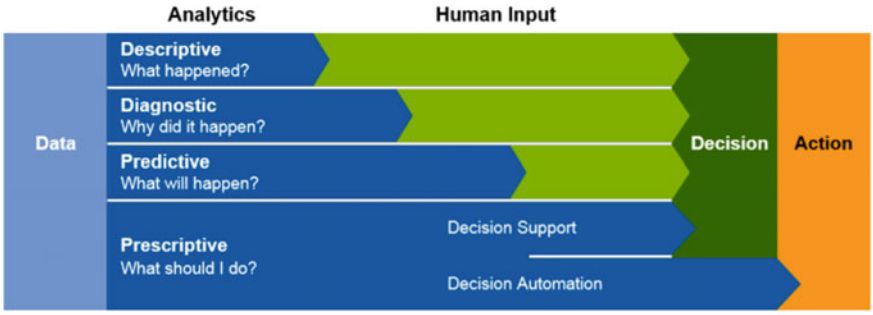

Fig. 1 Analytics capabilities

3.4 Knowledge Based Economy

According to Ahmed and Alfaki (2013), a knowledge-based economy is wider than the new economy or high technology and they are much related to the internet that is used often in the information society. The foundation of a knowledge-based economy is to create, disseminate and use knowledge and knowledge assets are given more importance than labor and capital assets (Al-Maroof et al., 2021; AlMehrzi et al., 2020; Shannak et al., 2012). Therefore, the societal and economic activities reach a very high level through sophistication and quantity of knowledge (Alzoubi et al., 2021a; Svoboda et al., 2021). Parcero and Ryan (2017) illustrates and explains the four pillars of a knowledge-based economy (see Fig. 1). It consists of four pillars and they are communication and information technology, innovation, education, and economy and regime (Alshurideh et al., 2019a, 2019b; Ashal et al., 2021; Awadhi et al., 2021).

The concept of a knowledge-based economy is used so an economy in the country can be described (Ahmed & Alfaki, 2013; Al-Jarrah et al., 2012; Alshurideh, Al Kurdi, et al., 2019a, 2019b). Dahlman and Utz (2005) states a knowledge-based economy is successful when there is link between industrial and science technology. The empowerment comes from increased lifelong and education learning with higher investments in software and research and development.

3.5 Knowledge Based Economy in UAE

According to Alfaki (2014), the UAE achieves good success in knowledge utilization due to technological infrastructure availability so they are moving towards knowledge-based economy. One of the strategic goals of the UAE is to expand in the non-oil sector with diversification strategy so competition with emerging markets can be made possible. In addition, the UAE federal strategy of 2011–2013 and UAE vision of 2021 and advocates in the increase of investments in research and development, science and technology so the economy of the UAE can be based on knowledge

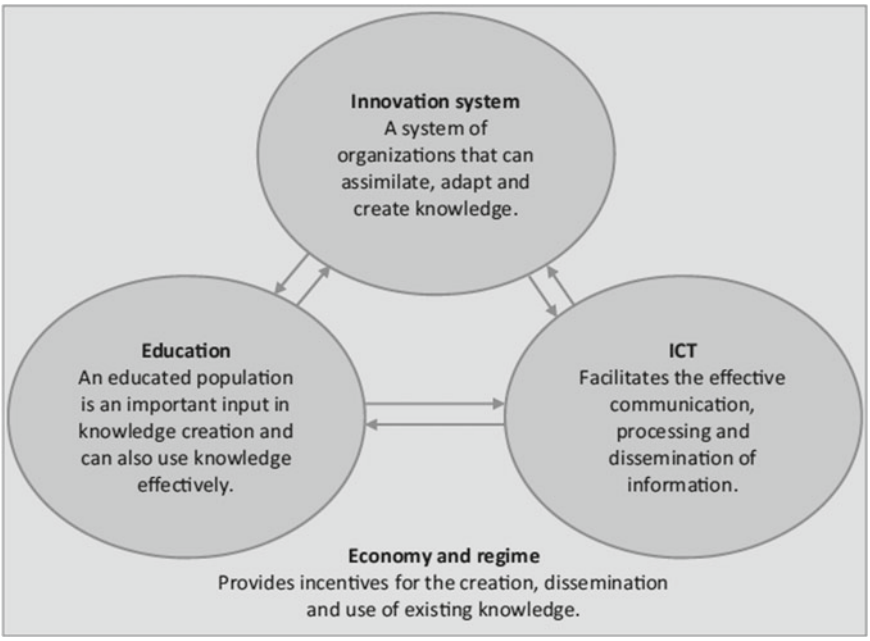

Fig. 2 The four pillars of a knowledge economy (Parcero & Ryan, 2017)

(Akhtar et al., 2021; Al Ali, 2021; Alzoubi, 2021a; Eli, 2021; Kashif et al., 2021). Figure 2 illustrates the performance of the UAE when comparing with Muslim countries as given by World Bank's KEI 2012 cited in Alfaki (2014). The performance of the UAE varies **with** other Muslim countries and the progress is quite impressive ranking 42nd, score 6.94 and the change is +6. In the UAE, there is good progress of a knowledge-based economy's implementation along with innovation, quality of infrastructure and macro-economic environment (Ahmed & Alfaki, 2013).

Alfaki (2014) finds that the UAE experienced major improvement in the ICT sector and ranks top when it comes to good performance in organizational innovation systems and ICT components of knowledge as given in Figs. 3 and 4. It shows a careful investigation of the four pillars such as ICT, innovation, education, and economic incentive (Fig. 5).

4 Research Methodology

The research methodology of this report was done through two methods, the first one used to gather the primary information was a qualitative method done thorough conducting a semi structured interview, this interview was done with an employee working at Smart Dubai and is expert in the data analysis field. Hamzeh Hamaraneh

Country	KEI	Rank	Change[a]
Sweden	9.43	1	–
Economies with large improvements in KEI rankings since 2000			
United Arab Emirates	6.94	42	+6
Oman	6.14	47	+18
Saudi Arabia	5.96	50	+26
Tunisia	4.56	80	+9
Iran	3.91	94	+1
Algeria	3.79	96	+14
Pakistan	2.45	117	+5
Nigeria	2.2	119	+5
Yemen	1.92	122	+6
Sudan	1.48	138	+1
Economies with decreases in KEI rankings since 2000			
Bahrain	6.9	43	−2
Malaysia	6.1	48	−3
Qatar	5.84	54	−5
Kuwait	5.33	64	−18
Turkey	5.16	69	−7
Jordan	4.95	75	−18
Lebanon	4.56	81	−13
Egypt	3.78	97	−9
Morocco	3.61	102	−10
Syria	2.77	112	−1
Bangladesh	1.49	137	−3
Myanmar	0.96	145	−8

Fig. 3 Muslim countries KEIs (Alfaki, 2014)

Index	UAE	Qatar	Bahrain	Kuwait	Oman	KSA	Korea	Singapore
KEI	6.73	6.73	6.04	5.85	5.36	5.31	7.82	8.44
KI	6.72	6.63	5.80	5.63	4.77	5.10	8.43	8.03
Economic incentive and institutional regime	6.75	7.05	6.75	6.50	7.15	5.94	6.00	9.68
Education	4.90	5.37	5.82	4.93	4.47	4.89	8.09	5.29
Innovation	6.69	6.45	4.29	4.98	4.94	3.97	8.60	9.58
ICT	8.59	8.06	7.30	6.96	4.90	6.43	8.60	9.22

Fig. 4 KEI, KI and the four pillar (UAE vs. Other countries) (Alfaki, 2014)

who the Head of Data Analytics has provided a thorough insight into the data analytics field at Smart Dubai, the interview questions were divided across three perspectives including knowledge-based economy, the use of the analytical tools, and Dubai pulse initiative.

The second method was to gather the secondary information of this report, though finding relevant publications, journals, and books from reliable sources like the University library, electronic databases like SSCI or EBSCO, recognized periodical journals and the organization main website.

Licensed to (putm@utm.my)

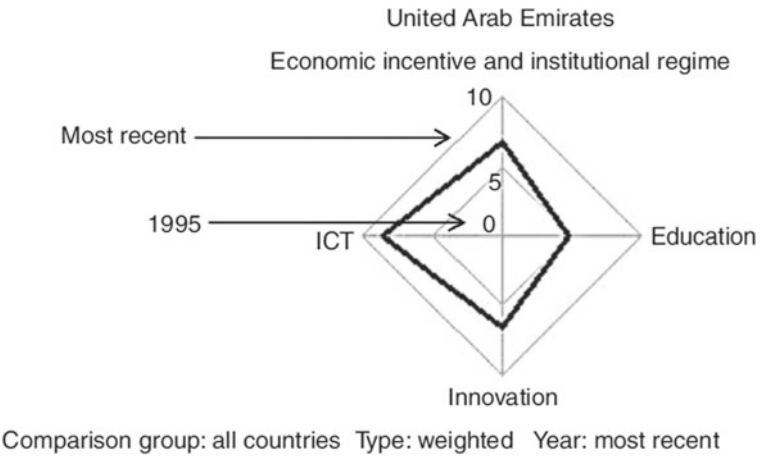

Fig. 5 KEI of the four pillars (UAE) (Alfaki, 2014)

5 Data Analysis

5.1 Smart Dubai Data Analysis

The following analysis points were concluded after a thorough analysis on the interview results and the related resources found:

1. Smart Dubai is supporting the knowledge-based economy through empowering the government entities with the technological tools and the reliable infrastructure of data sharing, storage, processing, and visualization. Which enables the government entities to make better and knowledge-based decisions in order to server the society better.
2. Smart Dubai is focused on building a collaboration between the public and the private sector to achieve several targets like smart transportation, smart society, smart economy, smart governance, and smart environment.
3. Smart Dubai has released the data law in 2015 "Law No. (26) Of 2015 on the Organization of Dubai Data Publication and Sharing" (Dubai Data, 2022), which makes Dubai the first city globally to release a Law to state the guidelines of the sharing of data between government entities and the open data available for the public.
4. The Dubai Data initiative will benefit the city by "increasing efficiencies in spending, job creation and innovation investment enhancement through creating new products and services and raise the level of citizen engagement. These benefits promotes government transparency and the ultimate happiness of Dubai residents and citizens" (DubaiPulse, 2018).
5. The main challenge that Smart Dubai is facing with building a knowledge-based economy, is the culture, people relay on printed papers and the usual routine

to perform tasks. Providing these tools that can replace people jobs are often frightened as mentioned by Hamarneh.

6. Smart Dubai vision is to make Dubai the happiest Dubai worldwide, although it meet seem simple but it is rather a large scope and challenging vision as stated by Hamarneh.
7. The Artificial Intelligence initiative by Smart Dubai that is considered as a predictive analysis project, which is used by Smart Dubai. According to Hamarneh, this tool can be used in so many use cases like:
    a. An AI service that will match children to school, so it will make it easier for parents to choose the right school to their children. Which reduces the burden that this task will have on any parents
    b. Another AI application is at Dubai Customs where thousands of containers are arriving to the port every day. AI will help them into deciding what to inspect and why and when by analyzing the Volume, history and country the container came from.
8. The AI can be of a great use in reducing or automating the repetitive tasks, like validating customer papers or inserting of forms information or detecting certain trends that will enable the government entity to perform better (Alzoubi et al., 2022; Hamadneh et al., 2021a, 2021b; Hanaysha et al., 2021a, 2021b; Lee et al., 2022a, 2022b).
9. Smart Dubai does not apply the prescriptive analysis tools, although that Hamarneh has mentioned that applying these tools can be of a great benefit to the government into making better decisions that will lower the cost, expect the demand through supply and demand mathematical modules (AlHamad et al., 2022; Ali et al., 2022; Alshurideh et al., 2022; Lee et al., 2022a, 2022b).
10. Dubai pulse is an initiative provided to all the stakeholders to make different analytical tools by the different data sets available for the use of the public that are regulated through Dubai data law. Many government entities are participating in this platform like Dubai Customs, Dubai Municipality, Dubai Silicon oasis Authority, Department of Dubai Economic Development, RTA, Dubai Health Authority and many other departments.
11. Dubai Pulse provides different data views like city flow, property land distribution, people flow, and property buildings distribution. These data views are available to provide the stakeholders with insights through interactive displays to enhance the stakeholder's decision-making process and create business value. Therefore, building a better and a knowledge-based economy (DubaiPulse, 2022).

5.2 DEWA Data Analysis

The following analysis points were concluded after a thorough analysis on the interview results and the related resources found:

1. DEWA is focused in making Dubai the smartest city on earth, and that can be accomplished through using the latest technologies and innovations to increase the happiness metric of Dubai citizens.
2. DEWA has adopted many initiatives to increase the reliance on Data in the decision-making process inclusive of the descriptive, predictive and prescriptive tools.
3. DEWA has adopted General Electric's industry wide Internet of Things platform, this platform enables the connection between machines, data, and people.
4. This platform will enable data to be collected and analyzed in real time to enhance the speed and efficiency of its operations.
5. This platform is designed to embed certain applications like built in Artificial intelligence to predict the assets lifecycle and prevent future malfunctions by using a continuous asset monitoring service to pre-identify and analyze root causes (AlShamsi et al., 2021; Holland, 2018; Nuseir et al., 2021a, 2021b; Yousuf et al., 2021).
6. DEWA currently uses dashboards to support the decision making process by the use of descriptive analytics.
7. The initiation of the GE platform will provide DEWA with many abilities to enhance their utilization of equipment's, better services to customers, attracting more beneficial opportunities and lowering cost.

6 Discussions

6.1 Comparison of Dubai Experience with the Analytical Tools' Literature

Smart Dubai is a unique example of high-level quality system that strive towards making Dubai the happiest city on earth. Smart Dubai has been adopting many projects that enhances the life of people and support the economy of the UAE. One of the main projects that Smart Dubai has initiated is the Dubai pulse project which is a platform to gather different data and visualize it in data views (Alsharari, 2021; Aziz & Aftab, 2021; Mehmood, 2021; Miller, 2021). Although that this project is roughly considered as a descriptive tool of data analytics rather than the prescriptive and predictive analytics. But it can assist in the decision-making process of the various stakeholders. Another project is the Artificial intelligence and machine learning project, which is a form of the predictive analytics tools, this project aims to eliminate any repetitive tasks and optimize the resources in order to provide better services to the citizens.

It is shown in the literature, that the use of the analytical tools can aid in the decision-making process on different managerial levels, hence establishing better services to the citizens and building a knowledge-based economy (Cruz, 2021; Khan, 2021; Lee & Ahmed, 2021; Mondol, 2021; Radwan & Farouk, 2021). Smart Dubai,

in this matter lacks the proper use of the analytical tools where it can be considered still seen as at the earliest stages of building a data driven added value projects, Smart Dubai has successfully established a collaborative data platform but still needs to establish projects that will have the different forms of the analytical tools like regression analysis, predictive modeling, pattern matching, data mining and machine learning.

6.2 Opportunities for Adding Value

Predictive analytics can provide the following opportunities to add value:

- Predictions: this analytical feature can predict the probability of a specific outcome (Idoine & Brethenoux, 2018). For example, possible repetitive congestion in any of the country main roads by predicting the outcome the government can make a diversion in the roads or build a new bridge that will aid in eliminating this congestion and keep the smoothness of the transportation. Another example of the prediction feature of the analytical tool is the maintenance scheduling of the government buildings or any public areas, this tool can predict the maintenance schedule of the area instead of having a problem reported and then responding based on it.
- Forecasting: the predicting of a series of outcomes over time (Idoine & Brethenoux, 2018).This feature can forecast a certain event in the future. Like the expected tourists in a certain season.
- Simulation: predicting multiple outcomes and highlighting uncertainties (Idoine & Brethenoux, 2018).

Prescriptive analytics can provide the following opportunities to add value:

- Rules: predefined framework for choosing between alternatives (Idoine & Brethenoux, 2018), for example, calculating the best way in performing an action or building an optimization model to ensure the optimization of the resources across the government. Also, it can aid in reducing any unnecessary costs and risks.
- Optimization: outcome-driven, constraint-based evaluation of an interdependent set of options (Fig. 6).

Moreover, the tools can increase the speed of the planning analysis, decisions that took weeks to be decided can be done within hours. Improved executive insights, more projects and opportunities can be exploited by the use of the analytical tools therefore creating and adding more value to the economy and the citizens (Ali et al., 2021; Alzoubi, 2021b; Alzoubi et al., 2021b; Farouk, 2021; Guergov & Radwan, 2021; Obaid, 2021).

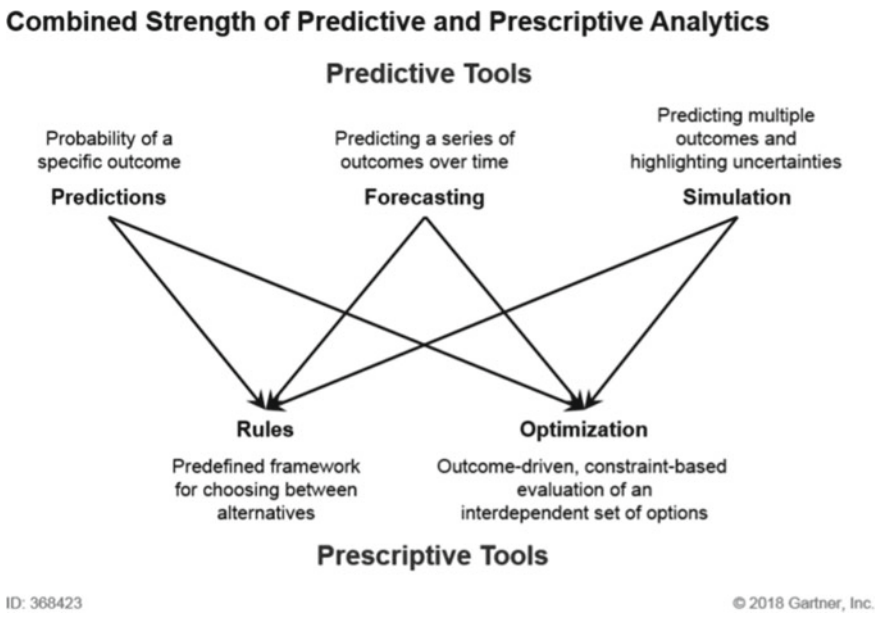

Fig. 6 Combine predictive and prescriptive analytics to exploit their respective strengths (Idoine & Brethenoux, 2018)

6.3 Challenges

The implementation of the tools in the government can encounter many challenges, the challenges can vary between infrastructure challenges to technological compatibility challenges. A few are mentioned below:

- Successful implementation of the tools comes from more than purchasing and deploying the software of the analytics, it also require the engagement of the right people, processes to leverage, implement, maintain, and govern the models and tools (Idoine & Brethenoux, 2018).
- Government data is scattered across many departments making the collection and the gathering process challenging to the smart government. Also, it can be challenging to decide on what is actually important from the massive amount of data.
- Government data can consist of unneeded and redundant data, therefore cleaning and reconstruction of data might be required.
- The data available can consist of different data formats or still manual paper information or even scanned documents with no stored fields making it hard to rely on it for analytical tools.
- The models that are generated from the analytical tools must be embedded in the operations and in the decision-making process to obtain the most use out of it.

– Testing and validating the models based on the different scenarios can be time consuming and tiring.
– Changing the culture and mentality of the people also can be considered as a challenge. Shifting from the regular decision-making process to advanced analytics tools can be challenging.

6.4 Global Cases for Benchmarking

The advanced analytics tools are still a trending and new technological advancement, but many governments or companies have decided to add the use of the tools to their strategy. The following cases can be used to benchmark with:

– A successful implementation of the advanced data analytical tools where at US Immigration and Customs Enforcement (ICE), the implementation of the tools where to better manage the overseas offices. The ICE manages more than 60 field offices in 45 nations. Till 2014 the decisions of choosing the ICE international offices were made based on subjective evidence or periodical surveys. But then in 2015 decided to shift to use the data of the workloads and the activities of the offices to decide on where to expand or where to shut offices without affecting the mission performance (Mahesh et al., 2016).
– Another case to benchmark with Virginia state case in building an integrated system of benefits eligibility of medical assistance. The offices that process those applications are often understaffed and overloaded with work (Alhamad et al., 2021; Alnuaimi et al., 2021; Alzoubi & Aziz, 2021; Ghazal et al., 2021; Hanaysha et al., 2021b). So, in 2015, Virginia Department of Social Services decided to take a different approach in addressing this problem. The information where gathered and analyzed by the use of the analytical tools to identify issues in processing the applications therefore enabling the DSS to provide better social services to the citizens (Mahesh et al., 2016).

7 Recommendations

This research paper aims to come out with new results in the field of smart cities that would help and support other cities to become smart and discuss the conflict, challenges and opportunities of knowledge-based economy and add value to their economies. Furthermore, this study provides a clear view of smart cities transformation and knowledge-based economy and the use of perspective and predictive analysis tools that help other researchers in the future to improve and develop studies regarding smart cities and get new results. The following are some points for smart Dubai to maintain the high-quality performance:

1. The result shows it is important to establish an information system and a collaborative platform of data for digital transformation of smart city.

2. Increase the benefits of technology in order to improve the economy.
3. All stakeholders should be engaged in the transformation to smart city and the build of the analytical tools' platform.
4. Create a roadmap to have a successful use of the analytical tools by monitoring, experimenting and implementation of these tools.
5. Investment in education, technology and communication in order to achieve competitive advantage against different economies (local and global).
6. Training program for the employees to develop, improve and enhance their skills and experience.
7. Engage and train the government sector leaders about the new data analytics and how it can benefit the economy.
8. Identify the gaps that are preventing the government from using the full capabilities of the use of this disruptive innovation tools.
9. Building a policy and a foundation of security, accountability that keeps privacy and promotes digital ethics.
10. Identification of the most important data relevant to the decision-making process and eliminating of redundant and unneeded data.

8 Conclusion

Due to the strong competition between cities and economies worldwide, Dubai became one of the most successful economies in the current century. By the vision of his highness Sheikh Mohammed Bin Rashid Al Maktoum vice president and prime minister of UAE, and ruler of Dubai, he builds up Dubai economy from oil economy to a non-oil economy and changed the economy to a diversified economy with various resources. There is numerous businesses in Dubai that made the economy stronger and more flexible, the strategies of his highness attracted most of the big companies and organizations worldwide to invest in Dubai and see Dubai as a very important business city in MENA region.

Dubai used the predictive analysis tools to know on what to depend in the future the use of that tools changed Dubai economy from oil to non-oil economy because they knew that in the future the world will not depend on the oil anymore, new resources are available now regardless oil and gas. The prescriptive analysis tools to know where Dubai economy want to go and what to do in order to increase and maintain its high performances and quality that attract business owners across the world.

Appendix

Smart Dubai—Interview Questions

As part of the information gathering of the Information Technology Management Course project, the following interview questions were prepared to be answered by an employee at Smart Dubai.

The questions were divided into sections as shown below.

Interview was conducted on 08/05/2019 at 10:45 AM with **Hamzeh Hamaraneh** who is the head of DATA Analytics in Smart Dubai.

Section 1: UAE Based Economy and Smart Dubai Contribution to it

1. **How can Smart Dubai empower or support UAE economy?**

   - We are empowering the government by using the tools and technology to represent the data and information.
   - By providing human resources to use the data in different uses of decision-making and across the city, while having the legislative and the authority to access such an information.
   - The Dubai data law that was released 2015. To be the first city to release such law, to regulate how the data used, stored, processed, and presented.
   - AI is filled by DATA. Not only we issued the law in 2015 but also we have the ethics of AI.

2. **What is the influence of smart Dubai on people of Dubai (residents, visitors, business owners, parents and families)?**

Smart Dubai has direct and indirect influence, by supporting the government and the non-government entities through our services so we can enable them to serve the society better like Dubai police, RTA, etc.

Another sector, government to citizens directly. Through channels like Dubai now through all the segregated government entities and bodies.

Traditionally, people will go through the normal norm of business. Now through the eservices we are providing better services by using DUBAI now by having a journey rather than the service itself. Customer focused.

3. **What challenges does Smart Dubai faces in the local and global market?**

   1. The most challenging area, or critical is the culture, people will feel that the paper is more reliable than the digital products. So changing the culture into knowledge society and paperless society is the challenge.
   2. Making people relay on the digital projects, technology advancements is moving into the society much higher than the culture will embrace it.

4. **What is Smart Dubai trying to achieve in the future?**

The goal is clear and very simple, to making Dubai the happiest city in the world; it is very simple but very big and challenging.

5. What new services, innovations and applications smart Dubai may provide to customer and Dubai society?

We have a lot of products and services, I think the main services are Dubai now, AI, and block chain.

Example of AI use case

An AI service that will match children to school, so we will make it easier for parents to choose the right school to their children. To reduce the burden that this task will have on any parents.

Use cases of AI

Dubai customs, thousands of containers are arriving to the port every day. AI will help them into deciding What to inspect and why and when. By analyzing the Volume, history and country the container came from.

In a nutshell, we have a lot of repetitive tasks and we tend to do it repetitively which can be resolved by the use of AI so we can focus on creative tasks.

To define any repetitive tasks to be automated.

Section 2: Analytics Tools Currently used in Smart Dubai

Does smart Dubai uses Predictive analysis, like machine learning, AI tools, and simulations.

Yes, they do.

Can you name few initiatives?

Many tools are used, our biggest initiative is the paperless initiative, by 2021 Dubai government will be the first government of paperless. AI technology can be used by eliminating any repetitive tasks. To call for the same documents repeatedly.

Do you think that those tools add value to the smart government and the knowledge-based economy?

Yes it does.

Does smart Dubai uses Prescriptive Analytics, like math programming models, optimization models, heuristics.

Hint: Those kind of tools often minimize the risks in making certain decisions related to costs and often important to use when there is time sensitive decisions to be made.

Exploring those tools, currently they are not using them.

Does smart Dubai uses those tools, and do you think they are adding any benefits to the government?

Of course it will add the benefits, like lowering costs, having those tools will benefit the government to make better decisions, like the supply and demand modules.

Can you give me a brief about Dubai Pulse?

Dubai pulse is a market place, we have tools and technologies and we are acquiring data sets and providing to the customers to make any analytical tools. So this service is provided for the public.

In addition, do you think it is related to the tools mentioned previously?

Yes it is, it is a representation of DATA to allow the different stakeholders to make better decisions.

Machine Learning Techniques for Stock Market Predictions: A Case of Mexican Stocks

Aqila Rafiuddin, Jesus Cuauhtemoc Tellez Gaytan, Gouher Ahmed, and Muhammad Alshurideh

Abstract Prediction of stock markets prices in a financial time series is very difficult and challenging task due to the nature characterized by dynamic, volatile, sentimental and chaotic behavior of the investors. The quantitative nature of data of the stocks gives a pace for the advanced simulation techniques, machine learning models a branch of Artificial intelligence learning process utilizes their predictive algorithms and forecasts the prices for future periods. With high productivity in the machine learning area applied to the prediction of financial market prices, objective methods are required for a consistent analysis of the most relevant existing literature on financial markets. Research revealed that most commonly used models for prediction of stocks are support vector machine (SVM) models and artificial neural networks (ANN). This research work is from the Mexican stock market with a comparison of SVM and ANN.

1 Introduction

According to the efficient market hypothesis (EMH) by markets are expected to follow random pathways and making it more unpredictable leading to a continuous quest for a model and the most important and challenging problems involving time series (Atsalakis & Valavanis, 2009; Chen et al., 2017) highlighted ANN and SVM, with data pre-processing. The research work by Laboissiere et al. (2015) who continued with pattern recognition for financial market prediction in brazillian market. According, there is a need for profitable system that attracts lot of attention from the business and academia (Weng et al., 2017). Due to non stationary in nature its difficult to predict the stock market prices (Tay & Cao, n.d.; Zhang et al., 2017). They are dynamic, chaotic, noisy, non-linear series (Bezerra & Albuquerque, 2017; Göçken et al., 2016; Kumar et al., 2016), that are influenced by the general economy, characteristics of the industries, politics, and even the psychology of investors (Chen et al., 2017; Zhong & Enke, 2017). An evidence of the efficiency of financial markets is summarized by a model capable of consistently generating returns above the market indices and represents EMH and enable large profits with financial operations (Kumar & Thenmozhi, 2014a). According to Wang et al. (2012), initial techniques were moving averages, autoregressive models, discriminating analyses, and correlations but artificial intelligence is considered to be an ideal and promising area of the research in the prediction of time series. ANN techniques are designed to address chaotic data, randomness, and non-linearity (Zhong & Enke, 2017). Computational system with the technological advances made it possible to analyse large historical price databases by Chiang et al. (2016). The intense computational use of intelligent predictive models is commonly considered as machine learning techniques.

2 Machine Learning

Fundamental analysis information of financial statements for the evaluation of the company helps the investors in decision making through specific components and returns (Foster et al., 1984; Lev & Thiagarajan, 1993; Ou & Penman, 1989). Based on the past financial statements the intrinsic value of a company can be estimated and compared to market prices for investments. There is a deviation of market prices from the original value due to under reaction or overreaction of customers on the available information (Desai et al., 2004; Kothari et al., 2005). With the revision in beliefs and sentiments of the investors, earnings announcements, future dividends (Collins & Kothari, 1989), new information released affects the market participants to predict the future change in the prices (Bernard et al., 1997). For developing effective market trading strategies (Leung et al., 2000a). there is an immense need for accurate predictions of movement of stock price indexes Stock market prediction is regarded as a challenging task of the financial time series prediction process since the stock market is essentially dynamic, nonlinear, complicated, nonparametric, and chaotic

in nature (Abu-Mostafa & Atiya n.d.). Integration of Machine learning techniques with artificial intelligence systems seek to extract patterns learned from historical data in a process known as training or learning to subsequently make predictions about new data and integrate (Xiao et al., 2013). Empirical studies using machine learning commonly have two main phases. The first one addresses the selection of relevant variables and models for the prediction, separating a portion of the data for the training and validation of the models, thus optimizing them. The second phase applies the optimized models to the data intended for testing, thus measuring predictive performance. The basic techniques used in the literature include the following: artificial neural networks (ANNs), support vector machines (SVMs), Stock returns based on accounting variables are mispriced at time as a violation of efficient markets due to the varying time risk factors (Fama, 1991; Hirshleifer et al., 2012).

The layers of basic processing units of the neural networks are interconnected, attributing weights for each connection (Lahmiri & Boukadoum, 2015), which are adjusted in the learning process of the network (Kumar & Thenmozhi, 2014b), in the first training phase optimization of not only the interconnections between the layers of neurons but also the parameters of the transfer functions between one layer and another, thus minimizing the errors. Finally, the last layer of the neural network is responsible for summing all the signals from the previous layer into just one output signal—the network's response to certain input data.

Whereas neural networks seek to minimize the errors of their empirical responses in the training stage, an SVM seeks to minimize the upper threshold of the error of its classifications. Huang et al. (2005) took the training samples and transforms them from their original dimension space to another space, with a greater number of dimensions, in which a linear separation is approximated by a hyperplane (Kara et al., 2011). This algorithm, which is commonly used to classify data based on input variables in the model, seeks to minimize the margin of the classification hyperplane during the training stage of the model. The transformation of the space of original dimensions to the space in which the classifications are performed is done with the assistance of kernel functions, from estimated parameterization in the training of the model, as detailed by Pai and Lin (2005).

ANN and SVM have been successfully used for modeling and predicting financial time series. Although ANN can be one of the very useful tools in time series prediction, several studies showed that ANN had some limitations in learning the patterns because stock market data has tremendous noise, non-stationary characteristics, and complex dimensionality. ANN often exhibit inconsistent and unpredictable performance on noisy data (Huang et al., 2005; Kim, 2003; Kim & Han, 2000; Kumar & Thenmozhi, 2014b; Lahmiri & Boukadoum, 2015; Manish & Thenmozhi, 2005). Therefore, predicting stock price movements is quite difficult.

Thus, the literature regarding financial market prediction using machine learning is vast, which hinders revisions, systematizations of models and techniques, and searches for material to determine the state of the art. Tools are needed to objectively and quantitatively select the most relevant works for a literature review covering the most influential articles. Thus, the intention of this work is to present methods for the selection of the main advances in machine learning applied to financial market

prediction in the Mexican market clarifies a knowledge flow that literature brings a summary of the best procedures followed by the literature on applying machine learning to financial time series forecasting.

ANN is applied predict accurately the stock price return and the direction of its movement. ANN has been demonstrated to provide promising results in predict the stock price return (Avci, 2007; Egeli et al., 2003; Karaatlı et al., 2005; Kimoto et al., 1990; Olson & Mossman, 2003; White, 1990; Yoon & Swales, 1991). Leung et al. (2000b) examined various prediction models based on multivariate classification techniques and compared them with a number of parametric and nonparametric models which forecast the direction of the index return. Empirical experimentation suggested that the classification models (discriminant analysis, logit, probit and probabilistic neural network) outperform the level estimation models (adaptive exponential smoothing, vector auto regression with Kalman filter updating, multivariate transfer function and multilayered feed forward neural network) in terms of predicting the direction of the stock market movement and maximizing returns from investment trading.

Recently the support vector machines (SVM), has been also successfully applied to predict stock price index and its movements. Kim (2003) used SVM to predict the direction of daily stock price change in the Korea composite stock price index (KOSI). The experimental results showed that SVM outperform random forest, neural network and other traditional models (Huang et al., 2005), in their study, investigated the predictability of financial movement direction with SVM by predicting the weekly movement direction of NIKKEI 225 Index. Support vector machine (SVM) is a very specific type of learning algorithms characterized by the capacity control of the decision function, the use of the kernel functions and the sparsity of the solution. Established on the unique theory of the structural risk minimization principle to estimate a function by minimizing an upper bound of the generalization error, SVM is shown to be very resistant to the over-1tting problem, eventually achieving a high generalization performance. Another key property of SVM is that training SVM is equivalent to solving a linearly constrained quadratic programming problem so that the solution of SVM is always unique and globally optimal, unlike neural networks training which requires nonlinear optimization with the danger of getting stuck at local minima. Some applications of SVM to financial forecasting problems have been reported recently in most cases, the degree of accuracy and the acceptability of certain forecasts are measured by the estimates' deviations from the observed values. For the practitioners in financial market, forecasting methods based on minimizing forecast error may not be adequate to meet their objectives. In other words, trading driven by a certain forecast with a small forecast error may not be as pro1table as trading guided by an accurate prediction of the direction of movement.

3 Objective

This research objective is to predict stock price movements based on three machine learning techniques: Support Vector Machines, Artificial Neural Networks, and Deep Neural Networks. The Machine Learning approach can be equally applied to forecast continuous and categorical variables. If the predictive variable is a continuous one it is said to be a regression based approach. Otherwise, when the predictive variable is a categorical one it is referred to a classification problem. This research considers stock price movements as a categorical variable since it is aimed to predict an "up" or "down" movement.

4 Methodology

The predictive model considers as target variables the daily closing prices of the main Mexican Stock Index (IPC) and seven representative Mexican companies: Grupo Alsea (ALSEA), America Movil (AMXL), Grupo Bimbo (BIMBOA), Cemex (CEMEXCPO), Grupo Carso (GCARSOA1), Grupo Mexico (GMEXICO), and Grupo Maseca (GRUMA). Data ranges from September 2013 up to December 2019 which acounts for 1,424 observations and were downloaded from the Bloomberg Terminal. Daily closing prices were transformed to log-returns and the categorical variable was built by the following conditional: if the log-return is positive then it is an upward movement (1), else if the log-return is negative then it is a downward movement (0). Whole estimations were performed in R v.3.5.1.

Based on Kara et al. (2011), the predictive model considers technical indicators as predictors such as: Simple Moving Average (SMAVG), Weighted Moving Average (WMAVG), Stochastic Slow (SLOWD), Stochastic Fast (FASTK), Relative Strength Index (RSI), Moving Average Convergence Divergence (MACD), Larry Williams Percent Range (WLPR), and Commodity Channel Index (CMCI). Predictors were not transformed to log-returns. Once, data was subsetted into training (80%) and testing (20%) sets. The first step was to perform a Principal Component Analysis to extract the main influential features where it was used the correlation matrix to scale the features. Figure 1 shows the PCA biplot of the IPC where it is observed that RSI, SLOW and FASTD are the most representative features along the PC1 axis. Meanwhile SMAVG and DIFF are the most representative features along the PC2 exists.

Once main drivers were identified that mostly explain the categorical variable ("movement"), they were normalized under the minmax strategy in such a way to speed the convergence process. Then, it was estimated a Support Vector Machine model considering a linear kernel. Next, a Neural Network was estimated with one hidden layer, three neurons, and a logistic activation function. Finally, the Deep Learning approach was considered by increasing the number of hidden layers in the

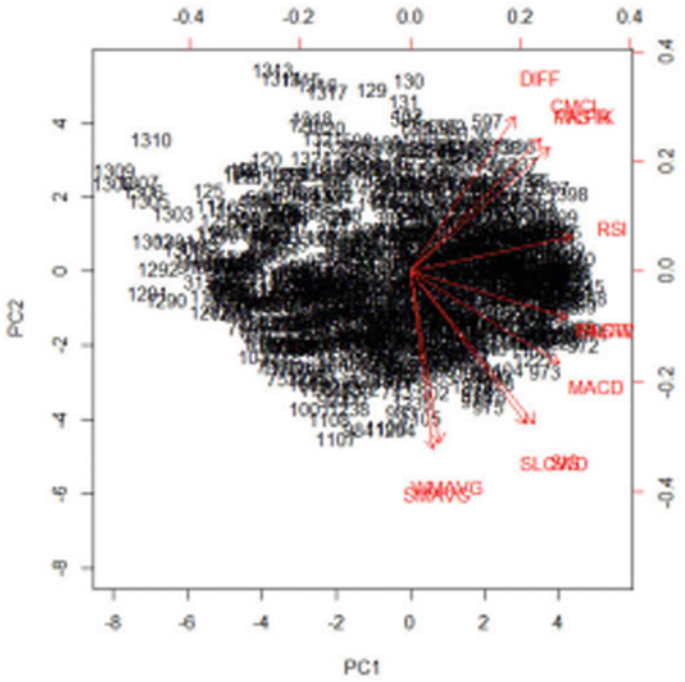

Fig. 1 The IPC principal component analysis

Neural Network. In both techniques it was estimated the confusion matrix to predict (classify) true positives, true negatives, false positives, and false negatives.

Findings Table 1 Summarizes the Support Vector Machine (SVM) and Neural Network (NN) market prediction accuracy levels. The NN columns are read as the number of hidden layers and neurons in the network. For example, (5,4,2) states three hidden layers, each one with 5, 4, and 2 neurons, respectively.

In most cases the NN model outperformed the SVM. But within the NN approach not all the Deep Learning estimations could outperform the single (3)-NN hidden layer. The greatest accuracy level was obtained on Gruma with a (5,4,2)-NN hidden layers. In this case, it is argued that an upward or downward movement can be predicted with a 75.1% accuracy level. The accuracy level was calculated from the confusion matrix. For example, a predicted movement with an accuracy level of 70.8% for GMexico under the SVM approach was obtained as (Fig. 2).

Other studies like (Huang et al., 2005) which got an accuracy level by the SVM model of 75% applied to NIKKEI 225 weekly prices. Kara et al. (2011) obtained a SVM accuracy level of 71.52%. Patel et al. (2015) estimated an accuracy level of 86.69% under the NN approach and an 88.69% accuracy level by the SVM model applied to the S&P Bombay Stock Exchange SENSEX.

Table 1 SVM and NN estimations

Index/company	SVM (%)	NN			
		(3)	(3,2)	(4,3,2)	(5,4,2)
IPC	68.0	69.2% (94.8)	67.5% (94.28)	68.5% (91.13)	68.9% (94.28)
Alsea	69.4	73.4% (94.40)	73.4% (94.90)	72.5% (93.58)	71.5% (93.40)
Amxl	71.1	72.5% (74.70)	74.8% (95.74)	72.1% (94.37)	70.8% (93.93)
Bimbo	70.4	71.5% (92.06)	67.5% (91.19)	70.05% (90.83)	71.8% (89.70)
Comex	71.1	69.2% (102.13)	66.9% (110.24)	70.8% (97.63)	72.5% (95.84)
GCarso	72.5	69.2% (102.13)	66.9% (110.24)	70.8% (97.63)	72.5% (95.84)
GMexico	70.8	73.4% (94.03)	74.4% (93.98)	72.8% (93.44)	72.5% (93.96)
Gruma	69.0	71.1% (110.55)	70.8% (108.90)	70.5% (110.13)	75.1% (95.93)
The Error estimation in parenthesis

5 Practical Implications

The importance of this research is for trading and investment strategy purposes that could be automated given an uncertainty environment (Al-Jarrah et al., 2012; Assad & Alshurideh, 2020a, b; Shah et al., 2020, 2021). Specifically, it is referred to Algorithmic Trading where behavioral patterns are analyzed, modeled, and predicted under mathematical approaches such as Machine Learning techniques (Al Shebli et al., 2021; Alhashmi et al., 2020; AlShamsi et al., 2021; Nuseir et al., 2021; Yousuf et al., 2021).

6 Originality

Most of research on Artificial Intelligence has been done on developed financial markets where liquidity and number of listed companies are higher than financial emergency markets such as the Mexican. It was shown for an emergency financial market that "market prediction" accuracy levels are similar to those obtained in other research works done on mode developed financial markets.

Machine Learning Price Prediction During and Before COVID-19 and Consumer Buying Behavior

Tauqeer Faiz, Rakan Aldmour, Gouher Ahmed, Muhammad Alshurideh, and Ch. Paramaiah

Abstract In the unprecedented situation of COVID-19, the global economy has turned upside down. This has led to sudden and unprecedented pressures on products demand and price forecasting. The study utilized regression techniques to predict product prices during and before COVID-19 using multiple influencing factors such as increase of COVID-19 positive cases on daily basis, number of deaths on a particular day, and government restrictions level. The data was gathered from worldometers website and combined with local store on sales based on the date. The results were eye opening as the product sold in the months of Mach, April, May and June 2020 were different than last year. This means the customers buying habits were totally altered due to many reasons such as job loss, wages reduction due to remote working, or promotions. Moreover, these products prices were directly proportional to increase of new COVID-19 cases, rise of daily deaths and government restriction levels imposed during the pandemic. The study uses machine learning data mining algorithms such as Logistic regression (LR), Decision Tree, Random Forest and K-Nearest Neighbor. Decision Tree and Random Forest works best in the pandemic situation to predict

product price as compared to Logistic Regression and KNN. However, different outcomes were recorded when comparing the sales during pandemic and before pandemic.

Keywords Price prediction · Regression analysis · Covid-19 sales · logistic regression · Decision tree · Random forest · k-nearest neighbor

1 Introduction

The COVID-19 pandemic has turned the global economy upside down (Akour et al., 2021; Alshurideh et al., 2021; Nuseir et al., 2021a). The COVID-19 crisis is exerting sudden and unprecedented pressures on products demand and price forecasting (Al-Dmour et al., 2021a; Shah et al., 2021; Taryam et al., 2020). Many industries, starting from overseas travel to consumer goods have dropped in demand. Consumers are contracting for enormous discounts and asking for renegotiations (Abbas, 2020; Al-Dmour et al., 2021b; Aljumah et al., 2021). Dubai Economy and Trade licenses authority has confirmed increase of 179% issuance of online shopping trade licenses as compared to last year. Companies have to put their energy and resources to re-invent the ways to look into the market demand and price forecasting during this unprecedented and uncertain times to expand their business (Abdelnour et al., 2020; Al-Jarrah et al., 2012; Alzoubi & Inairat, 2020).

The aim of this study is to find out most selling products during the pandemic, see the change in product price over the period of four months, predict prices of most selling items in normal days as compared to products which have been sold during the pandemic.

2 Research Background

This research project compares the effect on product prices before and during the pandemic. Small to medium enterprises (SME's) deploy resources to understand the market situation based on collected data to uncover the best deals for consumers (Al Suwaidi et al., 2020; Al-Gasaymeh et al., 2020; Assad & Alshurideh, 2020). Product prices are dependent on various other industries e.g. oil, real estate and other inter-linked industries. US crude oil has gone negative for the first time in the history. An overflow of unwanted oil in the market caused US Oil price to plunge to almost − $40 a barrel (Ambrose, 2020). This focuses on looking at product demand during the pandemic and predict product prices and compare this result with the data available before the pandemic. Ministry of human resources and emiratization (the "MoHRE") has declared it legal to reduce employee salary until the COVID-19 crisis prevails (Barr, 2020). Organizations have reduced employee's salaries ranging from 20 to

35% in the UAE. There is no proper statistics on actual salary reduction as it varies from company to company. This makes consumer's buying power very limited and stress upon daily or weekly re-pricing of products.

Therefore, this research investigates "Re-pricing of products" during the COVID-19 pandemic as price prediction or forecasting has been investigated in best case situation so far. Nevertheless, predicting product prices in a crisis like COVID-19 has not been described in the literature. This article reports the internal and external factors involved in Re-pricing of products during the pandemic or emergency like COVID-19 and sales comparison will be made before the pandemic.

3 Aims and Objectives

The study will focus on analysing data mining techniques used to predict product prices during COVID-19, design and develop model based on the requirements, test the model accuracy, and deploy the model to the industry. Finally, this research will compare the results of findings before and during the pandemic. The overall research objective is to apply regression data mining technique to study the effects of prices on certain products during and before COVID. To accomplish this goal, the report will focus on the following major objectives:

RO1[1]: Obtain data and apply data mining techniques such as Logistic Regression, Decision Tree, Random Forest and K-Nearest Neighbour for price prediction during and before the emergency situation like COVID-19.
RO2: Determine how much of the variation in the dependent variable can be explained by the independent variables. In other words, this defines the strength of the relationship.
RO3: Build and Assess model accuracy based on the findings and suggest which model performs the best based on the given data.
RO4: Discuss the outcomes of different models.

Regression analysis is most widely used for forecasting, and this requires an expert understanding and readiness. Previous work on price forecasting contains all the required information to pursue with this report. However, researchers have focused on biological or health issues during H1N1 and Swine pandemics rather impact on pricing in unprecedented situation like COVID-19. Online collaboration required at each development phase with the SMEs to consider all important factors of pricing.

[1] Research Objectives.

4 Literature Review

The purpose of this section is to discuss published work on price forecasting during the pandemic. Keeping this information in mind, different repositories of research articles were interrogated. There is adequate amount of research done in price forecasting, however, forecasting during the pandemic has never been carried out, which clearly indicates the research gap.

Support vector regression (SVR) against Long short-term memory (LSTM) neural network algorithms was used by Bakir et al. (2018). In their comparison study of SVR and LSTM, they introduced a framework to predict mobile phone prices in European shops. According to Bakir et al. (2018), better prediction performance was obtained with the use of multivariate models of SVR and LSTM neural networks. In fact, the Root mean squared error (RMSE) of €33.43 was recorded with SVR model but accurate prediction results were obtained using multivariate LSTM RNN model for next days' cost with an RMSE of €23.640. However, LSTM and SVR time series models work best in price prediction, but the authors have not shared any information of external factors effecting the product prices. In case of mobile phones, the stock can last for years but this will really change the discussion when items expiry date is taken into consideration.

Researchers studied the dynamic price forecasting in Simultaneous Online Art Auctions and investigated two questions: The first question referred to the function of price dynamics in predicting SOA and how it varied from the individual-auction case. The second question probed why the inclusion of price dynamics resulted in superior prediction, and they examined the role of bidder competition and its relation to price dynamics (Dass et al., 2010). The writers used functional data analysis modelling approach which is an emerging statistical methodology that works on functions observations for example price curves in online auctions. (Chen & Fan, 2010; Dass et al., 2010; Elgerd, 1982) had proposed FDA-based an alternate model to the Bass model for price forecasting in 2008. According to Dass et al. (2010) and (Elgerd, 1982), FDA belongs to Fuzzy Logic and Neural Network family as it mimics the continuity processing performed by the human brain. In their research contribution, they developed two main dynamic prediction models, DFM-I and DFM-II for price forecasting. In DFM-I, it incorporated both the price and the price velocity information until the time of prediction, whereas the second model (DFM-II) considered only the price path till the time of prediction. Both these models included static pre-auction information for example the opening price or the item characteristics). DFM-I outperformed all competing models in terms of predictive accuracy. Forecasting price dynamics in particular the price velocity has a major impact on forecasting price, statement made in their first conclusion. Though the context of "An effective pricing framework during COVID-19" is very much aligned with "Dynamic Price Forecasting in SOA", however, the most important factor of re-pricing during the pandemic situation and how other factors impact the product prices still remains buried. This article will primarily focus on the relationship of external factors on predicting prices during the virus situation.

The literature work discussed of Elgerd (1982)various stock price prediction techniques. Opinion mining or Sentiment Analysis in other words, was used to predict stock prices by using historical data. The prediction model training was based on messages which was grouped in to five classifications such as "Strong Buy", "Buy", "Hold", "Sell" and "Strong Sell". All other irrelevant data was discarded, and the purpose of this method was to check how human mood can be used to predict the stock. Support Vector Machine (SVM) has been used a lot for high dimensional data for time-series analysis due to its performance and the authors of this article tested this model for its popularity.

Lab of tropical crops information technology China (Mucedola, 2021) predicted price of vegetables using Back propagation (BP) neural network algorithm. Back Propagation NN has multilayer feed forward networks being trained by the error back propagation algorithm. The BP model contains input layer, hidden layer and output layer, with key attributes of which is that information transfers forward, and the error back propagation. The study revolved around the green pepper price prediction, which is produced locally, and its price fluctuated in recent years. The price is affected due to seasonal production, May to October each year is considered as off-season and busy season remains from November to April. Due to spring festival, the demand of green pepper becomes high during Mach and April. The article also indicates the change of price due to high temperature and rain fall. The price drop due to these external factors are negligible in the current scenario. In order to determine "Re-pricing" due to pandemic, it is necessary to analyze all the relevant impact factors to forecast the product prices. This research article will focus on predicting prices during the pandemic.

OSEMN framework covers all the steps from gathering raw data all the way up to analyzing data and building dashboards or reports (Faiz, 2019). This model contains the framework as (O)—Obtain raw data, (S)—Scrubbing or cleaning data, (E)—Exploring or Visualizing data to search patterns or trends, (M)—Modelling data for prediction, (N)—Interpret the results. Any project related to machine learning or data analytics always follow the given steps. "An effective Pricing framework during COVID-19" will be using the similar techniques discussed in "Scrubbing data for medium-sized enterprises" to pre-process data to make it fit for use. Data pre-processing techniques, finding outliers, and removing irrelevant information will be followed according to the framework mentioned in this article.

The airfare price prediction using machine learning techniques provides the best time for customer to purchase an air ticket before it gets increase (Elgerd, 1982). According to this technique, the most informative features such as departure time, arrival time, free luggage, days left until departure, number of transits, holidays, overnight flights and day of the week play a vital role in ticket prices (Elgerd, 1982). Eight different machine learning regression models were selected which includes, multilayer perception (MLP), generalized regression neural network, extreme learning machine (ELM), random forest regression tree, regression tree, bagging regression tree, regression SVM and linear regression. The historical data was gathered of a particular airline, and experimental models have shown that machine learning prediction models brought satisfactory results. They concluded that

"Regression Tree", "Random Forest Regression", and "Bagging Regression Tree" machine learning models brought accurate results while "Random Forest Regression" and "Regression Tree" outperformed considering the execution time.

There are numerous research articles based on price prediction using machine learning algorithms. According to Elgerd (1982), Regression Tree, Random Forest and Bagging Regression works the best to forecast airfare prices. The LSTM and SVR were compared (Elgerd, 1982) against the mobile phone prices prediction and they obtained best accurate results with these models. In a nutshell, articles reviewed in this research have used SVR, Random Forest and LSTM brought accurate results as compared to Nearest Neighbour and other similar machine learning algorithms. However, there is no single machine learning technique which works best with all kinds of data. This publication recommends that some other popular regression analysis techniques such as Multinomial Logistic Regression, Decision Tree, Random Forest and KNN should be used and evaluated for large amounts of data with multiple categorical fields. As the price prediction during the pandemic or emergency situation has not been explored before, so, certain parameters which affects the pricing were included such as promotions, new COVID cases, new daily deaths and restriction levels. Worldometers website provides covid information on daily basis of all the countries and the sales information were obtained from a well-established supermarket. The two data sets were combined together based on date column. There were almost 50,000 data rows which were sufficient to be used for model building. The data mining model accuracies were improved by discarding the irrelevant and multicollinear columns from the data and the results were compared against pandemic vs non-pandemic situation.

5 Methodology

This section focuses on data analytics project lifecycle and actual implementation of the problem discussed in aims and objectives of Sect. 3. Due to the unprecedented time of COVID-19, ecommerce has observed price fluctuations in different products. As mentioned in Sect. 1, customer's purchasing habits are shifted to selection based due to its limited buying power. Most of the business entities relies on price prediction framework to run their businesses. This data science project research is illustrated in the following Fig. 2, Research Methodology. As the past data will be collected and analyzed, the research will be a quantitative analysis. The whole research process will involve finding the most selling products in the month of March, April, May, and June and predicting the product prices during and before COVID-19. Regression data mining techniques such as Logistic Regression, Decision Tree, Random Forest and KNN will be applied, and the model outcomes will be compared and generalized. Descriptive analysis answers the "what happened" by summarizing past data, usually in the form of dashboards. In this research first we will create a dashboard to see most selling products using Microsoft Power Business Intelligence tool or Python coding

can also help to show graph for most selling products. The data will be imported to Power BI tool and a dashboard will be designed based on the requirements. Following reports will be generated using this tool:

- Top 5 most selling products (Sect. 3—Aims and Objectives), Frequency of change of Unit_price during the COVID-19 when there is increase of new cases diagnosed as COVID positive (Sect. 3—Aims and Objectives), Frequency of change of Unit_price of the most selling products before the COVID-19
- Filtering data to required months (i.e. March, April, May and June 2020)

The second type of analysis is the Predictive Analysis, and it answer the question "what is likely to happen". This technique utilizes previous data to make predictions about the future sales. Predictive analytics relies on statistical modelling to forecast. The accuracy of prediction depends upon the data quality and sufficient training dataset.

In this supervised machine learning problem, "Logistic Regression", "Random Forest", "Decision Tree" and "K-Nearest Neighbour" will be applied and their results will be recorded. The focus of this study is on data mining regression techniques, so the research approach of this study is quantitative. Secondary data (data from business or data resided in computerized databases) will be collected from the e-commerce store and will be used in this research. The Worldometers website provides COVID-19 cases on daily basis. A CSV file related to COVID cases is downloaded and will be merged with ecommerce file. The reason to merge COVID new cases and deaths information is to find a relationship among product Unit_price and daily new cases or new deaths. The purpose of this research is to explore the effect of product prices when new cases or deaths are increased, and the research approach is quantitative. Another most interesting feature of Government imposing restrictions to be followed during the pandemic will also be merged with the excel sheet.

The objective of this research is to understand change of certain product prices when the COVID positive cases are increased. In this study, the data science project methodology has been followed. There are several steps in data mining price prediction. In order to implementing these methods, Python machine learning libraries such as pandas, scikit learn, matplotlib, seaborn and sklearn will be used. Microsoft Excel and Power BI is also required for column addition and dashboard creation. All outliers will be checked and removed to pursue the analysis following the techniques mentioned in article "Multiple approaches on scrubbing data for medium sized enterprises" (Faiz, 2019).

According to Beklemysheva (2019), Tziridis et al. (2017), AlHamad et al. (2021), Nuseir et al. (2021b), Salloum et al. (2020), Ghazal et al. (2021), Alshurideh et al. (2020), Al Kurdi et al. (2021) implementing machine learning solutions using python is time saving as python offers number of frameworks and libraries. Python provides extensive libraries for machine learning such as data analysis, visualizing and provides machine learning algorithms. Model building is based on some certain steps as shown in Fig. 1.

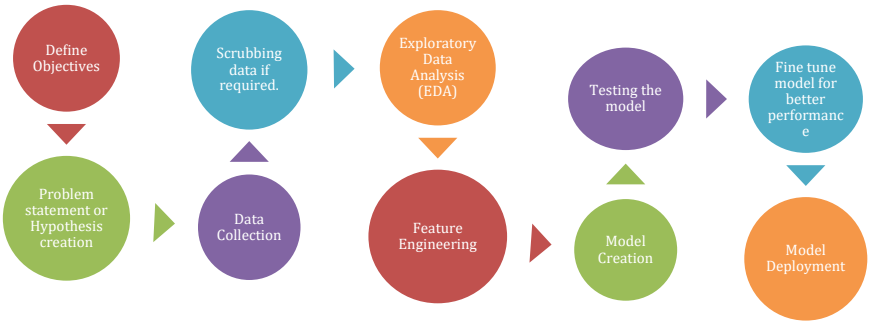

Fig. 1 Supervised learning—model building

6 Findings and Analysis

This section presents the results, and analysis relating to the prices of selected products during and before COVID-19 which is the aim of this research. Data Science project lifecycle methods is followed before building any model as mentioned in model building Sect. 5. Some fancy python coding is used to build the model. Let us understand the pandemic data used in this research first.

The dataset is obtained from a renowned E-Commerce store in UAE and is used for research purposes only. The company name will not be revealed due to non-disclosure agreement. The obtained data consists of 51,308 individual data rows. In this dataset, New_cases, New_deaths and Restriction_level columns are manually added using Microsoft Excel. The COVID-19 cases information is updated on regular bases on worldometers.info site. The site allows to download more than 200 countries daily COVID cases as a CSV file. The file was downloaded from the website and only UAE COVID cases were filtered from the file and merged to the sales report using Microsoft Excel according to the "Order_date".

There are 17 columns in the dataset, which are described below and a sample is shown in Fig. 2:

- **Order ID**—Customer order is given a unique id and it is auto-generated by the system at the time of purchase.
- **Order date**—It lists the date of purchase in 'yyyy-mm-dd' format.

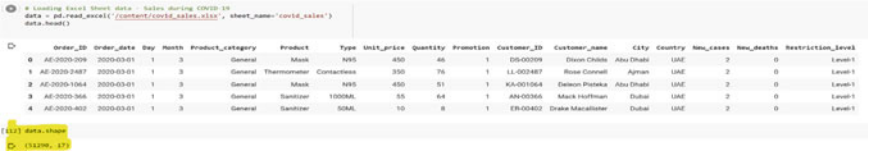

Fig. 2 Sample data

- **Day**—Day is obtained through Order date column and display the day of the month e.g. 1 represent first day of the month. The column has range of values from 1–31.
- **Month**—This column converts Order date to month and only month information is retained. The proposed dataset has month of March, April, May and June values.
- **Product Category**—It holds the product categories and has 4 distinct values. (1) General, (2) Fashion, (3) Fruits & Vegetables, (4) Electronics
- **Product**—One of the most useful columns and it consists of names of the products. The column has 34 unique products in the list.
- **Type**—Product is divided into further categories e.g. Mask has N95 and Surgical types.
- **Unit_price**—Actual price of the product and it's a numerical field.
- **Quantity**—Number of items ordered by the customer.
- **Promotion**—This tells whether the product is on promotion, 0 means product is sold on normal price, 1 means product is sold on offer price.
- **Customer ID**—This field contains customer id information.
- **Customer Name**—The column saves customer name.
- **City**—Name of the city where the product is delivered.
- **Country**—The column has single value as data is based on United Arab Emirates.
- **New_cases**—This field is inserted manually to establish relationship between number of products sold when the cases were increased. The data is obtained from worldometer.com website.
- **New_deaths**—This field lists the number of deaths on a particular day recorded during the COVID-19. This field is also taken from worldometer.com and merged based on the dates.
- **Restriction Level**—This field may affect the Unit_price as the Government of UAE was imposing different restrictions alerts on the public to contain the spread of COVID-19. The values are populated in the excel sheet based on the Ministry of Health and Emergency Crisis & Disasters Committee for COVID-19 pandemic announcements on different dates. The data is obtained from UAE ministry of health website (mohap.gov.ae). This field has five distinct alert levels which includes:
  - **Level-1** allows normal activities with precautions; **Level-2** requires physical distancing and restrictions on leisure and social activities.
  - **Level-3** applies restrictions on many activities including at workplaces and socially, to address a high risk of transmission; **Level-4** Extreme precautions to limit community transmission and outbreaks, while allowing some activities to resume whereas **Level-5** Drastic measures to contain the spread of the virus and save lives.

From the above datapoints, "Unit_price" will be dependent (target) variable and "Day", "Month", "Product", "Type", "Quantity", "Promotion", "New_cases", "New_deaths" and "Restriction_level" are the independent attributes.

First, let us understand the pricing changes during the COVID-19. Comparison is made on pure on-demand product pricing during the month of March, April, May

Fig. 3 Quantity sold

	Quantity			
Month	3	4	5	6
Product				
Dragon_fruit	624	1211	2153	1533
Gloves	3807	2285	3984	1620
Mask	7140	6367	7366	10706
Sanitizer	10874	10282	12732	13674
Thermometer	2990	2372	3950	4613
Vitamin_C	1523	7190	8356	8365
Water_melon	1284	181	265	87

and June 2020 as this was the peak time of COVID-19 pandemic. Figure 3 Sales Report offers several useful information to simplify the analysis report.

The significant change of "Unit_price" reflects that the price of Sanitizer was shifted 24 times during these four months, similarly, Vitamin_C had been modified 16 times, Mask prices 13 times, Gloves 4, Thermometer 6, Green_leaves 5, Hair_clipper 2 and Samsung Mobile 2 times. Next important feature of interest in the given dataset is "Quantity" sold during the pandemic. The Fig. 3, discovers that Sanitizers are at the top with around 47 K units sold, Mask holds the second place with 37 K, Vitamin_C is the third most demanding product, Thermometer, Green_leaves and Gloves are also among the top selling products category during this time.

The following two figures (Fig. 4—Change of Masks and Sanitizers Prices) are evident to see the change of Mask and Sanitizer prices during the month of March, April, May and June. The Vitamin_C, Thermometer, Hair_clipper and Gloves depicts the similar kind of behavior in these four months.

Sanitizer, Mask, Vitamin_C, Contactless Thermometer, Gloves, and Green_leaves are most selling products found in the given dataset as shown in the Fig. 5—Top Selling Products in COVID-19.

Monthly quantity sold of different products statistics is shown below. Dragon_fruit is included in this study because this is the top season for Dragon_fruit to be sold in the market. However, the demand of Dragon_fruit has gone down which can be proved when considering the data before pandemic.

Another useful graph that shows the distribution of quantitative data to facilitate comparisons between variables is box plot. The box depicts the quartiles of the dataset whereas the whiskers reflect the rest of the distribution. The box plot also known as box and whisker chart is a way of displaying the distribution of data based on the minimum, first quartile, median, third quartile and maximum.

Outliers can be seen in case of Vitamin_C and Thermometer in Fig. 4 Boxplot. However, this will not be removed as the Unit_price has been changed with respect to different factors. A violin plot is like box plot, except that violin plots show probability density of the data at different values. Some box plots and violin charts pertaining to the dataset are shown in Figs. 6 and 7.

Fig. 4 Change of masks and sanitizers prices

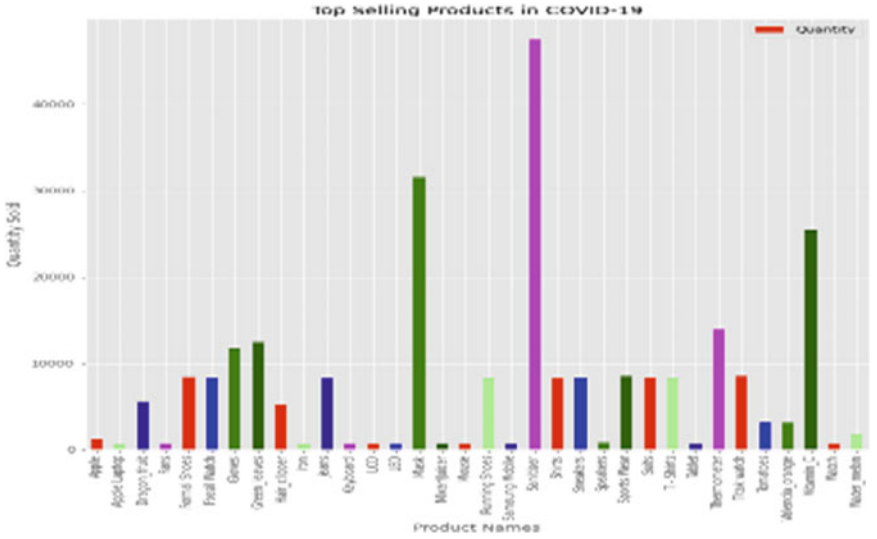

Fig. 5 Top selling products in COVID-19

Unit_price of Mask and Thermometer seems to be spread out in the above violin graph. The value of Unit_price ranges from 5 to almost 850.

Product Mask sub-category N95 and Surgical Masks prices are varying with respect to time, Similarly, Vitamin_C 20Tab bottle and Contactless Thermometer prices have changed slightly as shown in the Fig. 8 Violin Chart.

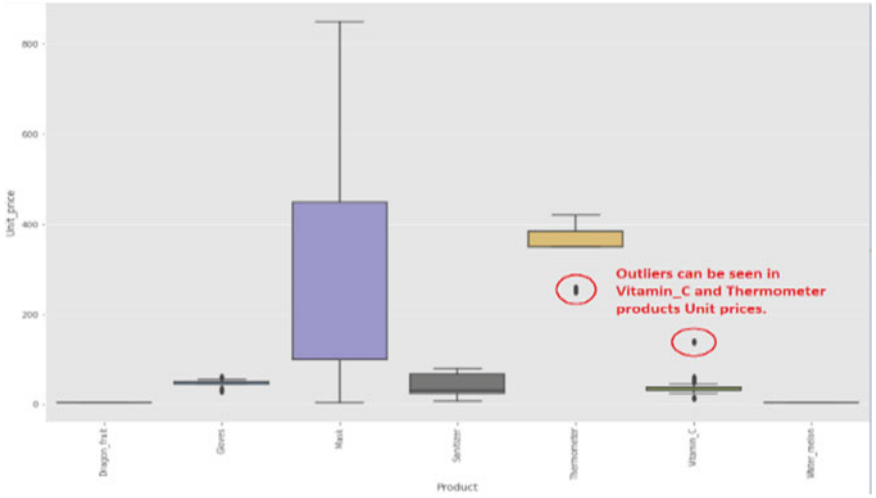

Fig. 6 Boxplot

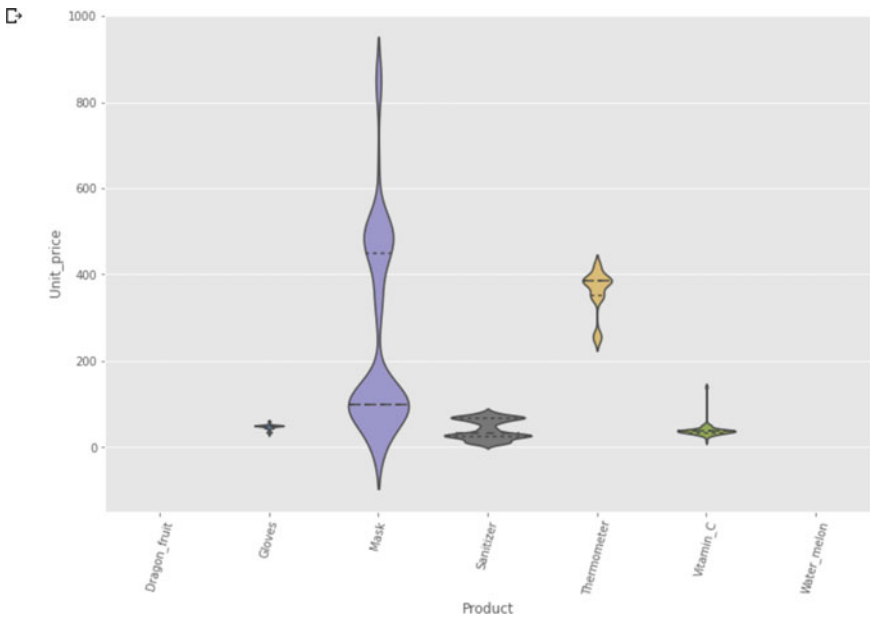

Fig. 7 Product prices during COVID

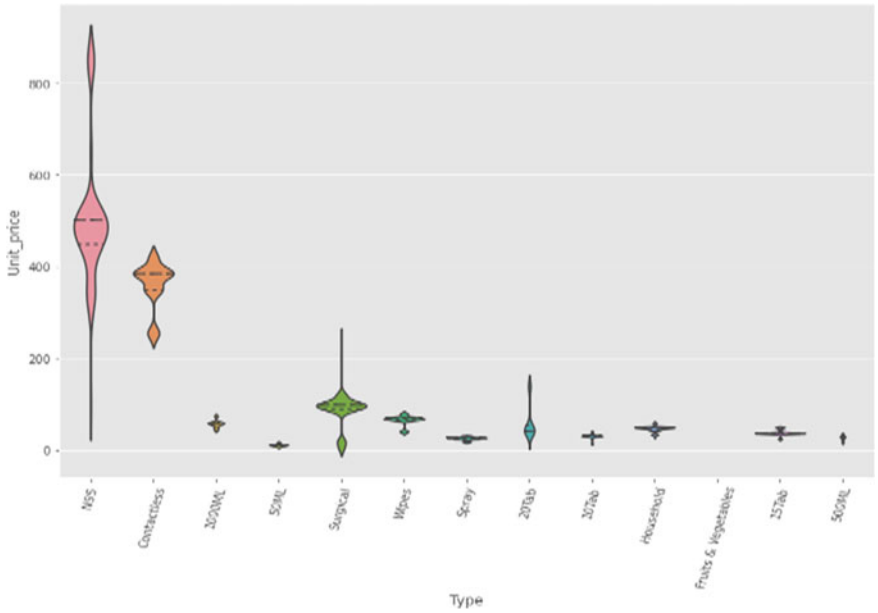

Fig. 8 Violin chart—product sub-categories

The Swarm plot Fig. 9, displays the different unique values of the Unit_price of selected products. According to this graph, 12 different masks prices are recorded, and other products prices are self-explanatory.

Fig. 9 Swarm plot during COVID-19

Licensed to (putm@utm.my)

The data obtained from the business (raw data) is not always numerical while mathematical formulas require numerical data. This section explains on finding useful information in your data and transforming them into format that is suitable for model building in machine learning. Feature engineering is divided into following categories:

- **Feature Selection**: All attributes in the data are not equal in preference and magnitude. It is important to select a limited subset of features from the large features pool. A key to features selection is to select such attributes which shows the relationship between dependent and independent variables. There are few attributes which are more handy than other attributes to ensure the model accuracy. All irrelevant data attributes are dropped from the dataset after looking into correlation matrix of exploratory data analysis section. Order_ID, Order_date, Product_category, Customer_ID, Customer_name, City, Country, Month and Quantity columns were dropped from the dataset.
- **Feature Transformation**: This covers scaling and dealing with null values. Log functions are used to reduce data skewness. The data used in this research project is clean and fit for model building.
- **Feature Extraction**: When dealing with huge data, it requires processing and large number of variables consumes lot of processing power and memory. Therefore, duplicate data should be removed, or dimensionality of such variables should be removed.

As of now, there is a strong correlation among dependent and independent variables and it's time to build the logistic regression models in SKLearn. Logistic Regression model in machine learning is useful for discrete dependent variables as well as categorical variables.

Multinomial logistic regression is appropriate for categorical data. As Scikit-learn is shipped with solvers, Stochastic Average Gradient descent solver technique will be used as it is fast for big dataset with 1000 max iterations taken to converge. Mean absolute error (MAE) and Root mean squared error (RMSE) are useful common metrics to measure accuracy.

Decision Tree Regression Model—Decision tree model random_state is 101, this will decide the splitting of data into train and test values. Setting random_state a constant value will make sure that same sequence of random numbers are generated each time when you execuate your model.

Random Forest—There are several reasons to use the random forest such as high dimensional data, avoids overfitting and helps to see features importance.

Random Forest suggest that Promotion has 16% impact factor on dependent variable that is Unit_price, New_cases contribute to 9%, while product type Type_Fruits & Vegetables influence the model by 8%. There are many other factors which are impacting the Unit_price and depicted in the above Fig. 10.

K-Nearest Neighbors (KNN)—KNN is applied with n_neighbors equal to 3.

Finally, the accuracy graph shown below Fig. 11, depicts the model's accuracies. According to the sample data fed into these models, the Decision Tree and Random

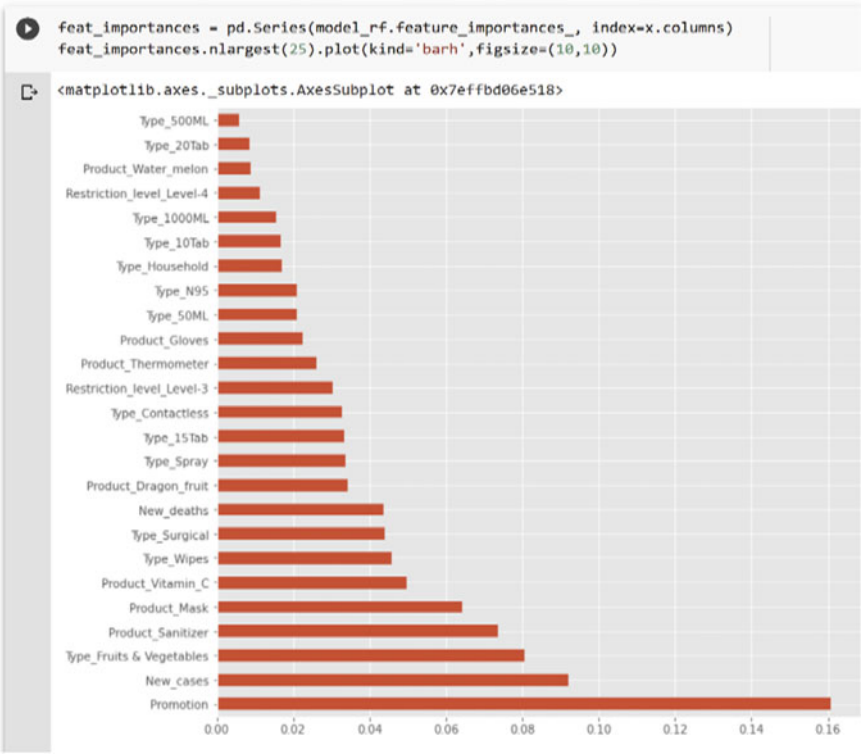

Fig. 10 Feature importance

Forest brings the highest accuracy level of 99%, whereas KNN is 83% and the least accurate model is the Logistic Regression in the current scenario.

It's time to understand data before pandemic. Similar approach is followed to understand the data before COVID-19. The top 5 most selling products before the pandemic are Green_leaves, Jeans, Titak watch, Sports Wear, and Formal shoes as shown in Fig. 12. To compare the similar product prices sold during the COVID-19, all other products are dropped for the analysis and the price distribution before COVID-19 is shown in (Fig. 13).

The product "Mask" of "N95" and "Surgical Mask" types prices are shown in the graph for the months of March, April, May and June 2019. The values displayed in the Fig. 15 below are stable throughout these three months and no noticeable changes are recorded.

The correlation matrix in Fig. 14, highlights the positive and negative correlation between quantity and moth variables.

The Swarm plot in Fig. 15 indicates the different prices of products in the given dataset which appears to be constant. The OLS matrix in Fig. 14 below lists the R-squared value and P value which is appropriate for this dataset.

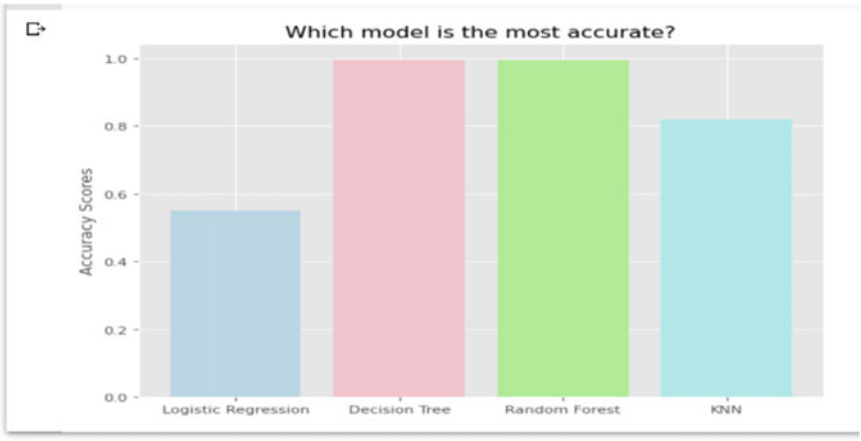

Fig. 11 Model accuracies

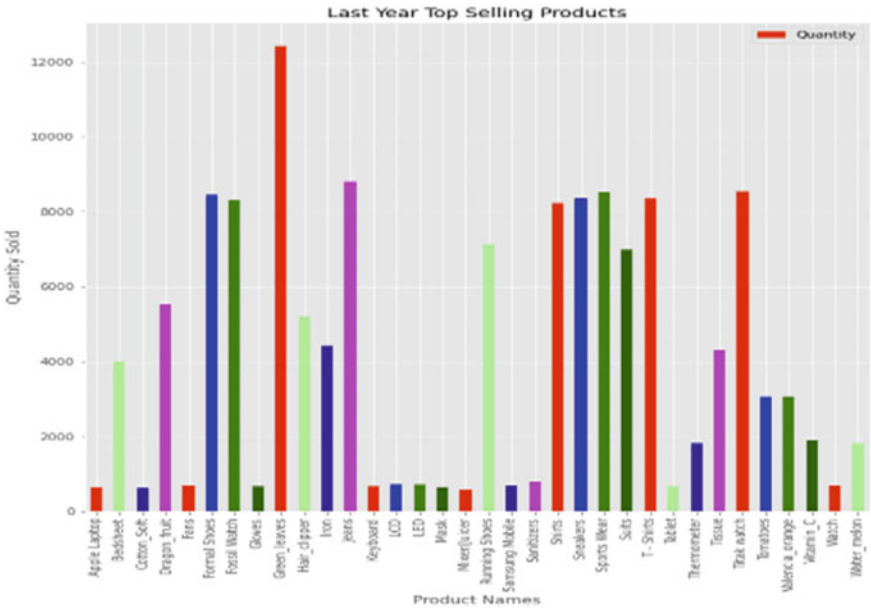

Fig. 12 Last year top selling products

The data is split into training and test sizes, 70% of the data will be used for training purpose and remaining 30% would be considered for testing.

Models' accuracy Scores—After passing this data to Logistic Regression, Decision Tree, Random Forest and KNN, model accuracies were recorded as follows.

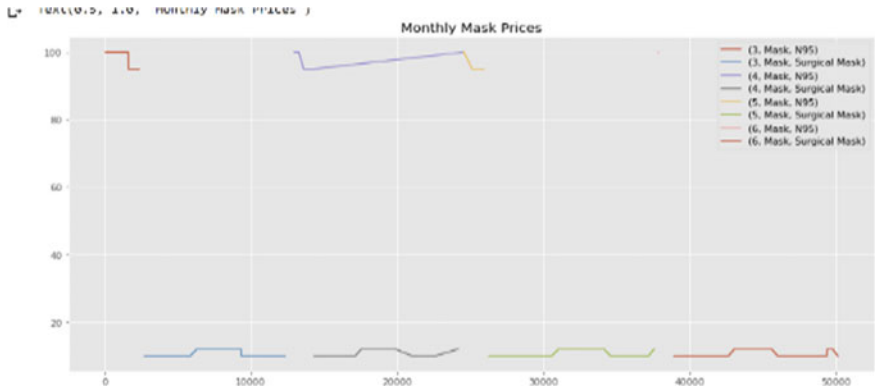

Fig. 13 Price distribution before COVID-19

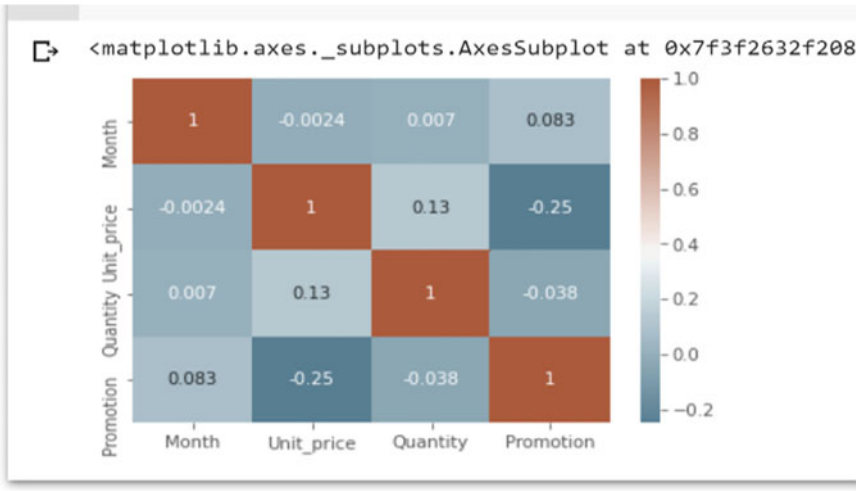

Fig. 14 Correlation matrix

All the four models are predicting almost the same and their predictions scores are identical as shown in the Fig. 16.

7 Results Comparison and Recommendations

In this study, logistic regression, decision tree, random forest, and knn regression models were applied to the collected dataset, and the following result comparisons are made.

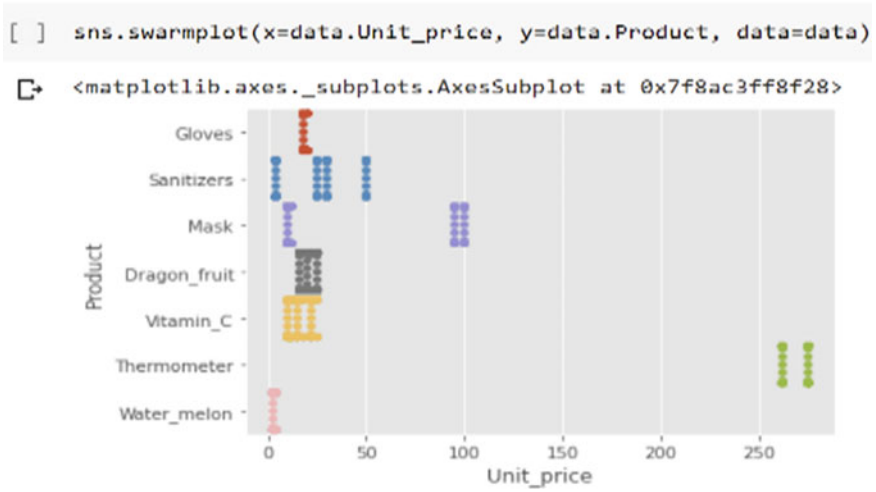

Fig. 15 Swarm plot before COVID-19

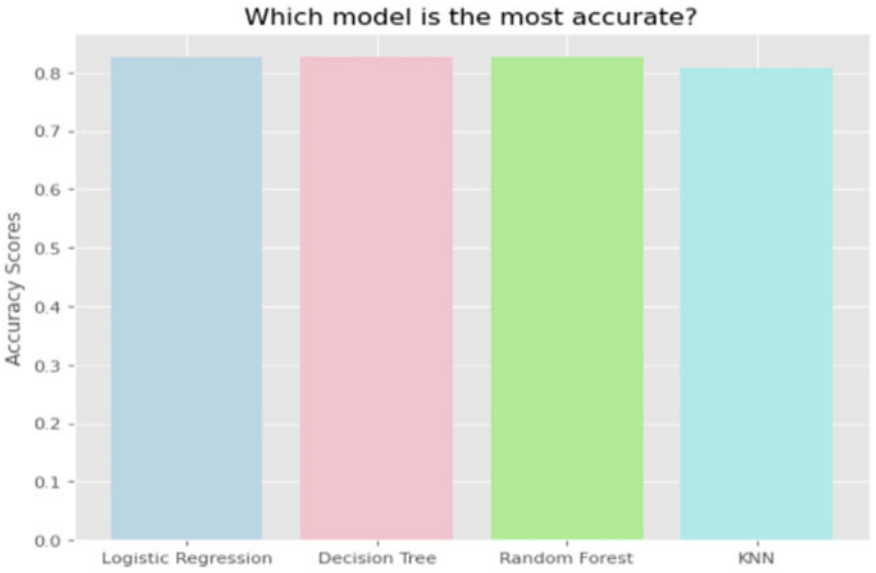

Fig. 16 Model accuracies before COVID-19

Starting with the features used in both datasets (during and before covid-19) discussed in Sect. 4, there were 17 features used during the pandemic and 14 features were used before covid-19. Addition of these extra four columns during the pandemic is explained and supported by arguments in previous sections. The New_cases, New_deaths, Restriction_level, Promotion, Quantity, Months and Promotion are the

most important features influencing the Unit_price. Both datasets share different outcomes in terms of most selling products. During the COVID-19, the most selling products were "Mask", "Gloves", "Sanitizers", "Contactless Thermometers", "Vitamin_C", and "Green leaves", whereas before the Covid-19 factor, the top selling products were "Green leaves", "Jeans", "Titak watch", "Sportswear" and "Formal shoes". Comparing and contrasting these two different outcomes support the initial argument mentioned in Sect. 1 that the consumers buying habits were changed and customers were buying the products as per the situation. As there were no physical activities outside the house, the sales of footwear, clothing and other leisure products were gone down drastically.

During the pandemic, some products prices were dependent on certain conditions. The Swarm plots shown above are evident that the Mask and Sanitizer prices were changed due to certain conditions while it remained constant before the pandemic. According to the regression models used in last section, prices of mask, sanitizers, gloves, vitamin_c and thermometer were changed (swarm plot) due to the following impact factors:

- Increase in covid-19 positive cases
- Number of daily deaths increased during the pandemic
- When Government was imposing restrictions to follow health and safety precautions
- Product demand was increased

The two correlation matrixes in Table 1 tabulate the relationship between dependent and independent variables. There is a slight relationship between dependent and independent variables however, multicollinearity problem exist in the dataset as independent variables are correlated as well. New_deaths and New_cases are strongly correlated independent variables in this scenario. As the focus of this analysis is to find the effect of COVID-19 impact factors on Unit_price of different products, so discarding these attributes will not serve the purpose. A similar kind of dilemma has been noticed in the dataset used for before COVID-19.

Table 1 Correlation matrixes (During & Before COVID-19)

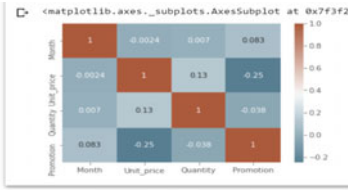
Correlation Matrix – During COVID-19	Correlation Matrix – Before COVID-19
	


Table 2 Features importance

	During COVID-19		Before COVID-19	
	Random forest		Random forest	
1	Promotion	16%	Promotion	29%
2	New_cases	10%	Dragon_fruit	14%
3	Fruits & Vegetables	8%	Fruit & Vegetable	8%
Decision tree			*Decision tree*	
1	New_cases	24%	Dragon_fruit	24%
2	Fruit & Vegetables	24%	Thermometer	16%
3	Promotion	18%	Promotion	15%

The top three important features which are influencing the model are listed in the following Table 2 based on the two datasets. According to the Random Forest, the top feature impacting the model is Promotion field during the COVID-19 and before the COVID-19, whereas Decision Tree has two variants at the top level which is New_cases in the COVID-19 situation and Dragon_fruit before the pandemic. The second most feature influencing the model is New_case and Dragon_fruit in Random Forest with the values of 10% and 14% during and before COVID respectively. The Decision Tree's second most impacting features are Fruits & Vegetable and Thermometer during and before the COVID-19 with distribution of 24% and 16% accordingly. Promotion comes at number three with the values of 18% and 15% influencing the DT model during and before the pandemic. Here, only top 3 features are discussed.

Four regression techniques were applied to the two datasets as discussed in Sect. 4. The datasets were split into training and testing purposes. The training set data was set to 70% to build the model while remaining 30% data was used for model evaluation. All categorical variables were converted to dummy variables using panda's built-in library. Table 3 displays the accuracy scores obtained when applying Logistic Regression, Decision Tree, Random Forest and KNN to the data tables. Accuracy evaluation metric is used to determine how good our model is, based on dependent and independent variables. During the COVID-19 situation, Logistic regression accuracy scores are 55.1% which means the model has been failed to produce the accurate predictions. KNN accuracy scores are 81.8% which is fairly good. On the other hand, Decision Tree and Random Forest predicted 99% accurate results and standout from the rest.

Before COVID-19, the models' predictions are almost same as the number dependent variables used in the dataset was fairly simple and straightforward. That is why the differences are not significant in these four models. According to the Table 3, first three models (LR, DT and RF) have similar 82.5% accuracies while KNN is reduced to 1.9% and was recorded 80.6% accurate predictions. Figure 17—Accuracy scores signifies the comparison accuracy scores of the mentioned four models.

Table 3 Accuracy comparison

S. no	During COVID-19—accuracy results		BeforeCOVID-19—accuracy results
1	Logistic regression	55.1%	82.5%
2	Decision Tree	99.2%	82.5%
3	Random Forest	99.3%	82.5%
4	KNN	81.8%	80.6%

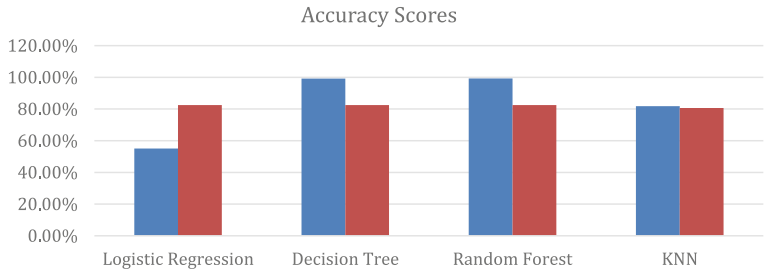

Fig. 17 Accuracy scores

There could be many factors that may have contributed to this Logistic Regression inaccuracies such as it requires more data, weak relationship, or multicollinearity.

8 Conclusion

This research focused on regression analysis during the COVID-19 pandemic. It predicts the unit price of most selling products during the COVID-19 and compares the prediction with the last year data i.e. before COVID-19. According to the findings obtained in Sect. 6, Masks, Sanitizers, Gloves, Vitamin, Contactless Thermometers are the most selling products, and it makes sense as well. During the COVID-19, daily routine activities were badly affected, and people were forced to practice social distancing. That is why, people were purchasing the items which were highly recommended by doctors and government officials.

Decision Tree and Random Forest showed the maximum accuracy score of 99.2% during the pandemic. Which means these two machine learning algorithms are reliable for e-commerce price prediction based on multiple independent variables. The second accurate model was K-Nearest Neighbor with the accuracy score of 81.8% which is again acceptable results for this kind of data during the COVID-19. Since, Logistic Regression gave the least accuracy score of 55.1%.

The accuracy score of Logistic Regression, Decision Tree and Random Forest was the same as 82.5%, while accuracy score of KNN model was 1.9% less than the rest. However, all the model's accuracy score is above 80% which makes all of the

somewhat acceptable for this situation. The reason for this was that the Unit Price of products stayed constant throughout the four months. Which is why all these models behaving the same.

The future augmentation to this study is to collect data from multiple e-commerce stores from different emirates (states) and pass this data through models currently used in this study, mentioned in Sect. 6. The relationship between dependent and independent variables should be re-evaluated to see the patterns. Moreover, models accuracy should also be compared to form a generalized opinion of these findings.

Secure CoAP Application Layer Protocol for the Internet of Things Using Hermitian Curves

Raja Masadeh, Omar Almomani, Esra Masadeh, and Ra'ed Masa'deh

Abstract Internet of Things (IoT) is a modern technology that allows devices to sense status and take suitable reactions without human interference; this leads machines to interact directly with another machine, called machine to machine (m2m) communication. Many network technologies were involved in making the IoT idea work well. Devices in IoT are connected through the wireless network. Thus, different protocols on different network layers are used in IoT. One of the primary routing protocols used on the application layer is Constrained Application Protocol (CoAP) which is a new web application transfer protocol. Where it is better suited to constrained environments than HTTP for IoT. In this study, Hermitian-based Cryptosystem (HBC) is applied on the CoAP protocol in order to increase the security of IoT. The Hermitian curve is an algebraic geometric curve capable of generating a vast number of points. Simulation results are presented, showing significant performance improvements of AG codes over Hermitian codes against Reed-Solomon (RS) codes and Elliptic Curve Cryptography (ECC). This study proved that HBC outperformed the RS and ECC in terms of several points and key length, which leads to increase security.

1 Introduction

Internet of Things (IoT) is a modern concept, appears in the latest few years. It consists of two terms: Internet and Things. The idea behind this concept is to connect any item in the world using the Internet. Such items or Thing are not only smart devices (Yassein & Aljawarneh, 2017; Yassein et al., 2016). A milk bottle in your fridge that is supplied by a sensor might be connected with the shopping list on your mobile phone. In case that the milk bottle is empty the sensor sends a message to your phone to add milk as one of the items on the shopping list. Also, the coffee machine may be connected to the Internet with the alarm on your smart phone, in order to get the coffee ready when you are awake. In this case the mobile sends a message to the coffee machine to turn on and get the coffee ready.

Since lifestyle become more complicated and connected technology take the most important responsibility to make such communication become true using the most important concept "Internet of Things". As shown in Fig. 1, Cisco (Kalyani et al., 2015) had done an analysis about the number of devices connected to the internet over years with respect to world population. The study shows in 2015 the population of the world was about 7.2 billion and about 25 billion devices were connected to the internet, which means each person in average used about 3.47 devices. However, a huge growth is expected in 2020. The study expected the population to become about 7.6 billion, however about 50 billion devices expected to be connected to the internet, which is in average about 6.58 device for each Pearson.

The first appearance of IoT was in 1999, by a group of network specialists who utilized the preexisting sciences such as radio frequency identification (RFID) and emerging sensing technologies (Evans, 2011; Hart & Martinez, 2015; Kalyani et al., 2015). Moreover, IoT include sensor networks that use sensors to read the status of a specific device in specific time and send the information to a sink node to take the appropriate action. The flow of the information should choose the best path between nodes, here appears the responsibility of the routing protocol used (Yassein & Aljawarneh, 2017; Yassein et al., 2016). Many routing protocols are used in IoT such as 6LowPAN-IPV6 over IEEE 802.15.4, Routing Protocol for Low Power and Lossy Networks (RPL) and Constrained Application Protocol (CoAP).

CoAP is a routing protocol that stands on the application layer. It aims to take place of HTTP protocol. This protocol was designed to meet low power devices with low overhead and multicast support. CoAP was also build as an alternative protocol to connect low power devices to the internet.

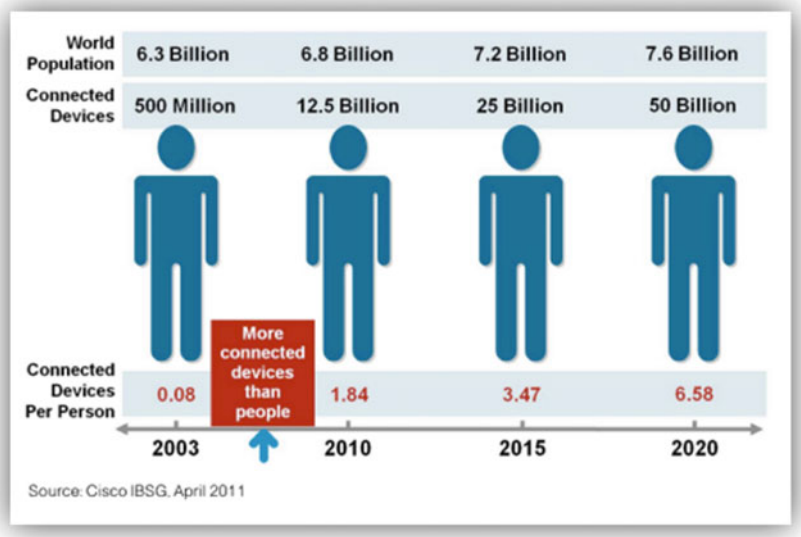

Fig. 1 Cisco analysis of IoT (Kalyani et al., 2015)

The main issue that faced the CoAP is the security. Many researches are suggested many solutions in order to solve this problem. Such as the data encryption standard (DES) which was the most familiar and used over than 30 years but now it has a main drawback which is easy to crack by any attacker; and the advanced encryption standard (AES). While, there is another algorithm is not used in CoAP till now which is called Hermitian curves (Rovi & Izquierdo, n.d.). Which is algebraic geometry (AG) curve that plays a main role in coding theory and cryptography. Moreover, the main goal of using AG is to create an effective coding and secured system.

The testing environment will use Contiki-Cooja 3.0 simulator. The difficulty of this simulator that it is not documented. However, all IoT protocols are well programmed which make the environment easier for the researchers than start from scratch. The Contiki-Cooja is written in two programming languages JAVA and C. the windows of the simulator are written in JAVA while the nodes inside and the flow of scenarios is written in C.

The reset of this paper is organized as follows: Sect. 2 contains the background in detail for both CoAP and Hermitian curve. Section 3 presents the related work. While Sect. 4 illustrates the proposed algorithm. Section 5 presents the simulation results. Finally, Sect. 6 draws the conclusion.

2 Background

2.1 Background of COAP

The most challenging mission in IoT is planning and designing a secure network and suppling end-to-end connection. In addition to that, security is the most significant factor in IoT because the most of interchanged packets and information are secret and critical. The main issue could be occurred when adding security to the network because it leads to consume more energy, since it is immediately related to the network lifetime. Thus, many researches presented to examine this problem, by using some traditional security techniques and try to adopt them into IoT. In this section, CoAP protocol is discussed.

Lately, the IETF constrained RESTful environments (CoRE) working team purposes to share the standardization and permit to combine between the constrained devices and the internet at the service level. Thus, they presented a new protocol which is called Constrained Application protocol (CoAP) (Rovi & Izquierdo, n.d.). Which is similar to the application transfer model of HTTP and execute some its characteristics. One of the most aim of CoAP is designing a specific requirement web protocol that goals to utilize in 6lowPAN, taking into account the structuring automation, power and other M2M (machine to machine) applications which are used in smart towns (Kushalnagar et al., 2007). Thus, these applications can be managed by using CoAP protocol which leads to rise the significance of web services during the daily lifetime for people. However, CoAP use UDP connection protocol between client and server by default to guarantee datagram arrival even through connectionless (Kerasiotis et al., 2010). The features of CoAP that recognize from other protocols that make it more suitable for constrained network and devices are presented in the following (Kovatsch et al., 2011):

- Web protocol that fulfills M2M constrained requirements which is consolidated protocol that is designed for constrained nodes. Moreover, it is suitable and applicable on RAM of 8–12 K and 8–16 bits microcontroller nodes.
- Simple caching and proxy abilities, where this protocol props caching, and the last responses could be cached in case the proxy is utilized in order to reply later such as the work of agents when they in the sleep mode.
- UDP binding that supports reliability using the multicast and unicast requests. In other words, CoAP has the choice to transmit a large number of packets by using UDP with reliability guarantee using Back-off algorithm. In addition to that, supporting the multicast requests but the reliability is not guarantee.
- The variety of message exchanging, which means this protocol permits to read, create, delete, modify and update a resource on any node because it depends and based on REST architecture.
- Content type and URI support. That means CoAP supports all the huge media types.

As mentioned above, CoAP is similar to the application transfer model of HTTP and execute some of its features. Thus, the standard methods which are completely supported by CoAP such as POST, PUT, DELETE and GET methods which are close to HTTP methods. In addition to that, these methods capable to monitor and effect the resources. These methods are presented as follows (Shelby et al., 2014):

- POST, this type of methods is used when a new subordinate resource is required in order to be differentiated under a present resource URI.
- PUT, this method is used within updating or creating a resource stable with URI that is defined in advance.
- DELETE, this type is used in case of deleting a URI specified resource.
- GET, this method is utilized in order to gain any resource information which is known by using URI.

As shown in Fig. 2 CoAP has client—server interaction model is similar to HTTP (Levä et al., 2014). When the sender (client) sends a request for any action, the receiver (server) replies with response message that includes the resource representation and the response code. However, CoAP functions the roles of clients and servers at the same time. CoAP achieves M2M requirements through supporting asynchronous operations over the UDP. This operation is done by using four exchange messages which are CON, Non-Con, ACK and REST as presented in Fig. 2.

2.2 Hermitian Curves

The AG curve is by depicting the number of points which accepted the curve equation which is called point on the curve. Thus, this curve is called either a projective curve because j represents the x-axis, k represents the y-axis and s represents the z-axis, which means it represents three—axis (j, k, s) or affine curve in case represents two-axis (j, k).

The projective Hermitian curve which is defined over a finite filed (2 m) where $b = \sqrt{f}$ and $f = 2\ m$ is a finite filed length (Alzubi, 2015), the proactive Hermitian curve is mathematically modeled by the following equation (Mohammad, 2017):

$$H(j, k, s) = j^{b+1} + k^b w + k s^b$$

If all partial derivatives of the curve do not disappear at this point on the Hermitian curve, $H(j, k, s) = 0$, the Hermitian curve is smooth, or the projective points must be nonsingular. The curve is considered to be nonsingular or smooth if all of the points that fulfill it are nonsingular (Carrasco & Johnston, 2008).

These three partial derivatives make the Hermitian curve smooth or nonsingular (Mohammad, 2017):

$$\frac{\partial H(j, k, s)}{\partial j} = (b + 1) j^b = j^b$$

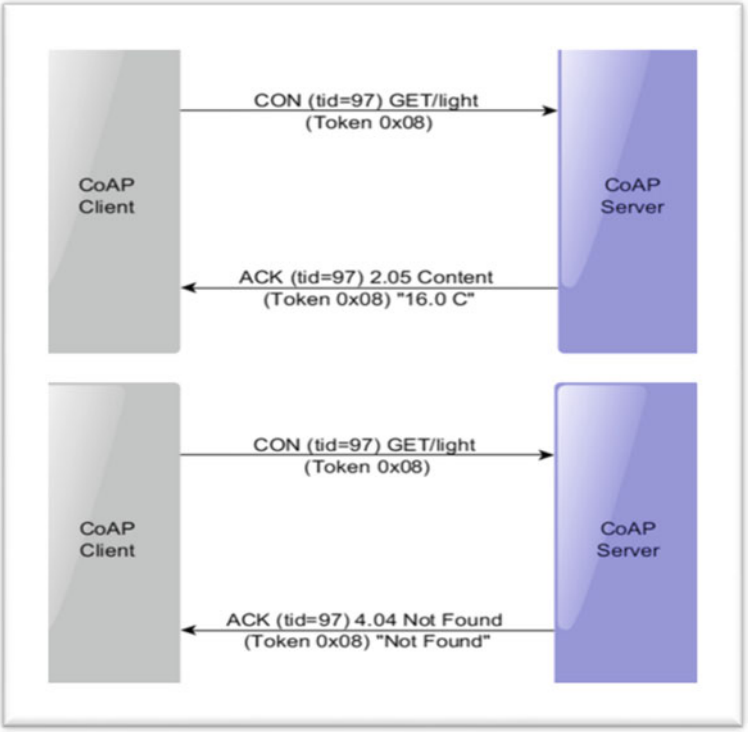

Fig. 2 CoAP transaction model (Levä et al., 2014)

$$\frac{\partial H(j,k,s)}{\partial k} = bk^{b-1}s + s^b = s^b$$

$$\frac{\partial H(j,k,s)}{\partial s} = k^b + bks^{b-1} = k^b$$

The only point where all three partial derivatives disappear is (0, 0, 0). However, this is not a point in projective space, the curve is smooth, and all points are nonsingular (Carrasco & Johnston, 2008).

The affine Hermitian curve, which is defined over finite fields (2b), is mathematically represented by the following Eq. 2 (Mohammad, 2017):

$$H(j,k,s) = j^{b+1}k^b + k$$

H (*j, k, 1*), which s-axis equal 1, when substation it in Eq. 1 (Mohammad, 2017):

$$H(j,k,1) = j^{b+1}k^b 1 + k1^b$$

where $1^b = 1$, that will get Eq. 2.

If all partial derivatives of the curve do not disappear at this point, the Hermitian curve should be smooth, or the affine points must be nonsingular, recalling that the Hermitian curve should be smooth or the affine points must be nonsingular. The curve is considered to be nonsingular or smooth if all points that fulfill it are nonsingular (Carrasco & Johnston, 2008).

These three partial derivatives (Mohammad, 2017) smooth, or nonsingular points on the affine Hermitian curve (j, k, 1):

$$\frac{\partial H(j,k,1)}{\partial j} = (b+1)j^b = j^b$$

$$\frac{\partial H(j,k,1)}{\partial k} = bk^{b-1}1 + 1 = 1^b$$

The only position on the projective Hermitian curve where all three partial derivatives disappear is (0, 0, 1), and this point does not satisfy Eq. (3) (Mohammad, 2017).

$$H(0,0) = 0^{b+1} + 0^b + k$$

$$\frac{\partial H(j,k,1)}{\partial 1} = k^b + bk1^{b-1} = k^b$$

The first partial derivatives (Mohammad, 2017):

$$\frac{\partial H(j,k,1)}{\partial j} = (k+1)0^b = 0^b$$

The second partial derivatives (Mohammad, 2017):

$$\frac{\partial H(j,k,1)}{\partial k} = b0^{b-1}1 + 1 = 1^b = 1, \text{where} 1^b = 1$$

The third partial derivatives (Mohammad, 2017):

$$\frac{\partial H(j,k,1)}{\partial 1} = 0^b + 0k1^{b-1} = 0^b$$

Over finite fields (2^b), the number of locations that fulfilled Hermitian curve H in Eq. (3) (Mohammad, 2017):

1. Compute $r = \sqrt{f} \in f = 2^b$.
2. Compute number of points $\#p = r^3 + 1$.
3. It's worth noting that we added one to step 2: the point at infinity. Hermitian curves, like algebra curves, have a specific point at infinity (*j, k, 0*).

3 Literature Review

Many researchers have recognized that IoT encompasses many concerns that need to be investigated in many ways, with a particular focus on security. As a result, many solutions have been proposed to address this problem. In Raza et al. (2012), the researchers suggested using the datagram transport layer security (DTLS) protocol with CoAP in order to supply end-to-end security in the internet of things. While the DTLS wasn't designed for constrained devices, it was designed for the internet, which is a heavyweight protocol that has a long header to suit a singular IEEE 802.15.4 maximum transmission unit (MTU). Thus, 6LoWPAN is utilized to pressure the header of the IP layer. According to that, the researchers suggested mechanisms to employ the compression abilities of 6LoWPAN to compress the header and the message of DTLS. The researchers defined many compression techniques that are related to their contribution, such as record header, handshake header, client hello message, and server hello message. One of the outcomes shown for the record header of the DTLS could minimize the number of bits by 62%. However, the researcher's study did not prove that compression does not impact security. According to that, the researchers (Kothmayr, 2011; Kothmayr et al., 2013) suggested a new solution based on RSA which energy consumption is high.

The researchers (Raza et al., 2013) proposed another resolution by using DTLS. The suggested solution was a combination between DTLS and CoAP for the internet. Moreover, it includes four main components; DTLS, CoAP, DTLS header compression (using 6LowPAN), and a CoAP-DTLS integration module that was improved to permit the application to access CoAP automatically. This solution is evaluated by using Contiki OS, which uses actual sensors. The evaluation results show the essential gains in the network response time and power consumption by decreasing the packet size. Thus, they could reduce the number of fragments or avert them by utilizing compression in case the payload was a little above the threshold.

The researchers (Brachmann et al., 2011) illustrated two main issues that required to be resolved to secure the communication links; secure group communications that aim by using DTLS to establish a secure connection for the collection of devices, and end-to-end security purpose is to perform a fully secure communication among HTTP and CoAP by using 6LoWPAN border router and DTLS-PSK protocol.

In Alghamdi et al. (2013), the researchers presented an analysis of two well-known protocols that could be used to increase security in CoAP networks. These protocols are DTLS and IPSec. The analysis was based on the architecture of X.805 standard that supplies a top-down method to do the following; edit, predict and discover the security vulnerabilities in the network. In addition, the researchers mentioned that these protocols weren't designed and transacted for constrained devices. In comparison, the researchers in Ukil et al. (2014) suggested a lightweight approach by using an advanced encryption standard (AES) which is 128 bits symmetric key algorithm, which came up with the Auth-Lite approach that becomes the lightweight security for CoAP. However, the suggested process is applicable in vehicle tracking systems but may or may not be efficient and valuable for other applications.

In Bhattacharyya et al. (2015), many solutions were presented by the researchers depending on the idea of session security. The researchers used the Lightweight Establishment of Secure Session (LESS) algorithm in CoAP and the DTLS-PSK channel encryption method. Theory communication and message exchange LESS algorithm is used to protect the session key since it uses the AES-CCM encryption technique. Moreover, the algorithm separates the key to ensure secure communication. The DTLS algorithm includes six main steps; pre-sharing secret, session initiation, server challenge, client response and challenge, client authentication, and server authentication. The analysis of one study shows that DTLS is more reliable since it uses six steps rather than request/response in LESS, and each step in DTLS may have multiple messages. However, the researchers' solution is applied for unicast security only, not to multicast security issues.

4 Proposed Algorithm

In this section, a proposed algorithm is described, which its main goal being to secure communications between different objects in IoT networks that are connected with each other. The Hermitian-based Cryptosystem (HBC) method (Mohammad, 2017), which is based on AG code over Hermitian curve, is employed in this study. Hermitian curve can create a huge number of points in a curve which plays a significant role in generating encryption keys. In addition, that its main employment in this technique is to generate private and public keys based on (Mohammad, 2017). Moreover, HBC can perform data encryption in addition to error correction, which is another advantage compared with other algebraic geometric code methods.

As shown in Fig. 3, HBC (Hermitian Based Cryptosystem) is applied to CoAP protocol located in the application layer. HBC is based on an algebraic geometric curve, Hermitian Curves (HC). Moreover, it inherits all advantages and characteristics of HC, whose main significant characteristic is the number of points that can be generated. Thus, it plays the primary role in generating a massive size of encryption keys and defining the size of the plaintext message. Moreover, HBC has three main functions; keys generation, encryption, and decryption. Keys generation includes public and private keys; a public key is employed to encrypt a message, while a private key is used to decrypt the same message. In HBC, three types of private keys, Q, I, and G (Mohammad, 2017), are used to compute the public key by the following Eq. 4 (Mohammad, 2017), as illustrated in Fig. 4.

$$Kpub = G * I * Q$$

As shown in Fig. 5, the main inputs for the encryption algorithm are plaintext which denotes by M and a public key that indicates to *Kpub*, which is selected

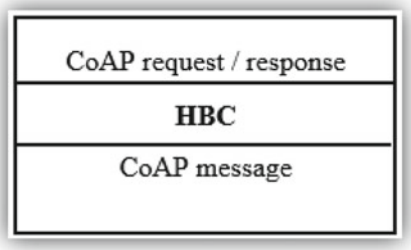

Fig. 3 General model of suggested work

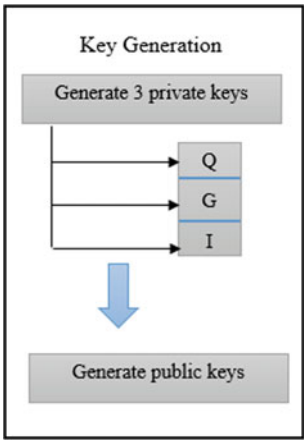

Fig. 4 Keys generation (Mohammad, 2017)

randomly from many keys that are generated by Eq. 4. In addition to that; by applying the public key on the message that will be sent, ciphertext (C) is created as presented in Eq. 5 (Mohammad, 2017).

$$C = M * Kpub$$

In turn, as presented in Fig. 6, the decryption algorithm has ciphertext (C) as an input that is transmitted from the sender to the receiver. As shown in Fig. 6, this algorithm has three main steps; compute D, Z, and P. Where D is calculated by applying Eq. 6 (Mohammad, 2017) to eliminate the effect of the permutation matrix form the C. While Z indicates to error detection and correction on D. Finally, Plaintext denotes as P, which is the original message sent by the sender after the decryption process.

$$D = C \times Q - 1$$

5 Simulation Results

This study presents the average running time results of the encryption and decryption processes for various message lengths. Moreover, the proposed work is compared with other cryptographies applied on CoAP, such as Elliptic Curve Cryptography

(ECC) (Asif, 2016; Ganesan et al., 2008) and Reed-Solomon code (RS) (Alzubi et al., 2016; Lee & O'Sullivan, 2010) in terms of the number of points and key size.

As transparently shown in Fig. 7, the average running time of the encryption process increases by increasing the message length and the finite field. In addition, the running time includes the keys generation, encrypting the message, and the transitions of a message. At the same time, the decryption process consists of the message decryption process. Thus, the average running time of the decryption process increases with the message length but is less than the encryption running time, as shown in Fig. 8.

To generate a strong and long key in cryptography, the number of points on the curve has a high and direct effect. Thus, calculating the number of points over the Hermitian curve based on the chosen finite field is the same as the RS code, which

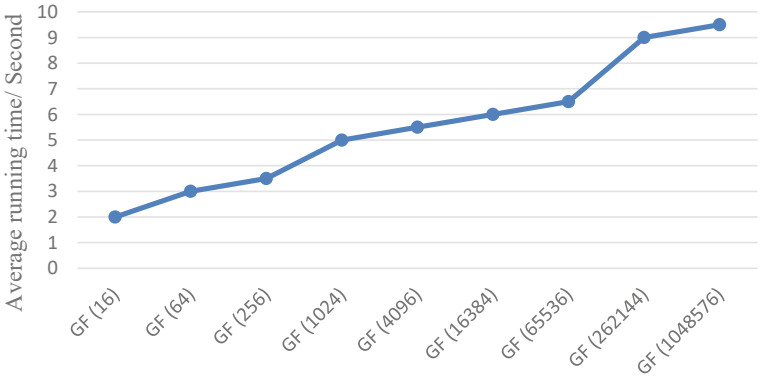

Fig. 7 The average running time of encryption process for various finite field

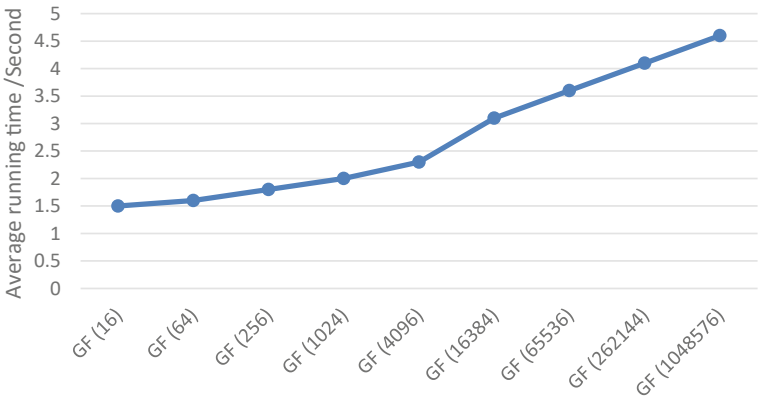

Fig. 8 The average running time of decryption process for various finite field

contrasts ECC. The number of points over HC depends on the selected finite field, while EC is computed by applying the following Eq. 7 (Blake et al., 1998). However, RS is calculated by using Eq. 8 (Johnston & Carrasco, 2005).

$$\neq P = (w-1)(w-2)\sqrt{q} + 1 + q$$

$$\neq P = q2 - 1$$

where the number of points denotes as P, w indicates to the code length and q indicates to the characteristic of the finite field for instance filed.

It is evident in Table 1 that HC is more secure than EC and RS because it can generate many points compared to them. In other words, the number of points that satisfied the HC are significantly increased, especially when choosing a higher field compared to the slightly raising in both EC and RS, as shown in Fig. 9. Thus, applying the Hermitian curve to COAP will increase the security. For instance, GF (22^0) can generate 1,073,741,824 points which satisfies HC, while EC can generate 1,050,625 points and RS can generate 262,143 points.

Depending on Fig. 10, it is obvious that the public key length of HC is larger than the other key length of both EC and RS, which leads to being more secure and more complicated to decrypt the message. Thus, two main reasons to increase the complex message decryption; are the extensive length of the public key and each point represented in non-binary.

Table 1 Number of points for Hermitian curve compared to RS and EC for various GF (2^b)

$GF\ (2^b)$	Number of points for Hermitian	Number of points for Elliptic	Number of points for RS code
$GF\ (2^2)$	9	9	3
$GF\ (2^4)$	65	25	15
$GF\ (2^6)$	513	81	63
$GF\ (2^8)$	4097	289	255
$GF\ (2^{10})$	32,769	1097	1023
$GF\ (2^{12})$	262,145	4225	4095
$GF\ (2^{14})$	2,097,153	16,384	16,383
$GF\ (2^{16})$	16,777,217	66,149	65,535
$GF\ (2^{18})$	134,217,729	263,169	262,143
$GF\ (2^{20})$	1,073,741,825	1,050,625	262,143

6 Conclusion

This study proposed a new solution based on AG codes over the Hermitian curve to solve the central issue of IoT, which is security, by applying this algorithm to the CoAP protocol. The Hermitian curve can generate a maximum number of points on the curve that plays a crucial role in creating the encryption key compared to the other types of AG curves, such as the EC and RS. This work proved that the suggested solution outperforms RS code and ECC in terms of key length and the number of points which indicates the number of generation keys. However, the drawback of this algorithm is the power consumption.

As a future direction, a new solution will suggest decreasing the power consumption, preserving the security, or increasing it by employing metaheuristic optimization algorithms such as (Alzaqebah et al., 2019; Masadeh et al., 2019).

Effectiveness of Introducing Artificial Intelligence in the Curricula and Teaching Methods

Hani Yousef Jarrah, Saud Alwaely, Saddam Rateb Darawsheh, Muhammad Alshurideh, and Anwar Saud Al-Shaar

Abstract This research examined educators' perceptions of the effectiveness of introducing artificial intelligence (A.I.) and expert systems into the curricula and teaching methods of higher educational institutions in the United Arab Emirates. Ninety-three faculty members in various departments of UAE colleges of education completed a questionnaire assessing the impacts of Artificial Intelligence on students' creativity, problem-solving skills, data were analyzed to identify differences based on gender, educational qualification, and experience. The results of t-tests and ANOVA analysis revealed that participants had overall positive attitudes toward introducing A.I. and expert systems into the curricula and teaching methods. Although no differences were found based on gender or experience, statistically significant differences were associated with academic qualifications, whereby participants with master's

degrees gave higher ratings than those with doctorates. Based on the findings, introducing A.I. and expert systems into higher education curricula and teaching methods is recommended.

Keywords Artificial intelligence · Expert systems · Teaching methods

1 Introduction

Artificial intelligence (A.I.) is an efficacious mechanism to deal with complex conditions (Claudé & Combe, 2018) and it is among the most rapidly developing multimedia educational technologies (Salloum et al., 2020a; Tripathi & Al Shahri, 2016). AI has two types: strong and weak. The strong one is supposed to emulate the function of brains of the humans but it is not created yet while the weak one is common in life of people and it comprises Natural Language Processing (NLP), Machine Learning (ML), Speech recognition, Machine vision, and Expert Systems (ES) (Al Claudé & Combe, 2018; Salloum et al., 2020b; Shebli et al., 2021).

The rate of use of Artificial intelligence and expert systems is proportional to the increasing number of courseware inventions among educational colleges (Amarneh et al., 2021; Nuseir et al., 2021). Adaptive learning courseware can be referred to as the technology requiring students to master the same objectives of learning. The adaptive software engine is responsible for determining timing and order of the content and it evaluates performance of the student based on a number of factors and after that the student is guided through the course content (Alhashmi et al., 2020; AlShamsi et al., 2021). Adaptive courseware is existed for many years ago but nowadays it is used in all of the education stages and professional development. And also, it is expanding to other branches like foreign languages, economics, physiology, anatomy, and business (Gebhardt, 2018; Yousuf et al., 2021).

Intelligent tutoring systems (ITSs) is a special genre of e-learning systems, where the operation of ITSs is based on making an emulation of the human teacher in the process of teaching and learning. The personal and portable characteristic of e-learning that appeared with the coming of the mobile computing system, put a key stone to the beginning of mobile intelligent tutoring. The aim of the Mobile intelligent systems (MITSs) is to adapt with daily routine of the mobile learners without any bad effect on their other activities. We should note that there are limited capabilities in improving the efficacy and potency of learning in case of handheld terminals. While in the non-portable ITS rivals, MITSs is considered agent-based systems as their tasks are achieved by agents (Glavinic et al., 2007).

Over the past 2–3 decades, the development of tools for multimedia technology-enhanced student learning has accelerated quickly to enhance the interactive capabilities of students as well as educators. Multimedia tools have immensely benefitted educational institutions across fields, fostering learners' problem-solving abilities and communication and thereby augmenting their creativity, imagination, and

cognition, as well as enhancing teachers' planning by providing insights into student aptitudes and learning processes.

NLP abilities and social intelligence embedded in A.I. give machines the ability to read and understand human languages as well as to adapt to different learning styles, aptitudes, and rates. Expert systems, which are a type of A.I. comprising software programs, have human influence approaches to problem-solving.

The following items: Human–computer interaction interface, interpreter, working memory, reasoning machine, and knowledge base constitute the essential structure of any expert system. The expertise of the expert system including rules and facts is stored in the knowledge base. Acquiring a new knowledge, storing and expressing knowledge in a trend that the computer can accomplish, should be enabled by the knowledge base in the stage of establishing a knowledge base. The facts in the working memory are matched with the knowledge by the reasoning machine and obtains new information. The storage unit should furthermore store the intermediate information gotten during processing. Explaining the outcome of the inference engine output, taking into consideration to interpret the cause and correctness of the conclusion is the responsibility of the interpreter (Tan, 2017).

It is worthy to mention that in the latest several years NLP has belonged to the most challenging areas. Analyzing of the education web pages and learning systems based on internet are in a need to the essential role played by the NLP techniques based on semantics and syntax of the natural languages (Salem, 2000).

The application of expert systems offers many advantages that support the educational process (Ghadirli & Rastgarpour, 2013). The chief benefit of an expert system is its ability to act as a "smart" teacher; thus, enabling independent learning outside of the classroom. The expert system also interacts with the learner by asking a set of questions and providing its conclusions in the form of diagnoses or suggested treatments. A similar process to the humanistic approach is to solve complex problems. A.I. and expert systems operate at a constant scientific and consultative level that is stable (Clement, 1992). This technology provides students with enjoyment that differs from traditional methods and introduces students' happiness and creativity in education, helping them to imagine all that is new.

The main objective of this study was to assess different perceptions on the effectiveness of A.I. expert system implementation on the curricula and teaching method in education colleges, a case of Colleges of Education in the United Arab Emirates.

Accurately, this research measured perceptions of faculty members at Colleges of Education in the United Arab Emirates (UAE) regarding the effectiveness of introducing A.I. and expert systems in the curricula and teaching methods on the students' creativity and the problem-solving ability.

The research questions relevant for this study include (1) how the Artificial Intelligence expert systems implementation has influenced the curricula and teaching methods of education colleges? (2) How does the implementation of the Artificial Intelligence systems in education colleges affect the creativity and the student's ability to solve problems?

2 Literature Review

2.1 The Meaning of A.I. and How It Works in Educational Colleges

There are various perspectives to view A.I., if we take for instance the business perspective, we can define A.I. as the combination of robust methodologies and tools used in solving the problems of business. And if we turn into the research perspective, A.I. is the interest of making computers replace humans in doing things that they do better nowadays (Brown & O'Leary, 1995) or AI can be defined as the mechanism interested in the creation and study of computer systems which shows some intelligence forms. We mean by intelligence as the system which can draw and reason valuable conclusions, learn new duties and conceptions about the world surrounding us (Rao et al., 1999).

A.I. refers to the aptitude exhibited by machines or software (Claudé & Combe, 2018), and the field of A.I. researches how to create computers and computer programs capable of intelligent behavior. Baker and Smith (2019) defined A.I. rather broadly as "computers which perform cognitive tasks, usually associated with human minds, particularly learning and problem-solving" (p. 10). As they explained, A.I. describes a range of technologies and methods, including machine learning, natural language processing (NLP), data mining, neural networks, and algorithms. Artificial intelligence systems execute tasks that usually need human intelligence, such as visual insight, speech recognition, decision-making, and translation between languages (Jewandah, 2018).

Accordingly, the A.I. field draws upon multiple disciplines, including computer science, information engineering, mathematics, linguistics, psychology, and philosophy. Based on the simulation of the human mind, A.I. technology has belonged to the science of algorithms and intelligent techniques based on replicating and understanding the archetype of the human psyche. The human brain sends signals to the body, which in turn controls all social processes and activities that occur daily, such as feeling, sensing, thinking, and movement. A.I. was introduced to emulate these processes and has had some success.

A.I. and expert systems have published several studies on the development across diverse areas such as medicine, chemistry, physics, engineering, education, training, manufacturing, and management (Tan, 2017). Furthermore, applications of AI nowadays expanded to finance, consumer products, medicine, and manufacturing taking into consideration that implementing of an adequate A.I. technique in an application should always be competitive. Knowledge-based systems (KBS) and expert systems (ES) are contributing deeply in numerous areas of decision making in industries such as production planning, advanced manufacturing processes, plant layout, materials, and purchasing (Rao et al., 1999). Claudé and Combe (2018) highlighted the effectiveness of A.I. as a tool for managing complex situations. A.I. and its branches of expert systems can address complex problems in record time, which accelerates the process of accumulating new knowledge by presenting the information in a manner

Licensed to (putm@utm.my)

tailored to learner's needs, thereby enhancing their reasoning skills and ability to conclude. Additionally, the A.I make the content easily memorizable by the students and make the work more comfortable for the teachers who prefer using them.

Jewandah (2018) emphasized that improvement and development in the A.I. industry would increase productivity for organizations at a lower cost And also, his results indicated that integration of the adaptive learning courseware as low-stakes assignments improves the outcomes of the students with a relatively modicum effort on both sides of the students and the instructor.

The inferencing system and the knowledge base are the two major parts of any AI-based education software. The knowledge base comes from procedures, theories, facts, and relationships which represent knowledge of the real world about people, events, objects, places, etc. while the thinking mechanism or the inference system is the technique of employing the knowledge base to resolve the complicated problems (Salem, 2000).

2.2 The Role of A.I. in the Achievement of Educational Goals

Information and communication technology (ICT) became an important part in the system of education for either completely replacing the teacher or just helping him in realizing a traditional lecture. E-learning is achieved between education on one hand and ICT on the other hand (Glavinic et al., 2007). Hence, the implementation of multimedia technology in higher education has been recognized as critical to maintain educational quality and achieve global competitiveness (Duncan, 2010; Popenici & Kerr, 2017a, 2017b; Warschauer, 2004).

In the future, the expert system may compromise applications which are more interactive, mobile, and intelligent that may blur the distinction between agents and expert system (Grove, 2000).

Mobile learning or m-learning is a subclass of e-learning and currently it is attracting high attention as it is the upcoming type of learning but the development of this type of ought to be achieved through evolutions of technologies related to wireless infrastructure like UMTS, GSM, and WiMAX. Utilizing of the previous infrastructure will help in making a network of mobile devices dedicated to the process of learning (Glavinic et al., 2007).

Accordingly, countries with highly developed higher education systems are increasingly incorporating multimedia and mobile technologies as intrinsic elements of new "connected learning" networked economies. However, educators have only recently begun to explore the potential pedagogical opportunities that A.I. applications afford for supporting learners throughout their education (Zawacki-Richter et al., 2019). Many teachers are yet to understand the benefits of I.A. in schools. They have a limited understanding of its pedagogical uses and have many questions regarding how to integrate A.I. as a supportive resource (Hinojo-Lucena et al., 2019; Zawacki-Richter et al., 2019). A.I. can impede students' imagination and learning self-efficiency if not applied to the university curriculum in a creative and

balanced manner. As a result, the students may complete courses and graduate without enhancing their level of performance, development, and innovation.

Expert systems, such as hardware, software, and knowledge engineering, have a statistically significant impact on the quality of decision-making. This was confirmed by Rafeeq (2015), who established that A.I. applications could provide substantial assistance to employees in the completion of their tasks because of their superior ability to perform tasks perceived as painful.

Al-Bishtawi et al. (2015) underscored the importance of expert systems in banks in facilitating electronic audit procedures such as swiftness in task execution and obtaining necessary data and information. A.I. enhanced the efficiency and quality of the audit by saving effort, time, and costs allocated to the implementation of the audit procedures and plan.

2.3 Expert Systems as Educational Tools

The technology of expert system firstly was created in 1960 but the origin of development in this branch of research go back to the concept of production system two decades earlier. In the current days, there are a considerable number of expert system obtainable on the internet containing applications in science, medicine, and industry (Grove, 2000).

Expert systems—the most notable applications of A.I.—transfer the logical processes of the human mind and present these consistent processes through a machine. Khanna et al. (2010) defined expert systems as a computer application that resolves efficiently the complicated issues that need vast human experience; it simulates rational thinking using precise knowledge and interfaces. Additionally, these systems employ human expertise to solve the problems that usually require human intelligence.

Expert systems have an immense capacity to carry out tasks, have access to rare human knowledge and expertise, and seek to preserve it and facilitate their use in specific areas by applying multiple perspectives to identify appropriate solutions to complex problems (Al-Maroof et al., 2021; Wan Ishak et al., 2010). Expert systems can provide solutions, answer questions, or provide advice at similar to or higher levels than that provided by human experts in the same field (Leo et al., 2021; Lucas & Van Der Gaag, 1991). In this way, users can exploit their insights and experiences using the analytical and data retrieval powers of the system (Al-Hamad et al., 2021; Keen, 1980). The teaching processes employed by expert systems include dynamic and rational training, and they play a critical role in enhancing teaching so that both teachers and students become interested and engaged in the learning process (Nazir et al., 2021; Sultan et al., 2021). These processes can then be used in educational curricula to promote and improve students' performance by fostering creative skills such as thinking, imagination, and cognition (Alshurideh, 2014; Alshurideh et al., 2021).

The study of Stella and Madhu (2017) emphasized the promotion of an expert system in the Nigerian educational system, finding that the tool provided great assistance for repeated study and understanding. Organizations can lose more of their useful problem-solving and analytical capabilities if A.I. technology and expert systems get neglected. Hassan (2010) identified the uses and efficacy of A.I. in libraries, finding that librarians' insufficient knowledge of artificial intelligence affected their understanding of any type of practical application in libraries and how to extract knowledge and use it in information bases in expert systems in libraries.

Using of internet grows continuously and additionally, the wireless communication supports the portability of internet access. Hence, the internet-based expert systems are available for accessing everywhere in the world at the needed locations (Grove, 2000).

2.4 Expert Systems as Educational Tools

The success or failure of educational technology use is highly dependent on teachers' attitudes toward technology. Teachers' technology self-efficacy is a critical factor in attitudes toward educational technology and the propensity to utilize it. Some studies have indicated that men tend to have higher computer self-efficacy than women (Koch et al., 2008; Ong & Lai, 2006; Sieverding & Koch, 2009) which can affect their attitudes towards its usefulness for education. The study of Wong et al. (2012)found that the effect of computer teaching efficacy on perceived value and attitude toward computer use was significant for female student teachers but not for their male counterparts.

Several studies have applied technology acceptance models (TAM) to assess teachers' perceptions of the usefulness, ease of use, and attitudes toward technology use and education in the classroom (Wong et al., 2012). The study of Wong et al. (2012)found that their TAM model accounted for 36.8% of the variance in intention to use computers among student teachers, and significant differences were identified based on computer teaching efficacy and gender.

Regarding the use of educational technology in Southeast Asia and Serbia, respectively, other researchers have used different measures to evaluate teachers' attitudes toward technology. Some studies have reported more positive attitudes towards technology among males than females (Chou et al., 2011; Durndell & Haag, 2002; Durndell et al., 2000; Kay, 2009; Kesici et al., 2009; Ong & Lai, 2006).

Cai et al. (2017) meta-analysis of gendered attitudes toward technology use revealed that males tend to hold more favorable attitudes toward technology use than females. However, some studies have found the opposite (Chou et al., 2011; Johnson, 2011; Price, 2006), and others indicate no significant differences (Imhof et al., 2007; Teo et al., 2015, 2016). For example, the studies of (Teo et al., 2015, 2016) examined pre-service teachers' perceptions and found no significant differences based on gender.

Table 1 Distribution of the study sample

Variable	Categories	Frequency	Percentage
Gender	Male	55	59.1
	Female	38	40.9
	Total	93	100.0
Educational qualification	M.AMA	40	43.0
	Ph.D	53	57.0
	Total	93	100.0
Experience	<5 years	10	10.8
	5–10 years	44	47.3
	>10 years	39	41.9
	Total	1093	10.8100

3 Method and Procedures

3.1 Population and Sample

This study used the survey method to collect quantitative data using questionnaires. Random sampling identified 93 faculty members from the college of education in 5 UAE Universities. To gather the whole sample from the population of the five UAE universities using the simple sampling technique, 15–17 faculty members were selected from each university. Data collection occurs during the second semester of the academic year 2018/2019. Table 1 presents a summary of the participants according to gender, educational qualification, and years of experience.

3.2 Instrument

Data was collected using a two-part tool. The first part collected primary socio-demographic data (gender, educational qualification, and experience). The second part comprised 25 questions measuring faculty's perceptions of the effectiveness of the introduction of A.I. and expert systems in the curricula and teaching methods of university education colleges. A five-point Likert scale scored the responses. The case ranged from 5 = completely agree to 1 = disagree.

The questionnaire was presented to a group of arbitrators to ensure its reliability. After an initial review, some paragraphs got deleted, new sections added, and others modified. The Cronbach's Alpha coefficient used to verify the scale's stability and internal consistency calculated resulted in a high value of 0.932.

3.3 Statistical Processing

Frequencies and percentages of personal information, arithmetic averages, and standard deviations of questionnaires are used for developing questionnaire paragraphs. An independent-sample t-test is applied to variables with two categories and analysis of variance (ANOVA) is used in analyzing variables with more than two groups.

4 Results

Table 2 presents the means and standard deviations of the questionnaire responses. Regarding RQ1 ("How do faculty assess the effectiveness of introducing A.I. and expert systems in the curricula and teaching methods of university education colleges?"), the findings indicate above-neutral attitudes among faculty with means ranging between 3.48 and 4.26. The lowest scoring items related to A.I.'s ability to help in developing students' perception and imagination (item 4), giving students the ability to manage difficult and complex situations (item 7), and to creatively solve problems presented in the absence of complete information (item 5).

Regarding RQ2 ("Does the effectiveness of introducing A.I. and expert systems in the curricula and teaching methods of university education colleges vary according to variables such as gender, educational qualification, and experience?"), independent-sample t-tests and ANOVA were applied to measure differences between means depending on the gender, educational qualification, and experience. Table 3 presents the results of a t-test analyzing differences according to gender. Although female faculty considered A.I. to be more useful and practical than their male counterparts, there was no statistically significant difference between assessments based on gender.

Table 4 summarizes the results of the t-test assessing differences in faculty perceptions according to academic qualifications. There was a statistically significant difference in faculty's understanding of A.I., whereby participants with master's degrees more commonly assessed the use of such technology as useful and practical ($t = 2.457$, $p < 0.05$).

The degree of freedom has calculated using the formula of (n–1) where n is the sample size. Therefore, there are 39 degrees of freedom for *MA* and 52 degrees of freedom for a Ph.D.

As shown by Table 5, an ANOVA found no statistical difference between participants' perceptions of AI-based on teaching experience.

5 Discussion and Recommendations

This study used a questionnaire to assess UAE faculty members' attitudes towards the usefulness and effectiveness of A.I. in enhancing learning. Although overall, the

Table 2 Summary of questionnaire results

No	Item	Mean	SD
1	Introducing artificial intelligence (A.I.) and expert systems into the university curricula increases students' creativity and performance	4.26	0.71
2	Introducing A.I. and expert systems into the university curricula enhances students' ability to think creatively	4.24	0.79
3	Introducing A.I. and expert systems into the curriculum helps students to respond quickly and creatively to new situations and circumstances	4.05	0.77
4	Introducing A.I. and expert systems into the curriculum develops students' perception and imagination	3.48	0.97
5	Introducing A.I. and expert systems into the curriculum helps students to solve in a creative manner the problems presented in the absence of complete information	3.61	1.11
6	Introducing A.I. and expert systems into university curricula increases the students' ability to discover knowledge creatively	3.82	1.06
7	A.I. and expert systems play a vital role in giving students the ability to manage difficult and complex situations	3.49	1.13
8	A.I. and expert systems in the university curricula increase students' pleasure during the lecture	3.94	0.94
9	A.I. in the university curricula increases students' ability to learn and understand based on past experiences	3.87	0.92
10	Introducing A.I. and expert systems increase the students' ability to develop creatively	3.75	1.00
11	A.I. and expert systems in the university curricula increase students' ability to understand and perceive visual matters	3.86	0.90
12	A.I. and expert systems increase the students' ability to innovate and renew creatively	4.00	0.94
13	Introducing A.I. and expert systems in the university curricula enhances students' creative skills	3.80	1.03
14	A.I. and expert systems in the university curricula creatively improve students' decision-making	3.95	0.88
15	A.I. and expert systems in the curriculum teach students the skill of interpretation	3.81	0.89
16	A.I. and expert systems help students to develop their performance	3.68	0.93
17	Introducing A.I. and expert systems in the university curriculum help students to creatively apply knowledge	3.67	0.78
18	A.I. and expert systems in the curriculum enable students to creatively present information	3.78	0.86
19	A.I. and expert systems in the curriculum help students to creatively carry out their assigned tasks	3.97	0.97
20	A.I. and expert systems in the curriculum help students to understand the information quickly	4.02	0.90
21	A.I. and expert systems help students to obtain timely and accurate information	4.14	0.90

(continued)

Table 2 (continued)

No	Item	Mean	SD
22	Introducing A.I. and expert systems in the university curricula enable students to keep abreast of technological developments	3.96	1.03
23	A.I. and expert systems help students to choose the best alternative	4.12	0.78
24	Introducing A.I. and expert systems in the university curricula increase productivity of the student	4.12	0.95
25	Introducing A.I. and expert systems in the university curricula enhances student intelligence	3.89	0.90

Table 3 Test Results for independent sample *t-test* to detect variances by gender variable

Gender	N	Mean	SD	t	df	P
Male	55	3.870	0.554	−0.423	54	0.673
Female	38	3.921	0.601		37

Within groups	1.535	2	0.767	2.425	0.094
Between groups	28.482	90	0.316		
Total	30.016	92	1.083		

participants reported that A.I. and Expert systems to be a useful tool in fostering students' innovation and creative thinking, the lowest scores were related to the role of A.I. and expert systems in developing students' perception and imagination (item 4), providing students with the ability to deal with complex cases (item 7). Faculty also had somewhat less confidence in the capacity of A.I. to assist problem-solving in the absence of complete information (item 5). Claudé and Combe (2018) described A.I. as a useful tool for managing complex situations; however, finding of this study indicates the limits of A.I. and the continued need for teachers to help in guiding students to address complex problems and obtain the necessary information to solve them. A study on the use of intelligent information systems in biomedical education highlighted the importance of students' use of search engines, bibliographic websites and library resources to support their research (Aparicio et al., 2018). Zawacki-Richter et al. (2019) meta-analysis demonstrated that the faculty used A.I. tools

to provide teaching content to students, it was generally combined with support by giving feedback and hints on how to solve questions related to the content, as well as detecting the difficulties/errors of students (Alsharari & Alshurideh, 2021; Alshurideh et al., 2019a, 2021).

The lack of significant difference in faculty perceptions of A.I. according to gender aligns with previous findings regarding the impact of gender on attitudes toward technology (North & Noyes, 2002; Teo et al., 2015, 2016; Imhof et al., 2007; Alshurideh et al., 2019a, b, c; Kurdi et al., 2020, 2020a, b)

In the context of the Arab Gulf region, there is a limited research on educators' attitudes toward A.I.; however, we can compare the results with findings on attitudes toward other educational technology tools. Al-Emran et al. (2016) found no statistical difference between male and female educators' perspectives, which they attributed to equal levels of use and experience. However, a large-scale study of educators at King Saud University. Alwraikat and Al Tokhaim (2014) found that female instructors' attitudes, towards mobile learning, were significantly more positive than that of male instructors. The study of Al-Hunaiyyan et al. (2017), which studied the impact of instructors age and gender differences in the acceptance of mobile learning, found that the younger instructors were more likely to accept the mobile learning compare to the elderly instructors. Additionally, the study of Alwraikat and Al Tokhaim (2014) study findings affirmed that female instructors were more favorable to mobile learning compared to male counterparts.

The lack of difference based on experience suggests that the participants are using this technology with a high degree of mastery regardless of experience. Therefore, they view the same impact on students after the inclusion in the teaching methods and curriculum. Teachers' performance and interaction are at the same level, despite their experience. Other studies in the Arab Gulf region similarly identified no differences in attitudes toward mobile learning based on the faculty members' expertise (Al-Emran et al., 2016; Eltahir, 2019). Gebhardt (2018), in the study on Adaptive Learning Courseware as a Tool to Build Foundational Content Mastery: Evidence from Principles of Microeconomics, also found that the use of the courseware promoted the student's mastery of concepts on the principles of Microeconomics.

Based on the findings, the researchers offer two main recommendations:

(1) A.I. and expert systems introduced into the curricula and teaching methods of university education college. The two have a significant impact on students' creativity and excellence return.
(2) Further research, similar to this study, must be conducted on applications of A.I. in higher education systems in developing countries, and different perspectives should have been explored. The reason for choosing this study is most of the developing countries are yet to embrace e-learning due to some limiting factors such as cultures, economy, and the level of technological development. For example, this study focused on teachers' perceptions of learning-facing tools, i.e., software that responds to students' needs and is used to receive and understand new information (Baker & Smith, 2019). Future research should examine

precisely how faculty members use A.I. to support students' learning and the level of acceptance of A.I. in educational colleges in developing countries.

This study has several limitations. First, the sample was limited to the college of education faculty rather than encompassing faculty across departments. Future studies can examine perceptions of A.I. educational technology across disciplines to evaluate if any differences can be related to educators' area of expertise. Future research can also incorporate additional variables such as age to measure teachers' perceptions, as well as measures of teacher self-efficacy and mastery of A.I. and expert systems.

Declaration of Conflicting Interest The author(s) declared no potential conflicts of interest concerning the research, authorship, and publication of this article

Funding The author(s) received no financial support for the research, authorship, and publication of this article.

A Roadmap for SMEs to Adopt an AI Based Cyber Threat Intelligence

Abhilash J. Varma, Nasser Taleb, Raed A. Said, Taher M. Ghazal, Munir Ahmad, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract Cybersecurity has started to become the most significant concern among organizations as the number of threats and criminal activities in the past decade has increased exponentially. Cybercriminals and their attacking techniques have become increasingly sophisticated over the past couple of years. Conventional security measures will no longer be able to detect and mitigate the propagation of such advanced attacking trends. More and more hackers have started focusing on Small and medium-sized enterprises (SMEs) taking advantage of their limited resources. Therefore, SMEs will have to quickly adopt Artificial Intelligence (AI) based cybersecurity system in their infrastructure to defend themselves effectively and efficiently. It is currently forecasted that by 2021, 75% of all organizations will use AI and Machine learning (ML) applications in their security architecture to protect against all cyber threats. In this paper, the researchers identify the various challenges faced by SMEs in

adopting an AI based cybersecurity due to their knowledge gap and lack of expertise. The researcher intends to provide a good background on AI, Cyber Threat Intelligence (CTI) and highlight some of the significant benefits provided by an AI based CTI system. A simple roadmap is developed using a qualitative research methodology to help SMEs effectively implement an AI based Cyber Threat Intelligent system in their infrastructure.

1 Introduction

Cyberattacks have increased exponentially over the globe. The world-famous investor Warren Buffet sees cyber risk as one of the gravest threats to humanity. In the past decade, we have seen some of the largest data breaches, national level hacking activities, political manipulations, and the use of botnets to bring down major telecom industries (Alzoubi et al., 2021a, b). These are compromising our private, professional, and national existence. No industry or organization is now completely safe from a cyber threat and therefore, the security professionals are always expected to stay current and up to date on the latest attack trends and vulnerabilities used by hackers (Kashif et al., 2021). They must detect, analyze and protect the organization in real-time (Alshurideh, 2022; Alshurideh et al., 2022a, b). Alkhalil et al. (2021) mentioned that the global cost of cybercrimes is expected to reach USD 6 trillion by 2021; 43% of the total cyberattacks target small businesses; $3.9 million is the average cost of a data breach for small to medium size businesses; organizations usually take nearly 6 months to detect a breach; the number of connected IoT devices will reach 75 billion by the year 2025 (Alnuaimi et al., 2021a, b).

Cyber threat intelligence is a process that proactively and iteratively searches various systems, databases, networks (Farouk, 2021), and other resources to detect and educate itself about the changing cybersecurity threats that can evade existing security controls. It enables the cybersecurity professionals to quickly recognize indicators of cyberattacks, analyze the attack methods and respond in a timely manner (Ali Alzoubi, 2021a, b). The cyber threat intelligence helps organizations to isolate and remedy these advanced threats before a cyber threat occurs. Even though various cyber threats follow different methods of cyberattack, they have a similar life cycle starting with the victim reconnaissance to performing malicious activities on the victim's network\devices (Mondol, 2021). The primary purpose of Cyber threat intelligence is to detect all weak points in the existing security solution and thereby take the necessary actions to safeguard the organization (Al Ali, 2021).

Over the years, Cyber Threat Intelligence has evolved from small ad-hoc tasks to a much more powerful program with their own dedicated staff, tools and processes that can support the entire organization (Radwan & Farouk, 2021). Most organizations nowadays not only consume cyber threat intelligence but also produce them.

This shows the growing maturity, popularity and professionalization in this field (Lee, 2020). Without the help of advanced data mining techniques, ML and AI, it is practically impossible for cyber analysts to stay on top of the latest attack trends, analyzing the current attack logs, generating intelligent reports that can be used to share and report on cyber security (Al Kurdi et al., 2021; Alhashmi et al., 2020; Salloum et al., 2020). AI and ML systems can significantly support cyber analysts in early detection as well as providing timely recommendations for mitigating various threats (AlShamsi et al., 2021; Nuseir et al., 2021; Yousuf et al., 2021).

In this research, the researcher will be reviewing some of the existing literatures on AI and CTI, discussing their core processes, functions and development lifecycle (Akour et al., 2021; Almaazmi et al., 2020; Alshurideh et al., 2020a, b, c). One of the key issues identified in the literature review is that SMEs are currently lagging in adopting this technology in their infrastructure due to several challenges such as limitations in budget, expertise, knowledge, etc. This problem can be overcome if there is a roadmap that can help SMEs to plan and successfully implement an AI based CTI system (Al Al Suwaidi et al., 2021; Alzoubi et al., 2021a, b; Shebli et al., 2021). Thus, the aim of this research is to develop a simple, effective, customizable roadmap for SMEs. The effectiveness of the roadmap was evaluated using a qualitative analysis and based on this result, an updated, customized, and focused roadmap is finally presented by the researcher (AlHamad et al., 2022). The main advantage of this research would be that it will provide enough knowledge and the confidence for SMEs to go ahead with their investments in AI based cybersecurity and how to use intelligent AI based systems to protect the organization from the vast number of cyber threats in the modern technological environment (Lee et al., 2022a, b). The research also covers some of the main challenges and risks that are usually faced by SMEs as part of their adoption of AI based CTI system (Miller, 2021).

2 Literature Review

In recent years, there has been a significant increase in the number of cyberattacks faced by organizations. Traditional firewall and antivirus based cyber defense tools is now primitive and are no longer able to effectively block cyber threats or keep up with the rapidly developing threat vectors. Cyber attackers are developing new sophisticated AI based smart malwares that can understand the target system, learn their environment, evade detection, and make intelligent decisions making it more and more complex and challenging for the organizations to detect and defend against various cyber threats (Alzoubi, 2021a, b). It is practically impossible for cyber analysts and forensic investigators to keep up with the advanced number of threats, the amount of data to be analyzed and the speed of processes to actively respond to all cyber threats in real-time (Alhamad et al., 2021). Existing literature shows that even though there has been a significant increase in the number of organizations that have started to adopt AI based Cyber (Alzoubi & Aziz, 2021a, b). Threat Intelligence for their cyber defense, a vast majority of cyber security professionals still lack a

deep understanding of Cyber Threat Intelligence, how AI based algorithms work and most importantly how to secure and harden an AI based CTI system (Ali et al., 2021). This is mostly because AI based CTI systems are not mature yet and is still an evolving technology (Alshurideh et al., 2020a, b, c). Large enterprises have the luxury of higher budget to invest in the latest innovative solutions, infrastructure, resources and for acquiring the required knowledge and expertise. Small and Medium sized Enterprises (SMEs) do not have this luxury and often struggle to invest and implement such new technologies in their infrastructure (Alshraideh et al., 2017; AlShurideh et al., 2019; Ghannajeh et al., 2015). SMEs therefore become most vulnerable to these advanced cyber threats as they are not kept up to date with the emerging cyber defense mechanisms (Alzoubi et al., 2021a, b).

Lee (2020) based on their latest CTI Survey, the biggest challenges faced by most organizations on the successful implementation of CTI are difficulties in integrating CTI with existing systems, the overall cost of implementation and continual improvements, lack of trained cyber security analysts and limited management support. Lidestri (2018) surveyed about 603 IT and IT Security professionals working for various US organizations who have already deployed or are planning to deploy an AI based CTI program in their organization. In this survey, while 71% of AI users voted that the AI technology will increase the speed of analyzing threats and providing a deeper security, only 60% of the current non-AI users believed this to be the primary benefit. 69% of the respondents believe that incorporating AI in Cybersecurity will increase the speed of analyzing threats while 64% believe it will help to quickly contain the infected endpoint (Ghazal et al., 2021). Cyber threat intelligence will increase the requirement for organizations to retain and employ more talented cyber analysts with AI exposure. This will bring a positive cybersecurity posture. Based on the survey, 68% of AI users said AI will improve the productivity of the IT staff while only 60% of non-AI users agreed on this. In one hand, 69% of AI users said that AI and ML technology will significantly improve the effectiveness of various application security activities, while on the other hand, only 59% of the non-AI users believed in this (Alzoubi & Yanamandra, 2020). The AI security experts\users believe that AI adaptation will help reduce the complexities in various security architecture. 56% of AI users responded that the adoption of AI based CTI system will decrease the overall complexity of the organizations security architecture while only 40% of non-AI users shared this view (Lee et al., 2022a, b). As the AI maturity level increases in the organization, the cyber analysts become more capable in understanding and identifying areas where AI implementation would be most beneficial (Aasriya, 2021). The stability, knowledge and expertise of AI based threat detection is drastically expected to improve as more and more organizations start to incorporate it and invest in this technology (Alkalha et al., 2012; Alnuaimi et al., 2021a, b; Altamony et al., 2012; Zu'bi et al., 2012). While non-AI users believe that an AI based CTI system will help them detect 41% of the previously undetected zero-day exploits, the AI users responded that they are able to detect 63% of these exploits with the help of AI (Lidestri, 2018).

With the boom of the Internet of Things (IoT) and cloud computing, the SMEs have become heavily dependent on the cyber world and therefore need to adopt the

latest cyber forensic investigation techniques on exchanged and stored data (Singh & Singh, 2021). The growing attack surface includes amateur threats, such as phishing, sophisticated distributed denial of service attacks and skilled nation-state actors. Prevention is nearly impossible. Advanced persistent threats show that hackers are patient (Lee & Ahmed, 2021). Given enough time, attackers will be able to get in since the cost of an attack is low and automated probing will eventually find a weakness. ML, Data mining and AI can quickly and efficiently detect any network abnormalities, including static and dynamic malware attacks. They can quickly analyze, learn and act intelligently against advanced cyber threats (Hanaysha et al., 2021a, b).

3 Background Information

3.1 Artificial Intelligence (AI)

AI was explained as the science and development of intelligent systems and programs that can understand human intelligence (McCarthy, 2007). Artificial intelligent systems are technologies that can gather or read data from their various inputs, learn from their environment and make autonomous decisions based on the intelligence acquired through their experience and knowledge (Hanaysha et al., 2021a, b). They can adapt to different situations and act independently without any human intervention. AI should be able to automate most of your repeatable tasks and in the long run make intelligent decisions on behalf of the cyber analysts (Ahmed et al., 2021; M. Alshurideh et al., 2020a, b, c; Harahsheh et al., 2021; Naqvi et al., 2021). This will include functions like planning, reasoning, training, problem solving, etc. It's a highly effective tool that can continually learn from internal, as well as external data and become a vital part of the cyber security infrastructure. According to Davies (2020), AI systems can include capabilities like Cognitive computing, ML, DL, Natural Language Processing (NLP), Computer Vision, Speech, RPA, etc. as depicted in Fig. 1.

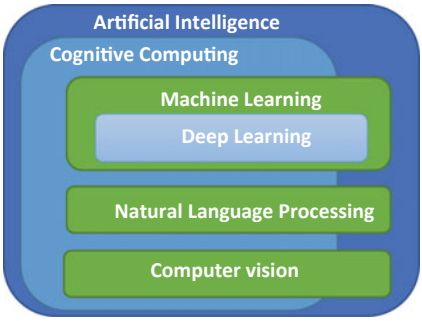

Fig. 1 Artificial intelligence

Cognitive Computing works with multiple subsets of AI such as ML, DL, NLP, Computer vision, etc. to simulate the human thought process and provide recommendations to help humans make better decisions. **Machine Learning** is a subset of AI and it enables machines to interact with data, learn from them and probably make changes to the algorithm in response to the data received without the need to follow explicitly programmed instructions (Alshurideh et al., 2022a, b). It includes deep learning, supervised algorithms and unsupervised algorithms to support predictions, analytics and data mining. These algorithms are used to recognize patterns and anomalies in data. Deep learning is a subset of ML. **Natural Language Processing** is a subset of AI that enables machines to work with text and languages, extracting their meaning and generating texts that are natural and grammatically correct (Ali et al., 2022).

3.2 Cyber Threat Intelligence (CTI)

Cyber threat intelligence is the final product that is disseminated after all cyber information is collected, processed and analyzed through a rigorous procedure called the intelligence cycle. It enables organizations to collect the correct threat intelligence and create a secure plan to detect, respond, prevent and mitigate various types of cyber threats and strengthen the organizations defense (Alzoubi et al., 2020a, b, c, d). The data should provide accurate useable intelligence. Figure 2, shows the various phases in the cycle.

According to Lee (2020), the Intelligence cycle starts with the Planning phase where the requirements are identified. This includes the specific questions and concerns that are to be addressed by the CTI program. Even though the requirements have a generic nature to all organizations, the specifications are unique to each

Fig. 2 The intelligence cycle. *Source* 2020 SANS CTI Survey

organization (Ahmad et al., 2021; AlMehrzi et al., 2020; Alzoubi et al., 2020a, b, c, d; Hayajneh et al., 2021). They are updated in an ad hoc manner based on the past incidents or upcoming trends in the industry. Specify who will be consuming the finished product—will it be used as an input to another system, will it be sent to Cyber analysts with technical expertise or will it be sent to top executives for their broad overview of the current cyber trends (Mehmood, 2021).

These requirements are then passed on to the Collection phase where they identify and evaluate the sources of intelligence that will help answer the requirements in an efficient manner. In addition to the inhouse data that is collected from the different departments\groups, information is also gathered from commercial threat feeds coming from CTI-specific vendors, generic security vendors, open-source threat feeds and forensics data (Alzoubi et al., 2020a, b, c, d). Information should also be periodically evaluated to ensure that it is current, effective and usable (Aburayya et al., 2020; AlShehhi et al., 2020; Svoboda et al., 2021). A data source that may have been critical in the past might no longer be needed, and new data sources might need to be identified as the organization and the threat landscape change (Alzoubi & Aziz, 2021a, b).

This data is then processed in the Processing phase to a format that is usable for the analysis phase (Alzoubi et al., 2022). Thousands of log events are generated every day by each system, these need to be collected, filtered and processed by automated systems to make any sense from the data. In the Analysis phase, the data is synthesized to support the requirements that were defined in the first phase. It searches for any potential security events and alerts the respective teams (Alzoubi & Yanamandra, 2020).

The final step is the Dissemination phase where the intelligence gathered is disseminated to the intended audience outlined in the planning phase. The data should go to the right recipient in the right format so that they are able to use it effectively. Timeliness and relevance are critical to the effectiveness of CTI dissemination. Cyber Threat Intelligence is primarily presented in the form of reports or brief summaries via emails, spreadsheets, power point presentations, etc. It is also used as an input to various security tools to generate alerts in an automated fashion (Alzoubi & Ahmed, 2019).

3.3 The Benefits of an AI Based CTI

Organizations generate and consume huge amounts of raw CTI data but it's incredibly time consuming and cumbersome to convert into intelligence. Most of these data is used for analyzing the application and its security (Alzoubi et al., 2020a, b, c, d). AI and ML programs can be the most beneficial for such tasks as they can analyze thousands of records\events, learn their behavior and raise an alert to the cyber analyst in case a vulnerability is detected (Alzoubi et al., 2020a, b, c, d). Semi-automation of cyber security tasks and data processing will be the golden standard followed by industries as the AI based CTI program maturity improves (Joghee et al., 2020).

Licensed to (putm@utm.my)

3.4 *The Core Functions of an AI Based CTI System*

Alnuaimi et al., (2021a, b) proposed the core functions of an AI based cyber threat intelligence as shown in Figure 3. *Identification* of threats and the vulnerabilities is key to understanding the risk a potential attack can have on the organization. AI and ML algorithms can *discover* abnormalities in behavior patterns, flag it immediately and alert the cyber security analyst of a potential breach or threat. AI can use its data sets to *detect* cyber threats by identifying common threat characteristics. It is important to *investigate* events to gather maximum amount of information about the attack, the attack vector, its status, exploits and vulnerabilities (Aziz & Aftab, 2021). *Analysis* would enable the security analyst to identify the vulnerabilities, the devices that were compromised, the elements that failed to prevent the attack and how it happened (Alzoubi & Ahmed, 2019). AI would enable the security analysts to respond in a timely manner and *prevent* any form of progression. AI would be able to immediately *respond* to threats and isolate the infected equipment and stop the threat from progressing any further. Deep learning and ML enable AI to learn the behavior of attacks and thereby *predict* when, how and where the attack will begin. This will enable the security analysts to take appropriate actions to better prevent or mitigate an attack before it happens (Akhtar et al., 2021). AI enables the organization to *continuously monitor* the cyberspace to discover new threats vectors as well as defend against known and unknown threats.

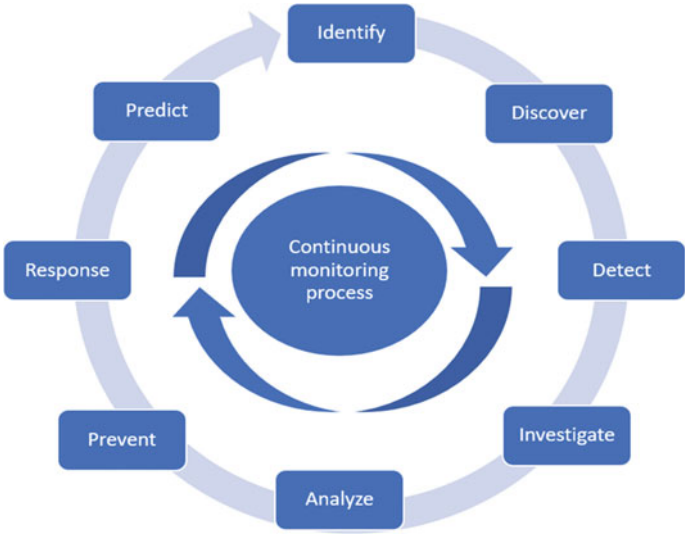

Fig. 3 Core functions of an AI based cyber threat intelligence

3.5 Designing an AI Based CTI system—The AI Development Life Cycle

Darraj et al. (2019) married the traditional SDLC with AI specific design and technology. Figure 4 depicts the 9 phases in the AI development life cycle: Planning, Analysis, Design, Implementation, Training, Optimization & Validation, Testing & Integration, Deployment and Maintenance. In the Planning phase, we need to clearly specify the Cyber threat intelligence requirements, its scope, security, access control, privacy and data encryption along with governance, laws and compliance (Emerita, 2021). In the Analysis phase, various cybersecurity AI tools are analyzed to identify the right tools, algorithms and data sets that are optimal for the organization. Here we will be able to decide which tasks can be automated and which needs a human intervention. In the Design phase, the AI based CTI solution is designed for the organization using the above identified AI tools covering ML, natural language processing, deep neural nets and cognitive computing (Khan, 2021). You will specify what will be the outcome and who will be using the system. In Phase four, the designed AI-CTI solution is implemented. In the Training phase, the designated data sets are used to train the AI-CTI algorithms for building its intelligence that will later be used for automation and taking intelligent decisions (Guergov & Radwan, 2021). In phase six, the cyber security analyst should optimize and validate the AI algorithm and data, ensure the cybersecurity hardening and patching are met and the system is functioning as intended. In phase seven, AI-CTI solution is integrated with the various systems in the organization and tested. The cyber security analyst starts testing the system ensuring all security and privacy requirements are completely met and confirm all PII, PHI, PCI/SOX and FTI data are appropriately protected (Obaid, 2021). In phase eight, the solution is deployed to production environment and becomes completely active. Here the cybersecurity analyst will continue hardening the system, patching and continuously monitor the AI-CTI solution. Phase nine is continual operation and maintenance of the AI-CTI system. The system, as any other application, needs to be continuously monitored and patched to ensure it meets expectations and requirements of the organization. We must make sure the AI system is behaving and functioning as planned. Threat forecasting and risk assessment should be performed at each phase considering the indicators of attack, compromise and interest. All vulnerabilities should be identified and remediated at each phase (Alnazer et al., 2017a, b).

3.6 Incorporating AI into Cyber Threat Intelligence

Learning can be defined as the process of acquiring knowledge or skill sets and when this knowledge is applied in a decision-making process it is called intelligence. An AI system must first learn before it can apply intelligence. To start off, AI systems can be used to perform daily repetitive tasks such as scanning, auditing, analyzing and reviewing huge volumes of data, logs and reports. It can perform

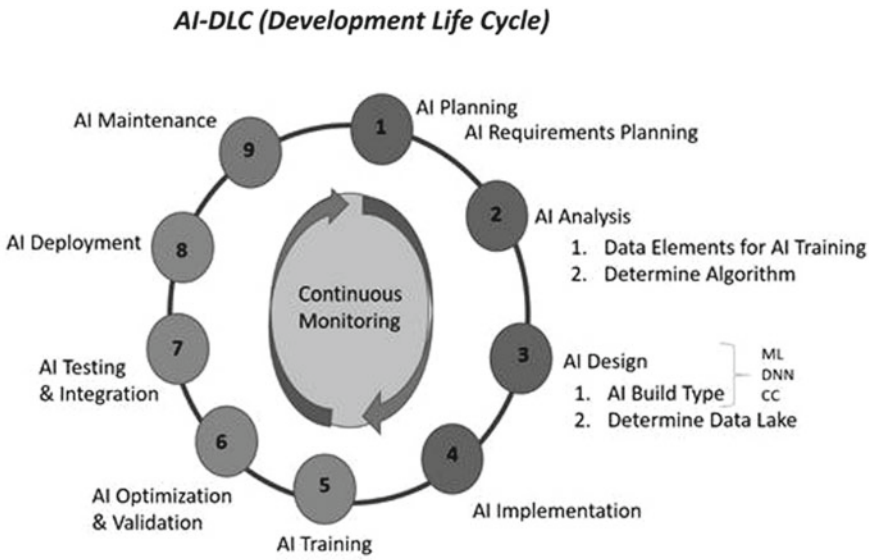

Fig. 4 An AI development life cycle

event correlation and generate intelligent reports which can then be further analyzed by the cyber analysts to strengthen the cyber defense system. AI allows to free up security operators so that they can now focus on more advanced tasks that require deeper thought processes (Alnazer et al., 2017a, b). There are several AI enabled tools and applications such as Neural Networks for intrusion detection, JASK security platform for detecting cyberthreats at its early stage, Cylance's security solution for predictive threat prevention, etc. to support cyber defense (Hamadneh et al., 2021). Adopting an AI based CTI system would improve the cyber resilience of the organization making its cyber defense strategy to be more proactive than reactive. The most significant feature of an AI based CTI system is its ability to adapt and learn. Overtime the system would be able to detect and respond to both known as well as unknown threats. Truong et al. (2020) categorized the most common applications of AI based cybersecurity into: Malware detection, Network intrusion and Phishing/Spam detection as illustrated in Fig. 5.

4 Research Design and Methodology

To address the research problem, the researcher has come up with a simple roadmap for SMEs that can help them to easily and effectively incorporate an AI based CTI system in their cyber security architecture. This roadmap was shared with some of the subject matter experts who are currently working in the cyber security team for various reputable organizations. This research is limited to the development of a

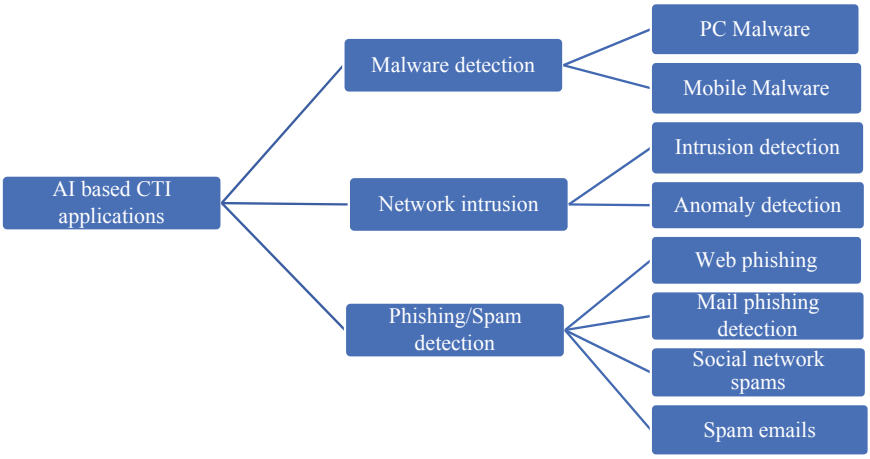

Fig. 5 Common AI based CTI applications

roadmap for SMEs for the successful adoption of an AI based CTI system as part of their cyber defense.

A qualitative research primarily deals with data which is verbal in the participants own written or spoken words based on his beliefs and understanding of the phenomenon (Bless et al., 2000). It tries to identify the problems that might be experienced by the participants with respect to the subject. The qualitative approach is appropriate for this study because the data collected and used focuses on the participants' subjective experiences in the field of organizational cyber security and the way they interpret them.

To evaluate the effectiveness of this roadmap we will be using a qualitative research method where the newly developed framework, as shown in Fig. 6 will be shared with various IT professionals. These participating IT professionals would be requested to evaluate the effectiveness, efficiency and the simplicity of the roadmap. The feedbacks from each of the participants are noted and used to develop our final roadmap for SMEs for the successful adoption of an AI based CTI system.

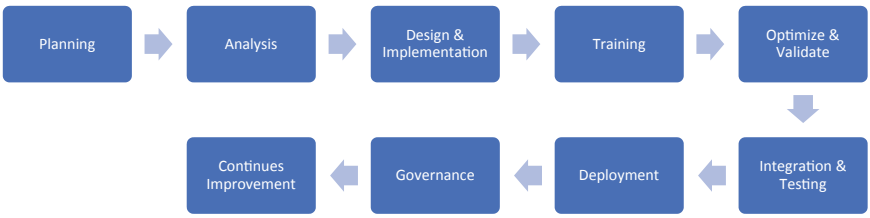

Fig. 6 A roadmap for SMEs for adopting an AI based CTI

1. Planning
    a. Setting up the requirements, scope, goals, security, access control, privacy, data protection, compliance.
    b. List of systems to be integrated.
    c. Create a team of experts with in-depth technical and process knowledge. Include SMEs from third party partners.
2. Analysis
    a. Identify the data platform.
    b. Evaluate data quality.
    c. Data collection (inhouse + external).
    d. Analyze various AI tools, algorithms, data sets.
    e. What tasks to automate.
    f. Tasks that need human interaction.
    g. Selecting the use cases that is easy to implement, provides a significant benefit, high impact to the cyber defense, high quality, complete, up-to-date data set that is readily available, has a with a very high impact.
    h. Look at some of the common use cases like malware detection, network intrusion detections and Spam\phishing detection.
3. Design and implement
    a. Designing the AI solution using the selected AI tools, algms, data sets identified from step 2.
    b. Specify what will be the outcome, who will be using it.
    c. Implement the solution in development environment.
4. Training
    a. Use pre-defined data sets to train AI to build intelligence.
    b. Exchanging and collaborating with other threat researchers and security professionals through various open-source threat intelligence platforms like Open threat exchange, Facebook threat exchange or IBM X-Force exchange is very critical for improving the efficiency and effectiveness of the AI algorithm in detecting new threats. Such collaborations help the AI solution to keep up to speed with the latest attack trends and vulnerabilities.
    c. Train cyber analyst for AI by upskilling their employees and improving their knowledge in the logic underpinning the AI algorithms and its behavior. Create proper interfaces that can enable them to interact with the AI tools and incident alerts.
5. Optimize and validate
    a. Fine tune the AI CTI for maximum efficiency and effectiveness.
    b. Ensure the AI CTI is functioning as intended.
    c. Continue patching and hardening.
    d. Assess the performance wrt initial requirements.

6. Integration and Testing
    a. Deploy Security orchestration, automation and response (SOAR) technologies to improve incident alert triage quality, defining a standardized incident response workflow, improving the security and operations management as well as reducing the onboarding time for a cyber analyst.
    b. Use SIEM to integrate the silos.
    c. Security and privacy requirements are met.
    d. Data is properly protected.
    e. Test the system thoroughly.
7. Deployment
    a. Deploy to production.
    b. Continue patching and hardening.
    c. Ensure the AI CTI is functioning as intended.
    d. Begin continues monitoring.
8. Governance
    a. A clear, transparent governance process needs to be implemented and adhered to monitor the performance of the AI-CTI solution. The controls should include checks on the roles and responsibilities, AI algorithm behavior abnormalities, risk tolerance, output verification and key performance indicators to measure the success of the program.
    b. Control processes to monitor the performance of AI CTI.
    c. BCP if the AI CTI stops working or goes rogue.
    d. It gives you the information you need to reduce Mean Time to Detect and Mean Time to Respond (MTTD and MTTR)—with a quicker, more decisive escalation process.
    e. It enables SOCs to assess and refine their IR processes, continually.
9. Continues Improvement
    a. Look at adding other tasks into the AI CTI.

The roadmap was sent via email to:

a. Senior Cyber Advisor working for a manufacturing company.
b. SIEM—Subject Matter Expert working for a reputed Information Technology and Service provider.
c. Director of Network, Infrastructure and Security working in the hospitality industry.

5 Findings and Results

5.1 Comments Received from the Senior Cyber Advisor

The road plan looks fab. It is really very impressive and efficient from what I understand. Great Job. I have some suggestions hoping they will be of some help.

Continual Improvement: I was expecting it from the planning phase itself. I was happy to see a heading in the end. I would recommend that every phase should have a clause of continual improvement. For instance, the processes defined need to be changed and improved with changing time. Our design needs to continuously evolve to better our product and its security. In the heading 9 itself we can say something of this sort in a couple of lines maybe?

Reviews and Approvals: Can we add some reviews and approvals? For instance, I would be more comfortable saying "reviewed and approved pre-defined data set" than 'pre-defined data set'.

One subheading, maybe a one liner somewhere about 'Segregation of Duties'?

5.2 Comments Received from the SIEM—Subject Matter Expert

Vulnerability assessment and Penetration testing should be used in the Planning phase for a better understanding of the current security infrastructure. This can be used to customize the solution for the customer. Getting to know the type of industry and customizing the solution accordingly for EG: Bank (SWIFT, PCIDSS), Healthcare (HIPPA etc.). Knowing the Number of users in an organization is important for the right sizing of Tools and devices. Use cases have to be custom tailored as per industry type of the organization. eg: create use cases for SWIFT application for banks etc. Providing Analyst with a Database for them to input information based on customer feedback after an incident is raised. Creating automated Templates in SOAR based on the incident triggered and for low-risk incidents automating the action using SOAR. For eg: IP is blacklisted, automatic action of blocking IP. Data should always be encrypted and make sure the main hardware is not connected to internet. Testing of the system should include PT or VA activity and detection of the threat. Tasks based on customer requirements and required less analysis by the Engineer needs to be automated. Further automation can be achieved but should have a final approval from Analyst before performing the actions.

5.3 Comments Received from the Director of Network, Infrastructure and Security

In the Planning phase, the company's mission, vision and executive management directions has to be analyzed. Based on these directions, the current security infrastructure must be reviewed and their setbacks to be noted. The AI based enhancements should be able to overcome these setbacks to gain the confidence and buy-in from the executive management.

Future research on various AI based cyberattacks by nefarious actors, their prevention and mitigation methods can further bridge the knowledge gap and secure the defense against such cyberattacks. The application of AI is a relatively new trend in combating cybercrimes and is still evolving. Further research should be conducted to improve the maturity of AI based cyber threat intelligence, their design, architecture and implementation. International Government bodies should also research and study how best they can legally cooperate and fight cybercrimes. The roadmap was evaluated and developed specifically for an SME; therefore, larger organizations might have added requirements to be addressed in the roadmap.

Considering the generic audience with backgrounds from different industries and having their unique requirement, we have restricted ourselves from discussing any vendor application or solution in detail. This gives us the opportunity to create a general guideline for SMEs that want to develop their own AI based CTI application as well as helping them negotiate with third-party service providers to make an educated and detailed blueprint to support their strategic decision on how they want to implement an AI based CTI system in their infrastructure.

6 Conclusion

Cybercrimes are increasing day by day and the attackers are using technologically advanced, complex and sophisticated threat models to evade detection. Adaptation of the various AI technologies have several benefits and can be used to detect and prevent attacks before it takes place. It is imperative that cybersecurity analysts have a deep and clear understanding of the AI algorithms, their functions and various possible applications to make the most of the cyber threat intelligence. The cyber analysts should ensure the AI systems are secured, hardened and continuously monitored to check and confirm they are behaving as expected, meeting all security/privacy requirements. More and more SMEs are acknowledging the need for an AI based Cyber Threat Intelligence to provide a secure and reliable cyberspace. It is critical that SMEs work together with larger organizations, Government, and other not-for-profit organizations to improve the current overall maturity of AI programs so that they become more dependable and less prone to going rogue.

The researcher believes that SMEs should start investing and adopting the latest AI based cyber security systems in their infrastructure so that they are all well prepared

and understand the nuances of future AI-powered exploitations and other attacking trends. This will also help in the continued research, development and maturing of the AI technology. With the help of this article, cyber security leaders would have gained the knowledge and confidence required for the successful implementation of an AI based cybersecurity system as part of its cyber defense and resilience program. Organizations can start off with the basic automation of daily repetitive tasks such as analyzing security logs, errors and reports for the Cyber analyst. Eventually, the AI applications scope can be increased to a broader set of more complicated cases to significantly increase the speed, efficiency, and effectiveness of their cyber defense.

7 Recommendation and Future Research

Even though there are several benefits in incorporating AI in CTI, very few SMEs have successfully implemented this in their infrastructure. There are several factors contributing to this, such as lack of expertise, lack of thorough knowledge about the algorithm behavior, its stability, cost of implementation, lack of awareness about the evolving cybercrimes, false positives, marketing hypes, etc. Due to these, SMEs often struggle to come up with a strong roadmap that would enable them to implement an efficient AI based CTI system. With the help of the qualitative analysis that was completed in this research, the researcher proposes the final roadmap, Fig. 7, for SMEs to develop their own customized AI based cybersecurity in their current security infrastructure.

Planning—In the Planning phase, based on the company's mission, vision and executive management direction, analyze the security infrastructure of the company using vulnerability assessment and penetration testing to understand the current risks. The AI based CTI system should be an enabler for the SME to achieve their strategic goals and should be able to mitigate the identified risks to gain the confidence and buy-in from the executive management. create a team of subject matter experts that include inhouse members with technical expertise, deep process knowledge as well as third-party partners. The third-party partners should be well experienced working with SMEs so that they can provide innovative solutions that are effective, optimized for SME requirements and are budget friendly. Specify the list of requirements, objectives and scope of the AI based CTI system. The specifications should also include information regarding the security, access control, privacy, data protection, encryption and compliance requirements. You should also list out all existing applications

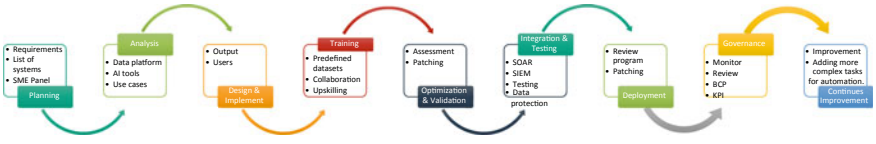

Fig. 7 Roadmap for AI implementation

and systems in the organization so that we do not miss out any critical application during rollout.

Analysis—In this phase, you need to analyze the data sets, data platform, AI tools and algorithms available in the market to identify the best ones that meet your organizations requirements. AI systems are heavily depended on the data that is fed to the system and is popularly publicized to be Garbage in garbage out systems. Identify the datasets that will be used by the AI based CTI system and evaluate them. The data sets used should be of the highest quality, up-to-date and complete. Specify which tasks should be automated by the AI based CTI system and which processes require human intervention. By the end of this phase, you should have selected the use cases that is easy to implement, provides significant benefits, has a high impact in the organizations cyber defense strategy. Select use cases that already have a high quality, complete, up-to-date data set that is readily available. The use cases have to be custom tailored based on the industry type of the SME. Some of the popular use cases are:

- Use of ML for analyzing huge amounts of data and identifying threats before it is exploited. ML can observe anomalies much quicker and with lot more accuracy than humans can and thereby enabling us to predict future threats.
- AI and ML can be used to track and detect any phishing attempts and remediate much faster than humans can. AI-ML can scan through every email in its network to detect phishing campaigns, block them or tag them immediately.
- AI-CTI systems can effectively combine threat intelligence received from various external sources such as discussion boards in the dark web, hacking patterns used, zero-day vulnerabilities, latest attacking trends, etc. This information can be used by the system to proactively determine when and how a cyber-attack might make its way to the organization. This will give the cyber advisors enough lead time to close the vulnerability or mitigate the risk.
- AI can be used to automatically learn the network topology, the traffic pattern and suggest security improvements. AI algorithms can be used to scour through large volumes of data, analyze them and identify anomalies. The AI algorithm can be trained to take some predefined steps in the event of an attack through inputs from the subject matter experts and overtime it will learn these response pattern and make its own decisions.
- ML can be used to learn and create a behavior pattern for your devices. AI can use this pattern to detect any anomalies on the behavior from these devices such as unusual amounts of downloads, uploads, financial transactions, shipments, data access, sudden change in typing speed, etc. Such activities will then trigger the AI algorithm to immediately flag those devices and block them. Al based antivirus software's can detect unusual behavior from programs rather than depending on traditional methods such as matching signatures of known malwares.

Design & Implementation—Design the AI solution using the selected data sets, platform, AI algorithms and tools. Specify what is the expected output from the system and who will be using the system. The solution is then implemented in a development environment.

Licensed to (putm@utm.my)

AI Training—Start building the AI intelligence using reviewed and approved data sets that were pre-defined as per our algorithm requirements. Exchanging and collaborating with other threat researchers and security professionals through various open-source threat intelligence platforms like Open threat exchange, Facebook threat exchange or IBM X-Force exchange is very critical for improving the efficiency and effectiveness of the AI algorithm in detecting new threats. Such collaborations help the AI solution to keep up to speed with the latest attack trends and vulnerabilities. Train cyber analyst for AI by upskilling their employees and improving their knowledge in the logic underpinning the AI algorithms and its behavior. Create proper interfaces that can enable them to interact with the AI tools and incident alerts. Provide the cyber analyst with a database for them to input information based on the customer feedback after an incident is raised.

Optimize & Validate—Optimize the AI based CTI system through fine tuning, patching and hardening to maximize the effectiveness and efficiency of the system. Deploy Security orchestration, automation and response (SOAR) technologies to improve incident alert triage quality, defining a standardized incident response workflow as well as improving the security and operations management. Create automated templates in SOAR for low-risk incidents with the actions to be taken such blacklisting IP, blocking IP, etc. Access and validate the performance of the system with respect to the initial requirements that were specified, ensuring they are functioning as intended.

Integration & Testing—Start integrating the system with the various applications that are part of the scope of this project. Applications such as SIEM can be used to integrate various security systems in the organization working in silos and then SIEM can be integrated to our AI based CTI to automate the tasks. The main hardware should not be connected to the internet. Test the system thoroughly to ensure the security and privacy requirements are met and data is appropriately protected with encryption. Use penetration testing and vulnerability assessment to detect the threats.

Deployment—The AI based CTI solution is deployed in the production environment. Continuously monitor the performance of the system, patching and hardening the system as and when required.

Governance—A clear, transparent governance process needs to be implemented and adhered to monitor the performance of the AI-CTI solution. The controls should include checks on the roles and responsibilities, segregation of duties (Mehmood et al. 2019), AI algorithm behavior abnormalities, risk tolerance, output verification and key performance indicators to measure the success of the program. It should allow the cyber analysts to assess and refine their Incident Response processes, Mean Time to Detect and Mean Time to Respond (MTTD and MTTR) matrix. The data sets and the initial requirements specified in the planning phase must be periodically re-evaluated to ensure the quality and effectiveness of implemented AI based CTI system. We should also look at documenting a business continuity plan (BCP) in case the algorithm goes rogue.

Continues Improvement—Once the organization and the cyber advisors are confident with the performance and the logic controlling the AI based CTI system, we should start looking at expanding the scope of tasks to be automated and include

more complex tasks to maximize the productivity of the program. Moreover, SMEs should continuously monitor and review each process so that the products efficiently and effectiveness improves over time.

Future research on various AI based cyberattacks by nefarious actors, their prevention and mitigation methods can further bridge the knowledge gap and secure the defense against such cyberattacks. The application of AI is a relatively new trend in combating cybercrimes and is still evolving. Further research should be conducted to improve the maturity of AI based cyber threat intelligence, their design, architecture and implementation. International Government bodies should also research and study how best they can legally cooperate and fight cybercrimes. The roadmap was evaluated and developed specifically for an SME; therefore larger organizations might have added requirements to be addressed in the roadmap.

Considering the generic audience with backgrounds from different industries and having their unique requirement, we have restricted ourselves from discussing any vendor application or solution in detail. This gives us the opportunity to create a general guideline for SMEs that want to develop their own AI based CTI application as well as helping them negotiate with third-party service providers to make an educated and detailed blueprint to support their strategic decision on how they want to implement an AI based CTI system in their infrastructure.

NoSQL: Future of BigData Analytics Characteristics and Comparison with RDBMS

Muhammad Arshad, M. Nawaz Brohi, Tariq Rahim Soomro, Taher M. Ghazal, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract The growth of digital world has become so fast and the data volume turned to more composite in relations to size from terabyte and higher, the variation of data including structured, unstructured and hybrid, pace has gone so high in growth of data. This is called 'Big Data' as a worldwide phenomenon. Typically, this is measured as the collection of data from multiple sources has become so huge that it can't be well exploited or maintained by using regular methods used for data management: e.g., RDBMS the conventional relational database management systems or search engines used conventionally. The experts have been working to solve handle these problems, the traditional relational database management systems are modified by precisely

designed a set of substitutes DBMS's; which are search based systems, New SQL and NoSQL. This goal of this study is to provide characteristics, classification and evaluation of database management system called NoSQL in Big Data Analytics. The study is planned to help people, specifically the companies to gain. The current computation power also falls less against the massive extended storage volume. The fast growth of unstructured data requires a complete model change for the new age to meet the incoming challenges and observe the progress of new proficient techniques for data engineering. The explanation of BigData, RDBMS and NoSQL have also been described in this study to put light on difference of data and requirement of new technology. This study will highlight the differences, capabilities of both RDBMS and NoSQL database management systems in accordance with BigData. With the help of qualitative and quantitative approach the study has emphasized on the limitation of RDBMS and requirement of new technology NoSQL used for unstructured BigData used for analytics.

1 Introduction

NoSQL, for "Not Only SQL", attributes to a diverse and progressively more recognizable collection of non-relational data management systems; where SQL is not being used for manipulation of data as well as databases are not built primarily on tables (Akhtar et al., 2021; Al Ali, 2021; Alhamad et al., 2021, 2022; Ali et al., 2021). While working with massive data whose architecture does not necessitate a relational model NoSQL database management system are preferable. These structures are disseminated, non-relational databases planned for all-encompassing wide range data storage as well as for densely-parallel data operations and processing over a great amount of commodity servers. Non- SQL languages and systems are also employed by them to interrelate with data and information (although several latest APIs that renovate SQL inquiries to the system's indigenous query language or tool). NoSQL database systems came up next to chief Internet corporations, like Facebook, Amazon and google which experienced difficulties while working with massive amounts of data and information with usual RDBMS systems were not able to deal with. Multiple processes can be carried out by them like, investigative and prophetic analytics, ETL-style the transformation of data, and OLTP non-mission-critical (like handling transactions between organizations and long duration transactions). Unlike the conventional DBMSs and data warehouses, these systems as inspired by Web 2.0 applications are planned to reach out to the maximum number of those users who are doing updates and the reads as well (Ali et al., 2022; Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2022).

A relational database system which is planned and intended to offer ACID (Atomicity, Consistency, Isolation, Durability) properties, traditional SQL-based OLAP in Big Data domain and real-time OLTP (Online Transaction) are known as NewSQL system. Utilizing NoSQL-approach features like column-based information storage and scattered styles this system has covered up all the limitations encountered by

conformist RDBMS system. Other novel features introduced by this system are in-memory processing, symmetric multiprocessing (SMP) or Massively Parallel Processing.

The data that is too much comprehensive, ambiguous, readily changing is hard to be tackled using the conventional methods as per the observation of analytics. These days every research institution, businesses, and governments are generating extraordinary amounts of data which is too complex as well. Hunting of required information from such enormous data is very crucial for the organizations. It's a great challenge to extract the meaningful insight out of the bulk of data swiftly. That is why analytics has become inextricably important to understand the significance of Big Data to perk up their business performance and boost their market share. In the past few years, the ways to deal with the variety, velocity, and volume of big data has improved to a great extent. The immense rise in data size necessitates rapid analytics with each new inquiry by the application user. This situation has escorted the technologists to introduce a new DBMS system that can triumph over this processing holdup at Database side. As the structural design of RDBMS has restrictions to handle such huge data and carry out analytics. NoSQL architecture is specifically designed to deal with such speed breakers. Thanks to the flexible and adaptable architecture of NoSQL massive volumes of information can be processed rapidly.

In this paper, we will discuss the conventional RDBMS features as well as its limits to manage the huge data. Furthermore, NoSQL Databases will be discussed along with their types and distinctive characteristics to deal with Big Data will be explained. The application areas where NoSQL databases can incorporate will also be discussed. By means of the industry's experience with NoSQL, we will also attempt to elucidate the problems that can be encountered using later mentioned systems for Big Data. Finally, there is going to be a comparison between the two systems about how they contend with normal data to Big Data.

2 Literature Review

From the several data-models, the model that has been surpassing all others is a relational model from the start of early 80 s, with achievements like Oracle databases, MySQL and Microsoft SQL Serveralso known as Relational Database Management System (RDBMS). The models mentioned before are all designed on the relational model. The main reason to build RDBMS was to provide data processing to businesses and from that time till now RDBMS is proving as the best tool for information storage whether the information is personal data, financial statements, transaction processing and so on (Aziz & Aftab, 2021; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021a, 2021b, 2021c, 2021d).

Licensed to (putm@utm.my)

2.1 Big Data

As time went by, the provisions for data kept on growing. This data has seen a revolution from structured to unstructured in form and from Megabytes, Gigabytes, Terabytes to Petabytes in size this ever-changing data has caused people to consider about a different solution to supervise this big amount of data. As the data became big, comprehensive, multifaceted, structured or amorphous, and diverse, it needed noteworthy consideration and concentration. Vast amounts of data are being produced at a very swift rate from a variety of distinct prospective areas, systematic tools, and the internet, especially the world known social media, mentioning a few of them. This type of data was termed as Big data. Big data points to those datasets the size of which are past the ability of typical database software techniques to capture, process and manage, store, and examine (Al-Khayyal et al., 2021; Al Batayneh et al., 2021; Alshurideh, 2022; Alshurideh et al., 2022). This characterization is deliberately subjective because it is evident that as technology progresses over the passage of time, the volume of datasets that become licensed as big data will also enlarge (Al Guergov & Radwan, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021a, 2021b; Joghee et al., 2020; Naqvi et al., 2021; Shebli et al., 2021).

4v's can explain the nature of Big data easily. 4v's include Volume, Variety, Velocity, Variability.

2.1.1 Volume

The magnitude of produced and stored data, its importance, value and potential insight is determined by its size. Means whether the data is worthy enough to be termed as Big data or not.

2.1.2 Variety

Variety is the kind, category, and the architecture of the data. This assists experts who scrutinize it to efficiently employ the consequential insight. Big data it the collection of unstructured type data including videos, audios, images and text; also, it uses data fusion to fill in the missing pieces.

2.1.3 Velocity

It can be described as, the pace of data production and processing in the system to comply with the business requirements, tests, and obstacles that stretch out in the technique of escalation, improvement, and lastly the growth. Big data is usually obtainable in up to date format.

2.1.4 Variability

Irregularity and unpredictability of the data set can obstruct the course of action to hold and handle it (Fig. 1).

While considering big data, one problem is its growth, but the other bigger issue is the dire need to manage and store not just the structured data but also the unstructured data as well as the pictures, videos and files. An analytical case in point is that the relational model cannot deal with the data traffic that the social media sites like Facebook and Twitter produce, also it is not the type of data they want to store. Now, for the conventional data processing systems, this significant velocity of the increase in the volume of the data poses a solemn challenge (Alshurideh et al., 2020; Alzoubi, 2021a, 2021b; Alzoubi et al., 2022a; Alzoubi et al., 2020b).

Newly, though, in many cases, the utilization of relational databases escorted to troubles both due to discrepancy and glitches in the design of data and restraints of parallel scalability among various servers and massive size of data. The two main tendencies that brought the mentioned issues into the consideration of international software community are.

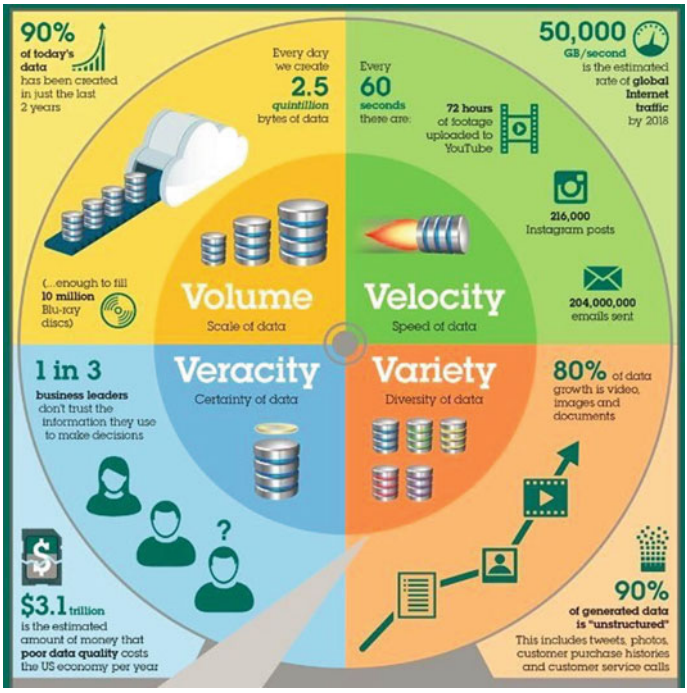

Fig. 1 BigData 4 V explanation ("Big Data," IBM, [Online]. Available: http://www.ibmbigdatahub.com/infographic/extracting-business-value-4-vs-big-data)

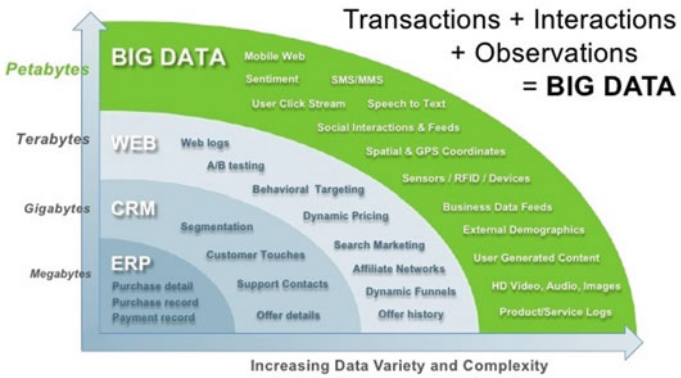

Fig. 2 BigData Transactions with Interaction and Observations (Slide Share, [Online]. Available:https://www.slideshare.net/cloudstack/vbacd-july-2012-apache-hadoopnow-and-beyond. [Accessed 12 February 2018].)

1. The massive increase of the quantity of data produced by sensors, systems and users, additionally fast paced by the attention of a huge module of this volume on big disseminated systems like Google, Amazon and other cloud services.
2. The escalating interconnection and intricacy of data fast paced by Web 2.0, Internet, social networks and exposed and uniform access to sources of data consists of different systems at a very large number (Fig. 2).

Big Data = Transaction + Observation + Interactions.

Due to this very reason, a lot of emerging companies took up different kinds of non-relational databases, which are also known as NoSQL databases and the application run arise e.g. Yahoo which used PNUTTS to fulfill enormously parallel and physically worldwide dispersed database system to run their web based applications.

Since their release NoSQL ("Not Only SQL") systems are extensively accepted in several realms. The main idea behind NoSQL systems is to hold up applications not properly served by relational systems, specifically those which involved in managing and processing BigData. NoSQL system can be classified as graph databases, document stores and key-value stores. It is important to mention here that, there is not one specific query language like standard query language used in RDBMS or a typical APIs used to communicate with various NoSQL systems. Normally, customers are required to use custom build APIs at programming level to communicate (Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020, 2021). This makes portability to be reduced and necessitates code at system-specific level.

2.2 Characteristics of RDBMS

The data organized in relational databases is in the form of tables, which are made up of columns and rows. In order to remove ambiguities during queries, these tables cannot have duplicate rows and every table has been assigned a primary key to a column that distinctively recognize each and every row that is known as record. For example, Fig. 3 demonstrates that Product_ID in the product table is the primary key. Author_ID Column used as Foreign Key in the Product_Book table, which is a child table, Author_ID column is used to reference Author table which is a parent table. The keys used like Foreign and performance, that scan be described as supplementary table relationships may possibly be mandatory while retrieval of data.

Multiple tale inheritances are utilized by libraries' database to hoard familiar traits in a common table knows as Product table (please refer to Fig. 3), every single one of unique attributes is kept in specific type product tables. This said method is far additional well-organized in contrast to concrete table inheritance where for every product category a new table is fashioned, and the queries used are custom-made for specific products. But, as explained to get all the significant characteristics of an established solution multiple table inheritance necessitate many joined operations.

The RDBMS make it certain to have Database ACID properties as the primary prerequisite. For databases, ACID properties act as the vital concept. The abbreviation globally knows as Atomicity, Consistency, Isolation, and Durability.

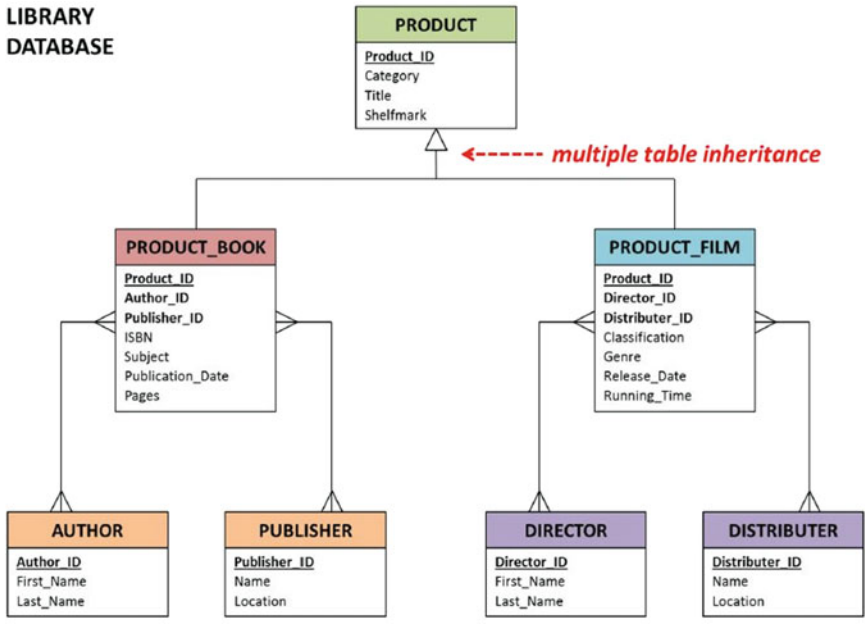

Fig. 3 Relational Database Schema [17]

The ACID makes certain arrangements to business to keep these purchase of sweater dealings from overlaying one another thus the merchant is kept safe from the flawed register and account balances.

2.2.1 Atomicity

Atomicity is the first ACID property and it is best explained by the phrase "all or nothing" to understand this let's consider an example; When a database gets an update, either all of it is available or none of the updates happen to be accessible to anybody past the application or user executing the update. The above-mentioned action performed on database is called a transaction and it is either assigned or canceled. In other words, only a part of an update cannot be put into the database, you get whole of it or none.

2.2.2 Consistency

ACID property of consistency makes sure that if there is a change to values in an instance then there will be a consistent change to other all values in that specific instance. The constraint of consistency is a base on data and it assists in the system as precondition, the condition after the execution knows as post-condition and at the end the change or transformation condition to be ensured on every transaction (Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b).

2.2.3 Isolation

The third property knows as isolation section of the ACID is needed when there are many transactions running in parallel known as concurrent. The executions of transaction that take place in parallel are known as concurrent transactions, for example shared multiple users accessing shared objects in the figure the scenario is explained at the top as actions happening over time. Basically, the safety precautions employed by DBMS to thwart clashes between concurrent transactions is known as isolation.

Let's understand this with the help of an example, if there are two parties updating the similar catalog article, the changes made by the first party should not depend on or be affected by the changes made by the other party to be able to work in isolation means that both parties act as they are the solitary user. Every change must be kept isolated from other users of the same catalog (Fig. 4).

Serializability is another important concept which should be understood while debating separation over transactions. The execution of transactions could be serialized once the consequence on the database is unchanged whether the transactions are executed in an interleaved manner or in serial order. Concurrent transaction i.e. Transactions 1 through Transaction 3 are being executed at the same time as it can be seen in the figure. An important point to keep in mind here is that in serialized

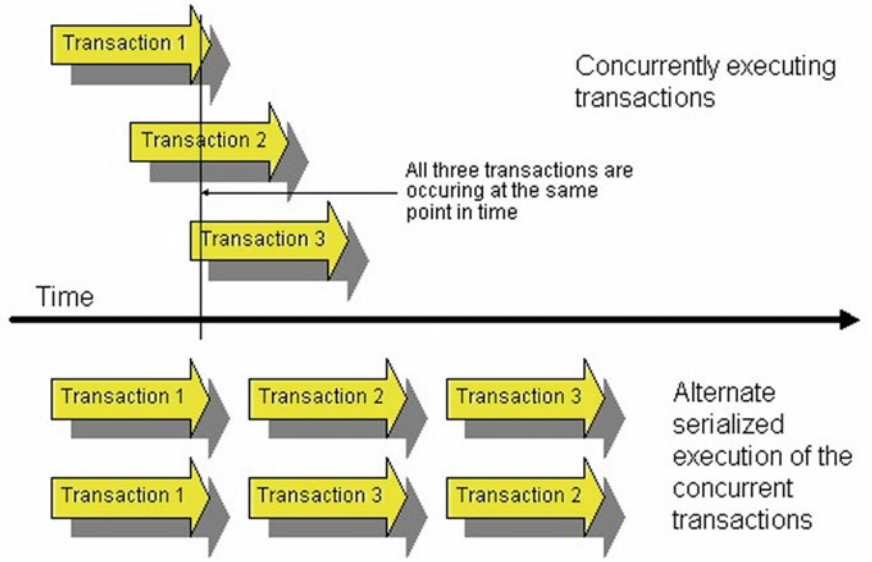

Fig. 4 Isolation Relational Database Property ("Database ACID Properties," [Online]. Available: https://www.servicearchitecture.com/articles/database/acid_properties.html.)

execution it is not compulsory that transactions started first will be the ones automatically completed before the finishing the other transactions in the sequential execution (Mehmood, 2021; Mehmood et al., 2019; Miller, 2021; Mondol, 2021; Obaid, 2021).

2.2.4 Durability

Durability is that ACID property which attends to the need of keeping a record of committed transactions. These updates are not supposed to be missed in any case as it's a very critical thing. It's the systems capability to recover the completed transactions in system or storage media failure. The durability features are as follows:

- The recovery of recently committed transactions in case of database failure
- The recovery of recently committed transactions in case of application failure
- The recovery of recently committed transactions in case of CPU failure
- The recovery of recently committed transactions in case of storage.

The restrictions of RDBMS's are to deal with amorphous, diverse, heterogeneous, massive amounts of data. For RDBMS retailer it is a huge challenge because of its architecture. This test to manage the big data has compelled them to devise a new technology that can handle the said amounts of data and information.

SQL-Like centralized databases have been pushed towards their perimeters by computational processing and storage requirements of applications like Big Data used for Analytics, Social Networking and Business Intelligence having large than

petabyte datasets. So, these limitations of paved a way that directed to the growth of horizontally ascendable, dispersed non-relational type of data stores, which are called as No-SQL databases, like Google's has built open source HBase implementation and Bigtable and the well-known Facebook has Cassandra. The effectiveness, competence, and cost-effectiveness of these approaches are gained by the embodiment of distributed architecture-based key-value stores, for example Voldemort and Cassandra. In regard to Data warehousing, Web 2.0, Grid and applications used in Cloud were very hard with RDBMS and it was a major drawback of this system. Pokorny (2013), emphases mainly to NoSQL databases from the perspective of cloud environment, chiefly concurrency model and scalability in horizontal fashion. The Relational Database Management Systems (RDBMS) and NoSQL databases are differing from each other, but NoSQL databases did not assure ACID properties (Radwan & Farouk, 2021; Shamout et al., 2022).

2.3 Characteristics of NoSQL Databases

The conventional database systems are designed on the basic idea of execution of transactions in the manner to keep the data veracity and reliability. This keeps the data consistent while managing it. The features of transactions are also known as ACID (Atomicity, Consistency, Isolation, and Durability) as we have already discussed. Though, developing a system compliant with ACID has made known to be a trouble. CAP-theorem has been observed, i.e. clashes arose among distributed systems diverse sides of high availability that are not completely resolvable.

2.3.1 Strong Consistency

On updates to the data set the version of data seen by the clients is totally same e. g. through the method of two-phase commit protocol (XA transactions), and ACID.

2.3.2 High Availability

In the case, if a few of the machines in a cluster are not working, all the clients still can always find a copy of the requested data. Down machines do not create a problem in this matter.

2.3.3 Partition-Tolerance

The goal of the entire system always is to maintains its characteristics and features even while being positioned on various servers at the same time being transparent to

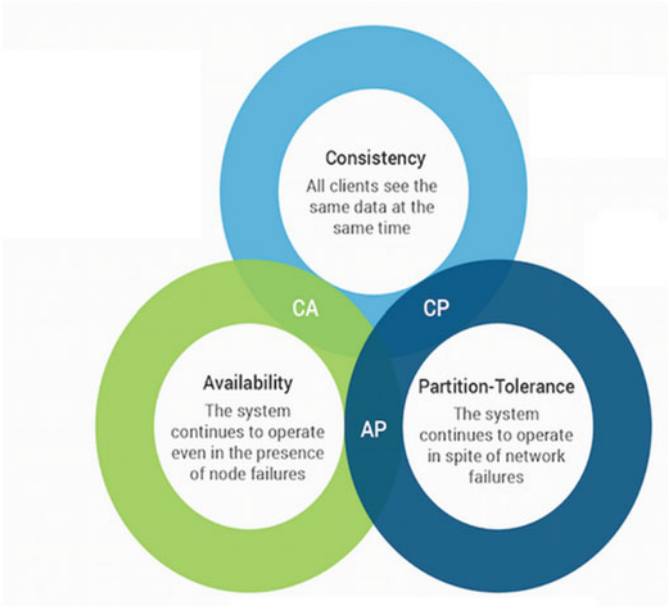

Fig. 5 Characteristics of NoSQL Database

the client. According to the CAP-Theorem, at the same time, out of three only two dissimilar aspects of scaling out can be attained entirely (see Fig. 5).

To attain improved Availability and Partitioning a lot of the NoSQL databases mentioned above have lessened the needs for Consistency. This step laid the way to develop systems globally called as a BASE (Basically Available, Soft-state, Eventually consistent). NoSQL databases have been classified according to the CAP theorem by Han, J. They had compared different NoSQL databases by executing multiple different criteria (Al Ali et al., 2021; Alzoubi et al., 2021; Batayneh et al., 2021).

Main Usages of NoSQL Database can be categorized as (1) Huge-scale and wide data calculation and processing (processing in parallel in the distributed systems); (2) Embedded IR (general machine-to-machine data search and reclamation); (3) Investigative analytics done on unstructured and structured data (knows as expert level); (4) Huge size data storage (unstructured, semi-structured, small-packet structured) (Afifi et al., 2020).

They prove valuable as well for machine-to-machine communication for information and data retrieval, recovery and exchange, for dispensing large number of executions, to the extinct ACID restrictions can be made soft, or the way is to apply them on application side not on DBMS side. In conclusion, when we are to deal with semi-structured or hybrid data these systems act as very good probing analytics, nonetheless to get to the lowermost of intellect, the researcher should be a skillful mathematician working in accordance with an expert programmer (Ghazal, 2021; Ghazal et al., 2021a, 2021b).

Table 1 Key-Value store NoSQL Database

CAR	
Key	Value
1	Make: Infiniti Model: Q50 Color: White Year: 2016
2	Make: Volvo Model: XC90 Color: Beige Year: 2009 Transmission: Auto Type: 4*4

"Characteristics of NoSQL," [Online]. Available: https://www.forbes.com/sites/forbestechcouncil/2017/09/18/renaissance-in-cloud-datamanagement/#4509108030cf

2.4 Classification of NoSQL Databases

NoSQL databases have been classified by Leavitt (2010) in three types: Key-value stores e.g.SimpleDB column-oriented databases—e.g. Cassandra, HBase, Big Table and document-based stores—e.g. CouchDB, MongoDB. In this segment, according to the suitability of different kinds of tasks we categorize NoSQL Databases into four basic categories,

(1) Key-Value stores.
(2) Document databases (or stores).
(3) Wide-Column stores.
(4) Graph databases.

2.4.1 Key-Value Stores

Classically, in these DBMS the data objects are stored as alpha-numeric identifiers (keys) and related values in plain, standalone tables (also known as —hash tables‖). The values could possibly be as simple as text strings or could be more complex like lists and sets. Data searches can usually one can perform data searches only with the use of keys, not values, and they are restricted to precise matches. See Table 1.

2.4.2 Document Databases

As the name indicates, document databases and the idea were derived from Lotus Notes, these mainly are designed and intended to store and manage the different kind of documents. Customary data exchange systems like JSON (Javascript Option Notation), XML, or BSON (documents are encoded by Binary JSON). Contrasting to

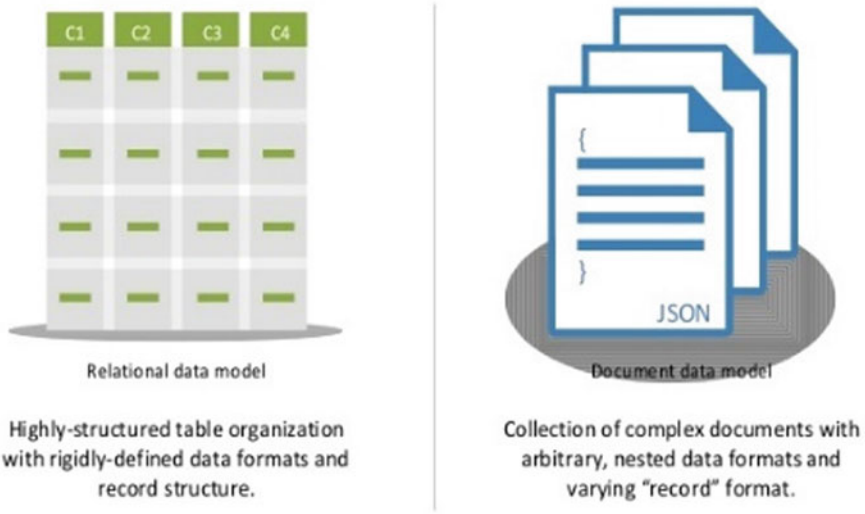

Fig. 6 Document Type Database vs Relational Database (Slide Share, [Online]. Available: https://www.slideshare.net/cloudstack/vbacd-july-2012-apache-hadoopnow-and-beyond. [Accessed 12 February 2018].)

the uncomplicated key-value stores illustrated above, in the value column of document databases structured and unstructured data is present—particularly attribute name/value pairs. Hundreds of these attributes can dwell into a single column, also from row to row the type and number of attributes recorded can differ. In document databases, the values and keys are totally searchable which is in contrast with simple key-value stores (Ghazal et al., 2013, 2021c; Kalra et al., 2020) (Fig. 6).

2.4.3 Wide-Column (or Column-Family) Stores (BigTable-Implementations)

Wide-Column (or Column-Family) stores (after this WC/CF) are just like document databases. To house multiple attributes for each key they utilize a column based distributed data structure. Whilst several WC/CF stores comprise a Key-Value DNA (for example the Cassandra Dynamo-inspired), the majority are designed like Google's Bigtable, that is petabyte scale internal system based on distributed storage for data. This system is developed by Google for its famous search engine and additional products like Finance by Google and Google Earth. In general, the capability is not only to reproduce Google's storage structure BigTable, but Google's file system which is distributed in architecture (GFS) and its processing framework which is parallel MapReduce too. Similar scenario is with Hadoop, which comprises the file system called the Hadoop File System (HDFS, based on GFS) + Hbase (a

Licensed to (putm@utm.my)

Fig. 7 NoSQL Wide Column Database ("Graph Databases: NOSQL and Neo4j," infoQ, [Online]. Available: http://www.infoq.com/articles/graphnosql-neo4j [Accessed 26 March 2018].)

Bigtable-style storage system) + MapReduce (Khan et al., 2021; Lee et al., 2021) (Fig. 7).

2.4.4 Graph Databases

Relational databases have been replaced by graph databases with more organized relational graphs having key value pairing interconnected to each other. These are like object-oriented databases because of the graph is illustrated as object-oriented network of graph nodes, (objects in concept), relationship of node knows as edges and properties (the object characteristics stated as key-value pairs). The four NoSQL forms conferred here are those that are related with relations. Among other NoSQL DMS, these types are considered more human-friendly because they focus on the visual depiction of data and information (Fig. 8).

Many big organizations that deal with big data have now adopted NoSQL. Following is the table that shows a few of these big businesses (Table 2).

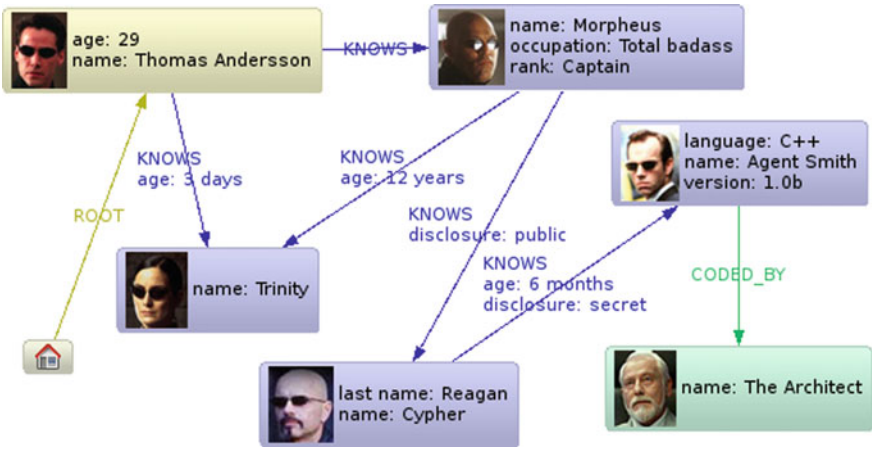

Fig. 8 NoSQL Graph Database Store ("Graph Databases: NOSQL and Neo4j," infoQ, [Online]. Available: http://www.infoq.com/articles/graphnosql-neo4j. [Accessed 26 March 2018].)

Table 2 NoSQL type used by Companies

Company name	NoSQL name	NoSQL storage type
eBay	Cassandra MongoDB	Column Document
Facebook	Cassandra	Column
Lots of Words	CouchDB	Document
MongoHQ	MongoDB	Document
Mozilla	Hbase	Column
Netflix	Hbase Cassandra	Column Column
Twitter	Cassandra	Column

Big businesses because of their high data storage demands have converted to NoSQL and its experts are also in the favorable light now.

2.5 Comparison Between RDBMS and NoSQL

In this study as the characteristics of both RDBMS and NoSQL has been described, the comparison between RDBMS and NoSQL has been analyzed in detail. Which shows the major differences and capabilities of both systems according to customer needs (Table 3).

Table 3 Comparison between RDBMS and NoSQL (Author Created)

S. No	Description	RDBMS	NoSQL
1	Data size	Gigabyte, Terabyte	Petabytes and greater
2	Schema	Static Schema	Dynamic Schema
3	Type	Relational	Non-Relational
4	Data	Structured	Unstructured
5	Scalability	Vertical	Horizontal
6	Language	Standard Query Language	Un-structured Query language
7	Joins	Helpful to design complex queries	No Joins, don't have interface to design complex queries
7	OLTP	Recommended and best used for OLTP Systems	Less likely to be considered as OLTP systems
8	Flexible	Rigid Schema, relationship bounded	Very flexible and no rigid Schemas
9	Auto elasticity	Require down time in most cases	Automatic, no outage required
10	Consistency	Strong consistency supported	Consistency varies per solution; some solutions have tunable consistency
11	Scale	Scale well vertically	Scale well horizontally
12	Transaction	ACID	CAP Theorem

"Characteristics of NoSQL," [Online]. Available: https://www.forbes.com/sites/forbestechcouncil/2017/09/18/renaissance-in-cloud-datamanagement/#4509108030cf

3 Material and Methods

In 1980's the primary cohort of commercial systems come into sight by Teradata Corporation and in the same time, the necessity surfaced for well-defined systems to determine the ability of DBMS dealing with very big quantities of data. Motivated by vendor's desires to weigh the commercial systems, in the starting of 90's the Transaction Processing Performance Council designed a series of data warehouse end-to-end benchmarks. Likely systems have been developed by TPC-H and PC-R at the beginning of 2000 (the details are all accessible from the TPC website2). With some update on a venture data warehouse, these benchmarks are limited to a data size of a terabyte, highlighting single and multi-user performance of complex SQL query processing abilities. Even before this, academia had started developing micro-benchmarks like EXRT and XMark benchmarks for XML-related DBMS technologies and the OO7, the Wisconsin benchmark, and BUCKY benchmarks for object-oriented DBMSs, (Matloob et al., 2021; Naqvi et al., 2021).

With the passage of time, the volume of data kept on growing from megabytes to petabytes in size and from simple data models (a few tables with a small number of relationships) to complex ones (big tables with many complex relationships). This change in the demand for data needs has led TPC to act in response. In the dawn

of 2000's TPC-DS developed its next generation decision support benchmark. Its foundation is based on the SQL programming language, but it consists of several big data elements, like exceedingly large system sizes and data. Even bthough the existing limit is 100 terabytes; the schema and data generator can be expanded to petabytes. Quite composite analytical data queries are also contained by it using sophisticated and complicated SQL structures and a synchronized update model.

3.1 Adaptation of NoSQL

The term NoSQL was invented in 1998. Lots of people assume NoSQL is a deprecating term fashioned to jab at SQL but in actual, the term NoSQL stands for Not Only SQL. Putting forth the idea that both these technologies SQL and NoSQL can exist together in their own specific place. For the previous few years, NoSQL technology has been heard and seen in the news most likely because of the reason that as many of the Web 2.0 leaders have taken the NoSQL technology. Facebook, Twitter, Digg, Amazon, LinkedIn and Google all these companies use NoSQL in one way or another.

The main factors behind the adaptation of NoSQL includes flexibility of data, no rigid schema and scalability.

3.2 Questionnaire Development

As discussed earlier technology is changing extensively, and data is becoming more crucial to any organization. The accessing and manipulation of data is much more necessary than saving it to storage. Accessing and storing of data to storage obviously is time consuming. The RDBMS's due to their architecture must consider the data types, relations and other hidden processes involved in execution and storing the data to disk and the same when accessing the data from storage. This adds up the time which is very crucial for the applications to respond. The massive data growth requires additional storage on the fly. This is difficult to manage in RDBMS environment (Rehman et al., 2021; Suleman et al., 2021).

On the other hand, accessing and storing of heterogenous type of data in NoSQL environment is very fast. The flexibility of multitype data such as text, images, videos and documents are managed very efficiently. The schema free and no predefined architecture gives a strong advantage over RDBMS. Dealing with enormous growth of data is very easy in NoSQL environment as it gives flexible scalable architecture by adding more and more additional servers called shards in running environment.

Qualitative Study has been done on previous researches for the same topic. This has helped enormously to get the basic idea about the database vendors and organizations requirements and improvements which have been done to accomplish the

day-to-day challenges. This also has shed light on the technology enhancements in this specific field within last 2 decades.

3.3 Data Collection

A questionnaire survey has been conducted as part of quantitative method. To get the current situation in dealing with bigdata and analytics a questionnaire has been developed and spread in IT field. The targeted people were IT company CEO's, CTO,'s, Database Administrators which are dealing with day to day management challenges and the network professionals which are designing networks to deal with bigdata. The results are then analyzed by the respondents and have helped in getting the result and findings for this study. As the restriction of direct access to all the respondents the study focused on various methods to collect data which include professional groups, emails, printed copies to professionals in contact. The results are then analyzed and discussed in Chap. 4.

4 Results and Findings

As the world already has adopted the NoSQL Database, to analyze the levels and reasons of moving the software developing companies towards it a survey has been conducted. The survey has been conducted to analyze and judge the necessity of NoSQL with respect to business needs, Data management problems, flexibility or low-cost DBMS adaptation.

The survey has been conducted among database administrators, IT company CEO's, technology decision makers, software developers and IT experts. The survey has been conducted considering those people doing business in RDBMS and Big Data.

The main points of the survey are given below.

- About half of the more than 250 respondents pointed to the fact that they have worked on NoSQL projects in past couple of years. The companies which have secured large software projects more than 50% of their projects are to deal with Big Data for their clients. The reasons of adaption of NoSQL is described by them as:
- 49% referred to inflexible schemas to be the major reason for their migration to NoSQL technology from the relational database system. A prime reason for switching to NoSQL is the deficiency of scalability and high latency/low performance when dealing with Big Data.
- Overall, 40% were of the viewpoint that NoSQL is very essential and significant to their daily operations, and it is continuing to become more important.

- The management of Big Data in NoSQL is much easier than in RDBMS due to the pre-defined architecture and limitation. As the capturing of multi structural data is greeted in NoSQL. The type of data is high rank in considering the NoSQL database to be used (Figs. 9, 10).

As per the above survey results explains according to software professionals the major factors which take part in deciding about NoSQL and RDBMS are BigData, unstructured data and the management of the same. This means when the experts have to deal with massive amount of unstructured data, they are more likely to adopt NoSQL (Fig. 11).

- Another question regarding the performance of NoSQL using BigData shows the experts agreed on having better performance than RDBMS.

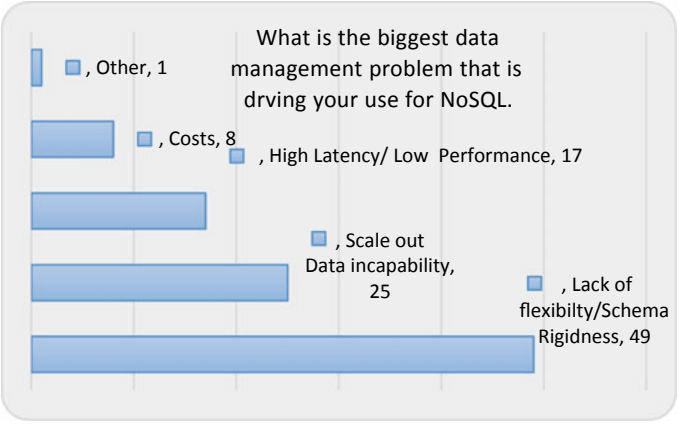

Fig. 9 Problems to driving towards NoSQL (Created by authors)

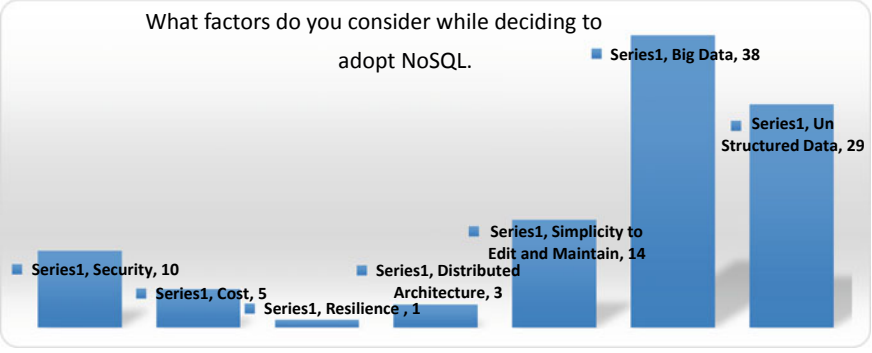

Fig. 10 Factor to decide NoSQL (Created by authors)

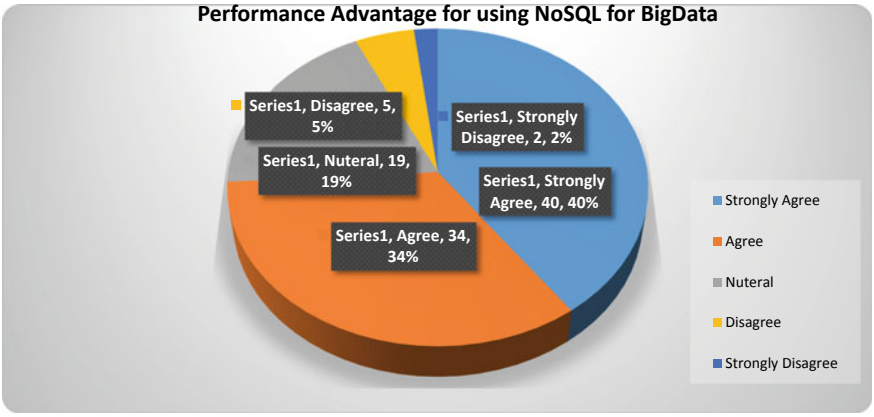

Fig. 11 NoSQL Performance with BigData (Author Created)

The architecture of DBMS and data has the main effect on performance. Performance is the major requirement of all bigdata based companies. At the same time fast data store and access is the major challenge for DBMS vendors and they keep doing research on this to get the customer's confidence. In the survey 40% of the respondents strongly agree that NoSQL perform well when dealing with BigData along with 34% agree for the same.

Those organizations that show considerably high needs of storing data are considering NoSQL seriously and the demand of NoSQL database experts have also risen to a higher level in these developing organizations.

Overall, the results of the survey can be concluded as more than 65% of the respondent are agree that when it comes to deal with BigData they have used, or their first choice is to go with NoSQL. The reasons that have emerged from the survey answers are particularly highlighted as pre-defined schema in RDBMS. This has very strong characteristic and work very well in small to large databases which deals with structured and well-organized data. This kind of architecture is very popular and successful in OLTP environments like Banks, online retail shops and university library systems. The ERP systems also have pre-defined database architecture and are doing well with RDBMS. However, when it comes to very large to huge databases with the data volume from petabyte and greater, unstructured type of data including text, files, images and videos and all incoming very massively, it cannot be handled by RDBMS with high performance. The massive increase in data also require scalability at hardware level and the DBMS system should accept it on the fly. This has been the major characteristic of NoSQL DBMS that it dynamic schema and accept any kind of data. As the previous studies has shown social media is growing very widely in terms of data and dealing with all kinds of data, all the social media systems are using NoSQL in one way or another. So, the other top factors highlighted as scalability, performance when dealing with BigData, simple in maintaining the system.

5 Conclusion

Storage and processing requirements of some applications like Analytics for Big Data, Business Intelligence and social networking which is growing rapidly over peta-byte datasets have forced RDBMS to their limits. This has directed to the development of technology that is horizontally scalable, dispersed non-relational database named as No-SQL. The study speculate about the primarily usages of NoSQL Databeses: The larger scale data processing system (parallel processing over distributed systems), (machine-to-machine data look-up & recovery); Analytics on semi-structured data (professional level); Huge capacity data storage (structured, semi-structured, unstructured) NoSQL is a huge and growing field, for the purposes of this study, characteristics (benefits and features of NoSQL DBMS); classification (the four categories with their features); and the comparison and assessment (with a table on basis of few characteristics- strategy, integrity, attributes, distribution) of different kinds of NoSQL databases. The study has also shown the difference between DBMS and NoSQL with present state and reason of acceptance of NoSQL databases. This study with motivation has provided an autonomous understating about the weakness and strengths of NoSQL databases which are supporting the applications that are dealing with large volume of data. The study has concluded the applications dealing with BigData performs well in NoSQL environment. Still the requirement varies from solution to solution. NoSQL will be emerging as the solution for BigData analytics in future.

5.1 Future Work

As the technology has been changing rapidly, the business is more relying on analytics. The analytics is based on data and the data is growing massively. The fast processing of this data is the major need of every organization. This is forcing technology leaders to put more efforts in making the DBMS more efficient in dealing with BigData. NoSQL has fulfilled the requirement to some level. However, there are still challenges that need more efforts from DBMS vendors to get confidence of customers. The main challenges are like data security and more compatible environments to most available development systems. Hope this study will help the users to understand the different DBMS architectures, BigData and its requirements and how to deal with this by understanding the nature. And will help users to guide to make decision while choosing DBMS according to their need and DBMS capabilities.

Internet of Things Connected Wireless Sensor Networks for Smart Cities

Taher M. Ghazal, Mohammad Kamrul Hasan, Haitham M. Alzoubi, Muhammad Alshurideh, Munir Ahmad, and Syed Shehryar Akbar

Abstract The Smart City is the most complete and covered framework that meets the need of different project facets related to the smart city. It allows the cities to use the urban network and raise their economic power, unique solutions of technology, and build the most efficient systems. Smart City is the advanced developmental product of the smart economy and information technology. It relies upon wireless networking, broadcast networking, internet mesh networking, telecommunication network, and the end-to-end sensor network in which the Internet of Things (IoT) is the core. The IoT serves as the core for integrating the wide variety of sensors in each day's objects and interconnects the sensors through the internet using specific protocols for exchanging the communications and information that lead to location tracking, management, monitoring, and intelligent achievement recognition. It not only supports one city but also interconnects it with the other smart cities. This paper

aims to explore the use of IoT-based machine learning approaches that help develop a smart city.

Keywords IoT · Machine learning approaches · Smart City · Wireless sensor network

1 Introduction

Internet of Things (IoT) has been one of the leading technologies of the rapidly blooming trends within the environment and smart cities (Alshurideh et al., 2022). According to the sources, the term IoT was first defined in 1999 as the basis of infrastructure for the information society. The IoT or Internet of Things is the system that includes buildings, modern vehicles, physical devices, and the most important electronic devices that we use daily and are interconnected with each other on the internet to enable the collection and exchange of data (Ali et al., 2020). The Internet of Things allows users to control their devices through remote access across the network's already built infrastructure. It then enables the user to an effective and direct computer-controlled system implementation within the physical world (Ghazal et al., 2020). This is how it allows the rise in the precision, reliability, speed, and efficiency of the system and reduces human beings' intervention. When the IoT is. connected with the actuators and the sensors, it is converted into the cyber-physical system that is the smart city establishment (Saha et al., 2017).

From the last decade, the Internet of Things technology has played the most significant role not only in smart cities but also in smart homes, smart factories, and various smart grids, etc. The IoT operations here rely upon different sensors, video cameras, and mobile devices within the cosmopolitan city to share the data through the internet (Minoli et al., 2017). The most important assisted element of this Internet of Things (IoT) technology is the Wireless Sensor Network (WSN) which is the core of the IoT approach. The WSN has numerous sensor nodes that allow data management within the smart city circle (Ali et al., 2021). Moreover, every node of the wireless sensor network is utilized for a particular purpose and is operated with the battery's help that consumes the energy to process the data in every framework communication of smart city (Aljumah et al., 2021; MAlshurideh & Shaltoni, 2014; Alyammahi et al., 2020; Hasan et al., 2020; Shakeel et al., 2019; Sweiss et al., 2021).

At the current moment, Smart cities and Smart homes have the infrastructure that requires extensive control and monitoring of the information collected. This process has been made simple through the wireless sensor network that organizes the data through sensor nodes formulation as the self-sufficient model (Alzoubi & Aziz, 2021). Within a few years, the smart city's monitoring is extensively utilizing WSN and its use has been extended to home automation, environmental monitoring, and healthcare monitoring (Zanella et al., 2014). According to the results of a recent survey, it has been showing that the IoT technology has earned quite a significance

due to its use in the construction of smart buildings that have inheritance property to make them more sustainable and allows conservation of energy (Zygiaris, 2013).

The smart city's management framework utilizes the IoT devices used for various purposes, including designing nonstandard cooling and heating that connects the lighting which is dissimilar, and the fire safety system for a central management application to build up the standards. The IoT can change the water consumption ways in urban areas by implementing smart meters that enhance information integrity and leak detection (Ali et al., 2022). Additionally, it allows the assistance in strengthening different companies production and helps them in monitoring the loss in revenue owing to the mismanagement of time to process the information (Vlacheas et al., 2013).

Finally, complete content and organizational editing before formatting. Please take note of the following items when proofreading spelling and grammar

Furthermore, such smart meters can also be used to throw light over the technology necessary for the user by establishing real-time access to the residents. It allows monitoring of the consumer-facing gateways to collect data about water supply management and its use (Ejaz et al., 2017).

The IoT is also helpful in checking the smart traffic signals by adjusting the traffic and shifts during the holidays and keeping the cars moving without any manual interference. It allows the city authorities to collect information regarding traffic from vehicles, traffic cameras, road sensors, and monitors the accidents of traffic without any hurdle (Alzoubi et al., 2021). This puts the drivers on caution against the coordination and incidents of driving. Such types of prospective are quite infinite and the expected outcomes are generous (Sanchez et al., 2014). By taking the help of the IoT system, public transport is easily monitored and stays unobstructed. It keeps an eye on the roadblocks either due to heavy weather or the equipment breakdown (Guergov & Radwan, 2021; Khan, 2021; Mondol, 2021). It offers real-time data for the transport experts to carry out the emergency plans. It guarantees constant access to the network, providing full security and quick public transport through assisted devices and smart cameras at the transport covers and the other areas (Perera et al., 2014).

The smart cities now carry many surveillance cameras that have smart access and they monitor the control of traffic for the safety concern incidents within public streets. The software for video monitoring utilizes the services of IoT. It connects every camera of the system within the sensor to sense and measure data based on cloud-assisted IoT through computing and edge analytics using the WSN channel. The IoT's machine learning approach allows the completion of the investigation study by sending the recording of video to belonging people who can explain the issue and keep the people under protection (Talari et al., 2017).

The basic structure of the cloud-assisted wireless sensor network includes the sensor node. These sensor nodes are made up of the sensor arrays, System-On-Chip (SoC), distribution units, wireless communication interface, and the power supply (Alnuaimi et al., 2021; Alshurideh et al., 2019; AlShurideh et al., 2019; Joghee et al., 2021). The wireless communication interface of this sensor allows each node to work separately.

2 Iot-Based Wsn for Reducing Energy Consumption

There are two approaches: Hierarchical strategic making (HCSM) and the Dynamic Stochastic Optimization Technique (DSOT) system assisted by IoT that helps optimize the energy within the Wireless Sensor Network to monitor smart city to manage the data. One study has been conducted by Meenakshi et al., has combined the two approaches within the smart city for helping in reducing maintenance cost, consumption of energy (Akhtaruzzaman et al., 2020), and the environmental impact to lead towards efficiency with adoption of distinct elements within a single framework. The proposed models utilizing the two technologies achieved a better performance ratio (95.3%), higher prediction ratio (96.54%), higher reliability ratio (92.4%) in comparison with the existing approaches. The study showed better environmental impact with low cost and low consumption of emergency by combining HCSM and DSOT. Moreover, the IoT based Wireless sensor network has helped enhance network lifetime and the node battery life (Sundhari & Jaikumar, 2020).

Many other studies have utilized machine learning approaches to reduce energy consumption. According to the study conducted by Karan Nair et al., the Bluetooth Low Energy (BLE) method was utilized to optimize the consumption of energy within wireless sensor networks of IoT (Nair et al., 2015). The study utilized the hybrid topology for reducing the cost as well as consumption of energy (Alshurideh et al., 2012). It has been mentioned that the BLE approach can be used in operating utilized network topology whereas the hybridized star and mesh topologies use the multi-hop mesh topology (Alzoubi et al., 2022; Obaid, 2021).

A study carried out by Xue Wang et al. (2009) started algorithms of parallel sensor deployment optimization and the parallel particle swarm optimization (PSDO—PPSO) to mark the optimized energy tracking within WSN. The later algorithm, Parallel particle swarm optimization is utilized within-cluster head to enhance the area of coverage and reduce the power of communication within each cluster. On the other side, the former algorithm, the Parallel sensor deployment optimization algorithm, has been utilized to reduce the tracking of a target and energy consumption (Ahmed et al., 2020). Both approaches have found significant improvement in the reduction of energy consumption.

RERUM (Reliable, Resilient, and Secure IoT for Smart City) utilize framework to secure the smart city and provide security using IoT (Pöhls et al., 2014). The RERUM algorithm efficiently sensed the environment in a timely and trustworthy manner and is found best in improving the smart city's architecture. The RERUM has been integrated with IoT to enhance IoT reliability by providing security and protection to a smart city's applications (Aburayya et al., 2020; Al Batayneh et al., 2021; Al Shebli et al., 2021; Alshurideh et al., 2021; Alzoubi et al., 2020). The RERUM framework offers the application scenario and attacker model to achieve protection within a smart city.

One other method, named Media Based Surveillance system (EAMSuS) has been suggested by Vasileios et al., for the inculcation of the quick algorithm within the IoT smart city system (Memos et al., 2018). This framework provides the daily security

system that assures the most secured and light transmission of the rapid media sharing within the smart city (AlHamad et al., 2021; Alzoubi, 2021a, b; Farouk, 2021). The study achieved the low consumption of memory at IoT integrating WSN assistance in cybercrime social cloud for management of the smart city.

3 Iot Based Water Supply System

Water is the most demanding thing in the industries in urban cities due to economic sprouting. Such demands are often not met because of the short water supply and the high-water wastage culture. The water is wasted due to many reasons including majorly human error and then pipeline leakages or errors due to operator's negligence (AlHamad et al., 2022; Alzoubi & Ahmed, 2019). Water supply is quite irregular and water wastage can be managed with PLC use that can efficiently control the water supply system. Monitoring industries' water resources can properly control water theft. The supply chain of water in the urban areas is directly related to the water supply and its consumption (Joghee et al., 2020).

The water quality control distribution system must be by the water quality control, its continuity, water theft prevention, and monitoring technological processes. It must also cater to restrictions imposed concerning water availability, water tanks' storage capacity, and the wide water use (Hanaysha et al., 2021a, b). The supply system is made up of storage tanks, filtering units, pump stations, and the distribution network through dispatching units or pipelines. One structural system SCADA carries more than one PC major station that is the communication center linked through IoT with the other PLCs that are integrated within the pumping station. PLC also controls the technological process and the data collection and reports a similar operational hub for the analysis (Verma et al., 2015).

3.1 Current Water Supply System

The existing supply system is full of water wastage and theft. It is irregular but inefficient and doesn't meet the restrictions applied to it considering water tanks' storage capacity, water availability, and wide water usage. The existing system is widely dependent upon manpower and the person chose performs the job manually. Such higher dependency upon manpower makes the system highly prone to human error and is inefficient. This system allows a higher chance of personal water theft by simply attaching a house pump with a supply system and it leads to the wastage of the resources (Alzoubi & Yanamandra, 2020) This is why the system is full of unethical and irregular water distribution.

3.2 Automated Water Supply System

In the automatic supply system, the equipment is installed at the pumping station and is controlled with the help of IoT related PLC (Programmable Logical Controller) equipment that uses electrical and hydraulic parameters. The pumping function module present in PLC carries an optimization tool that allows a schedule for water distribution. It prevents water theft, creates water demanding statistics, has proximity sensors for detecting water and plans, and maintains water wastage reduction.

If the water levels detected are low, the sensor in the equipment signals PLC to initiate the pump station motor. The sensors' current status is displayed on the PC and the user graphical interface is created with SCADA software. Module for optimization helps in the reduction of water resources wastage based on machine learning algorithms (Alzoubi et al., 2019). Such algorithms reduce electrical energy cost by managing the schedule for pumping and predicting the times of engine on and off. It also helps in maintenance planning because of loading. The PLC is the central part of the automated water supply system that manages motor and pumping units and data is displayed on SCADA software in real-time for the user (Saha et al., 2017).

4 Iot Based Traffic Management System

The smart cities are now using the IoT in their traffic system. The problem of congestion and unforeseen events has been reduced by the integration of metal loops in the road that has data points that send a report about such events. The metal loop has sensors on it and street cameras allow the information transfer to major operation rooms (Alzoubi et al., 2019). The operation room staff analyze the data with Big Data Analysis's help and organize it under priority by utilizing a machine learning approach. The operation room then transmits the relevant information to the traffic lights integrated with IoT to change traffic direction away from the site of the incident or make room for other traffic in congestion. The digital display boards notify the traffic about the speed light and measures required to be taken for current road conditions (Misbahuddin et al., 2015).

The emergency vehicles are also caught in the congestion and have fatal consequences. This problem is also resolved by marking such vehicles with infrared (IR) beamers that provide IR signals. This method allows the release of signals that are taken by road cameras and they send it to the main room where the data is categorized and transmits orders to switch traffic lights immediately (Alzoubi, 2021a, 2021b; Miller, 2021).

The other most notable traffic problem is the parking space needed. It is also dealt with the IoT at the parking space. The counter for parking has sensors that show whether there is an empty parking slot. Such sensors need very little power because they are used only if any parking is offered (Mehmood et al., 2019). Moreover, they

also require less bandwidth and every sensor has its routing capabilities which allow the traveling of data to network doorway by combining such networks. This is why a network gateway is not required in parking sensor limits. The sensor network nodes will create a mesh and use the data of neighboring nodes to reach a network gateway (Alsharari, 2021). This final entrance will transfer information to a cloud application or computer and enables drivers to be seen in real-time. It allows safe streets, reduces congestion on the road and lower rates of the accident. It reduces the money spent on the roads fixation and provides an excellent boost to the economy (Saha et al., 2017).

5 Iot Based Deep Reinforcement Learning

Deep learning is the most effective machine-based learning approach which offers purpose classification, estimate, and forecast functions. Reinforcement learning provides a decision-making process and optimal control in which the software agents allow optimal actions policy learning on the states set in the environment (LeCun et al., 2015). The deep learning model is used for approximation of action values in applications where states number is quite large. The systems that merge reinforcement and deep learning are gaining considerable attention in smart cities' different applications (Ghazvini et al., 2020; Memon et al., 2020).

According to research carried out by Nemati et al., a deep reinforcement learning algorithm is used for learning the actionable policies to provide the medicines optimal dose such as heparin (Nemati et al., 2016). The researchers utilized the dosage trials sample dataset and its outcomes from various electronic medical records (Alnazer et al., 2017). They used Hidden Markov Model for the Q-network and state estimation with the neuron's two layers. The dosage agent learns the optimal policy by enhancing the entire reward, that is the overall time fraction when the patients are within the therapeutic range of activated Partial Thromboplastin Time (aPTT).

The machine-based approach is also applied in the vehicle image classification. Researchers proposed the Convolutional Neural Network (CNN) model combined with a learning component that guides where to look in car key parts image. The focused image created by the CNN model is measured with the reinforcement learning agent reward of learning identification of following visual attention part in the image. A similar effort is reported by Caicedo et al., where the focused attention on the object localization is reported through the use of a deep reinforcement learning approach (Caicedo & Lazebnik, 2015).

Li et al. have used the deep reinforcement learning approach in controlling the time of traffic signal to provide good signal time (Li et al., 2016). The proposed model has the four layers stacked auto-encoder neural network that works to estimate Q-function. The two actions defined include: Change lanes and allow other traffic to move through the intersection or stay in the current traffic lane. The reward function is represented by the difference in absolute value among opposite lanes length (Akhtar

et al., 2021; Aziz & Aftab, 2021; Mehmood, 2021). Such a result shows that the model works well than the conventional approach.

Resource management is one other task that utilizes DRL. Mao et al., formulates job scheduling problem with the various resources demand as the deep reinforcement learning procedure. In this method, the primary aim is the reduction of the slowdown of jobs. The reciprocal job duration is defined as a reward function (Mao et al., 2016). One other application where deep reinforcement learning plays the most critical role is the innate understanding of the language for text-based games. The researchers used the long short term memory networks for the training of agents with the useful text descriptions presentation along with the deep Q network for approximating the Q functions (Radwan & Farouk, 2021). Some other fields, such as energy management, have also included the DRL for improving the use of energy.

Indoor localization.

Only one group of researchers have utilized the DRL for the indoor localization services and the most promising approach found in the Relative Signal Strength (RSS) (Hasan et al., 2019; Islam et al., 2017). However, it has come up with some challenges in deployment, including device diversity and fingerprint annotation. Different machine-based learning approaches have been studied including transfer learning, SVM, neural networks, Bayesian-based filtering, and KNN. It is showed that for the Bluetooth low energy RSS fingerprinting based positioning applications, the estimation to decide that if the device is within the room provides quite reliable results (Islam et al., 2020). The researchers report the indoor based positioning results reading. They have studied three methods of accuracy including Centroid positioning, three border positioning, and the least square estimation. There are four BLE stations in the 6×8 sq. meter classroom testing area, and the LSE algorithm is applied that showed accurate positions compared with other methods (Nurelmadina et al., 2021). However, all three algorithms showed complete satisfaction (Kajioka et al., 2014).

Museums are best for utilizing BLE to offer location awareness as the building does not permit changes due to its protection rules. Researchers have established the method for making an interactive display of culture in the museum by BLE examples combined with the image recognition wearable device. This device provides localization to receive the signals of BLE for identifying the room where it is present. The device also recognizes artwork with the image processing facility. A combination of artwork identifier and closest beacon identifier is installed in the processing center to earn relevant cultural material (Al Ali, 2021; Eli, 2021; Kashif et al., 2021; Lee & Ahmed, 2021).

Wang et al. (2015) provide a system named DeepFi that uses a deep learning method for locating the indoor positions based on channel state information. This system includes the online localization and offline training phase. In the offline training stage, the researchers used deep learning for training total weights as the fingerprints upon the basis of before kept CSI. Improved localization accuracy of 20% was reported in the laboratory and living room settings. As their CSI approach use is only restricted to the WiFi network, not every network interface card supports the measurements from wide channels.

Licensed to (putm@utm.my)

Joined semi-supervised learning, deep learning, and the extreme learning machine to the unlabeled data for study classification phases and feature extraction performance for the indoor localization (Gu et al., 2015). They generated the accurate classification and higher abstract features by combining the semi-supervised learning and deep learning network in which the learning machine can raise the learning process speed. The results showed that deep learning enhances fingerprint accuracy by 1.3% for similar dataset training compared to the shallow learning method. The unlabeled data also showed a positive effect over accuracy. When the approach is compared with other methods, the approach has raised the accuracy level to 10%.

In another study conducted by Zhang et al. (2016), the group utilized the WiFi localization approach by utilizing deep neural networks (DNN). The four-layered deep learning model was utilized for the extraction of features from the WiFi RSS data (Wang et al., 2016). Within the approach, the researchers used Backpropagation and Stacked Denoising Autoencoder for the preparation phases. In the level of online positioning, DNN based location is additionally advanced by part of HMM. The experiments indicate that the neurons and hidden layers pose an effect directly upon localization accuracy. Raising the number of layers provides better results but when the network is deep, the results degrade. According to their results, when three hidden layers each layer carrying 200 neurons is used, the model showed optimum accuracy.

One other researcher has also utilized an artificial neural network for the localization of WiFi fingerprints. They used the localization approach, which used this artificial neural network and the clustering method based on affinity propagation. With help of affinity propagation clustering, the ANN model training is quick whereas memory overhead reduces. It also showed better positioning accuracy in comparison with baseline methods (Ding et al., 2013).

One other study has used the deep belief network as the localization approach based on ultra-wideband signals fingerprinting within indoor atmospheric conditions. The channel impulse response parameters were utilized to provide the dataset for the fingerprints. When the model was compared with the other methods, the DBN has shown better and improved localization accuracy (Luo & Gao, 2016). This work was further expanded by Zhang et al. (2016), where they used a deep learning model along with the regression model for learning the discriminative features automatically from wireless signals. The softmax regression algorithm is used for performing the activity recognition and device-free localization. It has been reported that the method enhances the accuracy of localization up to 10% when compared with the other methods.

6 Iot Based Underwater and Wireless Sensor Network

The IoUT is defined as the chain of smart interconnected underwater objects that are now defined as the IoT labeled underwater and wireless sensor networks (I-UWSNs). The smart objects have different sensor types such as autonomous underwater vehicles, ships, buoys, watchman nodes, etc. That is why, the I-UWSN is expected to

carry various practical applications, including monitoring the environment, disaster prevention, and underwater exploitation (Alshurideh, 2022; Cruz, 2021; T. Ghazal et al., 2021a, 2021b; Hamadneh et al., 2021a, 2021b; Shamout et al., 2022).

There are different ways of implying sensor nodes within I-UWSN for these purposes. The nodes are either deployed randomly or in the tree structure or grid form. For providing reliable communication, every sensor has communicational, computational, and intelligence capabilities in dealing with smart city environments. Different routing protocols are utilized for providing effective and reliable communication in the smart underwater environment. One of them is the self-organized underwater wireless sensor network that utilizes tree topology to deploy nodes. The dynamic address is assigned to every node for hierarchical, hop count, and identification level. For new node addition at each level, it only requires a parent address. It also resolves the problem of node isolation as well as the close loop (Alshurideh et al., 2020; Lee, Azmi, et al., 2022a, 2022b; Lee, Romzi, et al., 2022a, 2022b).

6.1 Topology Controlled Protocols

Another reliable routing protocol is the topology efficient discovery that can reduce the time overhead and accurately evaluating the reliability of the link. This protocol relies upon the time window that is allocated for transmission within which the time slot has been defined for the nodes for transmission of one or different packets.

One other work measures the reliability of the link. The model supports multiple-input multiple-output (MIMO), code division multiple access (CDMA), and Binary Phase Shift Key (BPSK) communication system. Geethu et al., used the depth-based routing protocol as mentioned above, which improves data reliability. This is an efficient approach for handling dynamic networks (Diamant et al., 2017).

7 Conclusion

Modernization is at the peak at this time as rural to the urban movement of population has been greatly observed, shaping people's lifestyle. More smart cities are in process that is expected to accommodate such a large number of figures. Several developments are undergoing in different countries regarding Smart City. The smart city is the shorthand for the technology-based services within society, which means the ICT (information and communication technology) is crucial for the implementation. The justified use of IoT based machine learning approaches has been proved valuable in various effective ways, including IoT-based WSN for reducing energy consumption. IoT based Water Supply System, IoT based traffic management System, and the IoT based Underwater and Wireless sensor network.

Machine Learning Approaches for Sustainable Cities Using Internet of Things

Taher M. Ghazal, Mohammad Kamrul Hasan, Munir Ahmad, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract As these tech-based cities continue to emerge, so do the experts dive deeper into the research on the various Internet of Things methods, and the most plausible machine learning techniques. What is Machine Learning? What role does it play in IoT-based platforms? How does it contribute to the continuous advancement of smart cities? What is IoT? How has it changed the lives of urban households residing in smart cities? How does IoT interact with machine learning to ensure more efficient cities? This research paper delves into the various existing literature in a bid to respond to these questions as effectively as possible. It looks the research that have handled issues of IoT and machine learning. The search criteria are set out in the methodology section that has inclusion and exclusion criteria for the articles considered in this paper. There is systematic evidence showing that IOT and machine learning can be used for the management of the future cities. The results suggest that IoT and machine learning are at the core of the development, maintenance, and

sustainability of smart cities. Further studies are required on how IOT can be securely used by analysis some of the security vulnerabilities faced by these systems.

Keywords IOT · Machine Learning · Digital Cities

1 Introduction

Humanity has advanced its technologies to the extent that they have become an integral part of our lives (Al Kurdi et al., 2020; Alshurideh et al., 2019; Kurdi et al., 2020). A few decades ago, the idea of having a city whose main operations and services are run and operated by modern technology seemed like something out of a sci-fi movie. Today, however, smart cities are mushrooming in different countries across the world, including Singapore, the UAE, Japan, Italy, the US, and the UK. A few decades ago, the idea of a city that utilizes different electronic sensors and methods to gather and analyze data seemed outlandish (Ismail et al., 2019). Today, however, the idea of smart cities is fast growing in popularity, as countries like Japan, the UK and Italy lead in the digitization of their City Asset Management Systems. Cities like Tokyo and Milan have been remarkably digitized in terms of traffic control, power plant operations, transportation systems, water supply networks, and waste management, and so on (Habibzadeh et al., 2019). With technology becoming not only more advanced but also accessible to the masses, smart cities are going to be part of the urban planning agenda in many countries. Since the concept of smart cities is a novel idea, there is no consensus on what the exact definition of the term 'smart city' is (). However, experts' scholars, and pundits agree on the key characteristics of smart cities. For instance, they all agree that smart city applications utilize the information and data gathered in many processes, such as the management of assets, services, and resources (Chhaya et al., 2018). In all these cities, the primary reason for the use of technology in the management of resources is to improve the quality and efficiency of services (Al Alshurideh, 2022; Alzoubi & Aziz, 2021; Batayneh et al., 2021; Hasan et al., 2022). This research paper seeks to explore the role of internet of things (IoT), electronic sensors and machine learning (ML) in the development, improvement, and maintenance of sustainable smart cities.

2 Research Methods

A. *Research Methods and Materilas*

The work was done by use of the secondary sources through a systematic review of the published papers. This method was widely used by authors lately as seen in the following paper (Ahmad et al., 2021; Al Khayyal et al., 2021; Almazrouei et al., 2021; Alshamsi et al., 2021; Aisha Alshamsi et al., 2020; AlShehhi et al., 2021; Assad & Alshurideh, 2020; Mehrez et al., 2021). Only credible papers

Licensed to (putm@utm.my)

that have been published within acceptable journals were selected for this work. Papers that have been peer reviewed and published in the IEEE journal were considered.

B. *Time Frame*

The researcher considered only the papers that have been published in the past 10 years based on their relevance to the research. The timeframe used in the references to achieve this research was to include papers published in 2010 to the once published in 2020.

C. *Search Key Words*

The key words that were considered here include IOT, Internet of Things, Machine learning, IOT architectures, learning-based algorithms, IOT security, Secure communication, and IOT taxonomy.

D. *Inclusion Criteria*

The materials must be available within the IEEE websites. The information must be available within three clicks and that was to ensure that the selected website meets the useability criteria. The top five websites when searching using the phrases selected and that was to ensure the researcher uses the once that are most visited. Work from peer reviewed journals to ensure high quality of the articles selected.

E. *Exclusion Criteria*

The type of website where the materials was located was a major exclusion criterion. Websites that do not support academics content, are political in nature, supported by organizations with biases were excluded from the list and the researcher would not select articles based on those sites. The sponsored websites as well as advertisement were excluded when it comes to website selection. The website providers can make payments to make their site appear within the search engines results, the above has a potential of biases hence must be excluded in the website selection. Duplicate work was excluded to reduce the time needed to carry out the research.

F. *Research Queations*

i. What is the role of internet of things and electronic census in the development and maintenance of smart cities?
ii. What role do the different machine learning approaches play in the improvement of the effectiveness of smart City applications?
iii. How will the internet of things revolutionize the lives of the thousands of households living in smart cities?

3 Literature Review

Broadly, the term smart city refers to an urban center or area that applies different electronic sensors and methods to gather data from devices, buildings, citizens, and

city assets (Sayakkara et al., 2019). These smart city applications analyze such data and use it to ensure more efficient and timely services, and real-time responses to various arising issues. In a smart city, the applications based on internet of things (IoT) gather and process data, which is used in the management and monitoring of information systems (IS), libraries, schools' hospitals, services, traffic transportation systems, water supply network, waste management systems, power plants, crime detection, and other community services (Shin, 2019). In smart cities, the internet of things (IoT) offers a platform of interaction, where the city authorities can directly interact with the residents, as well as the city infrastructure. Specifically, the platform on which smart cities run is based on the interaction between information and technology (Kortesniemi et al., 2019). In other words, in smart cities, information communication technology (ICT) is applied in the enhancement of performance, quality and interactivity of all urban services (Park et al., 2018). It is also used as a tool for controlling resource consumption and reducing costs, by improving the contact between the citizenry and the authorities. In smart cities the smart applications are used in managing the urban flows and sharing real-time responses.

Infrastructure Development, while these variables may vary from one context to another, there are some primary defining ones, including infrastructure development. Smart cities prioritize the optimization of infrastructural development to improve and support social, economic, cultural and urban development (Hahm et al., 2016). This explains why smart cities are associated with improved communication channels to connect such essential services as entertainment, housing, business, and telecommunications, among others. All these services can be linked through advanced technologies that enable a city to develop and grow.

Competitive Environment**:** Smart cities endeavor to create a highly competitive environment through information and communication technologies (ICT) and planning with the aim to expand urban sectors, which enhances the growth and development of businesses and the enhancement of the city's social economic performance (Park et al., 2018). In addition to promoting healthy competition, smart cities are sustainable and inclusive because their main strategic element is to achieve sustainability to find participation drivers, use renewable energies, and create better consumption habits, all with the aim to preserve the natural resources and to take care of the urban environment.

Protection and safety for the residents and ICT incorporation. The peace of mind of the residents goes together with new and emerging technologies. Security cameras are located all over the urban territory to ensure that the people's lives are safeguarded (Bairagi et al., 2016). These cameras and surveillance systems are accompanied by superior public lighting, and an effective system of surveillance (Ismagilova et al., 2020). Additionally, smart city authorities run processes for identity verification to minimize irregularities in the various dealings and settings (Alzoubi et al., 2021) Most importantly, the city residents get to receive instant responses to emergency calls regarding any accidents or domestic incidents, or anything related to the health of the citizens.

Ecological concerns: In the modern world, the environment keeps suffering due to unlimited human activity and other factors, which may be directly associated

with health hazards. Smart cities have effective environmental leaders, whose main concern is to create recycling and ecological mechanisms to enhance the quality of air and the general surrounding, and to protect them from further contamination (Rayan et al., 2019). One of the main aims of the smart cities, therefore, is to reduce the carbon footprint of the entire city to support its sustainability goals. When polluting gases are reduced, green spaces such as public parks, will be better preserved and less contaminated (Kouliaridis et al., 2020). As mentioned earlier, recycling is one of the citizens' daily routines. Smart cities have minimal or no problems associated with water collection and supply.

Participation and Open Innovative Processes. Overall, it has been established that smart cities use Information Communication Technologies (ICT) to adapt and innovate and increase their capacity to respond more promptly and effectively to the ever changing circumstances of the city by enhancing its intelligence (Erdin et al., 2015). Also, these cities use ICT to engage and interact effectively with the residents in decision-making and governance using a participation and open innovation processes. They also engage with the local people with the aim to improve the city's collective intelligence, as well as that of its institutions and organizations through a governance (Kreso et al., 2021). Here, the emphasis is on the participation of citizens and the core design of the cities with government and public efforts working together (Jamshidi et al., 2020). Lastly, smart cities apply ICT to ensure more efficient utilization of public infrastructure, including built environments, roads, and other physical assets, through data analytics and artificial intelligence (AI) to support a robust economic, cultural, and social development.

4 The Internet of Things (IoT) in Smart City Development and Maintenance

The internet of things (IoT), a key component of smart cities, refers to the interconnectivity of various physical devices through an internet platform. The interconnected digital devices can be controlled remotely using different telecommunication devices, including mobile phones (Wang et al., 2016). The internet of things (IoT), in more straight-forward terms, is the connection between diverse physical devices linked to and in constant communication with each other over an online based platform. A good example of a common application of internet of things (IoT) is the collection and analysis of weather fluctuations and changes (Zou & Wang, 2016). One of the most significant contributions of the internet of things to the development and improvement of smart cities is that it offers low-cost management of assets. For instance, the use of internet of things (IoT) eliminates or mitigates the need for human labor in various services (Rabbachin et al., 2015). Also, the internet of things offers fresh insights that can further revolutionize how the city functions. Research has demonstrated that the internet of things (IoT), through its intricate data analysis capabilities, has been able to unveil new insights such as establishing relationship

between industrial production and the weather (Almeida et al., 2015). Such insights and relationships demonstrate the ability of internet of things (IoT) and other aspects of technology to improve how cities function.

4.1 Smart Energy

One of the most critical areas of research that is related to the internet of things (IoT) is smart energy because it is important in ensuring the reduction of overall power consumption. Smart energy provides high quality and highly affordable ecologically friendly energy (Gnad et al., 2019). The concept of smart energy includes a broad multiplicity of energy and operational measures, which include smart leak monitoring, smart energy applications, and renewable energy resources, and so on (Fernando et al., 2020) Deploying a smart energy grid or using smart energy, implies a critical re-engineering of the services within the city. The smart energy grid is one of the most critical applications of the concept (Sayakkara et al., 2019). The smart energy grid includes a broad diversity of high-speed time series data in the monitoring of devices. To manage this kind of data, experts brought in a method to analyze and manage the time series information so as to make them organized on demand (Abawajy et al., 2018). Additionally, the smart energy grid is expected to grow in complexity into the foreseeable future(Ahmed et al., 2021; Al Naqbia et al., 2020; Al Suwaidi et al., 2021; Almaazmi et al., 2020). Therefore, experts propose a simulation system for testing the novel concepts and optimizing approaches and forecasting or projecting future consumption. Another critical application of smart energy grids is seen in leak monitoring systems (AlHamad et al., 2022; Alzoubi et al., 2022; Shamout et al., 2022). The main function of these systems is to model a gas or water management system that has the capacity to optimize the consumption of energy resources (Kaur & Sharma, 2015).

4.2 Smart Energy

Mobility is one of the most essential and critical aspects of any urban area. Through the internet of things (IoT) city authorities can enhance the quality of life for people. Smart mobility can be evaluated from three dimensions. The first dimension is traffic control. The optimization of the flow of traffic through the analysis of sensor data is one of the key elements of the city's mobility (Hosseinian Far et al., 2020) For effective control of traffic, data will be gathered from road cameras, cars, and counter sensors installed on the city's roads. The second dimension of smart mobility in cities is the use of autonomous vehicles. The internet of things (IoT) is expected to have numerous effects on how cars are operated. The most critical issue is about how the internet of things can enhance other vehicle services (Alzoubi et al., 2020a, 2020b). Wireless connections and internet of things (IoT) sensors make it easy to monitor the

performance of vehicles and to create self-driving vehicles. With the data gathered from the automobiles, the most congested roads can be predicted enabling the city and traffic authorities to make decisions that will significantly decrease congestion on the popular roads (Alshurideh et al., 2022; Lee, Azmi, et al., 2022a, 2022b; Lee, Romzi, et al., 2022a, 2022b). Self-driving automobiles can enhance the safety of passengers because they have the capacity to monitor and detect the driving of other motorists on the road (Zhang et al., 2017).

Regarding smart mobility, the last dimension is that off public transportation. The internet of things (IoT) can improve the system of public transportation by offering precise routing and location information to a city's smart system of transportation (Din et al., 2019). Also, it has the capacity to assist the city's passengers in making more informed decisions in their schedules, and to decrease the amount of time wasted. There are various perspectives on how to construct smart city public transportation systems (Joghee et al., 2020). The transportation systems in smart cities need to manage various types of data, like traffic and vehicle location data (Alhamad et al., 2021; Ali et al., 2022; Hanaysha et al., et al., 2021). Public transportation systems in smart cities should be designed in such a way that they are real-time oriented. This will help them make more informed decisions and prepare appropriate responses in real time. Also, they can use historical data analysis through the various machine learning methods (Gupta & Gupta, 2018).

4.3 Smart Citizens

The use of internet of things in smart cities covers a wide range of aspects in human lives, including the monitoring of crimes, the management of the environment, as well as the monitoring of social and public health (Park, 2021) All these components are fundamental and vital for human life within the urban settings. Additionally, making significant progress in technology is sure to improve the security status of the city (Alzoubi & Ahmed, 2019; Alzoubi & Yanamandra, 2020). Close monitoring and surveillance dedicated to crime will also have significant contribution to the citizens overall public and social health (Alnazer et al., 2017).

4.4 Urban Planning

Urban planning is yet another critical feature in smart cities because it helps them attain long-term goals and decisions. Since the environment and the city play critical roles in human life, achieving quality decisions is critical in this context. By Gathering data from citizens, devices, and the various sources in the city, it becomes possible to make effective decisions regarding the city's future. Urban planning refers to the process of making decisions that affect the city's functionality, design, and infrastructure. The internet of things (IoT) is highly resourceful in this context because

through the smart analysis of a cities data the authorities can predict those parts of the city that will be more populated or crowded in the foreseeable future and to come up with solutions for the possible problems (Alzoubi & Aziz, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021). A combination of effective urban planning and the internet of things (IoT) will have a major impact on planning future improvements to infrastructure (Syam & Sharma, 2018).

5 Machine Learning Approaches, IoT and Data Analytics for Smart Cities

Machine learning (ML) is one of the most celebrated modern innovations that has assisted human beings enhance not only numerous professional and industrial processes, but also improve everyday living. However, the term 'machine learning' has not been assigned universally accepted definition, but it is generally agreed that machine learning is a subclass of the broader field of artificial intelligence, which concerns itself with using statistical methods to create intelligent computer systems with the capacity to learn from historical data and databases. Presently, machine learning (ML) is widely applied in diverse industries and fields. For instance, machine learning is used in medical diagnosis, classification, prediction, image processing, regression, learning, and association and so on (Ali et al., 2021a, 2021b; Alnuaimi et al., 2021; Alzoubi et al., 2021). The intelligent computer systems based on machine learning algorithms have the immense capacity to learn from historical experiences and past data without supervision. Machine learning applications produce results and make projections based on past experiences of similar nature. Machine learning is considered one of the most remarkable breakthroughs in the broader spectrum of artificial intelligence. While machine learning comes with some frightening implications, its applications are some of the ways through which technology can ultimately improve human lives.

5.1 Machine Learning Internet of Things and Data Analytics for Smart Cities

The transformation of big data analytics, along with the internet of things (IoT) machine learning (ML) has helped various places around the world realized the idea of a Smart City. The idea underlying the concept of a smart city is to ensure effective rendering of services to the citizens and people dwelling in the city through advanced data analytics and technologies (Sharma & Arya, 2015). In this regard, the data analytics focuses on the data gathered by the various internet of things (IoT) systems and electronic sensors. The extent to which a city is smart can be determined by initiatives on environmental issues, technology-driven infrastructure, smart public

transport systems, and the utilization of technology in reduction of crimes, and the use of technology to manage wastes and water, and so on (Alshurideh et al., 2020; Alzoubi et al., 2020a, 2020b; Ghazal et al., 2021). In the context of smart cities, one of the machine learning (ML) techniques that is considered highly effective in gaining insights from the various gathered data is deep learning. Deep learning can be used to make sense of the patterns from the data collected, and to predict or to classify the data.

With rapid and widespread urbanization efforts and the unprecedented rates of population growth in cities, smart cities are becoming highly favored options, as they can offer a better lifestyle to the citizens and residents by applying innovative technological advancements. The smart cities highly depend on actuators and sensors to gather large volumes of information and data. This data is analyzed and applied in the extraction of potentially beneficial decision-making information. However, because of some limited capacities, only a small percentage of the data collected in the smart city is used because of various reasons (Mehmood et al., 2019). For instance, the data generated or collected may be highly diverse and noisy. Machine learning and artificial intelligence are known for their capacity to handle high volumes of error-prone or messy data. Advanced machine learning applies algorithms that can exploit the availability of both labelled and unlabeled data to provide effective personalized services and resource management in smart cities. The processed data or information can be used in numerous daily applications including prevention of pollution, management of healthcare, and designation of efficient transportation, stronger security measures, and better management of energy (Aziz & Aftab, 2021; Cruz, 2021; Radwan & Farouk, 2021). Academia, research and practice have demonstrated that the application of machine learning (ML) in the leveraging of internet of things (IoT-based techniques) have consistently proven to be more sensitive, accurate, cost-effective, and timesaving (Malche, 2019).

Machine learning has proven to be a proficient and powerful technology data has revolutionized how big data is analyzed. In smart cities, huge amounts of data are gathered from smart devices and sensors around the city (Al-Fuqaha, 2018). Deep learning and machine learning collectively have the potential to significantly enhance the quality of life through the application of diverse domains (Al Ali, 2021; Alzoubi, 2021a; Lee & Ahmed, 2021). Deep studies have been and are still being done in this area to reveal and explore more useful applications of deep and machine learning. Machine learning provides the computer systems the ability to learn automatically by accessing information and data provided and applying it in its self-learning process. This gives the computer systems and the internet of things (IoT) by extension, the ability to improve from experience without any programming efforts by humans (Akhtar et al., 2021; Eli, 2021; Kashif et al., 2021). Coined by Arthur Samuel in 1959, the term ‘machine learning’ has become a central area of focus in the planning of large smart cities as urbanization keeps growing by the day. With the data overload from the smart devices and sensors in smart cities individual reviewing may not be possible which makes it necessary to have a system that can not only learn but improve by itself from historical experiences (Napiah et al., 2018).

Machine learning requires a dynamic general and continuous learning mechanism as the smart city undergoes evolution in its operating environments and applications. Therefore, there is a need to explore the capacity and potential of machine learning and large amounts of data in the creation of personalized services in smart cities (Chilamkurti, 2018). In a nutshell, machine learning, and deep learning specifically play a critical role in ensuring improved efficiency in smart cities. The concept of machine learning is undergoing rapid evolution as an outcome of the improvement of the various algorithms, improved computer networks, upgraded approaches of capturing data, innovative sensors, and heightened interest in customization (Elhoseny, 2018). The primary objective of machine learning algorithms is to effectively interpret the information and data that has never been observed before, and to make projections beyond the samples used in training, such as real-life data (Alsharari, 2021; Mehmood, 2021; Miller, 2021). The precision and accuracy of the machine learning algorithms can be further improved by increasing the volume of training data given so as to strengthen or to reinforce their learning capacities.

5.2 Machine Learning Approaches for Smart Cities

Machine learning approaches are widely categorized into three main classes, according to the nature of the learning feedback or signal available in a system of learning. These three categories include the supervised, unsupervised, and semi-supervised approaches. The semi-supervised approaches refer to a combination of the supervised and unsupervised types. The semi-supervised algorithm works by applying huge amounts of input data with only a small section of it labelled as 'training data.' In a similar approach, referred to as reinforcement, learning offers feedback, which guides the computer programs in its interactions with a highly dynamic environment. The unsupervised algorithms work through self-organizing and recognizing concealed patterns in input data that is unlabeled to form neural networks (NN) through unsupervised algorithms of machine learning (Guergov & Radwan, 2021; Khan, 2021; Mondol, 2021). It has the capacity to process data and information without any error signal to assess and evaluate possible solutions. Unsupervised learning is important because to annotate large sets of data like speech recognition can be quite expensive and cannot be evaluated. Clustering is a classic example of unsupervised learning (Alzoubi, 2021b; Farouk, 2021; Obaid, 2021).

6 Performance Evaluation

A detailed review of the existing literature suggests that IoT and artificial intelligence are some of the most powerful forces on the list of technologies revolutionizing the modern idea of a city. Particularly, research studies suggest that machine learning is a critical component in the IoT program, when a city wants to achieve better

communication technology. Among others, the key findings from the research papers reviewed here include:

i. From Kortesniemi et al. (2019) the work characterized the machine learning problem in cognitive radios and showed the value of artificial intelligence when it comes to attaining real cognitive commination systems. The machine must be well advanced to levels where they can aid in decision making. The decision levels algorithm developed for the machine will help in classifying different observation models. It possible to have unsupervised algorithms that can be secure for the IOT. The challenges experienced within the learning machines algorithms should be known and addressed.
ii. Overall, the application of machine learning in the efforts to leverage IoT based methods, have consistently demonstrated to be more time saving, accurate, cost-effective and precise (Ismail et al., 2019). The ability of machine learning to process heavy amounts of data at once and with remarkable accuracy makes it a primary component in successful IoT based systems in smart cities. Particularly, the findings of most scholarly research studies suggest that busy systems as traffic and transportation systems need superior machine learning approaches because accidents can be fatal and costly.
iii. Research findings of Chhaya et al. (2018) study suggested that one of the most important aspect of machine learning is the unique ability to process huge volumes of data, and to allow machines to learn from past events. By so doing, machine learning gives researchers the opportunity to reevaluate standards in several sectors hence promoting
iv. Continuous improvement.
v. The internet of things will offer remarkable contribution on the developments of smart cities and maintenance from references (Wang et al., 2016; Zou & Wang, 2016). IOT will offer connections between the physical devices that are linked to it and the online platforms that are used for city planning and maintenance. The internet of things is now used in smart city systems such as those for the collection and analysis of weather and that has a potential to other areas such as city health status.
vi. Machine learning applications can be adopted to special wire sensor networks which can be incorporated in the management of smart cities (Elhoseny, 2018). It will be possible to have special networks that can be used for the transformation of the big data analytics together with internet of things and machine learning. Once integrated the smart cities can benefit through effective rendering of services to the residents. Data would be gathered by different IOTs and machine learning will offer the computer systems the capabilities to learn automatically and apply the experiences within the learning process of managing the cities. They will be continuous improvements on the way the cities are going to run and managed.
vii. From Syam and Sharma (2018), IOT facilitates integration between physical objects and sensors that are responsible for providing commination between them without having any human interventions. Despite their good algorithms

they are faced with different security vulnerabilities that should be addressed to have temper proof systems. Lightweight schemes are the most favored systems to solve the security challenges of IOT. Other new measures should be sought since the security vulnerabilities keep on changing.

viii. Also, Sharma and Arya (2015), findings firmly suggest that one of the sectors that heavily relies on IoT and machine intelligence is healthcare. In addition to healthcare, machine learning improves the quality of life by revolutionizing transport, security, law enforcement and crime management.

ix. From Nia (2021), machine learning, and the internet of things change how people respond to disasters and emergencies by gathering analyzing and disseminating important decision-making information. IOT and machine learning are tools that can be incorporated towards managing the cities security systems.

x. Based on the findings from Bairagi et al. (2016), IoT and Machine intelligence will alter the socio-political climate of the smart cities because the relationship between the government and the citizenry will be strengthened by inclusive and participatory decision making. The IOT will rely on information faster and Machine learning utilized to make the required analytics.

7 Conclusion

In conclusion, IoT, electronic sensors and machine learning are revolutionizing our idea of mega smart cities. These AI-based concepts have revolutionized how people go about their everyday lives. As smart cities continue to emerge, the word is going to change in a broad number of ways. First, ICT is going to reduce the number of people needed in the running of such services as water and waste management, security and surveillance, transport sectors, traffic management and industrial operations, among others. This paper has effectively responded to the research questions because it has demonstrated the centrality of IoT, electronic sensors and machine learning in the designing and running of smart cities, such as Tokyo. These concepts contribute immensely to the fast and reliable conveyance of information and data among the relevant people and departments, for effective and well-informed decision making. Machine learning's biggest contributions include its almost limitless capacity to gather and process multiple volumes of data at remarkable speeds, and the reality that it allows machine to learn and contribute to the improvement of the city systems. Overall, IoT and Machine learning are gradually becoming seamlessly interweaved with the everyday lives of the citizens living in smart cities.

handling Big Data, is now of great concern. The acquired information is computationally expensive to process in terms of efficiency and runtime. Detection of suspicious activities on decentralized servers, generating and computing massive data streams requires time. Moreover, several stakeholders should be engaged to train the heterogenous malware data streams in the level of service application. Small experiments can be performed on the functionality of Batch ML on IoT datasets with available heap size resources. Among these candidate datasets, a little contribution has been already represented on the Mirai Attack. This research aims at the study of Data Stream Mining algorithms. Owing to the accuracy and interferences of the measurement, these algorithms are able to handle the non-hierarchical and unbalanced datasets similar to the Mirai Attacks. No single method can solely improve these critical standpoints. Thus, an Ensemble technique should be implemented. According to our study, a pool of meta or selective classifiers that interact based on the temporal Data Mining swiftly can outperform others. The maintainability and security concerns of such applications can be best fulfilled in meta-heuristics with the one-time scanning network approach for the recognition of the most frequent attacking pattern with the on-the-fly scheme. These are implemented in Create, Read, Update and Delete (CRUD) operations of the Big Data Systems.

1 Introduction

The human mind is routinely sensing the reality of things through five sense organs. However, none of these senses can singularly result in the perception of objects in contexts such as planning, investigating, composing music, playing chess, or journalism while a mystic unconscious mind is incorporated in the aggregation of all those senses and builds the perception of the objects (Akhtar et al., 2021; Al Ali, 2021; AlHamad et al., 2021, 2022; Ali et al., 2021). Perhaps the human mind's neurons, evolving over thousands of decades, are capable of tree mining and associative rule reasoning ability. How a learning machine can similarly train from high volume streams, processed with distributed structure in parallel with other measurements, is an unanswered question. The combination of state-of-the-art sensor technology with

IoT in which is rapidly penetrating human life is inevitable. In 2020, the number of connected things on the Internet exceeded 50 billion. Data Streams are typically dynamic such as time-series format and their memory usage and processing time are restricted to hardware and database servers' limitations (Ali et al., 2022; Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2022). Regarding the unbalance attribute, high missing and noisy percentual, the dataset exhibits a low ability for the computation therefore any structuring or classification for such data should be updated in on-the-sky responding time. Sensor Network characteristics are shown in Table 1.

Nowadays, tread events can be handled when more sensor nodes are connected through cluster-based routings. Therefore, there are principal protocols in the field of planning Wireless Sensors. These protocols are better in energy saving, result in a longer network lifecycle and higher network efficiency. Wireless sensors that are small, adoptable, cost-effective, energy-efficient, and secure play an important role in the management of security, monitoring, and privacy issues of IoT Systems (Alshurideh et al., 2020; Ali Alzoubi, 2021; Alzoubi, 2021a; H Alzoubi et al., 2020, 2022; Ghazal et al., 2021). Since sensors are relatively cheap and small therefore there is a restriction on their hardware resources like memory and CPU to process the detection log files and sensors should maintain the energy consumption and needed to operate on the simplest form of processors. Furthermore, the environment doesn't always allow us to have a constant sensor functionality in comparison to the wired sensor networks. Hence, there is an essentiality for the implementation of real-time Intrusion Detection Systems on groups with the least cost and energy consumption, which is working on the basis of a decentralized detection approach.

The importance of security is not hidden from any stakeholder on the Internet of Things. Today Artificial Intelligence is handling security more accurately and professionally. It fills the gaps of Internet of Things Systems against the form of robots that hijack their information for their own sake into other levels and increase the risk of stakeholders. Wireless Sensor Networks are working in hostile environments where fraud issues can easily happen in the physical layer (Sensor). IoT systems in

smart cities especially in applications such as electric power, health care systems, financial sector, and environmental disaster prediction (flood, tornado) can be the purpose of the attacker according to the level of damage they tend to bring to the public good. Similar to the aspect of term Internet advertisement and ransomware Web usage, in the Internet of Things Systems, malicious botnets are now threatening the privacy of the Users. Distributed Denial of Service (DDoS) attack is known as the most serious attack that transmits lots of data by taking up the bandwidth traffic. According to the reports published in the course of the pandemic on the DDoS attacks, there are 929,000 DDoS attacks in a 31-day (April–May 2020) with more than 2.8 TBPS bandwidth, and more than a thousand botnets are disrupting legitimate services like Amazon, eBay, Netflix, etc. or even public services (Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020, 2021). Unlike network layer (DoS (that occurs in the hardware such as I/O or Sockets, in the Distributed DoS (DDoS) attacks are performed from a legitimate request usually by a HTTP get command on a machined network. In contexts like Smart Cities and the Internet of Things, a middle-ware layer can be constructed to partly solve the above issue with located features' API architecture by semantic analysis of the code. It can be further extended not only by the Application level but also from the viewpoint of repository level which migrates the central cloud framework to Distributed Clouds (Fog Computing). An example of the Fog nodes clustering based on the Actors of different layer and applications are shown in Fig. 1.

A survey was conducted on the cyber criminal's behaviors and intension in order to develop a framework for IoT devices, applications, and Big Data Systems that require immediate awareness such as healthcare and public and financial services, who are threatened and lost control of their contents. The functional blocks and maps send the clustering results to actors by the implementation of the actors' model. This allows the users to contribute to the holistic and work for the sake of their prenatal network layers in the IoT. The attacks on the health, financial and public sector were reported that with the increasing demand on the performance of data mining the less traffic between the end cloud and the user can be gained. Table 2 presents the most important form of security and breach of the Internet of Things framework.

In our proposed framework a packet payload has been utilized to discover if an activity is benign or attacked based on a network packet. After the training of the classification model (Intrusive user experiment) with attributes (IP and MAC address), Channel, Socket characteristics were imported to the data stream mining ensemble of different algorithms. A simulation was performed with density and weight-based ensemble in the MOA (Massive Online Analysis) software. The results were compared with the accuracy and false-positive rates for the batch dataset of the DoS attack. Secondly, detection of a network intrusion in the server even at the Application level by the implementation of a Test Case scenario is elaborated. Here, different CRUD operations, feature locations are acting on a defined number of Test Cases, although applied filtering, high level of penetration, and big sample size stand as a generalized and wide strict rule for the Internet of Things.

The paper is organized as follows. Section 2 provides a summary of the results and research pathway of the recent publications and introduce the implementation of Data Stream Mining and IoT systems in DDoS attacks of different applications. Section 3 presents the dataset and the designed experiment with the proposed Ensemble. Section 4 presents the results of the Mirai case study and the accompanying risk on the CRUD processes. Section 5 concludes idea of each of the Ensemble techniques and the future research for smart cities.

2 Literature Review

The application layer DDoS Intrusion Detection form a new trend in Industry and professional issues and are now of great interest scientifically and is practiced in many algorithms such as Markov-based wavelet singularities detection model, Flexibility induced Random Walk Graphs, and Novel method Bayes-based Entropy minimization Clustering in temporal data Mining. Temporal effects caused lots of computational costs and should not be ignored as well as other effects. One main advancement for the prediction of the Big Data System of IoT system was the application of very fast algorithms for the implementation in the AI, especially in the networking and service development cases which need the fulfillment of the requirement of security planning. Full implementation can be explained according to the CENELEC Standards procedure of software development which includes, System planning, software architecture planning, and Coding, Software Interface planning and static

testing, software/hardware compatibility, and dynamic testing like Black-Box, simulators, and documentation. IoT systems' inventions always extending to new tools and methods and in between the usage of data science in the area of mechanical, civil and mechatronics engineering are among the most wanted specialization in the field of technological development such as smart aircraft and satellites, high-speed hyperloop driverless System, smart cities and health care system. The very fast algorithms can also be implemented at best for smart cities for usages such as indoor application, edge computing, subways surveillances systems, smart commercial buildings, and also for the specialized sustainability measures where mounting of the temperature, humidity, and pollution level can be of great importance (Aziz & Aftab, 2021; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021; Hamadneh et al., 2021; Nuseir et al., 2021).

The field of Stream Data Mining is very wide and it has become a very challenging task among computer science researchers. Even though Data Stream Mining is thoroughly analyzed in the literature, the concept of the method can be defined by major steps. It is started by the splitting of the incoming data into windows frame with fixed-width according to the hourly, daily, etc. bases. Then the summary of each window is used as input for the local clustering of the time-series. Two clustering algorithms are performed in this case one for the local clustering and the other one for the comparison and building of the proximity matrix. From this step, the data that is updated in an online manner is used for the clustering of the time-series, which is required by the users. Figure 2 is demonstrating the mining path in the data stream (Al Guergov & Radwan, 2021; Hamadneh et al., 2021a, 2021b; Hanaysha et al., 2021a, 2021b; Joghee et al., 2020; Salloum et al., 2020; Shebli et al., 2021).

According to the proposed diagram Data Stream Mining requires clustering (micro clustering) according to one of the following summarizations' algorithms: Growing

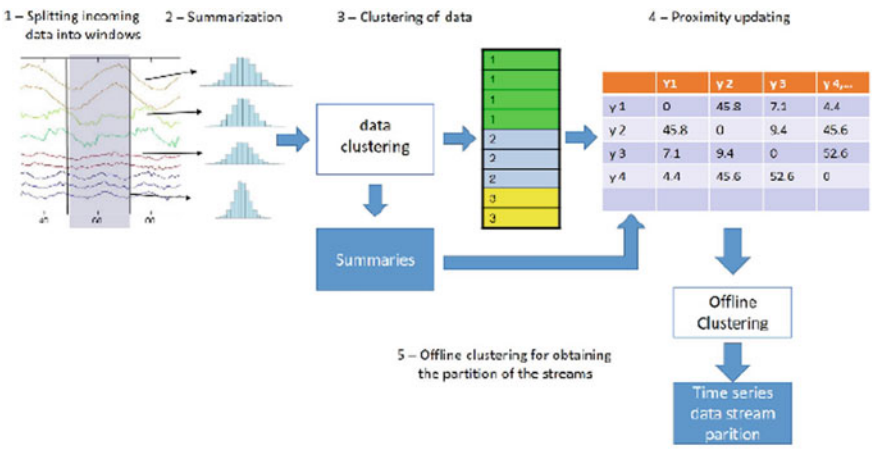

Fig. 2 Analyzing work plan

Neural Gas, hierarchical, Partitioning, density-based, and grid-based streaming method.

In a context such as Smart Cities, the memory and computational resources of the data streams are constrained by the hardware and software requirements, while the attractivity of the very fast decision tree is its temporal processing part of the dataset. The field of Stream Data Mining is very wide and it has become a very challenging task among computer science researchers. Detection of patterns, faulty and noisy data has been also widely discussed for the identification of patterns, planning of the IoT system safety, data repository, and security. There are normally two steps of cached-based meta- classification and main classification which can be organized in the mode. The principal idea behind the very fast decision trees (or Forest) is that it learns on the total macro view of an object and receive the knowledge from each singular Tree. The applications can be further extended in Jigsaw puzzles, Electrocardiogram Patterns and dynamic stock Market Data.

Incrementally Optimized Very Fast Decision Forest as an extension to the VFDT is reviewed on the Simon Fong Work on temporal data. Their work was mainly focusing on the iOVDFT algorithm and was published in two papers in 2017 and in 2018. This method was implemented to better evaluate the effect of the equal timeframe windows over a single day measurement of the sensors. After the implementation of the required MOA (Massive Online Analysis) component the chosen dataset on Intel Research Lab in Berkeley was evaluated (Part of the Weka Application). There are normally two steps of cached-based meta- classification and main classification which can be organized in the colorful visualization mode. Figure 3 represents the output of the Clustering module in two dimensions by MOA.

Obviously, for Sensor datasets, some attributes are not usually normalized, and their final cluster cannot visually distinguish as the above Generator based Visualization. This framework has no automatic way of normalizing the data and for this reason, the managing of the sensor from the data source is necessary when data classification is conducted using iOVDFT. But this makes it possible to look at the concept of Drift visually for the detection of the anomalies or abrupt changes in the Stream. It is anyhow possible to split the attribute with a supervised filter through different algorithms like Entropy and Gain ratio or using Weka classifiers for the attribute selection. Sometimes, MOA algorithm is used in the iOVDFT such as Tree Clustering, Randomized RBF, or KM Stream partitioning. However, the choice of an algorithm should be experimented with and must consider the complexity of the case. This transformation was also utilized in the DBSCAN, in a density-based streaming of the time-series. The chosen dataset for this case study has been set to measure the indoor environmental parameters based on the network of sensors positioned at the Intel Berkeley Research lab (Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b). Several sensors are measuring the temperature, humidity, and light in the indoor environment and broadcast their data to the Raspberry pi Board for recording and processing. The sensors were covered the public area of the Lab and according to the following figure, Server Rack and Lab area, as well as rooms, were excluded from the measurements. The data communication is performed by the LAN network. The recorded temperature by each sensor has been analyzed by

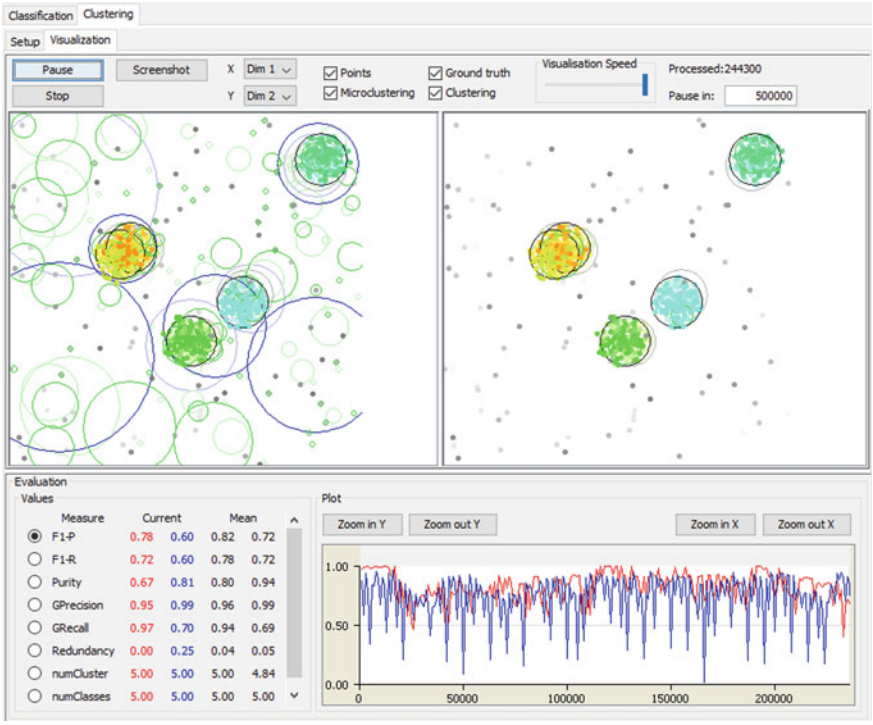

Fig. 3 RBF cluster generator visualization on MOA with 5 distinct colorful partitions

testing a set of 54 time-series each one made by 65,000 observations. In this dataset, epoch number was a sequence increasing monotones of each sensor i.e., readings from a similar number of epochs were read at the same time from different sensors. There is some missing value in both epochs regarding power blackout and missing mote (Sensors) dataset because of certain sensor malfunctions or dead battery. The measurements in the case study are in the unit of degrees Celsius for the temperature, the humidity was corrected in relation to the temperature, and light was measured in Lux. Voltage in volts, between 2 and 3 supplying by a lithium-ion battery and the changes of battery voltage is strongly correlated with temperature. One important achievement in the iOVFDT method is the consideration of the temporal aspects during the pattern recognition and in the prediction of similarity between time-series the ordering of the events was not neglected. Some time series could contain rich information such as hidden patterns that seemed to be treated in an unordered manner and were outranked. The same author has compared the CPU runtime of important data mining methods namely in another article.

From the above results (Fig. 4) it is clear for sake of disposition of distortion and latency there is a need to perform stream mining in a two-step data stream mining algorithm. The cached-based meta-classifier stands for the sliding window are updated in the process of knowledge discovery, and the second (main) classifier

is to verify whether the data is nominated for the knowledge discovery. The sliding timeframe should be adjusted in a way that covers the rate of data change for the prediction of the best sensor. Incremental learning, like IBK, is the better choice for the meta-classifier compared to the ones that need to search the full database—it is not efficient and the models cannot predict but with sufficient power, proper clustering can be achieved. They have also concluded how one HT (Hoeffding Tree) can be improved with the noise and misclassified recall along their CPU Time. The main limitation of this work is the restriction of the data stream in one single data stream in full processing. This means that if the even and odd measurements should be treated in different ways, the method should be adopted from the multiple data stream to discover the subsequences in the sequences of the multiple time series in single/parallel for the cashed-based classification. In a signaling study approach, acceleration and energy of the particles are given parameters of the partial differential equation model, thus, the system time and discrete frequency cycle are important. From the continuous segmentation like windowing, segmentation and discretizing representation like self-organizing map, signal shape language and transformation types like Laplace and Kalman filter or Fast Fourier Transform would be implemented which are out of the scope of Data Mining (Mehmood, 2021; Mehmood et al., 2019; Miller, 2021; Mondol, 2021; Obaid, 2021).

In research, published in relation to RGCE (Realistic Global Cyber Environment), a network traffic dataset was selected for the simulation of real-time DDoS attacks. RGCE is a project-based in Finland for simulation of the closed Internet environment provided by the RGCE project. One of the RGCE services is to provide real IP addresses and geolocations. While the virtual server operating on normal traffic with

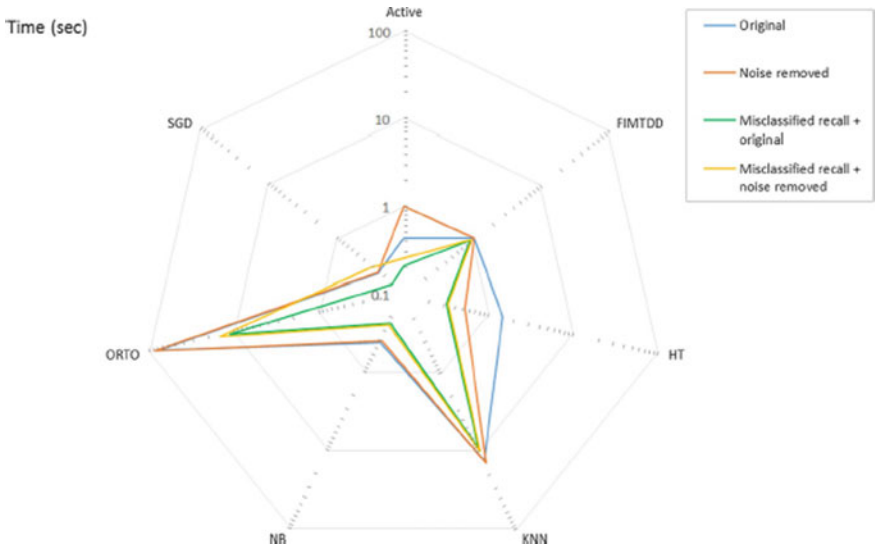

Fig. 4 Runtime measurement in different data stream mining

included text and gif format pictures on the homepage, the legitimate service is performed via HTTPS protocol (SSL/TLS) as a part of the program infrastructure. Here within, the raw network data were extracted in the Libpcap format (This format is a combination of captured Network Data). The captured dataset contains mainly HTTPS network traffic while test hosting communicated with the end-users only via an encrypted protocol.

In this configuration, unencrypted network traffic (HTTP) in the dataset is the first try for the clients (bots) and hosting server before a secure channel was created. Figure 5 represents the important region RNA of the RGCE service provided for the DDoS attacks which were extracted from the project in Feature Vectors captured in Libpcap format can have different scales. Therefore, all of the attributes namely size of packets, size of TCP, time interval since the last previous attack, and percentages of different TCP flags were standardized to the range between 0 and 1 according to a linear alteration on the Max–Min normalization principle. At least two parameters namely the clustering neighborhood size ε and the minimum number of records a cluster needed should be specified in the DBSCAN. The results showed that false-positive rates are quite low, especially with the PCA reduced feature. Network anomalies are the aggregate of remaining clusterless after the finishing of the simulation. An application of DBSCAN is shown in Fig. 6, where Nmin is equal to 3 and clustering neighborhood size of 0.25 (radius of each circle). As been discussed modeling of un-attacking behavior was performed with the help of density-based clustering by noise algorithms for discovering the outliers (DBSCAN). DBSCAN is considered a strong density-based clustering algorithm for detecting outliers and finding clusters in the dataset (Radwan & Farouk, 2021; Shamout et al., 2022).

Data Stream Mining algorithms, such as DBSCAN, have a powerful structure to explain the normal or attacked. The usage of clustering can help in the data mining efficiency, decreasing the number of false-positive rates. The performance of the clustering was also enhanced on reduced attributes, and the data were grouped based on their ordinal/numerical value. The most important achievement in this paper is the power of the classification in the finding of anomalies. Figure 7 shows features obtained for windows timeframe for the considered time point. It represents the normal traffic with a blue line, while a red line corresponds to the DDoS attack. Statistically, Chi-Square computed values calculated for anyone-second timeframe during inside and outside of the attack period.

As one can see, chi-square values corresponding to time intervals when the attack occurs are higher. The method mentioned in the previous section was used to find time intervals that contain anomalous traffic. On the other hand, the application of statistical measurements can successfully capture the attacker's behavior according to the attacking pattern. In this method, the exact time for the beginning and end can help us to locate and hold the attack activity on a real-time basis. In Fig. 8 the Chi-square of clustering is indicated.

Anyhow the results of experiments from ML models (KNN, K-Means, SVDD, and DBSCAN) confirmed that depending on the algorithm the false-positive rates can be varied slightly to be between 1 to 6% (false positive rate) (Afifi et al., 2020; Ali et al., 2021; Alzoubi et al., 2021a, 2021b). The main distraction of the mentioned

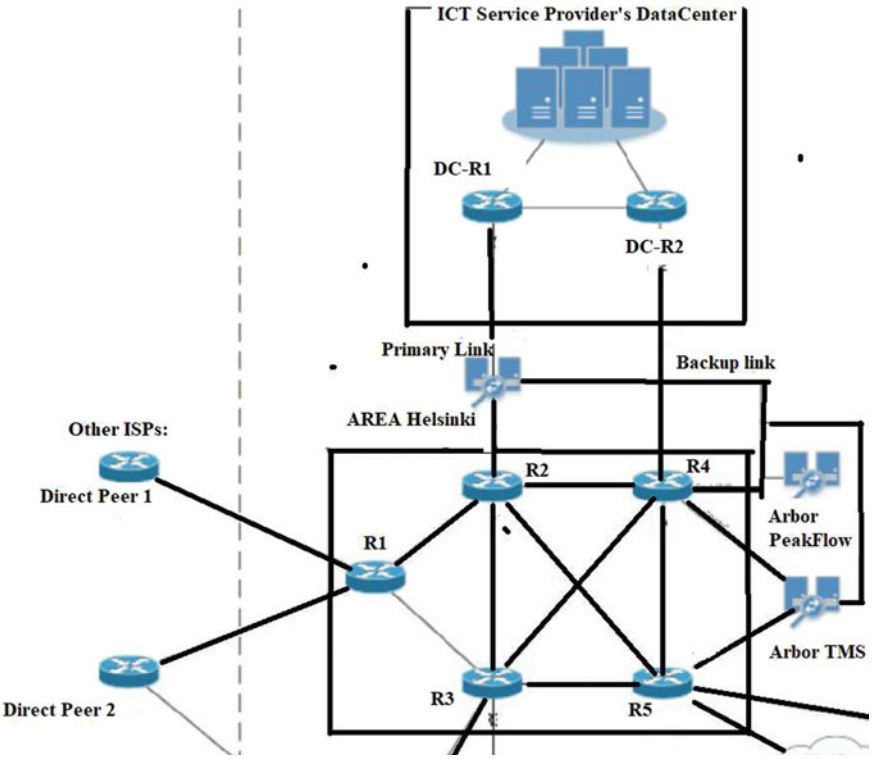

Fig. 5 RNA map (arbor networks peakflow)

methodology was that the target class was considered normal or attacked. In a real test case, there can be a range of different attacks happening at the same time; DOS, Probing (Port scanning), U2R (Buffer Overflow), and R2L (Password Guessing) could be mentioned. A multi-binomial model can be used to predict network intrusion. Additionally, nominal and numerical attributes must be identified as well as both the accuracy and precision have been checked. It was clear that density-based algorithm outperforms other approaches with regard to accuracy and false alarms. The false alarm can be explained low probably for model building. The results of different ML are presented in Table 3.

In the literature there are many DDoS attacks discussed the Ransomware and attacks in form of DDoS, for instance in a study dataset gained on Bitcoins total transactions from 2009 to 2018 were selected to perform clustering heuristics on data temporal analysis and graph mapping. The analysis revealed a significant repeated pattern between families of Ransomware by the techniques such as COSINE, TDA (Topological Data Analysis), and DBSCAN. The reliability of the analysis was confirmed for very little or too many Bitcoins addresses in the relevant clusters and

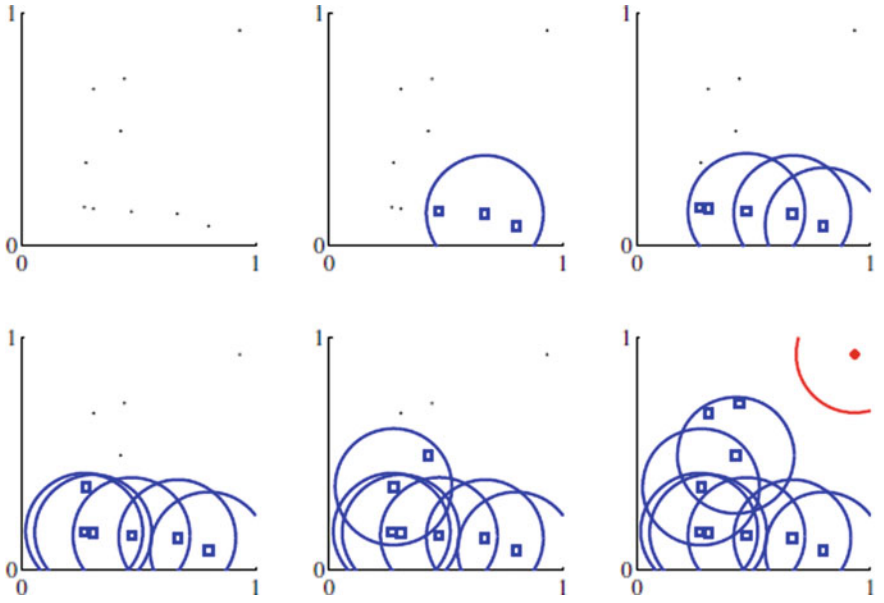

Fig. 6 Implementation of DBSCAN for network normal behavior

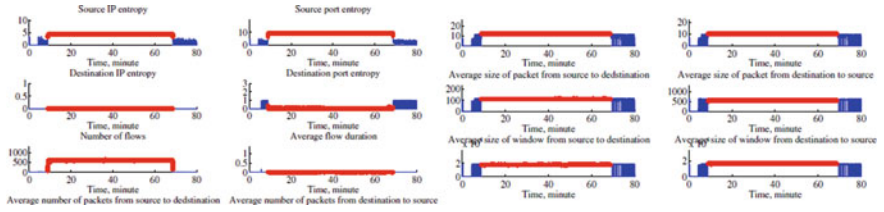

Fig. 7 Convolution between important attributes (timeseries)

their validity by statistical confidence level and compared with recent different scientific papers and studies. Figure 9 shows an example graph of 10 addresses (accounts) in a bitcoin chain block with 7 transactions.

This article aimed to use the Dataset on the Bitcoin transaction by seven different constitutes as a case. Although applied filtering, the high level of penetration, and the big sample size stand as a generalized and wide strict rule for the Internet of Things, we insist on concluding the results through more realistic initiatives and incentives for the better Internet of Things on the thematic too. The attribute of the selected dataset using 24 h transactions from 2009 to 2018 of the bitcoins testing through different features selection by mappers cluster. The dataset was filtered out by some heuristics and the selection was based on two parameters namely inclusion and threshold parameters. Other than the two mentioned above parameters we

DBSCAN	100	0.07	99.9993

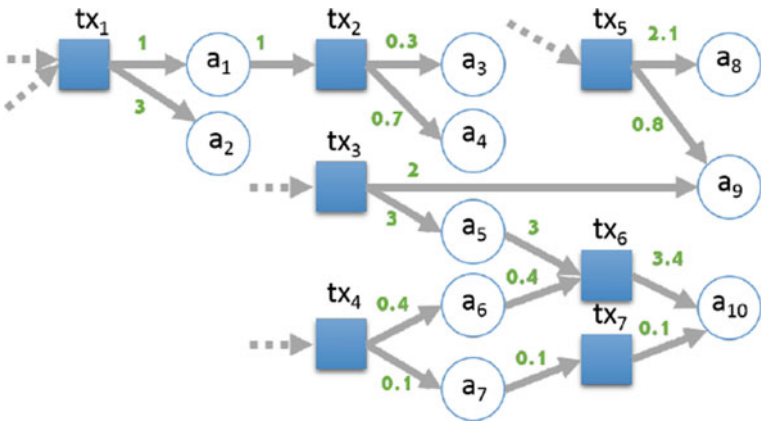

Fig. 9 BitCoin network (edge number is the number of Coins)

have seen that quantiles thresholds on the addresses were performed to avoid false-positive predictions of malice when there is no evidence of past significant events. Preprocessing of the data is therefore a very important step when working with the dataset more sensitive to the imbalance—temporal with attention on the metrics and hyperparameters (Al Batayneh et al., 2021; Ghazal, 2021; Ghazal et al., 2021).

As it has been demonstrated for the capturing of each snapshot of the network the following features for each address are considered. It should be noted that in regard to the temporal behavior of the different clustering windows were implemented in the dataset to distinguish between different geolocations. The result of this section was for this specific importance of specific attributes such as weight and count which are designed to quantify the merging property of the network or loop which is measured the splitting and switching of the network path, and also merging all to 1—N pattern where the currencies can be sold or converted to flat currencies.

After running the data over several other options in 2-dim neighborhood, the required output has been validated on two variables t-significances in relation to perplexity or an effective number of neighbors, which answers the question of how big a network normally is, and how important it is subjectively concerning which family (Fig. 10). Distances and sizes of the cluster are not conveying any concept, but the group of addresses means that DMALocker and Crypxxx are locating in the center while CryptoLocker and CryptoWall are often together in many groups. The most common application is the cluster purity for every Ransom with all addresses from the same family. The Cerber, CryptoWall, and CryptoLocker, have gained around 40 percent of purity where the most improved number of clusters were in the amount of k = 12,500 (Fig. 11).

Fig. 11 Percent of purity and no. of shared clusters of the ransom families

Licensed to (putm@utm.my)

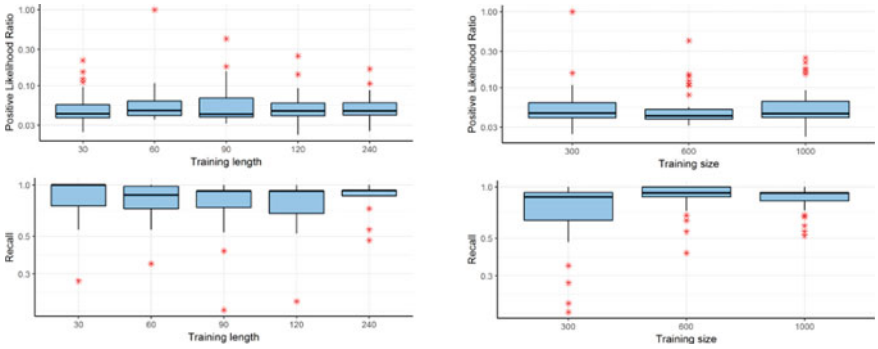

Fig. 12 Effect of training size and length on the positive likelihood ratio and recall

The co-clustering families were shown in the last tables were also supported for CryptXXX, from the Symantec warns security company that on 2016 as Trojan Trojan.CryptoLocker.AN, therefore it can advantageous to search for similar patterns of the Ransom families. There is a daily more than 500 K transaction on the Bitcoin alone and the number of false-positive rates can happen to the dataset. One of the most important achievements in this report is the class rebalancing to different Ransomware addresses. On the other hand, regarding the temporal characteristics of the dataset, the concept of sliding windows was introduced to the 30, 60, 90, 120, and 240 for the training of the model (Fig. 12). The effect of training size is indicated in the following graph. Finally, Accuracy and Recall were both along with the maximum likelihood function were improved by this setup (Ghazal et al., 2013, 2021; Ghazal et al., 2021;).

3 Research Method

In this research, we have firstly conducted a network anomaly detection experiment from KDDCUP 99, LAN activity log of a military environment. We aimed to predict the probabilities of malicious activities (intrusions). The class attribute of the model was binary with 38 attributes of numerical type and 3 attributes were of the nominal character. The attributes are categorized into four categories including inbound and outbound connection features which were basically:

- footprints of each network from source to host and vice versa (e.g. protocol, service type, duration, status of service, and data bitrate).
- Content Access Level Features such as the number of times a user access system directory entrance, administer passwords trials, access control, and user privileges,
- Network connection Time-dependent Features indicating the number of connections to the host in the last 2 s considering the error flag on the same port number.

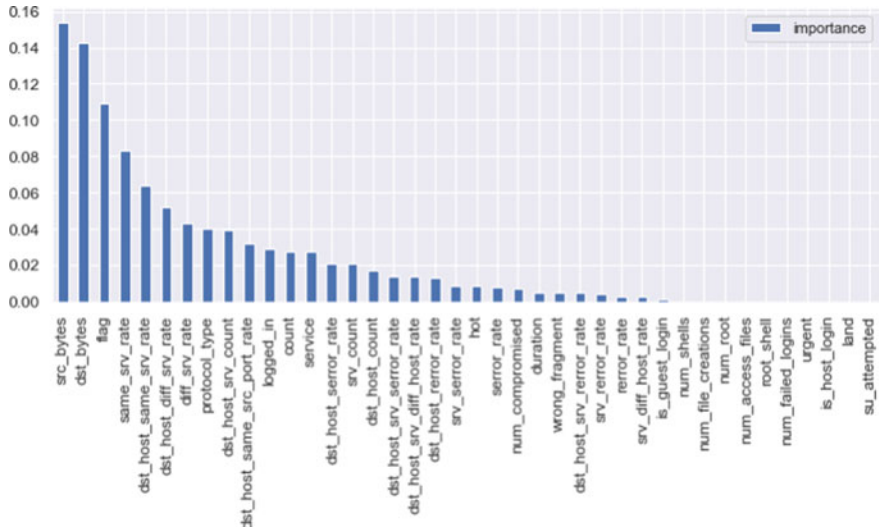

Fig. 13 Feature selection

- Destination Traffic Features, which are a representation of a connection to the same destination IP address of the host while activating the error flag. The feature selection method was performed by Random Forest in Fig. 13.

This experiment was firstly performed with the 4NN batch processing. Later on, by the evaluation of the model when the cost–benefit analysis would be considered the accuracy was 98.8% FP average rate and 1.4% of FN rate with the above 4NN. For avoiding the overfitting error, attributes were filtered on the hybridized subset selection and wrapper techniques models by using model information gain and SVM model. Both were purposely used to improve the model accuracy.

This prediction power resulted in approximately 1000 false positive alarms in network 50 K instances, where 6, 9, and 23 numbers of nominal and numerical attributes were selected. The following table shows the efficiency results of the SVM model. Table 4 shows the efficiency results of the SVM model.

Results of our experiments from batched ML models (SMO, KNN, ANN, and Logistic regression) confirmed that depending on the batch size, and other hyper parametrical, the F-Score model can be varied to be between 94 to 98% (with 2 to

4% false rate). Interestingly, in case 4NN algorithm with a batch size of 50 outperformed Bootstrapped LogitBoost, logistic regression, and Bayes Naïve. One of the achievements was the runtime performance of 0.25 s on Logitboost on KDDCUP 99 dataset with a high number of classes that are not distributed independently. Repeating the same setup for filtered SVM, TP and FP rates were promoted around 4 percent, but the runtimes were 58.93 and 13.98 s with 23 and 9 attributes respectively. These results are shown in the following tables (Tables 5 and 6)

This proved that each packet of data cannot implicitly explain the state of containing packet. This fact was also reported in the literature on the network anomaly detection on KDDCUP 99 dataset where temporal dependence is present. Nevertheless, the 97% True Positive rate accompanied by 1.5% False negative motivated us to switch to other datasets for the designing of the data streaming experiment on the Mirai DDoS network activity, a type of Ensemble detection strategy based on two learners. The stability learner stands for the ground truth on the past information and an evaluator that updates, replaces, or removes instances according to the most recent data streams forms a plasticity region around the classification problem. In an era of anomaly detection, Ensemble approaches were chosen for the concept drift in this study, which was DDM, EDDM, and Hinckley page (Kalra et al., 2020; Khan et al., 2021a, 2021b). The data was further classified and evaluated by Adoptive Hoeffding Tree, Leveraging Bagging, no-change, and/or majority classifiers with prequential Interleaved Test and Train samples. Regarding the temporal dependence of KDDCUP 99, usage of no-change and/or majority classifiers was proposed in the literature but in this experiment, the Kappa Statistics based on Random classifier by prequential cannot be misleading, measurements are compared based on the Classification analysis on Damped Statistic while computational costs and proposed Concept Drift Strategy resulted in relatively higher accuracy and recall. For sake of availability in real-time, the CRUD operations were performed on MongoDB DBS. The objective of this experiment is to work with a temporal type of attributes by application of stream data mining with fewer false-positive rates. We aim to make

comparable results as we believe that fewer false-positive rates with lower precision will be achieved in comparison with the Mirai dataset.

3.1 Dataset Description

The selected database is IoT devices' Mirai attack which is the Network Mirror data of 10 min of activity in a simulated controlled environment connected to an access point which is designed to have a victim and an attacker device. More than 700 k data packets are recognized and captured by having a binomial value for the class attribute of the model (value 0 when there is no attack and value 1 for a network attack) (Lee et al., 2021; Matloob et al., 2021; Naqvi et al., 2021). When a fraud packet is received the behavioral attributes can be extracted. Two types of data are contained in this packet which are statistics or bandwidth behavior of a small window. These temporal analyses could be on the general information of the packet senders and also on the traffic between the sender and receivers. The first type is defined as Source MAC and IP address (SrcMAC-IP). The second type is the traffic between source and destination (either IPs or TCP/UDP Sockets). The structure of the dataset embedded in MongoDB can represent that there are 20 classes of nominal on the features as well as numerical attributes (see Fig. 14).

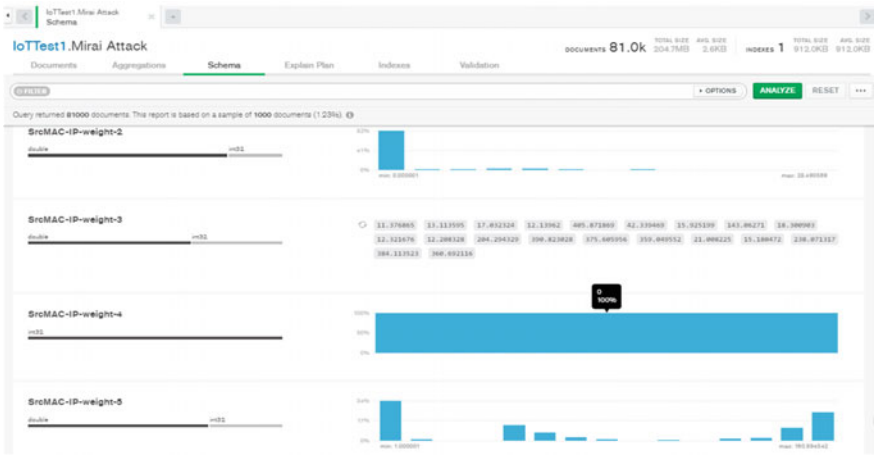

Fig. 14 Big data system implementation on MongoDB

3.2 Feature Extraction

The attributes harmonized through damped statistics such as packet id number, Linear Sum and Squared Sum can be further extended to explain the signaling behavior of the packets in regard to their context and traffic. Every packet was implemented in the feature extractor to create 23 features for the description of outbound bandwidth (8 features), inbound and outbound bandwidth (8 features), packet rate (4 features), and inter-packet delays of the outbound bandwidth (3 features). The packet size of outbound bandwidth statistic measures was divided to mean and standard deviations aggregated by SrcMAC-IP, SrcIP, Channel, and Socket. The packet size of inbound and outbound bandwidth statistic measures was divided into Magnitude, Radius, Approximate Covariance, and Correlation Coefficient aggregated by Channel and Socket. Packet count by the weight of SrcMAC-IP, SrcIP, Channel, and Socket, and packet's jitter by the weight, mean, and standard deviation of the Channel. For the consideration of timestamp, these values are extracted by the same feature with five windows of length 100, 500, 1500, 10,000, and 60,000 ms, which sums the total attributes into 115 plus one class attribute on the basis of their weight and decay factors while they are extracted. For the network administration, the IP address is like the postal code, and each channel is a mailbox. On the other phrase, residents (services) need to access their messages through their mailbox. The number of a channel cannot solely identify the path in which the packet would be sent while the UDP/TCP isn't defined. Mirai bot through ports number 23 and 2323 uses TCP/IP to map packets to services. These ports are belonged to Telnet service enter the command and control by legitimate access. The botnet can firstly disable the Telnet and search the ports by sending SYN, ACK, RST, etc. flags on large scales. One of the millions of inbound traffic could be accompanied by more than 1 GB ack flag and is known as TCP stomp flood. These bots are not anyway easy to handle but using CNC control on TCP/23 and looking for the NetFlow on this channel is also a good idea. The chart below (Fig. 15) is one out of 115 attribute representations of Channel chart 100-ms versus 1-min windows in the past as it has been aggregated by Channel of 10-s windows in the past.

3.3 Evaluations Sets

Contrary to the batched Learning which is leveraged by the random arrangement of train and test sets, in data stream Mining the challenge of streaming posed another type of evaluation. Among the recently developed approaches for the evaluation of data streams, the hold-out trainset in stream mining is used when cross-validation computational costs are big enough that make splitting of the data into train and test efficient. The problem in our case was that network vectors were based on damped statistics and chronologically on the basis of decay function and cannot separately be handled for the evaluation and validation of classification while it is

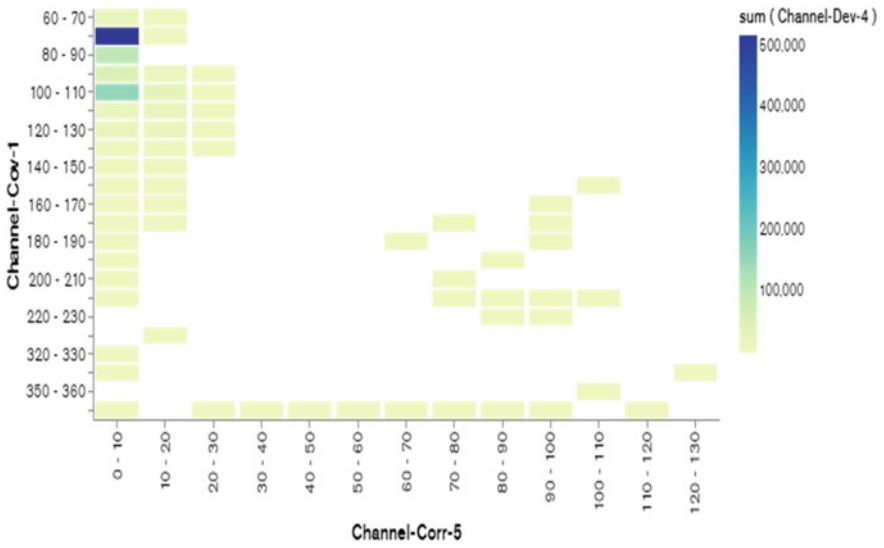

Fig. 15 Channel covariance versus channel correlation extracted from DBMango atlas

impossible to distinguish that last records are from 1 min or 10 min ago. In our case, a prequential test-then-train evaluation was performed by Hoeffding Adaptive Tree and Leveraging Bag separately. The evaluation process has taken 124.94 and 304.61 s respectively to complete the testing of every single point and train the model while the majority class which process runtime on the data without evaluation was 85.38 s. For both evaluations' frequency has been considered 10,000 packets which are around 2 percent of the whole 764,137 packets. In leveraging Bag, five Ensembles like bootstrap, Blast, and Stacking were chosen for the augmentation of drifting with 3 leaves and 6 nodes from a single leaf root at the beginning of the Mirai Bot activation. In Hoeffding Adaptive Tree, for the calculation of Information Gain at the given confidence level, the tree grown from root to 4 leaves and 7 nodes, and the leaf was again split to reciprocate the algorithm (Rehman et al., 2021; Suleman et al., 2021).

4 Classification Results: Ensemble Learning

The concept drift can detect changes according to the damped statistic, in Fig. 16 two streaming behaviors of the dataset and their detected anomaly are distinguished. It is clear that at the beginning of the stream dataset the number of false alarms is increased by the application of EDDM and Page Hinckley—the input values and detected changes are identified.

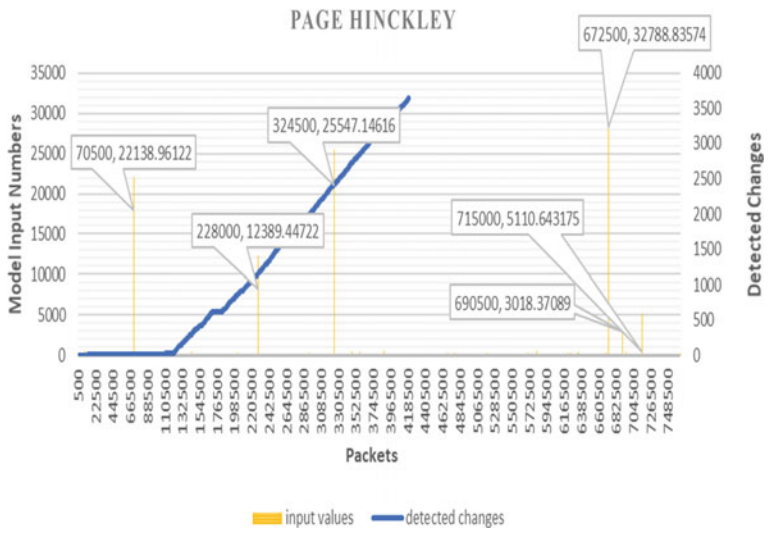

Fig. 16 Concept drift strategy for anomaly detection by EDDM performed on MOA

As it can be seen in Fig. 16, the data class attribute of normal type is less than attacked type and started on the 121 K records and is not happening. In Fig. 17, the accuracy of two tree classification is shown which can be compared with the majority class and can be best explained by temporal dependence of the Dataset.

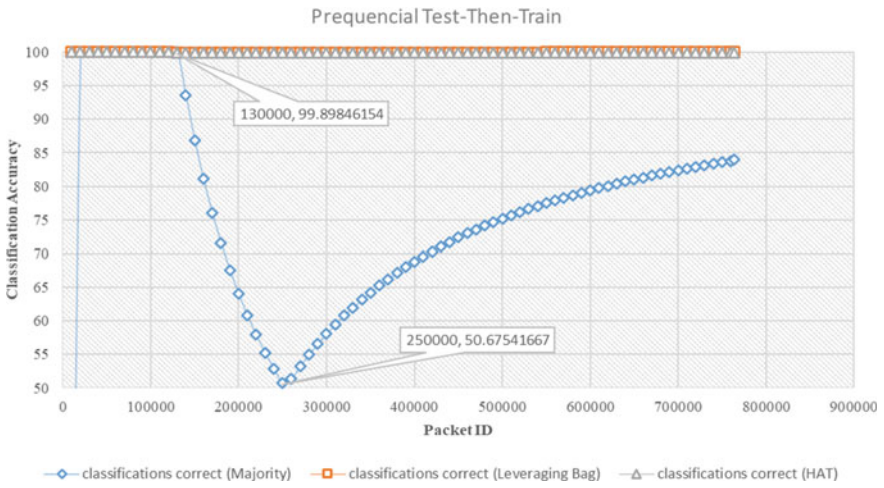

Fig. 17 Classification accuracy on majority class, leveraging bag and hoeffding adaptive tree

5 Conclusions

One of the challenges in Network Intrusion Detection is the stochastic behavior of the fraud activity which makes the Data Stream Mining suitable to use its ability of adoption to the drift. In this work, we have designed an experiment to show that even stream data mining datasets can be misleading and trapped the case in accuracy pitfalls. In tradition, batch Machine Learning the train and test dataset comes from the same distribution which has been now experimented for the inadequacy of false alarm rate in the KDDCUP99 dataset. In this work, our chosen IoT Mirai attack network mirror was implemented in Page Hinckley change Detection with the 115 attributes of different window sizes of 100, 500, 1000, 10,000, and 60,000 packets in a single drift strategy to predict the changes. We have also concluded that detectors worked well on the timespan in which fraud events occurred and allowed to contribute a diverse range of decay factors in the calculation.

The attributes were chosen in the evaluation by two groups of Tree consist of five Ensemble to test and train every packet. The proposed method was very adaptive and fast in comparison to the Batch Machine Learning, while it could advantageously get the frequency variation in comparison to the No-Change ADWIN which could process the more recent past.

6 Future Work

The chosen dataset in this work was a virtual IoT framework from a telnet protocol device including a bot to have legitimate access to the command and control. Big Data System provides a progressive framework, which is adoptive and can be synchronized with queries that create Dataset in different topologies. This can be advantageously providing an on-the-fly scheme in an online integrative network Lab with higher defense strategies in an era such as Smart Cities and a real-life problem like health and financial sectors.

Machine Learning-Based Intrusion Detection Approaches for Secured Internet of Things

Taher M. Ghazal, Mohammad Kamrul Hasan, Siti Norul Huda Sheikh Abdullah, Khairul Azmi Abu Bakar, Nidal A. Al-Dmour, Raed A. Said, Tamer Mohamed Abdellatif, Abdallah Moubayed, Haitham M. Alzoubi, Muhammad Alshurideh, and Waleed Alomoush

Abstract Nowadays, protecting communication and information for Internet of Things (IOT) has emerged as a critical challenge. Existing systems use firewalls to ensure that they are safe from any unexpected occurrences that may disrupt the desired systems and applications. Intrusion detection systems (IDSs) are an acceptable second line of defence for IOT applications. IDS play a crucial role ensuring that

it enhances the IOT security level maintaining sophisticated framework. Attackers have continuously been attempting to determine novel ways to circumnavigate security frameworks that prevent the structures. This paper reviews the security advances, threats and countermeasures for the IOT applications. A state of art review has accomplished using the references from 2009 to 2020 to encompass the real demography of the IOT security research data. This work also highlights the deep learning-based intrusion detection approaches for Internet of Things (IOT) security. With the systematic literature review approach, the review suggests that implementing existing security measures, such as encryption, authentication, access control, network and application security for IoT systems and their intrinsic amenability is ineffective for the IOT systems.

Keywords Machine learning · Internet of Things security · Intrusion detection

1 Introduction

The extent of the use of the Internet of Things (IOT) has made it imperative to have several devices on a network. As such, most of these are computers, but there are sensors, digital tools, and vehicles (Ghazal et al., 2021a, 2021b, 2021c, 2021d, 2021e; Lee et al., 2022a, 2022b). The large size of the network of devices and anonymous or uncontrolled structure of the Internet is imperative to consider (Al Kurdi et al., 2021; Alshurideh et al., 2019, 2021). Protecting data and communication systems is imperative in IoT security. A plethora of frameworks used in firewalls in IoT are useful in protecting each of these systems. Intrusion Detection Systems (IDS) are useful in IoT security and ensure that these frameworks are safe all the time. In this regard, attackers have continuously been attempting to determine novel ways to bypass the systems that prevent the structures (Akhtar et al., 2021; Al Ali, 2021; AlHamad et al., 2022; Alhamad et al., 2021). The IOT system requires ensuring that they have kept malware out of their operations. It is of the essence to achieve this objective because it means that they focus on ensuring that they have kept their devices and systems safe. Spark-Chi-Support-Vector-Machine is an example of an IDS algorithm (Ali et al., 2022; Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2022a, 2022b). The model reduces training time, increases performance, and is ideal for big data. It undergoes loading a dataset and exporting it in the resilient distributed datasets and data frame that deploys apache spark.

The data then undergoes pre-processing before the selection of features, training, testing, and evaluating in another dataset. It is an incremental task to ensure that intrusion detection systems are of the highest capabilities from the perspective of IOT security. However, it does not imply that companies should avoid trying to understand the implications of failing to detect intrusions into the systems that they have set. If the algorithms that they are deploying at a specific time have been outdated, it becomes easy for an attacker to take advantage of the system by attacking it at any given time. As a matter of consequence, the use of machine learning techniques in intrusion detection systems should help IoT companies avoid unwanted issues that may occur over time (Alshurideh et al., 2020a, 2020b; Akour et al., 2021; Nuseir et al., 2021; Salloum et al., 2020) Consequently, the essence of this paper is to outline the usefulness of machine learning in intrusion detection systems. As such, it will focus on deep learning and how best it is useful in the context of intrusion detection systems for IOT systems to protect systems and valuable information (Alshurideh et al., 2020a, 2020b; Ali Alzoubi, 2021a, 2021b; Alzoubi et al., 2020a, 2020b, 2022).

Big data analytics has become imperative in the analysis of data generated from IoT. Connected devices help in the process of data generation, and the analysis is imperative in improving the decision-making process. The role of big data in IoT is to ensure that the data has undergone processing in real-time. The data then undergoes storage using a variety of technologies available in the current world. IoT has become a backbone of the big data trend with output information becoming the data or input for another system. The data is further useful in guiding specific processes. IDS in IoT can be useful in enforcing its security, as shown in Fig. 1—for example, it is helpful in detecting attacks once a hacker breaks the cryptography (Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b, 2021a).

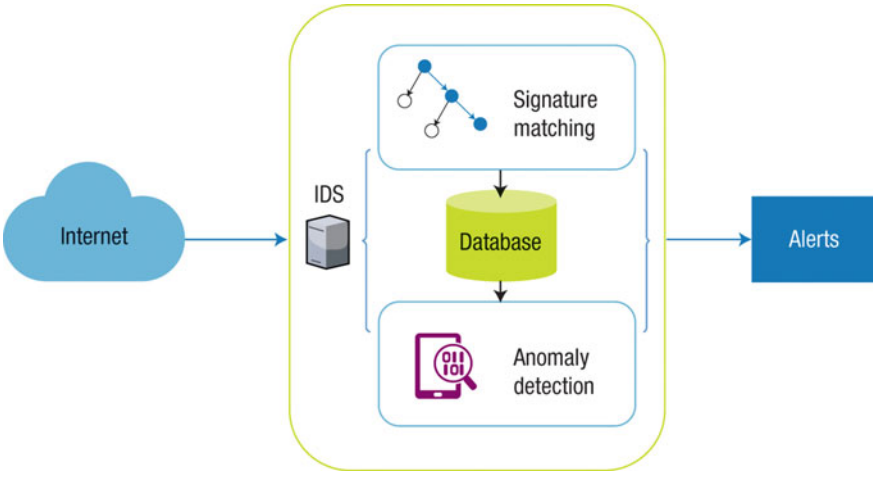

Fig. 1 IDS in IoT (Mohammadi & Namadchian, 2017)

The contribution of this paper is as follows:

1. An in-depth discussion of recent algorithm and techniques used in big data incentives.
2. Taxonomy of deep learning and its usefulness in intrusion detection systems.
3. Discuss the recent IDS threats; advance techniques and figuring out the research directions and its limitations in IOT & block chain applications.

2 Literature Review

Block-Chain-based security solutions for IoT systems help secure peer-to-peer networks. The blocks are composed of transaction records that users initiate. They help prevent unauthorised operations on IoT data by using blocks to register all transactions. The evolution of Intrusion Detection Systems hinges on the fact that there are specific elements that control them. The IOT network systems have increased in complexity to the point that they are prone to mistakes. In turn, these errors are easy to exploit from the context of attackers or intruders. The present IOT network systems have several critical deficiencies in their security networks, which makes it easy for attackers to target them for their gain (Aziz & Aftab, 2021; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021a, 2021b, 2021c, 2021d, 2021e). Although there is a need for additional work or tools that attempt to find and fix deficiencies, it is an incremental task to close all existing loopholes. Despite that intrusion detection systems exist, absolute prevention in a specific system is an additional task. As a matter of consequence, intrusion detection systems have emerged as the best way to find and identify any intrusion in a specific system. Afterward, it becomes imperative to have a framework for prevention, which may depend on automation alone.

Most of the IDS systems seek to protect IoT devices, from external attacks, which is critical for the organization. In this concern, the end to the unnecessary aggression experienced from the context of the external world is a crucial aspect of the business because it protects its interests. Several attacks on the IOT security system articulate may be detrimental to the IoT framework. Many of the attacks may occur on the network from authorized users in the company. Many security attacks are hard to identify from the context of the company in focus. New types of attacks have developed in cross-detection and prevention methodologies in various IoT systems. Consequently, security solutions like Check Point focus on the use of additional updates or learning to increase the dynamism of the entire IoT system (Alshurideh, 2022; Guergov & Radwan, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021a, 2021b; Hasan et al., 2022; Joghee et al., 2020).

The IDS should have three primary mechanisms that make them an essential part of the current protective technology. In this contemplation, the first part of the IDS is the data collection framework. The role that it plays in the IDS is to ensure that they track network flows in the technology. Once they articulate this aspect, it becomes critical to transmitting the data in the form of packets. The second part of the IDS is vectorization, where data is used for various features; as a matter of consequence,

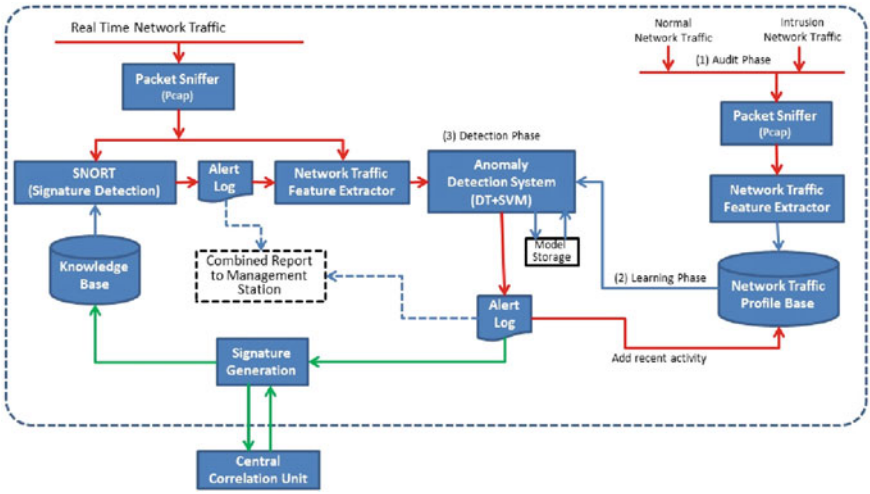

Fig. 2 IDS framework

they create feature vectors. The final aspect of IDS is the classification engine that gives classified packets to state whether the system is standard or there has been an intrusion. The use of vectors in the engine traces the flow of all packets within the system using previous knowledge to identify if there has been an intrusion or if the system is typical, as shown in IDS framework, Fig. 2.

The classification engine is an imperative aspect of the intrusion detection system. From a notable perspective, it decides if the converted features are part of an intrusion in the specific locality or if normalcy is present. the part is signature-based, which has the implications of classifications following anomalies or defined signatures based on the normal flow of packets in the systems (Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b) the first one has excellent reliability and decision time, but it cannot detect new types of attacks; as a matter of consequence, it produces a low detection rate. Simultaneously, the latter has low acceptable scalability, robustness, and flexibility. As a matter of consequence, each of these systems needs to imminent the correct dynamism to ensure that they reach the highest level of performance. Majorly, they need to use the best techniques to ensure that they follow machine-learning mechanisms.

Machine learning-based IDSs for enhancing the IOT security have become critical challenge for the industries. One of the crucial aspects of such systems is the need to have a significant training time for processing a large dataset from the network's previous flow of data. Traditional machine learning approaches include decision trees, logistic regression, and support vector machine (SVM). SVM is an algorithm that finds optimized hyper-planes to classify between two classes. Building an excellent SVM model majorly depends on finding an excellent kernel. Random Forest is built on several decision trees that combine the prediction of a single tree. Xgboost and Naïve Bayes are based on machine learning whereby the former is useful for

heavy computational power resources while the latter is a lightweight solution. With the emergence of technology called deep learning, it has been easy to provide an efficient mechanism for learning. The technique has been a critical aspect of the intrusion detection systems because it has provided a new way to examine machine learning and how technicians and coders can deploy it in various use cases. Deep learning has been a critical aspect of these systems because it is a parallel technology to intrusion detection systems and their machine learning algorithms. It has resulted in the reduction of the training time for these frameworks. Similarly, it has significantly helped raise the accuracy of the proposed system (Mehmood, 2021; Mehmood et al., 2019; Miller, 2021; Mondol, 2021).

Machine learning consists of a broad range of paradigms found in continuous evolution, which presents cross relationships and weakened boundaries. Various applications and views might culminate in differentiated classifications. As a matter of consequence, it is hard to refer to as fully applicable taxonomy accepted in the literature. The taxonomy is oriented to security operations professions. It has the proclivity to avoid any ambitious objectives of presenting the principal classification for all application use cases and artificial technology professionals. Machine learning is divided into shallow learning and deep learning alternatives. Shallow learning has supervised and unsupervised variants. The supervised version uses shallow neural networks, K-nearest neighbour, hidden Markov models, Random Forests, support vector machines, logistic regression, and Naïve Bayes. The unsupervised version has an association and clustering as examples. Deep learning also has supervised and unsupervised variants. Supervised deep learning has recurrent deep neural networks, feedforward, convolutional neural networks, and feedforward, fully connected neural networks. Unsupervised deep learning has deep belief networks and stacked Auto-Encoders. Unsupervised deep learning techniques do not need a representative and large dataset than that which human experts have previously classified. In contrast to that, supervised deep learning variants do not need a pre-labelled training dataset. Shallow neural networks are algorithms based on neural networks and have a pre-set of processing elements called neurons, which are organized into two or more communication layers. They include all neural networks with a limited number of layers and neurons. Despite their existence, they have been most useful as classification tools in cyber security. K-Nearest Neighbour is useful in various classification models and may be imperative in problems that relate to multiple classes. In contrast to that, a significant issue exists in the testing and training phases of the software. From a notable perspective, it is computationally demanding to classify all test samples and compare them against all the training samples used in the previous phase.

The Hidden Markov Model is an imperative model that entails a set of states to produce outputs by deploying a range of probabilities. The objective is to determine the states' sequence produced at observable outputs. The model is a useful way of understanding temporary behaviours and for quantifying the probabilities of specified event sequences. The latter use cases have been the most applicable in the context of cyber security despite that training of the model can occur on datasets with or without labels (Ahmad et al., 2021; Obaid, 2021; Radwan & Farouk, 2021; Shamout et al., 2022; Tariq et al., 2022).

Random Forest is a set of decision trees that contemplates the outputs of all tresses before giving a final response, which is typically unified. All decision trees are conditional classifiers, which mean that they are visited from the top, and at every node. The given conditions are checked against one or more aspects of the data that has been analysed. The methodology is useful for a large dataset and excels at several issues in the multiple class segments. In contrast to that, over fitting is a critical aspect of deeper trees and needs articulation to attain its goal. Support vector machines are classifiers with a non-probabilistic take on data. They are useful mapping samples of datasets in feature spaces with the objective of distance maximization between sample categories. There is no assumption on input features, but the performance is unfitting for multiple class classifications. The limitation in scalability might culminate in long processing time.

Logistic regression is a categorical classifier that has the objective of adopting a discriminative model (Afifi et al., 2020; Ali et al., 2021; Alzoubi et al., 2021b). It is similar to the Naïve Bayes algorithm in that it makes the prior independence assumption of features of inputs. The performance primarily depends on the training data's size (Al Batayneh et al., 2021; Ghazal, 2021; Ghazal et al., 2021a, 2021b, 2021c, 2021d, 2021e). In this consideration, the Naïve Bayes algorithm is a probabilistic classifier that makes prior assumptions that input features of a dataset have independence. In this concern, therefore, these are scalable and do not need a large training dataset to ensure that the results they produce are appreciable. The gap in the literature is a lack of succinct consideration of deep learning methodologies for intrusion detection systems.

3 Methodology

The methodology of choice for this paper was a review of the literature concerning the use of deep learning approach to implementing an intrusion detection system for information systems security. The objective was to find papers that discussed deep learning algorithms used in intrusion detection systems. The researcher was determined to find 56 updated articles from the year 2009 onward. Most of the deep learning algorithms have been present in the contemporary world from this time onwards. As a matter of consequence, it was imperative to include articles in English to ease readability and understanding. As a matter of impact, the researcher excluded articles written in a language rather than English. The database deployed for the research was Google Scholar, since it is a free database, and it offers peer-reviewed articles. These were critical in the study because they made sure of peer-reviewed information being used.

Research ethics is a critical aspect of a study that needs to be considered. The current research did not meet any ethics issues that were worthy of attention. The present paper did not need research ethics to be met at any point. There was no need for respondents to take part in the study because it would have mandated the use of a consent form to which they would agree to participate in the research or reject it

outright based on personal preference. The choice not to use respondents meant that it was relatively easy to conduct the study from the viewpoint of secondary analysis of data. The information obtained from the investigation would be deployed in helping understand the impacts of deep learning in intrusion detection systems.

4 Analysis

Intrusion detection SYSTEMS are a plethora of examples, but the most common are fuzzy logic, rule-based frameworks, support vector machines, artificial neural networks, and statistical intrusion detection systems. Fuzzy logic relies based on human thinking intending to convert information obtained into mathematical equivalents. Persons who have a specialty in one specific area develop rule-based systems. Their role is to examine the traffic in particular systems. Then, they develop attack detention and specific rules that the system should follow. Data mining is a technique used for reaching out for information in a big data setting. The data extraction depends on a set of rules whereby the objective is to ensure that the correlation between users and data has been established (Alshurideh et al., 2022a, 2022b; Ghazal et al., 2013, 2021a, 2021b, 2021c, 2021d, 2021e). It uses the fuzzy set theory to determine the usefulness of fuzzy logic in data. Support Vector Machines are the most preferred methodology for intrusion detection systems. They can select a specific feature vector, and they can distinguish data from two class sets using a particular feature vector for each one of them. They are deployed in several classification systems like sound analysis and face recognition systems. Artificial neural networks are models that give graphs of neurons of data. They have a way to correlate specific vectors with algorithms that help create new data. The method is imperative in examining and learning data behaviours in a system. An enhanced form of artificial neural networks has been preferred in data mining contexts due to increased efficiency. Statistical intrusion detection systems are based on measurements in statistics. In this context, the examination of system or user behaviour is imperative because it helps create a specific statistical model. New intrusions correlate with a particular mathematical model. Some of the methodologies used in intrusion detection systems include Gaussian Mixture Distribution, Chi-square distribution, and Principal Component Analysis (Kalra et al., 2020; Khan et al., 2021a, 2021b).

An intrusion detection system that is based on a signature is useful in detecting attacks that have already been identified. The objective is to reduce the false rates while increasing the detection accuracy, which needs to be considerably high. In contrast to that, performance may suffer when the detection of a new or unknown attack occurs. The system typically has a limitation in the rules used and can be installed beforehand in the intrusion detection system (Lee et al., 2021; Matloob et al., 2021; Naqvi et al., 2021). From another perspective, an intrusion detection system based on an anomaly is best suited for a context, whereby the attack is new or unknown. Although such a type of an intrusion detection system is best suited for such settings and has a high false-positive capability, it has broad acceptance in the

Licensed to (putm@utm.my)

current research community. Two challenges arise when developing a flexible and effective intrusion detection system to get to understand new issues. The first of these issues is the proper feature selection from the dataset of network traffic to detect the anomaly. The second problem is the lack of availability of a labelled traffic dataset from a real network that should be useful in the development of the intrusion detection system. Deep learning is a technique in the class of machine learning methodologies; it deploys consecutive information layer and processing levels in the hierarchy. The objective is to help in the representation and learning of features as well as the classification of patterns. From a notable perspective, the essence of deep learning is to help the classification results of images to increase. Besides, technology is useful in signal processing, natural language processing, video, images, audio, and speech. It is also helpful in pattern recognition, graphic modelling, and language, which are useful for intrusion detection systems. It means that several deep learning methodologies include Deep Auto Encoder, Auto Encoder, Deep Neural Network, Deep Boltzmann Machine, Restricted Boltzmann Machine, and Deep Belief Network.

Several advancements exist for algorithms used in learning contexts to improve the capabilities within the intrusion detection system that help it reach a low false alarm rate and a high detection rate. From a notable perspective, the deep learning-based approach is useful in overcoming issues that hinder the development of an efficient intrusion detection system. The unbiased comparison of the efficiency of two deep learning algorithms expects that their training be on a similar dataset. Similarly, their testing needs to occur on the same dataset. Although several proposals in the context of cyber security are prevalent in the contemporary world, they rely on a few and old public datasets. While this may appear to be a mistake in the modern manufacture of the intrusion detection systems, the results are hard to compare due to a plethora of issues. First, they may deploy a different split between the dataset used for training and that deployed in the testing phase. Second, one or both of these algorithms might implement a pre-filtering operation that can alter the dataset used in the training phase. Finally, the algorithms used may have differentiated featured. For these reasons, a meaningful comparison between the detection performances of various intrusion detection systems is an incremental task. In this context, the literature may discuss machine-learning methods for two distinct cyber security issues. However, it may fail to consider the training and testing phases for the analysis deployed. As a matter of consequence, some of the solutions obtained may have a higher level of accuracy than others, which is highly problematic. It means that the results might change significantly if the training settings have been differentiated. Additionally, there is a lack of a guarantee that a specific method that works on a given dataset is the best when used in some other datasets. While it may work for one set of data, it might fail to depict the same performance when used on a different one. Security administration professionals have noted this problem, but some remain unaware of its existence. It is imperative to thoroughly query the methods used in the evaluation phase before accepting the performance results from various deep learning algorithms (Rehman et al., 2021; Suleman et al., 2021).

Misclassification in the cyber security context may have an implicit cost that might result in serious problems. A false positive in intrusion detection systems and malware

classification may become the point of annoyance for security operators because it hinders the remediation in the contexts of actual infections. It is critical to get the correct information in all cases to ensure that the intrusion detection system achieves its objective within the shortest time possible. In this context, the phishing detection may cause legitimate and essential messages to fail to reach the specific individuals who need it. In this context, the failure to detect malware may have significant issues in the organization. Notably, phishing emails and network intrusions can be the point of compromise for entire organizations rather than just one aspect of the company in focus. Companies need to be ready to consider the performance of various deep learning algorithms and solutions in the context of organizations. It should be noted that they should then devote them to phishing detection and malware analysis in the context of the systems they have set. It should be noted that they need to perform experiments for intrusion detection systems with the orientation of detecting problems before they can implement them in specific use cases. In this context, the objective is to reduce problems that may make it hard for the organization to exist as a business entity.

Traditional intrusion detection systems have been a point of limitation for a plethora of companies. It should be noted that they are based on static detection rules, which are less than ideal for detecting malware and phishing attacks. There is a need for continuous and frequent updates in a specific system that is imperative for the detection of malware and phasing. For example, companies need daily updates of virus definitions in their antivirus libraries. If they fail to achieve this objective, it is highly likely that they cannot meet the ultimate goal of ensuring that they have the best performance. It should be noted that they could fail to get to know the specific malware they are facing, which may hinder their ability to detect specific instances of malware. When this happens, they compromise the entire system, and an intruder takes advantage of the whole company's security defences.

A similar problem influences advanced deep learning incentives that companies may want to ensure they keep malware out of their existing systems. Some companies may be relying on outdated datasets used for the training phase but think they will achieve the same goals they expect from the framework. It is a critical issue that affects companies because they need to supervise their learning approaches, which should help label training datasets in the best way possible. Creating a manual for similar datasets is expensive for most companies. The implication of cost lies in the fact that the dataset should be considerably large and comprehensive, which should allow the deep learning algorithm to know how to differentiate between various classes. Additionally, the operations are prone to errors and may result in incorrectness in the classification made. Lastly, most companies are unwilling to share data about internal networks because they believe it may give other firms an advantage over their existing data, which could compromise them. The scenario results in an overall scarcity of publicly available data that may be labelled for cyber security operations. The definitive implication is that the periodic retraining of a dataset to ensure organizations use deep learning incentives correctly might be impossible or extremely difficult.

5 Discussion and Open Issues

The IDSs are of various forms, which make them usable in the context of IoT frameworks. The usefulness of these systems depends on the specific use cases, where they are applied. One algorithm may fail to work in a context different from that for which it is designed. Thus, care should be taken to ensure that the correct methodology is deployed in a specific context. The failure to perform an analysis on the issues that may occur may result in unwanted complications. Table 1 is the summary of most related work from the literature along with techniques it also discusses the advantages and disadvantages of the machine learning algorithms.

6 Conclusion

IoT connects computers, but there are sensors, digital tools, and vehicles. IDS are an acceptable second line of defence for a plethora of companies. Big data analytics has become imperative in the analysis of data from IoT. IoT is the backbone of the big data trend with output information becoming the data or input for another system. The paper discusses recent algorithm and techniques used in big data incentives, the taxonomy of deep learning and its usefulness in IDS, and recent IDS threats. Examples of IDS are fuzzy logic, rule-based frameworks, support vector machines, artificial neural networks, and statistical intrusion detection systems. The basis of an IDS is on a signature is useful in detecting attacks that have already been identified. Developing excellent IDS expects understanding proper feature selection from the dataset of network traffic to detect the anomaly and the availability of a labelled traffic dataset from a real network that should be useful in the development of the intrusion detection system. Companies want to use these systems but are unwilling to share their data with competitors. Others fear the cost of installing IDS that will help keep their IoT devices safe. Unless the situation changes, it will be increasingly hard to implement IDS in IoT contexts.

Table 1 Summary of the most related works

Authors and year	Features	Advantages	Disadvantages
Munoz-Gonza´lez et al. (2017)	Convolutional neural network	High error detection rate	No way to be spatially invariant to the input data, cannot encode the orientation or position of the object, circumventing the problems needs adding more data
Tariq et al. (2022)	Convolutional neural network	Accurate, precise	No way to be spatially invariant to the input data, cannot encode the orientation or position of the object, circumventing the problems needs adding more data
Li et al. (2017)	Convolutional neural network	Accurate	No way to be spatially invariant to the input data, cannot encode the orientation or position of the object, circumventing the problems needs adding more data
Miller (2021)	Conditional deep belief networks	Accurate	Require a large volume of data, circumventing the problems needs adding more data
Mathew et al. (2017)	Conditional deep belief networks	Accurate	Require a large volume of data, circumventing the problems needs adding more data
Shamout et al. (2022)	Conditional deep belief networks	True positive detection	Require a large volume of data, circumventing the problems needs adding more data
Liu et al. (2017)	Conditional deep belief networks	Precise	Require a large volume of data, circumventing the problems needs adding more data

An Integrated Cloud and Blockchain Enabled Platforms for Biomedical Research

Taher M. Ghazal, Mohammad Kamrul Hasan, Siti Norul Huda Sheikh Abdullah, Khairul Azmi Abu Bakar, Nasser Taleb, Nidal A. Al-Dmour, Eiad Yafi, Ritu Chauhan, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract In the current pandemic scenario, healthcare data tends to be an important asset among organizations. The major challenge is to handle the data effectively while maintaining the privacy and security of the data. In a real-world, context healthcare data proves to be heterogeneous. Hence, managing such significance to big data has ardently laid numerous challenges among researchers and scientists around the globe. Cloud environment and blockchain technology can be discussed as usable platforms

which can deliver a comprehensive centralized data privacy system. In the current approach study, we have integrated both technologies to provide usability in medical systems. Further, we have also proposed and implemented a blockchain application with an integrated cloud-based environment regarding heterogeneous medical databases. The study is proposed in 2 phases to maintain the privacy and the accessibility of the data. The double-spending problem is also presented, as mentioned above, using Blockchain's consensus process. Each network node independently verifies the validity of individual transactions and entire blocks. As a result, there is no need to put faith in a single entity or other nodes. As a result, third parties are no longer required for network actions or blockchain management.

Keywords Blockchain technology · Cloud environment · Medical system · Healthcare databases

1 Introduction

In the recent era of digitization, data has exponentially grown from megabytes to terabytes. The challenge is to gather information from such volumes of data and provide an eccentric environment to maintain privacy and security (Alnazer et al., 2017; Hamadneh et al., 2021a, 2021b; Obaid, 2021; Shamout et al., 2022). Hence, a traditional computation system doesn't offer a paving technology to handle such generosity among the data (Ahmad et al., 2021; Alshurideh et al., 2020a, 2020b; Kurdi et al., 2020; Mehrez et al., 2021). We can say that blockchains are an emerging domain that may provide a substitute for outdated databases (Akhtar et al., 2021; Cruz, 2021; Guergov & Radwan, 2021; Khan, 2021). We may consider the different scenario in which domain may be used as a candidate solution Blockchain technology is a domain that offers us a global solution to our problems, which will create trust and guarantee transparency among several application domains (Alzoubi et al., 2020a, 2020b; Aziz & Aftab, 2021; Joghee et al., 2020). Hence, Blockchain manages privacy by maintaining centrally defined criteria. All connected chain members can check the centralized information by providing the right paths of the chain. Blockchain systems may have the capacity (Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi et al., 2022). The blockchain system is dependent on temperature conditions. During the documented and the transport, it assists in the cold chain. In this way, patients benefit from accessible documentation and are tampered with tracing the drugs flow transportation (Ali et al., 2022; Alzoubi et al., 2020a, 2020b; Mehmood, 2021).

The introduction of the Blockchain in the healthcare sector is primarily about increasing security and improving data protection. In addition to the possibilities of

the Blockchain for doctors, authorities, and patients, the interaction of the data flow between patients and hospitals or service providers in the healthcare sector can also be significantly improved (Alshurideh et al., 2022; Hanaysha et al., 2021a, 2021b). The Blockchain can be an ideal solution wherever information has to be stored and passed on. Even when companies exchange data from patients in the healthcare sector, the Blockchain improves data protection and transmission security (Alsharari, 2021; Alzoubi & Yanamandra, 2020; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b).

Another feature of Blockchain which unprecedently benefits end-users is smart contracts. The concept of smart contracts was introduced by Nick Szabo back in 1997 and is defined as a computer-based transaction protocol that implements the terms of a contract. Due to its properties, the Blockchain offers a suitable medium for implementing such contracts for the first time. Smart contracts are to be understood as computer programs that can make decisions when certain conditions are met. For this purpose, external information can be used as input through the smart contract, which then induces a certain action via the specified rules of the contract. The corresponding scripts with the contract details will be too stored in a specific address on the Blockchain (Alhamad et al., 2021; Ali et al., 2021; Alshurideh et al., 2020a, 2020b; Ghazal et al., 2021). If the specified external event occurs, a transaction is sent to the address, after that the terms of the contract are executed accordingly. Smart Contracts are tools with which human interactions are automated by executing, enforcing, verifying, and inhibiting contracts through algorithms. All interactions with the blockchain system, such as making payments, exchanging the digital key, or accessing the patient data, can be carried out by the user and the healthcare professional using a smartphone (Alzoubi, 2021a; Eli, 2021; Lee et al., 2022a, 2022b; Mehmood et al., 2019; Miller, 2021).

Health data management is crucial in the healthcare system. Their design may aid patients in receiving the correct diagnosis and avoiding drug errors. Cybercriminals had also turned their attention to patient data. Smart contracts can be used to correctly and safely manage patient health data (Al Ali, 2021; AlHamad et al., 2022; Mondol, 2021; Radwan & Farouk, 2021). Smart contracts will be used to store this information on a distributed ledger. When a patient needs to be transferred from one hospital to another, it can be done swiftly and efficiently without completing additional documents. Blockchain technology enables the patient's healthcare professional to examine his health data and medical records easily. Many hospitals and healthcare providers still use traditional databases. If these health data are saved in smart contracts and disseminated via Blockchain, they will be accessible to hospitals and research institutes worldwide. Smart contracts can also operate as gatekeepers, limiting access to data to only those with a private key, making it more accessible and transparent for both patients and providers (Alnuaimi et al., 2021; Alzoubi, 2021b; Farouk, 2021).

In Parallel, Blockchain can be implemented in patients' health records, which could be encrypted and stored in the Blockchain with a private key that only allows certain users access. Hence, efforts are aligned to ensure that research is conducted by HIPAA laws (securely and confidentially). Further, the study evidence can be stored in a blockchain and automatically sent to the payers as evidence of performance

(AlShamsi et al., 2021; Alshurideh, 2022; Alzoubi et al., 2021; Kashif et al., 2021). A directory could also be used for general health management such as drug monitoring, compliance with regulations, test results, and health product management to monitor the entire process. The patient data could be mapped in a digital contract for doctors and insurance companies. Hence, all the parties in the proposed contracts will be able to visualize the data at a glance; also, patients can decide individually which information they want to disclose (Alwan & Alshurideh, 2022; Hamadneh et al., 2021a, 2021b; Tariq et al., 2022a, 2022b).

There are several studies in the past conducted dealing with blockchain technology with varied application domains. We can say that Blockchain has unprecedently advanced and benefited biomedical research. For example, If the entire drug production cycle is handled in the Blockchain, all processes can be monitored. This includes production, transport, storage, and dispensing at the pharmacy (Al-Hamadi et al., 2021; Al-Naymat et al., 2021; Zitar, 2021). Manufacturers could check that the cold chain was adhered to, if necessary, and assign a QR code to the drugs. Patients can use this to verify the authenticity of medication and at the same time check the transport. In drug research, the Blockchain helps to obtain declarations of consent from testers more quickly and reliably (Al-Hamadi et al., 2015; Al Neaimi et al., 2020; Bibi et al., 2021). Here, too, data can be sent more easily between the various parties involved.

The advert facts and literature review show that blockchain technology has opened vast opportunities in several application domains. But certainly, medical systems are the need of time due to the current pandemic scenario. To address the factors related to healthcare application, the current study of approach is focused on shedding some light on the recent developments regarding the use of Blockchain in the context of public healthcare and discussing the workings and security features of blockchain technology in moderate detail. Further, we have also proposed and implemented a blockchain application with an integrated cloud-based environment regarding heterogeneous medical databases. The study is presented in 2 phases to maintain the privacy and the accessibility of the data.

In general, the paper's outline is discussed as an extensive literature study is conducted to understand the role of Blockchain in varied application domains. Then, a comprehensive framework is proposed in context with the medical system. Further, the study discusses the diverse impacts of Blockchain in the medical system. In the end, the conclusion and discussion is widely elaborated.

2 How Blockchain Works

A "blockchain" is a data structure in which data design is stored in an unchangeable manner. This takes place in the form of chained data blocks (hence the term "block" "chain"). Newly added data are regularly merged into a new block, provided with a data "fingerprint" (hash) and a timestamp or an ascending ordinal number (Al Hamadi et al., 2017; Aslam et al., 2021; Ghazal, 2021; Maasmi et al., 2021). In some

Licensed to (putm@utm.my)

blockchains, executable program logic, i.e., Smart Contracts, can also be saved in a forgery-proof manner.

To protect against tampering, exact copies are automatically generated and distributed via many independent computers, ideally globally distributed and operated by a wide variety of participants and organizations. Since the stored data is usually a log of transactions, it also comes from a distributed ledger, cashbook, or register, i.e., "Distributed Ledger Technology" (DLT). The hash of every data block in a blockchain is unique. Since the data fingerprint of the previous block is also taken into account when calculating this value, the hash of the newest block is also the data fingerprint of the entire Blockchain. This means that even the slightest change in older data is immediately noticeable when compared with other computers. Manipulation security is achieved with the help of automatic consensus building in the network.

As a distributed ledger, the Blockchain manages without a central authority, so the consistency of the data has to be ensured in another way. A new block to be appended must be identical on all computers involved in the network. To ensure this, certain conditions are specified which a block must meet to be attached to a blockchain or accepted by all nodes (Siddiqui et al., 2021). In the event of discrepancies, it is automatically determined based on a predefined algorithm which copies are discarded and recognized by all computers. This process is also called consensus-building. Traditionally, transferring values (e.g., amounts of money, property titles, certificates, ID cards, rights, etc.) requires intermediaries (e.g., banks or authorities) whom both transaction partners trust and who handle the transaction. Users of a blockchain trust its cryptographic protocol and that the majority of those involved (peers) behave honestly. In the future, distributed ledgers will take over intermediary functions in many application areas and thus enable a wide variety of peer-to-peer transactions ("trust through transparency") (Al-Dmour & Teahan, 2005). The concept of public-key cryptography was introduced in 1976 by Diffie and Hellman. An algorithm is used to generate a mathematically linked vital pair consisting of a private and a public key. This key pair can be used to create a digital signature. To do this, the sender signs or combines a message with his private key, which only he knows, and sends the resulting signed message to the recipient. He can now check the signed message with the sender's public key and thus verify the message's authenticity (if the two keys correspond). Overall, three goals can be achieved with a digital signature. Since only the sender knows the private key, the message's authenticity can be proven. In addition, the sender cannot deny having signed the message. Furthermore, the message cannot be changed unnoticed by the asymmetrical encryption, which guarantees its content integrity.

With the appropriate query tools often available online, the entire blockchain database can be searched and readout. If visibility is to be prevented, the data can also be encrypted and stored in the Blockchain. This leads to further challenges, such as the question of where the key material should be stored. In the case of public-permission less Blockchain, new data is not appended directly but initially forwarded to all computers in the network. After a few minutes, a computer "packs" all the accumulated data into a new block and attaches it to the Blockchain. Hash-secured data

can neither be deleted nor overwritten by individual participants. This is the most important unique selling point of blockchain technology, especially in public healthcare. Incorrect entries can always be corrected with a valid correction entry. Some blockchains only store simple information. The Bitcoin blockchain contains entries such as "Participant A transfers participant B two Bitcoins." Other blockchains offer more extensive functions: The Ethereum blockchain allows conditional transactions such as "After electronic confirmation of the delivery of the product P, A transfers the amount X to B." This enables business logic to be carried out automatically; this is known as a smart contract (Al-Dmour, 2016; Ali & Dmour, 2021; Zitar et al., 2021). With digital values stored on a DLT system, smart contracts are becoming a fundamental innovation for new business models. It should be noted that smart contracts are executed locally on each of the computers in the network. Compared to a central solution, smart contracts are very resource-intensive.

3 Integrated Network of Cloud and Blockchain for Medical System

In the past several studies are comprehended to understand the ease of technology in the real-world application domain. As we know, the current pandemic scenario has opened vast challenges among healthcare practitioners and scientists around the globe to determine the factors that can influence and improve healthcare costs. In comparison, the focus was to provide patients with utmost facilities with network capabilities. Hence, blockchain and cloud networks with healthcare databases can revolutionize administrators and healthcare professionals to work and enhance the captivity of their operations.

3.1 Development of Phase I Framework

The research framework was designed in 2 phases, Fig. 1 represents the first phase where the focus is to assimilate and regulate the factors responsible for sharing the information among healthcare professionals. Moreover, determining the benefits of technology can affluently impact the social and wellbeing of patients' healthcare.

3.1.1 Heterogeneous Medical Data

Patient data has immensely grown over the past decade, which has created massive challenges among researchers and scientists to design new adaptive technology. We may say that gathering the data from varied resources or heterogeneous has consolidated in the form of big data. This data has created a background to enhance our

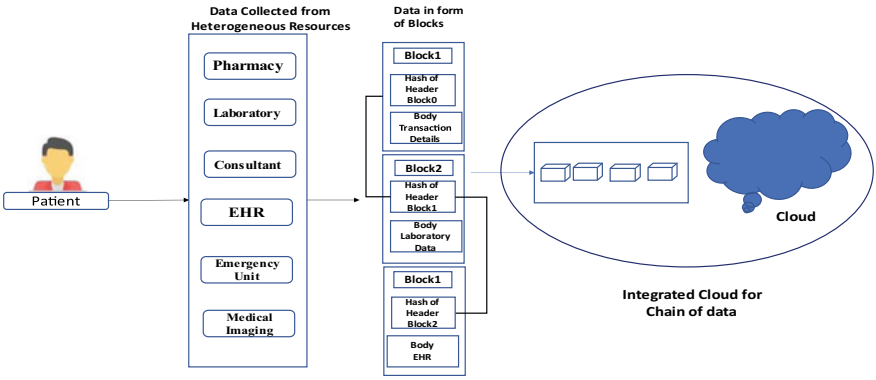

Fig. 1 The framework of phase I

technology to discover, analyze, and provide end-user services in a secure environment. Hence, Blockchain can be discussed as the technology which can cross many hindrances and give substantial privacy among the data shared. In Fig. 1, we have applied a coagulative blockchain and cloud computing approach in the healthcare system.

In the healthcare system, we can find data of several types such as patient symptoms, financial data, societal factors such as age, gender, origin, past abusive records, and others stored in the alphanumeric form. Moreover, audio, videos, imaging, including MRI, CT, Pet scan, and other aspects of data have different formats for storage. Then, we integrate the data from heterogeneous resources then we are submerged in the pool of data. Real-time accessibility of data in a private mode is the challenging factor; hence the Blockchain is the key technology that end-users can provide. I the current study of approach, we have designed a framework that can adhere and cope with the heterogeneous nature of data.

In the proposed approach, all the patient data was collected from varied heterogeneous resources such as Laboratory, Imaging data, Electronic Health Records (EHR) of the patients, Pharmacy data, and other clinical aspects of the patients. The first framework level extracts the data in different formats. It generates the data in blocks while uploading the same on the cloud-based architecture using recommender from the medical practitioners.

3.1.2 Blocks of Data

As we know, data has been gathered from disseminated resources, which has prudently influenced the medical system. Moreover, the data is stored in nodes where each node is subdivided into sub-headers to organize the data in the structured format eventually. The node consists of a header with a body; we can infer it to be a form of linked list where the body refers to having actual information or data of patient's

information. At the same time, the address of the previous node is stored in the hash value. The current scenario pertains to the flow of information from one end to another in a chain. This data network is flowing, which can alter the data with the flexibility of hashing technique and significant moment of nodes.

Similarly, Blockchain can be stated as a digital chain of records, where the links (blocks) of the chain are permanent records that rely on the previous link (block) to complete the document that is checked publicly through a network by machines (computers). The Blockchain contains one-way encryption so that the data, while publicly accessible and verified, remains secure and proprietary. This creates several security features that make it a leading approach in digital cryptography.

3.1.3 Integrated Network of Cloud and Blockchain

In general, the availability of medical data at a critical time can be essential for patient wellbeing. In several conditions, the monitoring of the patients can occur in a heterogeneous environment where the team of doctors from various hospitals needs to investigate the patients on different parameters. So, the challenge is to create an environment where patient healthcare data and financial transactions are easily maintained from one end to another. Adopted blockchain technology can play a crucial role in enhancing interaction among healthcare practitioners and providing a collaborative environment for end-users to handle such limitations.

Thanks to Blockchain, patients have more control over their medical records thanks to Blockchain, and it could also be used to transmit real-time data from wearables and medical equipment with doctors. Using the technology's secure network, medical gadgets might be tracked correctly from manufacturing through installation during patient operations. Regulatory authorities, who would gain from mandating the integration of blockchain technology to simplify medical device approvals and post-market surveillance, are likely to push blockchain adoption by medical device manufacturers. Blockchain will make it easier to collect and review patient data and medical device performance data during clinical trials. Clinical trial data could also be manipulated or falsified with the use of technology.

Further, blockchains make a distinction between public and private variants depending on the visibility of the data. In the personal variant, visibility is limited to authorized participants. The right to append blocks to the chain can be controlled in both cases: one speaks here of the properties "permissioned" or "permission-less." Here, public permissioned Blockchain is used in the public healthcare scenario, while a more restricted version is employed in biomedical research. In all cases, data stored on a blockchain can be encrypted so that the participants do the transactions but cannot see the content transported in it. The Blockchain in a different form to access the data can be discussed as below:

1. **Public Permissionless Blockchain**: All entries are open, while all participants remain anonymous or pseudonymous. Examples: Bitcoin blockchain, Ethereum, EW blockchain.

2. **Public Permissioned Blockchain**: Access for participants is controlled by technology. With this type of Blockchain, the system's end users are subject to the specified framework conditions and rules.
3. **Private Permissioned Blockchain**: All participants are known. Since the participants often know each other and their number is usually lower, reaching a consensus is simplified so that the creation of blocks is speedy.
4. **Private Permissionless Blockchain**: This type of Blockchain is suspected of being out for the snowball effect and is more likely to pursue fraudulent purposes.

Moreover, cloud-based computing and Blockchain can quickly investigate, store, and provide a private environment for a healthcare-based system. The cloud-based system has attracted several users to store the data, process the data, and deliver the services to end-users as per the need of the time. Nowadays, it has attracted several small and large organizations where they pay for the data or services which are required at an essential time. Hence, forfeited benefiting many organizations in terms of cost while enhancing the flexibility of time and availability. In the current proposed study, we have integrated the cloud and blockchain technology to provide the healthcare system with the flexibility of data storage, analysis of the study, and maintaining the private environments for patients' data.

3.2 Framework for Phase II

In a previous phase I, data is generated from patients and further stored in nodes in a cloud-based interactive environment. However, the challenge is to access the data while maintaining privacy and availability to end-users. Hence, blockchain technology can be easily applied to medical systems as it can easily allow a transaction to work securely while maintaining privacy among the user's access. In Fig. 2, a representative model depicts the flow of information patients' data in the distributed environment where confidentiality and privacy are maintained. For example, if the insurance companies want to access the patient's records, the organization needs to send a request to a cloud-based system. Where the receiver will access the request and confirm the ownership of data while verifying through the e-stamp. The e-stamp is the value that is generated during the transaction.

Although data on a blockchain is viewable by everyone, it is stored encrypted (depending on the technology) or for data security purposes. Encryption is often accomplished through the use of tried-and-true technologies such as public/private key cryptography. Participants are responsible for their key and identity maintenance, whether physicians or patients; a blockchain does not set any requirements for this. In the event of a private-permissioned blockchain, the patient's data can also be packaged behind a firewall, further restricting access. It should be highlighted at this time that future breakthroughs in the realm of quantum computing might significantly call into question the security of encryption and distributed ledger technology. Because the volumes of data recorded on a blockchain are tiny, it is common for merely

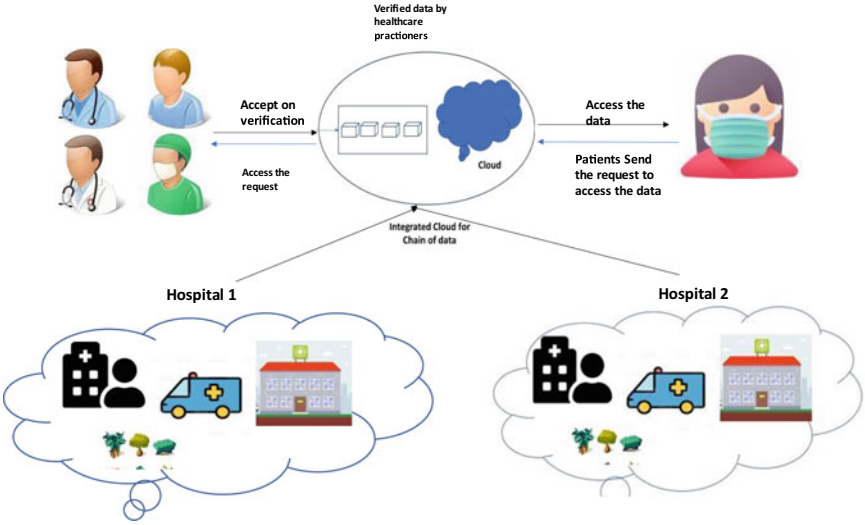

Fig. 2 The framework of phase II

a mathematical summary of the data to be placed there (usually as a hash). The chain member must then find out how to store the original data on safe servers but may subsequently establish its status at a particular time by making an entry in the Blockchain. All notarial applications are based on this.

Medical information is available with a high degree of certainty at all times due to the sheer technology, distributed, and fragmented storage, provided that a sufficient number of nodes keep the complete data set available so that partial failures of the underlying network can also be tolerated. Targeted attacks on a single central point are not feasible, while an attacker can restrict availability in private blockchains with considerable effort. A higher connection rate strengthens the network's resistance to failures caused by targeted attacks or technical faults.

To affect a blockchain of the public-permission kind with proof-of-work as a whole, an attacker must have control of the majority of all computers. It is problematic and quickly becomes apparent when the code is released as open-source and spreads across different nations, jurisdictions, and operators. The bulk of attacks on smaller systems have already succeeded. The great majority of attacks, on the other hand, are phishing efforts that steal access details. Mining malware, selfish mining, distributed denial of service, hacked crypto wallets, transfer Trojans, and other indirect attack scenarios are also feasible.

Hence, an identical architecture can be followed in the distributed environment of the medical system. Several hospitals can treat a patient while maintaining the financial ecosystem of the patients and providing flexibility among the healthcare practitioners to access the patients' data and provide comprehensive services to end-users.

Blockchain and IoT Enabled Healthcare

In the field of medical technology, various applications of Blockchain and smart contract ideas are conceivable. Although no concrete application scenarios have yet been created and published, research interest has already been aroused. In the age of digital medicine, more and more health-related data are available in different years. This leads to longitudinal sensor data such as radiological images, clinical information, outstanding patient files, and compassionate data, for example, genetic tests.

Modern preventive medicine requires evaluating such data across the population, for example, using current model-free statistics (deep learning). Traditional modeling in this environment is not used since data cannot be collected and made available in a centralized manner. There are no socially accepted methods of secure data storage and secure usage monitoring. One way out could be mechanisms that allow the owner of the data transactional, auditable control over its use. That is precisely the value proposition of blockchain technology. Not all blockchain characteristics are required; for example, it is unnecessary to decentralize the verification. According to the prevailing opinion, there are at least three significant technical challenges to be mastered:

1. **Complete data usage monitoring**. It must be demonstrably excluded that data usage bypasses the system. This can also make it necessary to certify secure hardware.
2. **Group and person-specific usage permits**. It must be possible to restrict the use of data to certain people or institutions or specific parts of the data.
3. **Complete decentralized data and logs**. Data must be transported across systems in a scenario where data is kept decentrally (in hospitals, insurance firms, mobile devices, etc.). Securing the communication from unauthorised usage is a significant problem.

In all three areas, some projects and approaches could be a basis for opening up a new type of access to the area of personalized, data-driven health management.

Data-centric medicine is the name for this type of tailored therapy. Today, data are abundant on a patient, and it continues to grow dramatically. Whereas a laboratory result and an X-ray image may have been the basis of a medical judgment in the past, many metrics will be used to produce an entire picture for medical recommendations in the future. In the context of patient management, this will also modify structures and processes. In the whole therapeutic chain, patient data takes the lead. The rising specialization of professions is also driven by data-based knowledge about a patient's health and the potential diagnoses, remedies, or preventive actions.

Traditional providers in the health sector and new suppliers such as companies in the food industry, sports, fitness, medical technology, or the IT sector will constitute the nodes of dynamic health networks that revolve around the individual. The rate at which people make decisions about preventative measures or therapies is increasing, as is the number of new products and health services available. Furthermore, this

type of tailored medicine allows you to find new places for health and arrange health themes flexibly, such as at home, in the car, in a restaurant, or at work.

As a result, data protection in the future must imply that patients have control over their data and decide how it is handled. He must trust that his data is constantly current and accessible while also being safeguarded from illegal third-party access. Blockchain technology plays a critical role in this scenario. The digital currency Bitcoin is the most well-known and oldest blockchain application. It is no longer enough to attack a single server to steal or alter sensitive patient data; now, every single computer in the Blockchain must be hacked. As a result, the system is highly safe and appropriate for sending sensitive health or medical information.

Apart from personal healthcare, Blockchain applications have proven useful in clinical studies, especially those involving several centers, placing high logistics and documentation demands. By using a blockchain, the history of the events and the existence of the data can be proven beyond doubt. Subsequent changes are practically impossible. This helps in monitoring and controlling clinical trials. It then makes it easier for licensing authorities to check the integrity of the data and thus evaluate the study results.

A case that exemplifies the use of Blockchain is in the scope of the supply chain is the cold chain of drugs. To guarantee the effectiveness of certain medications, it is necessary to transport them under precise temperature conditions. The negative consequences of an ineffective drug can be financially far-reaching for companies and, most importantly, ultimate for patients. Guaranteeing a constant cold chain and documenting it remains a crucial challenge to this day. The complicated transport logistics, in which many different parties and systems are involved, is inefficient and prone to problems such as lack of transparency and traceability of the transport routes and temperature conditions. It can result in retailers receiving drugs that they cannot understand the quality of and patients ultimately taking ineffective drugs.

While the sensor technology for the control of drugs is already partially available and the interface to the Internet of Things can ensure that the corresponding analysis data is fed into digital systems, a piece of the puzzle is missing for a holistic solution to the problem. This Blockchain can create trust between the individual participants in the supply chain and the end consumer. Without a blockchain, the information about the medication is stored and passed on to the consumer. Central servers or even in paper form. This creates a dependency on each intermediary involved in the supply chain—government officials, customs, banks, transportation and storage companies, etc. Coordinating all of these parties is also highly time-consuming and costly.

Another critical point here is increasing the efficiency of the supply chain, especially in terms of administration and payment. Here, Smart Contracts can call necessary information, and payments are automatically processed between the respective parties. For example, a contaminated medication package discovered afterward can trigger a corresponding complaint payment directly. Salaries and fees to transport companies can also be paid directly upon successful delivery.

4 Conclusion

While Blockchain promises to improve interoperability, security, and data protection, its limits must be recognized. The Blockchain is not intended to replace existing databases. Furthermore, the solutions are not appropriate for large amounts of data that require exclusive access inside a single firm. Blockchain solutions are designed to capture specific transaction data and distribute it to many users in a network where transparency and data security are critical.

The combination of a decentralized peer-to-peer network and a consensus technique for determining the state of the Blockchain offers up a flood of new possibilities. Because all network users often replicate both the Blockchain and individual processes such as digital signature verification, there is no single point of failure inside the network. This demonstrates that both network failure security and data availability are high. The consensus process also avoids the previously noted double-spending concern. Each network node separately verifies individual transactions and whole blocks. As a result, there is no need for trust in a single entity or other nodes; as a result, third parties are obsolete for network actions and blockchain maintenance.

Blockchain can be a game-changer in the healthcare sector due to its versatility and security. Blockchain as a forerunner in safe digital infrastructure Blockchain technology has several applications in the healthcare field. However, it is not yet thoroughly developed, nor is it a panacea that can be used immediately. First and foremost, several technological, organizational, and behavioral economic difficulties must be overcome before healthcare providers can adopt a blockchain tailored to the healthcare sector.

Analysis of Issues Affecting IoT, AI, and Blockchain Convergence

Nasser Taleb, Nidal A. Al-Dmour, Ghassan F. Issa, Tamer Mohamed Abdellatif, Haitham M. Alzoubi, Muhammad Alshurideh, and Mohammed Salahat

Abstract The purpose of this project was to appraise the integration or convergence issues influencing the mutual functioning of blockchain, AI, and IoT. The study argued that the recent developments in the field of IoT and blockchain prediction have involved the integration of innumerable classification schemes to establish a hybrid model. The introduction of the hybrid technique relies on the prediction performance that strives to override the limitations of any available architectural

scheme. This study offers a comprehensive exploratory appraisal of the issues influencing the successful integration of IoT and blockchain in regards to functionality and effectiveness of security, trust, and flawless communication issues. The exploratory research methodology was used in analyzing the issues affecting the integration of blockchain, artificial intelligence (AI), and the internet of things (IoT). The findings indicated that the integration challenges influencing the effective operations of blockchain, AI, and IoT as a single system involve security, scalability, accountability, and trust of communications. The study recommends that successful and effective integration will enhance the development of new business models as well as the digital transformation of market corporations. Accordingly, new approaches to convergence should ensure that executives address the new technology demands to obtain significant gains in efficiency.

Keywords Artificial intelligence · Internet of things · Blockchain convergence

1 Introduction

New developments in the integration frameworks between IoT and blockchain in different fields have sparked debates concerning the actual framework that should be adopted by firms desiring to benefit from the convergence of the two technologies (Akhtar et al., 2021; Al Ali, 2021; Alhamad et al., 2021; AlHamad et al., 2022). As one of the principal concepts guiding new prospects of industrial revolution, the Internet of Things (IoT) has achieved immeasurable milestones. Globally, the projected growth of IoT was about $170 billion in 2017 and is expected to be about $560 billion by end of the financial year 2022 (Ali et al., 2022; Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2022). Although countless professionals have indicated that IoT is the new industrial revolution, key challenges have affected the performance of IoT, starting from the ancient days in which there was the lack of a protected ecosystem covering all the construction blocks of IoT design as well as the scalability issues affecting the entire system. The number of devices operating in any IoT system has been one of the primary issues affecting the performance of IoT since its introduction.

It is commendable that the IoT has enhanced a common operating picture (COP) handling many applications and aspects of modern day life (Alshurideh et al., 2020; Alzoubi, 2021a, 2021b; Alzoubi et al., 2020a, 2020b, 2022). Blockchain, in this regard, has enhanced the effectiveness of COP because it has advanced the operations of wireless network and sensor devices that could not otherwise communicate via the conventional IoT network. Blockchain, artificial intelligence (AI), and IoT are the principal technologies that have driven the next phase of digital transformation. It is projected that these technologies will enable for the creation of new business models, including autonomous agents, digital version of IoT, receiving or sending money via blockchain technology, and autonomous decision-making as independent agents of economy.

The IoT has enabled a complex connection of things or objects, powered by sensing, communication units, and processing, to identify physical events, interact with their environments, and exchange data. The objective of such interactions is to monitor processes or make decisions concerning events requiring human interventions. Perhaps the most renowned inspirations related to the rise of IoT systems was the need to foster the real-time information collection as well as the need to offer remote and automatic control mechanisms that have replaced current conventional control and monitoring systems across industries (Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b, 2021a, 2021b). The integration between IoT, AI, and blockchain will introduce a new system architecture that will control and advance most of the ineffective procedures associated with the welfare of humankind.

2 Theoretical Framework

The theoretical framework adopted in this study considered the limitations of the existing shreds of research on the most effective convergence architecture for AI, blockchain, and IoT. The current research, in this regard, utilizes generalized philosophies and theories concerning the effectiveness of convergence between the three aspects of modern industrialization, including blockchain, AI, and IoT (Aziz & Aftab, 2021; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021b). The theories considered in this depends on the fact that the distributive ledger aspect of blockchain is one of the solutions for the existing security and privacy challenges.

2.1 Operational Definitions

- *IoT*—refers to the Internet of Things
- *COP*—denotes common operating picture
- *AI*—refers to artificial intelligence
- *Blockchain*—defines the digital transaction ledger that is often distributed or duplicated across the whole network of devices and computers operating in the chain of blocks.

2.2 Industry Description

The general industry guiding the integration of IoT, AI, and blockchain has produced innumerable scales of information requiring power, network connectivity, storage, and processing (Alhashmi et al., 2020; Al Shebli et al., 2021; AlShamsi et al., 2021; Nuseir et al., 2021; Yousuf et al., 2021). The objective of convergence, in this regard,

is to transform available data into meaningful services and information (Alshurideh, 2022; Alwan & Alshurideh, 2022; Tariq et al., 2022a, 2022b; Emad Tariq et al., 2022a, 2022b). Along with concerns such as network scalability and reliable connectivity, data privacy and cybersecurity are issues of critical importance regarding the networks serving IoT and related systems (Guergov & Radwan, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021a, 2021b; Joghee et al., 2020). The current industry involves centralized designs that have widely been used to connect, authorize, and authenticate different IoT network nodes.

3 Literature Review

The integration and performance issues affecting convergence of blockchain with the Internet of Things (IoT) has been addressed by many scholars. One of the main concerns of the issues affecting the seamless integration involve the fact that integrating these technologies focused on the prediction performance by filling the gap of limited literatures on the previous classification or convergence techniques. In modern world, artificial intelligence, IoT, and blockchain technologies have been acknowledged as innovations that can promote the existing business processes, disrupt entire market economies, and establish new business models. For instance, blockchain can enhance business process efficiency, security, transparency, and trust because of its decentralized, distributed, and shared ledger (Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b).

Issues affecting convergence or integration between AI blockchain, and IoT has often been neglected based on many factors. For example, these three technologies are often used separately and selectively based on the demands of a specific firm. These innovations, however, should be implemented collectively now and in the future. One potential integration platform between these technologies is the use of IoT to provide and solicit data, with blockchain offering the setup rules of engagement and infrastructure while the AI maximizing the rules and process optimization.

Information process integration for security, trust, and seamless flow is one of the principal objectives of connection IoT, AI, and blockchain. There are many solutions for addressing the vulnerabilities and threats affecting the operations of IoT. IoT has played a crucial role in the daily organization level by ensuring the ease of working in diverse enterprises. Accordingly, the threat level existing in IoT devices is relatively high, indicating that the assessment and integration demands of the different models must be guaranteed to ensure orientation (Mehmood, 2021; Mehmood et al., 2019; Miller, 2021; Mondol, 2021; Obaid, 2021). Because IoT security is critical commensurate with the activities of hackers and malicious users, it is arguable the current architectures are often prone to attacks.

Convergence between AI, blockchain, and IoT has also been discussed by several shreds of literature. It is outlined that the use of AI, along with the abilities of IoT has enhanced treatments targeting patients suffering from Hepatitis C, a blood-borne infection that is often asymptomatic in the initial phases. The progression of hepatitis

C throughout the final phases often complicates the treatment and diagnosis process. Accordingly, a system based on AI and machine learning algorithms can assist healthcare providers in offering effective diagnoses in the early stages (Radwan & Farouk, 2021; Shamout et al., 2022). Based on the effectiveness of the blockchain in ensuring seamless, secure, and confirmed flow of information, it is arguable that the convergence of AI, blockchain, and IoT can significantly enhance the services given to patients suffering from hepatitis C.

4 Problem Statement, Research Gap, Research Contribution

Many pieces of research have tackled the issues, capabilities, benefits, and challenges facing the integration of AI, blockchain, and IoT. The existing studies, however, have only focused on particular areas, including health, finance, and agriculture, with finance being at the forefront of most emerging studies (Afifi et al., 2020; Al Batayneh et al., 2021; Ali et al., 2021; Alzoubi et al., 2021a). Despite the evident success of the convergence of blockchain with IoT in some of these fields, the analysis of converging AI, blockchain, and IoT has not been addressed in most of the existing bodies of literature. Accordingly, this study strives to determine the opportunities and challenges of integrating these three technologies using the best architectural model to enhance the accountability and accuracy of offering a broad range of services.

4.1 Research Model and Hypotheses

The analytical approach was considered as the best research design for this research. An analytical mechanism denotes the application of appraisals to decipher an issue down to its specific elements appropriate for finding a solution. Generally, the analytical approach is also referred to as formal analysis (Ghazal, 2021; Ghazal et al., 2021a, 2021c, 2021d). The primary challenge linked with the analytic approach, however, is that the existing tools are limited to the specific problems they can identify and solve. The approach adopted in this study is founded on the fact that the issues influencing integration between IoT, blockchain, and AI include the common elements such as efficiency, trust, accuracy, and scalability. Commensurate, the research design or model hypothesizes that integrating the three technologies can produce significant outcomes for organizations over time.

4.2 Methodology and Research Design

The adopted methodology was the quantitative research design. The selected research method focused on the performance of organizations that have implemented the AI, blockchain, and IoT in delivering services to public. Quantitative research was important for this study because it is crucial to identifying trends and averages to predict or evaluate causal associations that generalizes outcomes to a broader population in the end (Ghazal et al., 2013; Kalra et al., 2020; Khan et al., 2021a, 2021b). This research method was adopted as an experimental and correlational research technique because it formally examines the predictions or hypotheses based on statistics.

Based on the required data to perform a comprehensive quantitative analysis of the data on convergence issues affecting the integration of blockchain, Ai, and IoT, trust issues were the major element involved in the process. Trust is one of the primary concerns that has affected the integration of blockchain with IoT and AI. The quantitative approach, in this regard, involved the different procedural steps appropriate to the existing study. Principally, the advantage of using a quantitative research method is that the design is necessary regarding the use of factual data needed to address research questions.

In the process of determining the most appropriate quantitative method for the study, the study relied on the proportion supporting the assisted perception, which concerned the distribution of respondents according to age, residence, household income, and marital status, among others (Lee et al., 2021; Matloob et al., 2021; Naqvi et al., 2021). Additionally, the study data focused on the number of companies that have performed based on issues such as level of education and understanding of key issues guiding data use and the need for historical evidence.

4.3 Population/Sample/Unit of Analysis

The sampling, population, and unit of analysis was regarded as one of the fundamental elements of the study. In this research, it was considered that the companies that have implemented some of the suggested frameworks have understood some of the most influential elements, including, among others, the challenges, benefits, and opportunities associated with any of the emerging issues. Regarding the study and associated measures, it is arguable that the study determined the efficiency of the suggested approach because of the urgent need to foster the transaction rate occurring through blockchain transactions.

According to the exploratory design of the suggested framework, this study considered the fact that the efficiency of any applicable approach should follow the contribution of the following specific elements: transaction efficiency (described as the study equation—Eq. 1), n (number of business transactions happening through the integrated AI, IoT, and blockchain platforms), communications trust via trust (t), and the nature of security associated with the transactions (s). It is noteworthy that

this model relies on the findings and design of the study conducted by Ghazal et al., in which the analysis relied on the equation outlined below

$$\text{Effectivity of performance} = s + n + t\,(n) \tag{1}$$

The inclusion of n depends on the fact that the data used in the appraisal relied on the procedural developments of blockchain in the development of convergence metrics between AI, blockchain, and IoT. In one of the papers published by the individuals supporting the convergence of blockchain, AI, and IoT, Ghazal et al. argue that the computation of the immediate communication trust focuses on enhancing the trust of consumers concerning the most detailed model of the blockchain.

5 Analyzing Data

Equation 1 presented above outlines all the variables that have been used in presenting all the data aspects in this study. Accordingly, once this process improves, it is arguable that the integrated architecture covering convergence of IoT, AI, and blockchain will outline a comprehensive sequence of tests to determine the accuracy of handling the challenges influencing the existing block chain models. In this study, the immediate test concerned the computation of trust transaction that majorly focused on the capacity of companies to improve the level of trust in the suggested blockchain models. It is arguable that this aspect was obtained via seeking the attitudes of the different users concerning their ability and capacities to obtain the outlined requirements.

The data model, commensurate with the qualitative analysis study has many inferences. Firstly, the level of consumer/customer trust is determined by adding the scale of successful transactions (St) to the number of unsuccessful transactions (Zt). The outcome of this figure is divided by tt (the aggregate or total transactions). In this regard, Eq. 2 provides the actual number of transactions associated with any type of transaction.

$$\text{T or transactions trust} = (St + Zt)/tt \tag{2}$$

Based on the equation above, it is difficult to determine the security of the transactions that can happen without allowing or understanding of the detected threats. In this regard, it is arguable that the threat numbers is computed by dividing ts (solved threats) with the overall risks or threats identified in the entire convergence system.

The number of secure transactions following the convergence of AI, IoT, and blockchain (S) is denoted by Eq. 3:

$$S = (td - ts)/td \tag{3}$$

S = (td –ts)/td. Which reflects the number of transactions as

Licensed to (putm@utm.my)

N = transaction days (dt)/average daily transaction (adt); that is:
N = 9dt/adt.

5.1 Discussion of the Results

It is arguable that one of the many challenges affecting effective integration of AI, IoT, and blockchain is the existence of heterogeneous alternative outlining the variety of IoT devices and applications that needs to integrate AI and blockchain with IoT tech founded on their requirements and demands (Rehman et al., 2021; Suleman et al., 2021). Generally, these alternatives are only founded on particular use cases that cannot suit a broad range of devices and applications in this specific sector.

As a result, new studies should advocate for the development of a set of standards and protocols that can support the essential and basic needs of all IoT devices and applications rather than introducing applications/devices that can only operate via IoT networks. The combined potential of AI, IoT, and blockchain is immeasurable. Based on existing kinds of studies, it is arguable that the amalgamation of AI, IoT, and blockchain technology can unlock several new business architectures for the accrual of funds from IoT devices and applications. The results presented in the formulas and considerations outlined above resonates with the fact that the security of transactions have the accuracy that reflect the percentages produced by the following formulas. When comparing the models, it is appropriate that the architecture controlling the design of the tables indicate centralization as about 100% of the model. These results indicate that either of the algorithms applicable in the development of a perfect architecture can help address all the concerns of blockchain, AI, and IoT convergence in both the short and long-terms.

6 Conclusions and Recommendations

The objective of this study was to assess the most recent and adopted architectures of blockchain. The analysis involved comparing the most popular, recent, and interesting consensus algorithms as well as evaluating the integration between IoT, AI, and blockchain via illustrating the existing field research. The paper also offered a comprehensive overview of the disruptive studies on the topic that current authors have continued to investigate. The findings indicated that the convergence between AI, blockchain, and IoT can enhance the adequacy of computational level as well as efficiency in optimizing the energy consumption of connected devices. AI, IoT, and blockchain are technologies that will continue to be integrated in myriad dimensions. This paper contends that the integration of these innovative models will occur because services, products, and business models will benefit from the diversity of these technologies. Generally, these business models can be widely adopted by any independent agent, including cameras, trucks, machines, cars, and numerous sensors.

Breast Cancer Prediction Using Machine Learning and Image Processing Optimization

Nidal A. Al-Dmour, Raed A. Said, Haitham M. Alzoubi, Muhammad Alshurideh, and Liaqat Ali

Abstract In this study, it is wanted to implement Naïve Bayes data mining techniques on a dataset gained from digitized Image of fine needle aspirate (or FNA) belonged to benign and malignant type of breast tumors. One of the most important factors causing cancers in the females, which can be measured from sample after maintaining in several hours' laboratory sample preparation at certain condition. As an alternative, Image processing can be substituted by measuring the geometrical features of FNA are well adopted economically and efficiently.

1 Introduction

Despite of the fact that planar feature separation is the main point discussed on the literature, we would like all feature in a standalone model to use Naïve Base Prediction modelling along with the evaluation by a separate testing dataset (Akhtar et al., 2021; Al Ali, 2021; AlHamad et al., 2022). The objective is not only to evaluate the prediction on the cancer dataset but also to check if Bayes Naïve is a good substitute for feature extraction (Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2020a, 2020b, 2022; Alzoubi, 2021a, 2021b). The most important required libraries are discussed in the following section.

Naïve Bayes is the method used in Machine learning for the classification of two or more objects which are very similar to variance and regression analysis dependent variable is linearly relate to the other variables (Akour et al., 2021; Al Kurdi et al., 2021; Alhamad et al., 2021; Ali et al., 2021, 2022; Alnazer et al., 2017; Alshurideh et al., 2020a; Salloum et al., 2020). Technically this algorithm using Bayes conditional probability:

- C is the class label:
  - C ϵ {C1, C2, … Cn}
- A is the observed object attributes
  - A = (a1, a2, … am)
  - P(C | A) is the probability of C given A is observed Called the conditional probability.

For observed attributes A = (a1, a2, … am), we want to compute and assign the classifier, Ci, with the largest P(Ci|A).

Two simplifications to the calculations.

Apply naïve assumption—each aj is conditionally independent of each other, then Denominator P(a1, a2, … am) is a constant and can be ignored.

In this paper, the essential data preprocessing stages are described in Sect. 2 then in Sect. 3 the configuration of Python for the LDA analysis are explained. Modelling methods is the subject of Sect. 4 and their tuning parameters are described in Sect. 5. The results are shown for the classification accuracy are discussed and the confusion matrix is represented. At last, the results are summarized and the usage of the Machine Deep Learning in Tumor Dataset classification are discussed in the conclusion.

2 Dataset Description

A. Dataset Description: The dataset features are consisted of 10 * 3 features according to ten parameter's Mean, Standard Error and Worst Value as follow:

(a) radius (mean of distances from center to points on the perimeter)

(b) texture (standard deviation of gray-scale values)
(c) perimeter
(d) area
(e) smoothness (local variation in radius lengths)
(f) compactness (perimeter^2/area − 1.0)
(g) concavity (severity of concave portions of the contour)
(h) concave points (number of concave portions of the contour)
(i) symmetry
(j) fractal dimension ("coastline approximation" − 1).

These parameters are gained by Image Processing software. This method consisted of the following steps:

1. Kernel Boundary Estimation with image processing
2. Geometrical estimation of parameter statistical
3. Gradual Optimization by Kernel Estimation.

B. Identifying Python tools and libraries

For this module we will describe the required libraries and tools for python framework which can model the data as well as doing all data preparation. The code itself will be provided in html and pdf formats:

1. libraries for arraying algebra, Density and Probability scatters

   (a) pandas
   (b) numpy
   (c) plotly
   (d) os
   (e) seaborn
   (f) imblearn
   (g) plt
   (h) scatter_matrix
   (i) sklearn.

2. sklearn libraries for data preparation

   (a) train_test_split
   (b) preprocessing
   (c) LabelEncoder
   (d) RobustScaler.

3. sklearn libraries for data mining, validation and reporting

   (a) BernoulliNB
   (b) metrics
   (c) classification_report
   (d) confusion_matrix

(e) accuracy_score.

In Tumor dataset 30 attributes are applied in the Gaussian Naïve Bayes to predict one target variable. At first data should imported in Jupiter notebook for further preparation by panda's library function read_csv.

All variables are real number other than diagnosis and ID which is integer which should be dropped from the variable raw_data and moved to train_raw. These variables' histograms are shown in Figs. 1 and 2.

3 Methodology

We have used python 3.6 to import the dataset into Jupyter Notebook. The details of results of coding within the description of all attributes are attached in the Appendix I; The distribution of diagnosis (target) is shown in Fig. 3 which should be drop to form to distinct variables X and then only diagnosis moved to variable y. Afterwards, the train_raw is splitted into train/test partitions with X_train, X_test, y_train and y_test. The train X_train has 398 with 30 columns while y_train would be 398with one column. On the other hand, the X_test has 171 records of data. The result of Gaussian fit function would be exported to pred variable.

After these preparation step test and train should be standardized to reduce the overfitting bias (Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b, 2022; Nuseir et al., 2021). For this purpose, we have imported RobustScaler (Al-Hamadi et al., 2015, 2021; Ali & Dmour, 2021; Al-Naymat et al., 2021; Aslam et al., 2021; Bibi et al., 2021; Ghazal, 2021). The Robust scaler use a transform and fit functions which is robust to outlier and remove the median and scale all features (Alzoubi & Ahmed, 2019; Aziz & Aftab, 2021; Alzoubi et al., 2020a, 2020b, 2021; Cruz, 2021; Eli, 2021). The correlation map was also visualized in Fig. 4. The advantage is that it shows the range of variables with their color (Maasmi et al., 2021; Siddiqui et al., 2021; Zitar, 2021; Zitar et al., 2021).

4 Results

In the following a training table layout that allows visualization of the performance of Naïve Bayes model are shown.

Accuracy on train set 0.9422110552763819

[[2427]

[16133]]

	precision	recall	f1-score	support
B	0.94	0.97	0.95	249
M	0.95	0.89	0.92	149

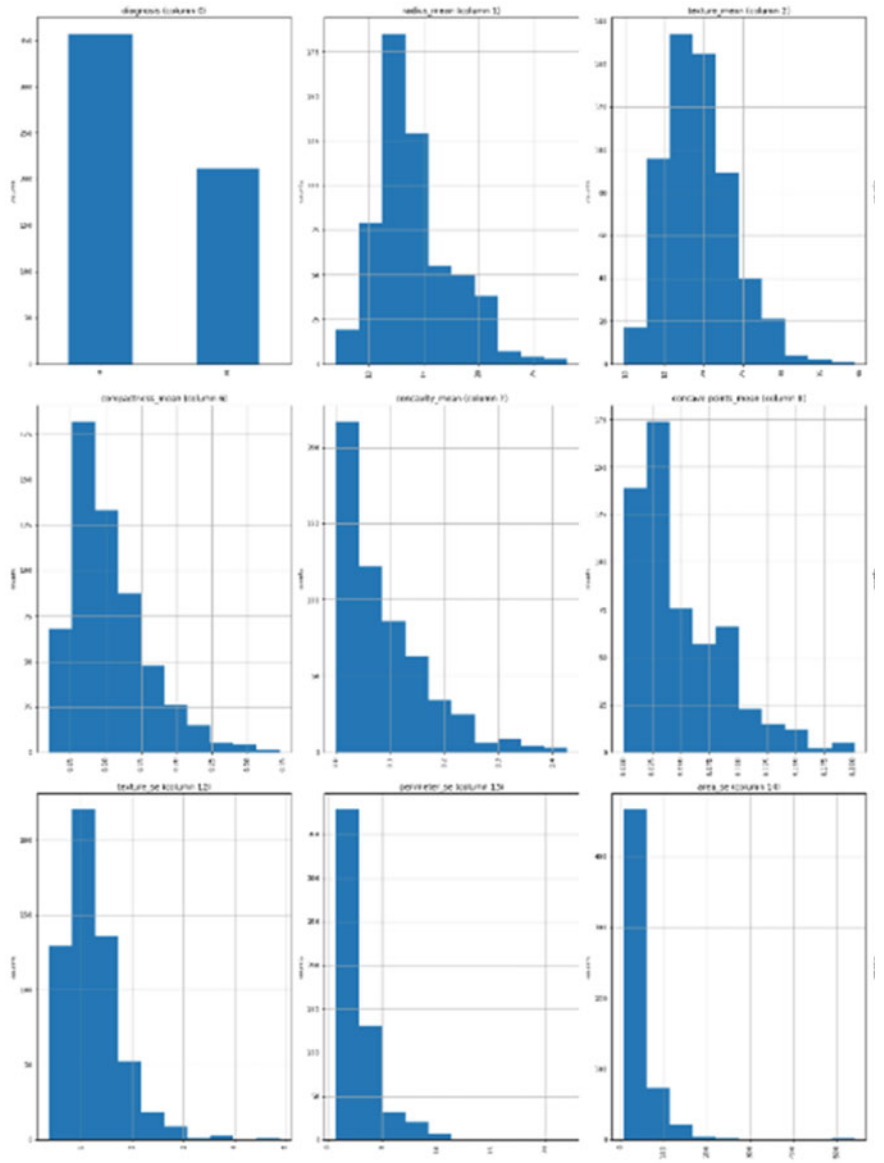

Fig. 1 Attribute histograms—first round

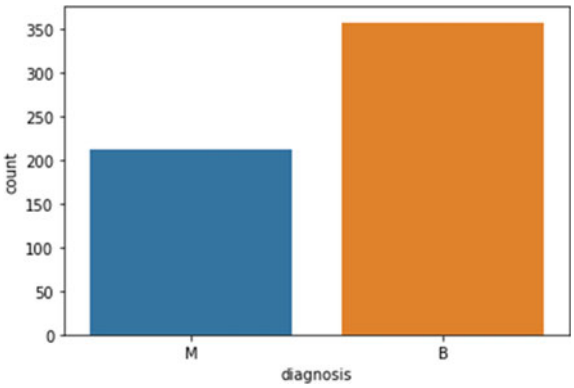

Fig. 3 Diagnosis class distribution

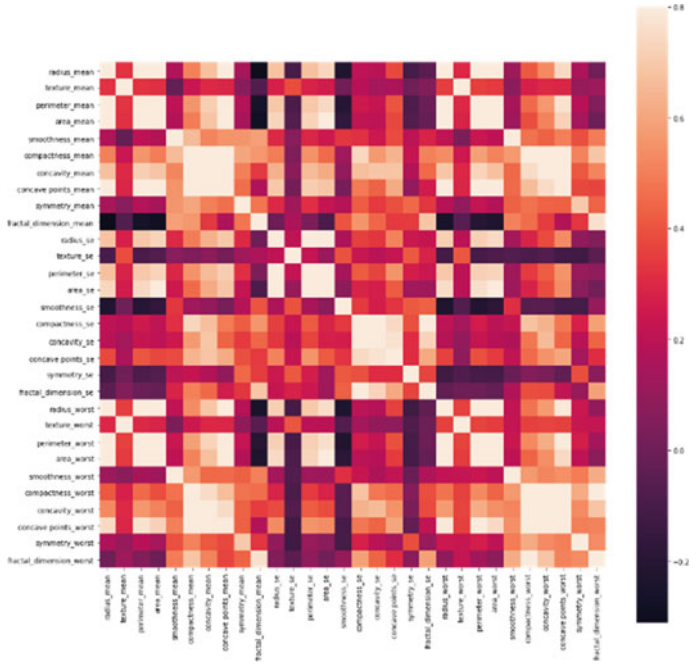

Fig. 4 Correlation map

accuracy			0.94	398
macro avg	0.94	0.93	0.94	398
weighted avg	0.94	0.94	0.94	398

Of 398 and 171 samples, the system predicted that there were M and B tumors, and of the 258 good tumor, the model predicted 16 as bad and similarly 7 of the

actual bad tumors were predicted as good. All correct guesses are located in the diagonal of the table, so it's easy to visually inspect the table for errors, as they will be represented by any non-zero values outside the diagonal (Farouk, 2021; Ghazal et al., 2021; Guergov & Radwan, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021a, 2021b; Hejazi et al., 2021; Khamees et al., 2021a, 2021b). We define overall success rate (or accuracy) as a metric defining—what we got right—which is the ratio between the sum of the diagonal values (i.e., TP = (242 + 133)/398 = 94.2% and TN = 242/(242 + 7) = 97.2%) versus the sum of the table. Precision and Recall are accuracy metrics used by the information retrieval community; they are often used to characterize classifiers as well (Joghee et al., 2020; Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b). The same is valid for the 171 records of testing which are shown in the following:

Accuracy on test set 0.9122807017543859

[[999]

[657]]

	precision	recall	f1-score	support
B	0.94	0.92	0.93	108
M	0.86	0.90	0.88	63
accuracy			0.91	171
macro avg	0.90	0.91	0.91	171
weighted avg	0.91	0.91	0.91	171

5 Conclusion

W Naïve Bayes has a best optimal runtime based on probability and mathematics with the advantage of being computationally inexpensive for real time (Al-Dmour & Teahan, 2005; Al-Dmour, 2016; Al Hamadi et al., 2017; Al Neaimi et al., 2020). The Naïve Bayes also attempts to model pairwise comparisons between different data classes based on conditional probability. We have used python framework through the following steps (Fig. 5).

It is mostly used when the observation sizes are continuous values (Mehmood, 2021; Mehmood et al., 2019; Miller, 2021; Mondol, 2021; Obaid, 2021; Radwan & Farouk, 2021; Shamout et al., 2022). The result showed model accuracy of 92 and 94% in testing and training dataset. The recall value was also 91 and 94%. Of 398 and 171 samples, 375 and 166 records were correctly classified.

We have analyzed the features through different literature articles which was often modelled in planar projected dimension and our analysis showed that the result of our methodology can be simpler with less computation costs in Python framework.

Development of Data Mining Framework Cardiovascular Disease Prediction

Raed A. Said, Nidal A. Al-Dmour, Mohammed Salahat, Ghassan F. Issa, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract One of the highest shares of data-driven technology of health sector happens for private insurance stakeholders. It is therefore clear that private insurance companies can only survive being competitive in covering different medical stages such as surgery, intervention and other clinical trials in a high-risk environment. Estimation of expected costs and coverage is also important for both patient and insurer. In this case study we as a Data Mining and Artificial Business consultant want to explore different techniques of data mining to find out business risks for patients. We have asked the insurer to provide us a sizable medical history to watch those features. We would like to predict if given biographical profile of the patient along with exam results can predict CVD so he can cover his costs with this Insurer. On the other hand, in case of higher error of misclassified CVD what kind of decision should be taken by risk holder and insurer. Which one of these attributes

causing this cost and what other stakeholders like target group of patients can be suffered from the loss? The ultimate goal is to develop a model that can predict the gap between those patients' perception of their disease and their real disease. This can further help stakeholders to develop specific insurance policy.

Keywords Data science · CVD · Data mining · Disease prediction

1 Introduction

The smart healthcare is composed of multiple participants that include patients, doctors, research institutions, and hospitals (Akhtar et al., 2021; Al Ali, 2021; AlHamad et al., 2022; Alhamad et al., 2021; Ali et al., 2021, 2022). In essence, it is considered as an organic whole that involves various dimensions such as disease control and monitoring, diagnosis, treatment, health decision making, hospital management and medical research (Aburayya et al., 2020a, 2020b, 2020c; Alhashmi et al., 2020; Taryam et al., 2020). It is clear that Artificial Intelligence can be considered from Information marketplace perspective as well as IT governance among stakeholders. But Cardiovascular Disease (CVD) exceptionally has been paid more attention among others (Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2020, 2022; Alzoubi, 2021a). Linkage between CVD and other diseases are the subject of debate for instance look at how Cerebrovascular diseases being accompanied with mental impairment resulted in higher fatal rate. On the other hand, any patient suffering from CVD should experience extremely condition for his or her rest of life. What Data science as a framework can serve for this diagnosis of CVD is a kind of unstructured machine learning which can be best interpreted when is coupled with biography of the patient in features such as age, weight, physical activities etc. (Alzoubi, 2021b; Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b, 2021b, 2022) (Fig. 1).

2 Dataset Description

A. Preprocessing

The raw version of dataset originally consists of 70,000 records in 12 features patient biographical, medical exams and some information given by the patient like the smoking attitude etc. needed to implement with various data mining techniques in the IBM Modeler software (Aziz & Aftab, 2021; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021b). Among the 12 columns of data, six of them were categorical, five numerical. The two remaining namely ID and age in days decided to be dropped out from the analysis which was filtered in source node of IBM SPSS. All data roles were set to Input except than presence of CVD as target. There was no missing or duplicated column in data. The numerical fields was checked for the outlier by comparing the range in boxplots of 3σ (95%). Gender, smoking, alcohol and physical activities as binary categorical data (Guergov & Radwan, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021a, 2021b; Joghee et al., 2020). Furthermore, the cardinality of the Cholesterol and Glucose categorical data was transferred from well above normal, above normal and normal to 0, 1, 2. Here the model prediction power can be enhanced according to the label's value which is more favorable. In Fig. 2, the name and type of all variables plus target role presense or absense of cardiovascular disease can be observed (following figure).

In Fig. 3, the distribution and statistical representation of all variables observed (following figure).

Measurement unit of height is centimeter and weight is kg. Systolic blood pressure is the exerted pressure when blood is flowed in arteries (Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021; Lee et al., 2022a, 2022b; Mehmood, 2021). Its normal value is 120 mmhg or below. Diastolic blood pressure is the measured pressure of blood between arteries and heartbeat with the normal value of 80 mmhg or below. The Cholesterol is a kind of fat measure which is ranged between 200 and 239 mg/dl. Glucose level is ranged from 100 to 140 mg/dl 8 h mg/dl hours before and 2 h after eating. For people without Diabetes is around 70–80 mg/dl (Fig. 4).

B. Bivariate Analysis

By univariate analysis we have observed that people older than 55 years are more suffered from CVD. We have also implemented the other categorical variables grouped by age which are shown in Fig. 5.

3 Methodology

Machine Learning of the selected dataset could semi-structured in in methods nature which can not only be perceived as clustering problem but also can be seen as a classification problem (Mehmood et al., 2019; Miller, 2021; Mondol, 2021; Obaid, 2021; Radwan & Farouk, 2021; Shamout et al., 2022). For initiating the modelling,

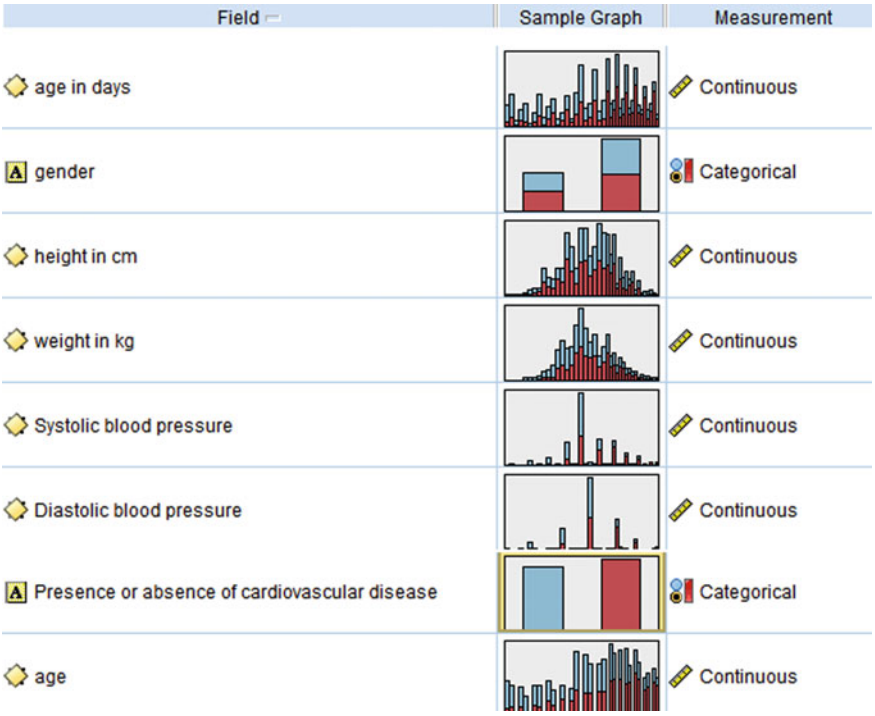

Fig. 2 Dataset fields

a feature selection was performed. The results of the feature selection are shown in Fig. 6.

4 Modelling

It is possible to derive more variable such BMI from our original dataset but because the coefficient of variation was far below threshold, we have selected only weight as the demonstration of the fat and glucose. By using the auto-classifier node we have set the baseline for model selection (Afifi et al., 2020; Al Batayneh et al., 2021; Ali et al., 2021; Alzoubi et al., 2021a; Ghazal, 2021; Ghazal et al., 2021a). The raw propensity with weighted voting Ensemble was selected between 9 different models. One advantage of this method was that exact feature could be defined by users. We have considered the selected features from the Fig. 6. On the other hand, the cut-off for calculation are outliers such as runtime, models accuracy and AUC configured to outrank when are below 50% (Ghazal et al., 2013; Ghazal et al., 2021c, 2021d; Kalra et al., 2020; Khan et al., 2021a, 2021b). This method is computationally cost effective ranking the models according to their number of features taken 3 min

Min	Max	Sum	Range	Mean	Mean Std. Err.	Std. Dev

and 22 s to finish calculation on 9 different models. The feature importance with modelling accuracies is summarized in Fig. 7.

The last two models namely Decision List and Discrimination Analysis was our choice for modelling. Linear Discrimination Analysis (LDA) is the method used in Machine learning for the recognition of two or more objects (Khan et al., 2021a, 2021b; Lee et al., 2021; Matloob et al., 2021). In LDA, which is very similar to variance and regression analysis dependent variable is linearly relate to the other variables. The difference between these methods is that in LDA, instead of distance relationship, dependent variable is solved by the ranking or ordinal outranking. The LDA is also closely related to Principal Component Analysis (PCA) core component analysis. Because both methods look for a linear combination of variables that best describe the data (Naqvi et al., 2021; Rehman et al., 2021; Suleman et al., 2021). The LDA also attempts to model differences between different data classes. The

	Decision Lis...	1	73,789.935	34	1.654	71.183	3	0.718

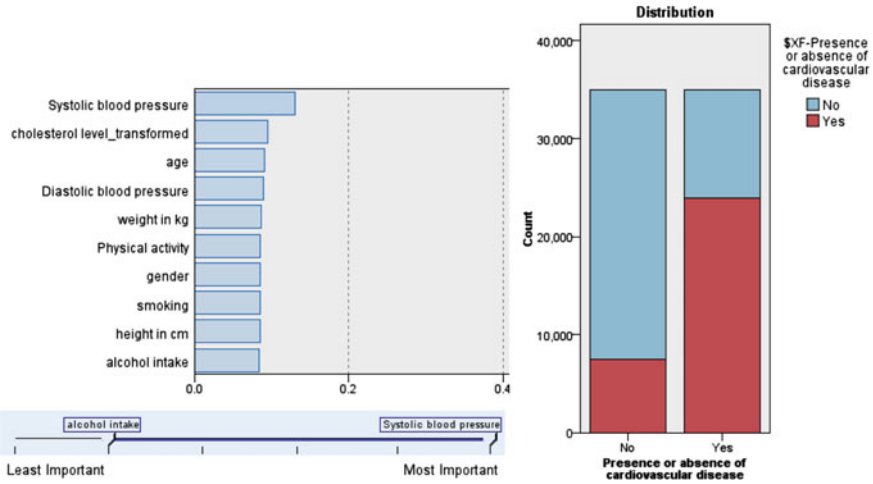

Fig. 7 Feature engineering

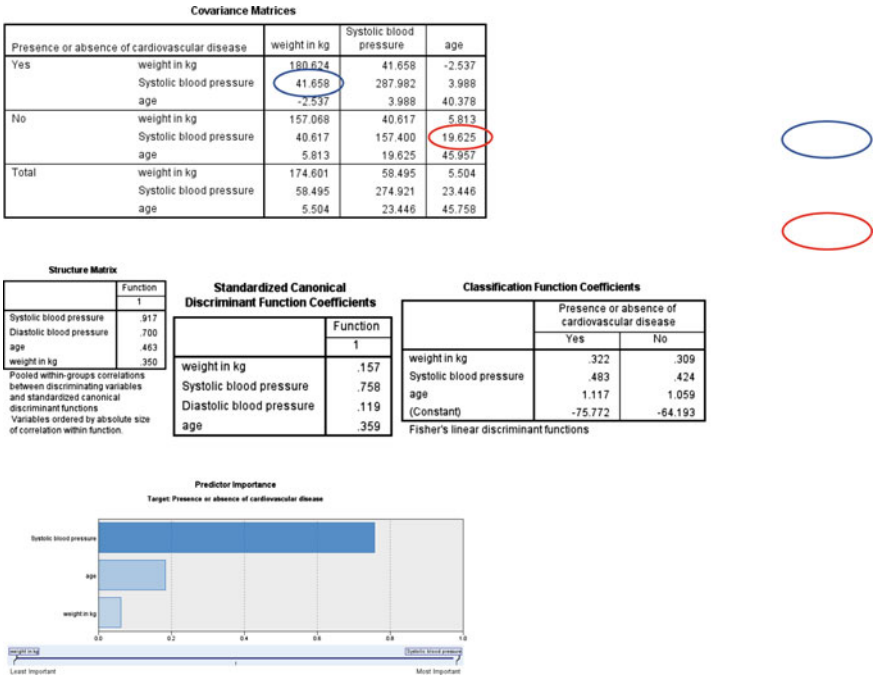
LDA is used when the observation sizes are continuous values. The other implemented algorithm was Decision List which is similar to decision tree. The method provides a set of classification rule that form an inherited order which make it easy for interpretation.

5 Results

The result of LDA was implemented for variable Systolic Blood Pressure fields. While no significant difference between Target grouping was observed in the covariance demonstrated for weight, the age parameter was significantly higher in No CVD patients (Fig. 8).

It should be noted that normal Value of Systolic Pressure is less than 120. This is related to age and weight according to the Discrimination function. The result of accuracy and confusion Matrix for the LDA analysis are shown in the following Fig. 9.

As can be seen in the above figure the more gain cannot be resulted by balancing the ratio of CVD to no CVD. The slight skewness between the cost of prediction FP and TP is on the basis of relationship between the Systolic Blood Pressure and



Covariance Matrices

Fig. 10 Decision list result analysis

Age. This correlation happened just between weight and Systolic blood pressure and can also approved or further analyze in the decision list. We can see that with hypertension stages below reach the second stage of hypertension value of more than 150 and if it goes beyond 180 it forms a crisis (Fig. 10).

6 Discussion

In this case study we have implemented data analysis, we have checked all the variables for outliers, sharp variances. We have transferred two categorical variables namely Cholesterol and Glucose from categorical into ordinal. At the preprocessing stage performed univariate analysis and compare all distribution versus target groups. We have seen that between the selected fields three variables are not allowed to contribute to the modelling and outranked them. Then we have used 9 different modeling algorithm and watch the number of fields or set of fields that can resulted

in acceptable accuracy with lower costs. Out of two remaining algorithm one was accompanied with 3 and the other with two 4 fields. We have chosen those models into our stream file and perform the modeling. The result was with 71.4% accuracy and the best optimal condition is slightly skewed from the unbalanced target value.

The blood pressure and age of the persons can form a pattern for Insurer. Our results proved that the patients are more perceived with more than 25% of the cases and our solution for the patients is to observe other cases, testing or interventionist to make sure they are in danger of CVD. This effect can be compared with the Prospect theory and used for our problem insurer policies. In regard to the framing, reference point we have seen that patients are suffering from bad nutrition are in same danger as the people who already suffered from CVD when they are old and their weight increased.

Unknown-Unknown Risk Mitigation Through AI: Case of Covid-19

Mounir El Khatib, Amna Obaid, Fatima Al Mehyas, Fatma Ali Al Ali, Jawahir Abughazyain, Kayriya Alshehhi, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract The purpose of this study is to investigate how artificial intelligence can mitigate unknown-unknown risks, taking COVID-19 as a case. The utilization of this technology has helped with the risk management and mitigations process by providing efficient solutions. Today, the artificial intelligence of applications plays a critical role in containing the fast spread of COVID-19 virus and reducing the number of infected individuals. This research will explore how countries around the world have benefited from contact tracing applications. The research discussed the UAE Alhosn application compared to the applications developed by China, Australia, Thailand, France, South Korea to identify the best features and better utilization of AI technology in the applications. In addition, a mixed-method approach used in this research, and a combination of a qualitative and a quantitative approach to make a clear understanding of the topic and find out accurate results. For qualitative research, interviews were conducted with five people from different companies in the UAE. For quantitative research, ten questions survey was sent to a sample of 50 random respondents who are the users of Alhosn application. Domain analysis was used to organize the ideas and to generate other ideas. The research will also gather secondary data based on reviews of literature related to the research topic. Based on the gathered information and research results recommendations were given.

1 Introduction

With the fast spread of COVID-19 around the globe, many sectors got affected, such as economy, hospitalities, and tourism (Aljumah et al., 2021; Alshurideh et al., 2021). One of the main sectors is the health care; projects in this sector are focusing on minimizing chronic diseases and early prediction of dangerous conditions affecting people (Alshurideh et al., 2020, 2021a, 2021b; Lee et al., 2022a, 2022b). Artificial intelligence (AI) has played a significant role in performing business and governmental tasks. Many governments are leading in the utilization of applications to connect with the citizens (Alhashmi et al., 2020; AlShamsi et al., 2021; Alshurideh et al., 2022; Mehmood et al., 2019). Therefore, they have developed applications that use artificial intelligence to mitigate the unknown-unknown risk of the crises. Which will help to contain the fast spread of the virus and reduce the number of infected individuals (Alzoubi et al., 2021; Hanaysha et al., 2021a, 2021b).

Similarly, the UAE has launched Alhosn Application with a purpose to contain the spread factor. Those applications have emerged as great examples of the utilization of artificial intelligence for better health and life saving issues (Aburayya et al., 2020a, 2020b; Ali et al., 2022; Ghazal et al., 2021). For the reason of the high spread of the COVID-19, more than 500,000 people worldwide lost their lives. Governments around the world started to use artificial intelligence in order to mitigate the unknown-unknown risk of the crises (Ali et al., 2021; Alnazer et al., 2017; Obaid, 2021). So, they started to create applications for the reason of reducing the chances of people getting the virus (Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b; Lee et al., 2022a, 2022b; Nuseir et al., 2021).

This research will study the impact of using artificial intelligence of applications in different countries, illustrating their features used to mitigate unknown-unknown risk of COVID-19. Emphasizing on Alhosn Application and provide recommendations for improvements.

2 Research Question and Hypotheses

Research Question

- How can we alleviate the known and unknown risks of COVID-19 by using the AI-based applications?

Hypotheses

- Artificial intelligence can mitigate unknown-unknown risks. COVID-19 as a case.

3 Literature Review

AI has been used by many organizations in different sectors to mitigate unknown-unknown risk (Alzoubi, 2021a; Guergov & Radwan, 2021; Khan, 2021). The purpose of this literature review is to evaluate and discuss how AI can help the health sector with mitigating the unknown-unknown risk through contact tracing applications. Many research papers and articles globally were reviewed to conduct the research.

Artificial intelligence is the science that allows machines to perform tasks that require human intelligence such as problem-solving, analyzing, speech recognition, etc. (Farouk, 2021; Mondol, 2021). Currently, AI is being used in different fields such as Human Resources, customer services, and banks for fraud detection (Alhamad et al., 2021; AlHamad et al., 2022; Alzoubi et al., 2022). However, organizations should understand that it's a double-edged weapon that has advantages and disadvantages (Alnuaimi et al., 2021; Alzoubi & Ahmed, 2019). One of the disadvantages is that it can be misused by attackers or hackers to expose the organization's data (Durbin, 2019).

There are many usages for the AI, one of them is that it is built in the applications as analytics tools (Hanaysha et al., 2021a, 2021b; Joghee et al., 2020). In the current case of COIVD-19, the AI was used in the applications to keep track of the infected people and analyze their input to mitigate the unknown-unknown risk of the rising numbers of the COVID-19 cases (Durbin, 2019).

Apple and Google announced a collaboration to slow the spread of the virus and accelerate going back to normal life (Akhtar et al., 2021; Cruz, 2021). Google stated that their initiative was to provide Application Programming Interfaces (APIs) to public health authorities around the world, which will allow them to trace the infected individuals and notify them to isolate themselves and take the necessary actions.

The applications are using Bluetooth and AI technology to operate (Aziz & Aftab, 2021; Mehmood, 2021). After downloading the application people are allowed to self-diagnose their health by feeding the application with their data. There are different uses for the AI in these applications; it has been used to analyze the data, and to protect the privacy of the users.

3.1 China

One of the successful implementations using the tracing Application was in China. Many tech companies developed different tracing applications to mitigate the unknown-unknown risk of the pandemic COVID-19. Jin et al. (2020) mentioned that 'the close contact detector' was added to the Chinese payment and social media applications in order to reach the largest number of people. These applications have a huge amount of user data that's been analyzed by AI technology (Alsharari, 2021; Eli, 2021; Lee & Ahmed, 2021). After downloading the applications, users have to add their details and scan a QR code to be able to enter or leave public

places and transportations. Based on the color code system, the application notifies all those who've been in contact with the infected individual in the last 14 days to quarantine themselves and to get tested (Jin et al., 2020).

3.2 Australia

Australia CovidSafe is another application that uses the contact tracing technology to contain the spread of COVID-19 (Al Ali, 2021; Miller, 2021; Radwan & Farouk, 2021). After downloading the application, the users have to add their personal information (name, age range, mobile number, postcode) in order to be identified by the health authorities. Australia health authorities stated that the application uses Bluetooth to send an encrypted code to all users. If an individual was tested positive, the infected person has to update the status in the application and give permission to the health authorities to alert those who have been in contact with him within 5 feet for more than 15 min during the past 21 days (COVID Safe application, 2020).

3.3 Thailand

To control the cases of COVID-19 in Thailand, an application called Thai Chana (Thai Victory) was developed by Thailand's Center for COVID-19 Situation Administration (CCSA) which was introduced to the public on 17/May/2020. The application has many features. Dr. Taweesin Visanuyothin, the spokesperson in CCSA mentioned that all businesses including street food vendors should be registered for the application online to get a QR code, these codes will be posted in front of their shops so that any customer will scan it before entering. The purpose of scanning the code is that people can be tracked and will be receiving warning messages if infected people had visited the same place. By this, the government will be able to track infected people with COVID-19 or the people who got close to them. Another feature of the application is that people can check wither the place that they are willing to visit crowded or not and wither they follow the control measures of COVID-19. Dr. Taweesin has also added that all users' privacy is protected and won't be shared with third-party, the only department that can access the information is the Disease Control Department (Huaxia, 2020).

3.4 France

StopCovid is the application that France established and design in order to trace and reduce the invasion of COVID-19 pandemic. The application designed on the contact tracing function which recognizes any person may contact an infected person,

this technology uses Bluetooth in the phones to trace any infected area or people that the user will contact. People who were diagnoses with coronavirus will have a special QR code to add it in the application, then the application stores this code in other people's devices to alert them if they are within one meter of the infected person (Wikipedia, 2022). The application was established on the 8th of April, as per TechCrunch, electronic news web site, their government hosted a press conference once the appl has been release to share the statistical analyses of the app. After three weeks of the release, 1.9 million users have downloaded the application from both stores and most of them activated it. However, most of the French population uninstalled it as they feel it won't help them, for many reasons. The majority of them see that the government will not have any record about the people as the application does not ask you to register your name, another reason that the application does not cover all European countries. France's digital minister Cédric O said. "If I have one regret it's obviously that it isn't compatible with other European countries." Moreover, the QR code should be entered manually in the application, which affected the accuracy of the application, this was a reason for them not to trust the application, however, Mr. Cédric O stated that the application will keep improving for better features and functions (Dillet, 2020).

3.5 South Korea

South Korea is considered to be a model since it did not take its citizens through a lockdown as in most of the countries. Moreover, there are fewer new cases in South Korea, with 244 reported deaths in three months since a sudden occurrence of a virus was announced in the country. This was achieved due to the good underlying basis of the country's coronavirus response with thorough testing mechanisms, which is backed by the countrywide contact tracers' network who dialogue with the infected people, followed by tracing their contacts. The technique involves the use of mobile phone alerts, though the Bluetooth applications are not used at the moment (Whitelaw et al., 2020). Thus, it is essential to be noted that the application "Corona 100 m" is based on the degree of surveillance that citizens of most of the countries do not find it easy to agree with.

Through this app, in case, an individual test positive for coronavirus, a text alert is sent to all the neighbors of the infected person who came in contact with him within 100 m, which is followed by contact tracing to curb the spread of the virus (Whitelaw et al., 2020). The alert text includes a link having many of the movements log of the infected people, and the neighbors are notified after every one minute. Moreover, these movements are traced from public data like television cameras' closed circuits. The results of the contact tracing are enhanced by the fact that the government of South Korean is permitted to access private records of people, such as the transactions of the credit-card (Whitelaw et al., 2020). Moreover, the most important segment of this application is that the movements of the people are published and anonymized online to ensure that the government's coronavirus guidelines are followed through

supervision. The developer says the application is very successful reaching 20,000 downloads per hour. Therefore, the use of this application has led to quick and accurate contact tracing in South Korea leading to a low number of new cases and deaths from the virus on the global map (Alzoubi, 2021b; Hamadneh et al., 2021; Kashif et al., 2021).

3.6 Alhosn UAE

During this challenging time, UAE launched an application named Alhosn UAE to contain the spread of the virus. The application was developed by the National Emergency Crisis and Disaster Management Authority in collaboration with the Ministry of Health and Prevention and local Health Authorities (Alzoubi & Aziz, 2021; Alzoubi et al., 2020a, 2020b). The application depends on Bluetooth technology, AI and QR codes in order to operate. The two main functions of the applications are; to provide quick access to test results, track people movement and inform those who contacted an infected case about their current health states (Emirates News Agency-WAM, 2020b).

The users can register in the Application using their Emirates ID and phone number; each user will have a unique QR code that follows a color-coding system that indicates users' health states. Those codes might be used in the future to grant access to public places (Alhosan UAE App, 2022).

Abdul Rahman Al Owais Minister of Health and Prevention stresses on the importance of collective efforts all segments of society citizens and residents from all nationalities in the process of containing the rapid spread of the virus. The government encouraged everyone to download the application by making it available in three languages at both Apple Store and Google Play for free to stand united against the pandemic (Emirates News Agency-WAM, 2020a).

Everyone in the country should have an account; thus, the developers took into consideration the individuals who are not using phones such as children, elderly, and People of Determination. They can be added to one of the family member's account or the care provider's account (Alhosan UAE App, 2022).

4 Research Methods

To evaluate how artificial intelligence can mitigate the unknown-unknown risk-taking COVID-19 as a case, a study was applied to several risk executives and IT employees across the UAE. A combination of both qualitative and quantitative approaches was used to conduct the study since each one of them has its weakness and strength. The mixture between the methods allows us to get accurate results from the quantitative questionnaire and unpredictable answers from the qualitative interviews.

Five interviews were conducted from 5 different organizations around the UAE, interviewing risk management experts and IT executives. Questions were in a qualitative approach, which gave us the chance to interact with the interviewees directly. It also allowed us to understand their perceptions and opinions in a clear way.

To get more accurate analysis and results about the artificial intelligence and especially about the Alhosn application, a quantitative survey of 10 questions was distributed in a random sample among the seven Emirates on 50 people who are using Al Hosn app. This method helped us to get a fast analysis and data collection. The quantitative method of search is the best way to get exact statistics that can be compared easily.

To analyze the results of the questionnaire, the research used the domain analysis which is the best way to come with new and different ideas and then organize them. It also categorizes each idea to the one related to it. However, a narrative analysis was used to conduct the interviews which allowed us to analyze the results and observe them.

5 Results

5.1 Interviews

Through the interviews, it was clear that risks are different from one organization to another, in our research we had the chance to interview five employees from different organizations: Ministry of Community Development (MOCD), Khalifa Fund for Enterprise Development (KFED), Sharjah Documentation and Archives Authority (SDAA), Abu Dhabi Islamic Bank (ADIB), and Sharjah Girl Guides (SGG).

Our interviewer Mr. Saeed from MOCD said that "risk is divided into many categories starting from enterprise risks and breaking into IT, cybersecurity, operations, financial risks, legal liabilities, accidents, and natural disasters." Moreover, information lost and damage of documents duo to viruses or natural disasters is the main risk in SDAA as per Mr. Taryam.

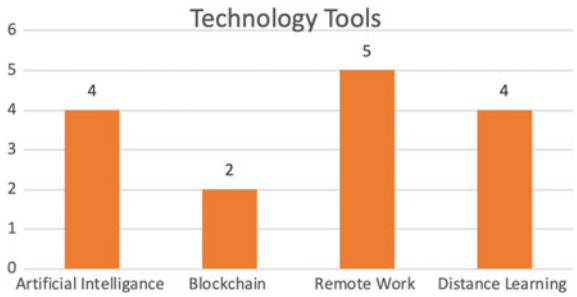
Moreover, Mr. Loay Mahmoud from KFED stated that "the risk in the organization is low in severity, as the health risk and the financial risk is very minimum". Also, the interviewee Mr. Francies, IT manager, said: "There are some potential risks that could occur in SGG and have a negative impact and influence, such as operational risks, safety-related risks, work environment risks, natural disasters, financial risks, staff, and members related risks." The last interview was with Mr. Jaber Ali, Branch manager in ADIB stated that as a financial institution they have a variety of risks such as embezzlement, information leaking, and scammers.

All organizations have strategies and methodologies in dealing with risk, therefore all of our interviewees agreed that they deal with the unknown risk by planning, setting policies, and procedures. For example, ADIB has a risk department that includes employees who are experts in risk management, they hold a

monthly meeting to discuss all the risks in the bank and might have emergency meetings in case of any risky situation.

Some of the interviewees mentioned that they are using and following defense-in-depth, risk-based, and business continuity policy approaches since they standardize the needed actions, resources, and crisis management communications during the unknown risk period.

Moreover, Mr. Francis said that their methodology is to find the root cause of the problems, look at the impact of each risk and the probability. Then, use that information to prioritize risks and come up with solutions as a response.



The organizations use several technology tools in the risk process, based on our interviews, all of them agreed on remote working, 4 out of 5 of the chosen organization uses AI and Distance learning, and 2 uses the blockchain.

ADIB uses AI to protect its customer's accounts form the risk of scammers as Mr. Jaber stated in his interview. They adopted the one-time password in any financial transaction that happens through their digital channels. Moreover, Mr. Saeed said that they use AI to implement risk responses, monitor and identify risk, and qualitative and quantitative analysis. Also, his organization uses AI to identify malicious codes and doing incident response in MOCD.

Remote working is another tool that been used by all mentioned organizations to mitigate the risk of COVID-19. Mr. Taryam illustrated that his organization can't stop working during the lockdown and their experience was successful. He added that the authority provided all the supporting applications and programs that mitigated the unknown-unknown risk, giving an example of that; they replaced the internal SharePoint by external SharePoint to ensure the employee's access to the needed information from home.

Similarly, ADIB head quarter replaced the employee's PCs with laptops with the required systems and applications ensuring the business continuity with a high level of security when working remotely to prevent the leaking of financial information.

Licensed to (putm@utm.my)

5.2 Interview—AlHosn Application

Our primary data shows that it was not mandatory to download Alhosn application in 80% of the organizations. However, ADIB management stressed on the importance of downloading the application. On the other hand, Mr. Loay and Mr. Francis stated that all their employees must download the application as it Identifies any COVID-19 positive cases and regularly checks the employees' health status.

Most of the candidates suggested new features to be added to the application. Tracking other infected people without leaving the application open all the time which affects the battery life and the data as per Mr. Taryam. Mr. Loay and Mr. Jaber suggested keeping a record of recommended safe areas such as shopping malls and groceries as well as a history of the visited places. Also, Mr. Francis suggested linking the application to Human Resources in the organization to alert them for any infected cases.

Three of our interviewees think that China developed the most powerful and effective application, as it's mandatory to download the application that helped to decrease the spared of the virus. A security feature in the application needs to be improved as it keeps a record of personal information and the visited places. Mr. Taryam stated that a third party might use this information for advertising purposes.

6 Survey

The survey targeted 50 individuals based on their age and location. The majority of them were aged between 20 and 40, 50% of them were between 20 and 30 years old, and 28% were between 31 and 40. Among the 50 candidates, 12 of them are located in Sharjah, 10 in Dubai, 4 in Abu Dhabi, and the rest are from the other Emirates.

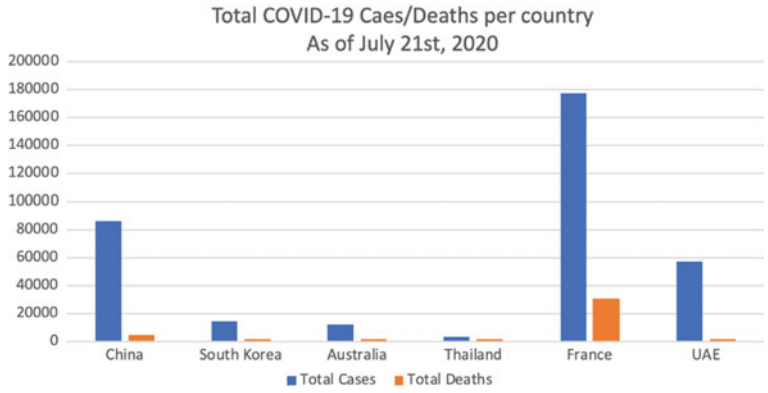
Questions 3 and 4 were based on the scaling from 1 to 5 as of 1 is least, 5 is most. 70% of them trust that the application can mitigate the risk of COVID-19 as they chose 5 from the scale. Moreover, 30–40% will likely recommend downloading the application to other people. The survey questions were followed by yes and no question, 70% of the candidates was not obligatory in their work or organization to download the application. Also, about the personal information in Alhosn's application, 80% of them find that their information is not safe and might be exposed. Moreover, the features in the application were satisfying for 60% of the users. Besides, all of the 50 candidates think that the application needs to be improved to mitigate the risk of COVID-19.

The candidate used Alhosn application in many places such as supermarkets, work, and closed shopping malls. Moreover, most of them voted for other countries' applications for the best application in their opinion, Thailand got 15 votes, China 12 votes, KSA 10 votes, Alhosn 3 votes, Qatar 2 vote and google 10 votes.

7 Discussion

It is evident that, the type and intensity of risks vary from one organization to another. Unknown -Unknown risks are the most critical of them all as they are usually unexpected an unplanned for. COVID-19 has changed all previous assumptions, the pandemic has proved the importance of having a Risk Unit at every organization, and it has also revealed which organizations have strong Risk Assessment and Business Continuity plans compared to those who failed to catch up with the others.

As we are in 2020, it is important to highlight the methods used to address risks have improved a lot. AI is a major tool used in many organizations to address risks such as COVID-19. As our research has proved the use of AI mainly through advanced tracking mobile applications by the governments of the countries illustrated in the literature review that helped control the spread of COVID-19. There is an evident link between the efficiency of the AI tools used and the number of cases and deaths in the country compared to the overall calculation. On the other hand, one example in our research, France, had a less impactful AI application which the public didn't trust, didn't download and the impact is disastrous as shown in the cases/deaths in the diagram below (Wikipedia, 2022).



Taking UAE as a case, our interview and survey results show unlike the countries that made it mandatory, it is still not mandatory to download Alhosn Application at many organizations (80% of the interviewees and 70% of the individuals surveyed). Also, the interviewees stated that even if it is downloaded, unfortunately, many of them don't activate it as it consumes their battery-life. On the other hand, most of them agree on the effectiveness of this application in controlling the pandemic in the country and worldwide.

8 Conclusion

In conclusion, risk assessment is a critical exercise that is conducted in most organizations. COVID-19 is one of the most critical risks in this century, if not the most critical of them all in both severity and coverage. The pandemic affected every country worldwide in all sectors mainly health and economy (Alameeri et al., 2021; Amarneh et al., 2021; Harahsheh et al., 2021; Leo et al., 2021; Shah et al., 2021). As our literature review showed the success of governments in controlling COVID-19 relies on the use of AI methods. Countries that have successfully launched advanced AI methods through mobile apps, access to analytical data, and linking it to the use of physical detectors have proved to control the pandemic with fewer cases of disease and fewer deaths. Our recommendation is to make Al Hosn Application in the UAE mandatory for citizens and residents to access public places. This will give the government a lot of insights on where the infected individuals have been and who they have encountered. Another recommendation is to increase the efficiency of the application by minimizing its battery usage. Finally, the Application can share the list of recommended or safe areas that implement all the precautionary measures to the users.

Appendix 1

1. Was it mandatory to download Alhosn App to resume the office work in your organization?
.....
.....
2. If yes, how did Alhosn App helped with mitigating the risk in your organization?
.....
.....
3. What feature can be added to the app in order to help the organization to mitigate the unknown un known risk?
.....
.....
4. In your point of view, which country developed the most powerful artificial intelligence app to face covid-19? Why?
.....
.....
5. In your opinion, dose this App have a threat on people privacy?
.....
.....

Appendix 2

Questionnaire to Evaluate the effectiveness of Alhosn app

This questionnaire is made for the purpose of evaluating Alhosn app which is an Artificial intelligence tool which is an app to track infected people with Covis-19 and how its impact on people in different areas in the UAE

Candidate Information

Name:

1- Age

20 to 30 years ☐

31 to 40 years ☐

41 to 50 years ☐

Over 51 ☐

2- Residential Area

Abu Dhabi ☐

Dubai ☐

Sharjah ☐

Ajman ☐

Um Al Quwain ☐

Al Fujairah ☐

Ras Al Khaimah ☐

Al Hosn App Inquirations

In the scale of 5 choose the most appropriate answer [1 is least, 5 is most]

3- Trust that app can mitigate the risk of Covid-19

1	2	3	4	5
☐	☐	☐	☐	☐

4- How likely do you recommend others to download the app

1	2	3	4	5
☐	☐	☐	☐	☐

In your point of view answer by yes/no

5- Was it a mandatory to download the app in your institution or work?
Yes ☐ No ☐

6- Personal information in Al hosn app can be exposed by third party
Yes ☐ No ☐

7- Are the app feature satisfying?
Yes ☐ No ☐

8- Do you think that the app can be improved which will have more impact in mitigating the risk of covid 19?
Yes ☐ No ☐

9- Where do you use Al Hosn app in order to protect you from being infected from the covid-19? (you can choose more than one choice)
Work ☐
Closed shopping malls ☐
Open areas of shopping ☐
Gym ☐
Beauty Spa ☐
Supermarkets ☐
Other ☐
[Specify] _____

10- Which from the following apps you think has the best features?
Thailand app ☐
China app ☐
UAE Al hosn app ☐
Qatar app ☐
KSA app ☐
Australia app ☐
Other ☐

Covid19 Unknown Risks—Using AI for Disaster Recovery

Mounir El khatib, Fatma Beshwari, Maryam Beshwari, Ayesha Beshwari, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract Artificial intelligence (AI) is a potentially powerful tool to mitigate the unknown unknown risk. Unknown-Unknown risks are unknown risks and accordingly unknown consequences. This research's objective is investigating the impact of AI on mitigating unknown unknown risk. For all six cases analyzed, it was possible to extract that unknown risk is hard to be reported in advance. Therefore, since the outbreak of the Coronavirus COVID-19, organizations have been eager to use AI in response to the consequences caused by this pandemic. As a result, AI played a significant role in rapid response, decision-making, early prediction, automated processes, and detection and tracking. This means AI has the potential to be used as a solution to mitigate the post event impacts and study the patterns for future prediction.

Keywords Artificial Intelligence · Machine Learning · Unknown risks · Uncertainty · Coronavirus · COVID-19

1 Introduction

Risk management is the guide to protect against any uncertainty and risk. The concept of 'unknown-unknown risk', which is the lack of awareness of the existence of a risk

that in itself is unfamiliar, has gained increasing attention in recent years, especially with the emerging crisis such as the Fukushima nuclear disaster. In many cases, the unknown unknown risk disturbed businesses, people, and caused huge losses.

Over last few months, as coronavirus spread across the world, countries are trying to learn about the COVID-19 to figure out how to slowdown the spread of the virus and defeat it (Akour et al., 2021; Alshurideh et al., 2021a, 2021b). It has been very difficult for business and health care systems to plan for the impact of COVID-19 due to the lack of historical comparisons of such outbreaks of this level and severity (Alshurideh et al., 2021a, 2021b; Hamadneh et al., 2021; Harahsheh et al., 2021). Countries struggled to act against this event due to the unknown nature of it and its consequence, which led many to follow the containment method to limit the spread of this virus and be able to focus on finding better solutions to react (Guergov & Radwan, 2021; Nuseir et al., 2021; Obaid, 2021; Taryam et al., 2020). Many new strategies were followed to decrease the impact of the unknown risk of this event such as school closure, traveling limitations, work from home, etc. (Ahmad et al., 2021a, 2021b; Aljumah et al., 2021). However, some of these strategies resulted in long-term damage to the economy due to the uncertainty of the shape of this virus during each stage and how to deal with it, which put a lot of stress on the healthcare system (Aburayya et al., 2020a, 2020b, 2020c; Cruz, 2021; Khan, 2021). In response to this risk, science and technologies have been working together to contain the negative consequences and reduce the losses for businesses and economies.

Allowing the potential of AI application in reacting against unknown unknown risk can be an opportunity to mitigate the impact of such risk (Al AlShamsi et al., 2021; Shebli et al., 2021; Yousuf et al., 2021). What makes it a good solution is the ability to increase in computing processing power, the rise of big data, and the adoption of cloud computing (Ali et al., 2022; Alzoubi et al., 2022; Mehmood, 2021). In addition, AI can adapt ambiguous or contradictory messages through visual perception, decision-making, and speech recognition as well as translating between languages (Hejazi et al., 2021; Khamees et al., 2021; Naqvi et al., 2021). AI is coming across as one of the main technologies that are accelerating the decision-making process based on real time insights.

2 Research Problem

Many papers were published regarding unknown unknown risk and how to deal and overcome the challenges posed by this type of risk. Unknown unknown risk is a type of risk that can be considered as an extremely dangerous risk because its possibility and consequences are undetermined. The danger of unknown unknown risk is that since it is unpredictable and no one is aware of it, it cannot be managed at its initial appearance that in some cases leads to disaster or organization bankruptcy and massive losses (Alshurideh et al., 2022; Shah et al., 2020, 2021). Therefore, this research will aim to study the ambiguity of managing and acting towards the unknown risk. Specifically, it will examine the contribution of AI in mitigating the

unknown risk and the management of change when this risk occurs. The capability of this technology can play a significant role in lowering the chances of negative consequences. This study will be based on the COVID-19 pandemic. It has been chosen because it illustrated the importance of technology in allowing life and businesses to continue as usual under such circumstances.

This paper will be divided into five sections. Firstly, the introduction, followed by a literature review addressing the unknown unknown risk, and Artificial Intelligence. The third section will gather data from secondary sources about different uses of AI in combating unknown unknown risk and COVID-19 will be a case study. The fourth section will perform a qualitative and quantitative analysis for these case studies, and based on the outcome, it will answer the hypothesis of this paper and present the effectiveness of this technology in mitigating unknown unknown risk.

3 Literature Review

3.1 The Need for Technology-Based Solution

Typically, once a disease or biological disaster becomes a reality, humans and human contact will aid its transmission and become the main element for spreading and aggravating infections and deaths caused by the disease or disaster (Hanaysha et al., 2021a, 2021b). A typical example is the case of the ongoing COVID-19 pandemic. COVID-19 is a looming but avoidable catastrophe. During the COVID-19 pandemic, the potential to control and contain the pandemic and its consequences using human elements have been critically undermined and also led to infected health care professionals (Blumenthal et al., 2020; Cabarkapa et al., 2020; Pietsch, 2020). Considering the potential human and economic consequences disaster could have, immediate actions must be taken to effectively monitor, manage, and recover disasters. Instead of relying solely on overstretched healthcare professionals and government officials, it is important to seek a better and risk-free solution to prevent and control disaster (Alshurideh, 2014; Aburayya et al., 2020a, 2020b, 2020c). This, therefore, necessitated the need for a technology-based solution to address these crises.

One justification for the technology-based solution is that it is not highly reliant on physical interactions (Hanaysha et al., 2021a, 2021b; Lee & Ahmed, 2021). That is, it requires limited human interaction and resources as it is able to operate with little or no human input, it is immune to infectious diseases, and it can function effectively in infected environments (Alsharari, 2021). More so, a technology-based solution is less vulnerable to human-related issues like stress, mental health burdens, physical fatigue, and other health challenges that frontline health workers may encounter during unknown risks and disaster recovery.

3.2 Unknown Unknown Risks

An unknown unknown can be defined as the state of being unaware that a particular risk exists. The repetitive unknown unknown is not a word mistake; it refers to unknown likelihood and unknown impact. Another research defined it as events considered to be impossible to find or imagine in advance (Kim, 2012). Many researchers have explored how to understand the unknown unknown, but the challenge exists in the nature of the event. In some research, they related the unknown unknown risk to the black swan theory, which is an unpredictable event that is beyond what is normally expected of a situation and has potentially severe consequences (Nafday, 2009). This term came from an ancient saying that presumed black swans did not exist and it was developed by Nassim Nicholas (Nafday, 2009). This is because both share the condition of having a major impact, extreme infrequency, and the widespread insistence (Alzoubi, 2021a; Lee et al., 2022a, 2022b). It is described by some as an outlier because it lies outside the realm of regular expectation, since nothing in the past can predict its possibility (Hajikazemi et al., 2016).

Sometimes, problems exist in people rather than the event itself and the major obstacle to address this type of event is the lack of capability to accept it, and people who cannot cope with unknown unknown will sometimes actively ignore it (Alles, 2009). Another challenge is to turn as many unknown unknowns to known known and being proactive in being exploring organizational environment (Eli, 2021; Miller, 2021). Not all possibilities can be thought of and planned, but there are ways to minimize delays and negative impact caused by unknown unknowns. The biggest takeaway is to become better equipped at identifying, predicting, and managing the risks related to these occurrences (AlHamad et al., 2022; Lee et al., 2022a, 2022b).

Despite that risk management performs as forward looking, it is not possible to identify all risks in advance (Hillson, 2016). Unknown Risk cannot be managed proactively and usually in unknown risk events, a workaround approach is used to respond to unidentified risk. The approach is based on planning once the unknown risk occurs and managing it. It is hard to predict it, but possible to manage and minimize its negative impact once it has happened.

3.3 The Need for Advanced Technology

In a bid to effectively predict, control, manage, and contain biological disasters like COVID-19, which are occurrences that are difficult to detect preemptively but have a high negative impact, advanced technology is needed. Although several emerging technologies have been revealed to show potency for disaster recovery (Jia, 2019), an advanced technology-based solution that is more promising is AI (Artificial Intelligence) technology.

3.4 Artificial Intelligence and Machine Learning

AI, as we know it, is the short form of Artificial Intelligence. This is where the science and technology come to play, with multiple approaches, on where the advancement of science creates a paradigm of virtue for every sector in any industry to succeed (Zhang et al., 2019). The famous mathematician Alan Turing, changed the world forever by asking a simple question and that is, 'Can Machines Think'? With in-depth research, he was able to prove the main and fundamental goal of artificial intelligence. AI was created for a reason and that is basically to replicate the human intelligence in a machine (Graham-Cumming, 2012). In simple words, AI can be defined as the simulation of human intelligence in machines that are programmed to think like humans and mimic their activities (Al Ali, 2021; Mondol, 2021; Radwan & Farouk, 2021). This term can also be used for any machine that demonstrates characters associated with a human mind such as learning and problem solving.

Moreover, Machine Learning (ML) is a subdivision of AI and refers to the study of computer algorithms that allow computer programs to automatically improve through experience (Lord et al., 2009). It is one of the ways to achieve AI and functions on small to large datasets by inspecting and correlating between the data to find common pattern. It is very important to understand how to choose the correct algorithm type and its logistic progression in order to get a correct output and avoid any bias affecting the application. Several researchers found that using correct algorithms and tools can help in dealing with uncertainty projects and complex environments better. In addition, they believed that AI as a tool is better and more accurate than traditional tools (Martínez & Fernández-Rodríguez, 2015).

AI was created for the entire basis and the future of all complex decision making and it has been extremely efficient with its evolution of machine learning. There are several types of AI where machines are being taught and knowledge is learned (Alzoubi, 2021b). Machines are given the opportunities to analyze and learn data just like the human brain (Motoda & Yoshida, 1998). With technology as advanced as this, there has been significant progress in manufacturing, finance, healthcare and even retail, all with the help of artificial intelligence (Zhang et al., 2019).

3.5 Why AI is Trending Now?

Over the past decades, the field of AI has made great progress toward computerizing human reasoning and its breakthrough in a wide diversity of sectors from healthcare to transportation. AI techniques are used by many industries through exploiting data and optimizing business and production processes. It processes the data in ways that are more dynamic and create value with faster and more accurate decision that result in reduced operational costs and personalized customer experience (Ferma, 2019). In addition, ML is assisting financial services companies with advanced fraud detection, and computer vision is optimizing offline retail. AI can assist with an

unbroken supply chain and boost productivity. Artificial intelligence is not only known to improve lives but has managed to save lives as well. AI has assisted with creating personalized drug protocols for a better diagnosis, with robots even assisting in surgeries (He, 2019). AI is helping the humankind to save the world by creating smart agriculture with efforts to solve global challenges (Motoda & Yoshida, 1998).

3.6 AI in Risk

AI is recognized for its potential in many fields including risk management. We can see that ML and AI are playing an important role in enhancing the risk management processes. Companies like oracle uses AI to conduct enterprise risk assessment through identifying risk material in the organization by calculating inherent risk using likelihood, impact, and analysis model (Folsom, 2020). Microsoft is another example that utilize AI to identify the root cause of risk occurrence and perform qualify analysis in earlier phases of risk management process (Microsoft, 2020). However, the level of implementation varies between the organizations, but it is clear that companies are in the beginning stages of understanding the full benefits of AI. The current usage in this field is only visible when losses occur or for known risks (Farouk, 2021).

3.7 Adopting AI Capabilities for Disaster Recovery

According to Turing et al., AI (Artificial Intelligence) is simply considered as a "thinking machine" (Turing & Braithwaite, 2004). It was described by Shukla and Jaiswal as a technique that can facilitate "a computer to do things which, when done by people, are said to involve intelligence" (Shukla Shubhendu & Vijay, 2013). With AI technology, machines can detect patterns that are too complex for humans to quickly detect and process. AI has been widely adopted in areas like machine vision, speech recognition, natural language processing, targeted marketing, and even in the healthcare management system, which includes using AI to combat COVID-19 (Davenport et al., 2019; Laghi, 2020). While other technologies like robotics, drones, smart sensors, virtual reality, and so on have all played positive roles in supporting health care professionals in managing and coping with the COVID-19 pandemic (Tavakoli et al., 2020; Zeng et al., 2020), AI will arguably be more instrumental in tackling some of the most striking and prevalent issues that both health care professionals and government officials are faced with. These issues include pandemic surveillance, drug and vaccine development for the coronavirus pandemic, and disaster recovery (Keshavarzi Arshadi et al., 2020; Laghi, 2020; Lin & Hou, 2020).

AI technology is very useful in searching for specific patterns or identifying trends and patterns across a large amount of data quickly and cheaply. For instance, AI can

extract data retrospectively from medical records or prospectively in real-time and process this data statistically for insights that can supplement any existing structured data to develop actionable information (Sharma et al., 2019). During the outbreak of the coronavirus, AI has been used to gather and analyze publicly available data, such as geolocation data, social media content, and content timestamps to identify and record potential cases of coronavirus in a cost-effective way without expending money on testing devices or employing clinical resources that involve health care professional (Klein et al., 2021).

As seen above, AI is irreplaceable in terms of handling complex tasks, which include extracting useful information from large datasets. However, considering the increasing advancement in technology and its applications, AI can be used as the main component in other emerging technologies (Jia & Yang, 2020), which can be used for disaster management and recovery. All these insights drawn from the COVID-19 pandemic (Keshavarzi Arshadi et al., 2020; Lin & Hou, 2020) suggest that AI has a great potential in disaster monitoring and managing.

AI technology, alone or when coupled with other advanced technologies, can be very effective in elevating disaster monitoring, control, and management (Kashif et al., 2021). That is, AI technology can be adopted to handle issues, such as early detection and identification of disaster, treatment design and development, public health interventions, and disaster recovery (through sentiment analysis using social media content. This study specifically focuses on adopting AI for disaster recovery taking COVID-19 unknown risk as a case study.

3.8 The Role of AI in COVID-19

COVID-19 is a global pandemic that was first identified in Wuhan city of China and exponentially started to spread across the world. This pandemic has changed the world significantly, not only for health care systems, but also for politics, education, economics, transportation, etc. Consider what makes COVID-19, as a crisis is its unknown nature as a virus and its consequences, as well as the speed at which it is spreading across the world. Although World Health Organization (WHO) and Centers for Disease Control and Prevention (CDC) have published instructions and regulations to reduce the risk of COVID-19 from spreading, it is still breaking out. Many countries considered this epidemic as a normal flu and ignored all advice released by WHO and followed the approach of herd immunity, but unfortunately this method made it worsen. This approach results in exploding the number of infected cases that eventually led those countries to issue a 24 h lockdown while preventing any type of gathering as well as closing their borders (Mayo Clinic, 2019). In response to this unknown risk, AI played an important role and it has been applied successfully in managing this outbreak.

Countries like Japan, Hong Kong, and South Korea combined lessons learned from H1N1 and SARS with the AI powered capabilities to process the unknown risk in real time which helped them to build defense and response systems to mitigate

losses associated with the COVID-19 epidemic (Rogers, n.d.). This proves that AI can analyze the anatomy of past crisis and apply that intelligence to the precautions that countries develop today as they prepare for the challenges of tomorrow. The truth is countries and organizations cannot predict the onset of the global pandemic (Akhtar et al., 2021; Aziz & Aftab, 2021). However, they can identify the telltale indications. AI can empower organizations to proactively spot growing unknown risk early and take decisive measures before massive loss occurs. Fortunately, AI and unsupervised machine learning are capable of analyzing, processing, and deriving actionable insight from all this data and can do so in real time.

3.9 Conceptual Framework and Hypothesized Relationships

Organizations are recognizing AI effects on the market and they became more interested in investigating AI as a new technology that can transform their management strategy. Unknown unknown risk is a big concern when it hurts the business without any contingency plan. Therefore, the ability of AI to predict and deal with the risk that might appear in the future is catching business attraction. Using AI to mitigate the upcoming unknown unknown risk in an organization can increase the chance of avoiding any loss. In addition, it will help the production to create new plans to reduce the risk. Moreover, they can manipulate it to their advantage, create an opportunity in having a change that exceeds that of opponents, and be the leader in the market. The objective of this research is to study AI capability towards unknown unknown risks negative consequences and the target audience for this research are organizations, project managers, and policy makers. Figure 1 represents the proposed hypothesis of this research.

H1: AI technology has a positive effect on mitigating unknown unknown risk.

4 Methodology

After a complete review of the literature, a qualitative method has been decided to be used to meet the objective and answer the question of this study, which is how AI can mitigate the impact of unknown unknown risks. A combination of secondary data and interview methods will be utilized. As secondary data, six case studies of different utilizations of AI in combating COVID-19 will be chosen to discuss the

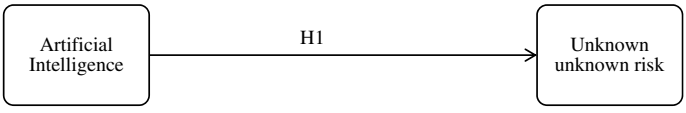

Fig. 1 Research conceptual framework

role AI played in mitigating the unknown unknown risk. In addition, a structured interview will be used to gather detailed information and the questions will be based on an open-ended approach. This data will help to better understand in which stage risk management processes can involve AI technology and the potential level of its capabilities in unknown events cases.

5 Data Collection

5.1 Case A: Canada BlueDot

The Canadian based AI model BlueDot that functions based on machine learning, predicts humans by spotting infectious disease outbreaks. It predicted the outbreak of the infection at the end of 2019 issuing a warning to its clients on 31 December 2019 before the WHO did so on 9 January 2020 (Kreuzhuber, 2020). A group of researchers who are working with the BlueDot listed the top 20-destination cities where passengers from Wuhan would arrive in the wake of the outbreak. They warned that these cities could be at the forefront of the global spread of the disease.

BlueDot aims not only to identify the threat of infectious diseases, but also to understand how diseases could spread to different parts of the world, then to determine the possible consequences of their spread. BlueDot was able not only to send out a warning, but also to correctly identify the cities that will be highly infected through using global air ticket data. It helped to predict where the infected people could potentially travel to. Eleven of the top listed cities were also the first areas affected by COVID-19 cases. For WHO, which is dependent on official statistics from Chinese authorities it was difficult to access such information and make forecasts early on (Pham et al., 2021).

5.2 Case B: China Detection System

CCTV based tracking was used in Asian countries to identify the potential infected people. China used infrared cameras to scan crowds for high temperature. Their AI powered system used facial recognition to identify individuals with high temperature and whether he/she is wearing mask. It is currently being used at Beijing's Qinghai Railway Station and it has the capability to inspect up to 200 people in one minute without interrupting passenger flow (Allam et al., 2020). This system also used to ensure citizens comply with self-quarantine instructions. According to reports, individuals who ignored the instruction and left home would get a call from the authorities after being tracked by the system (Preethika et al., 2020).

5.3 Case C: Dubai Police Movement Permission

The Dubai government announced a 24-h sterilization program, which aims to reduce the physical contact between people and speed up the sterilization program. Dubai Police used AI to find if the trip was for the reason claimed in the permit request. AI was used along with speed radars to identify which vehicle has a movement permit or belongs to people working for important sectors. In addition, if a vehicle did not get a permit and went out for necessary purposes, AI can recognize the route and check if this trip was in fact for an important matter. Plus, the system has the capability to identify the path a person takes when they work in vital sectors and it will know the route from home to work.

5.4 Case D: IBM Watson Assistant

Watson Assistant is a conversational AI platform that provides an engaging experience for users to get even their most complex issues solved by using supported chat and speech interfaces. It was preprogrammed with COVID-19 questions via the IBM cloud. Organizations in 12 countries from the city of Austin to the Polish Ministry of Health have been able to get up and running in as little as 24 h (Hanford, 2005). The objective of this type of technologies is to help reduce the waiting time for calls those users make to the telephone lines of state services relating to the novel coronavirus. In addition, it provides data driven insights to help employers make informed decisions on workplace re-entry, facilities management, space allocation, and other covered related priorities.

5.5 Case E: Microsoft Azure AI—ImmuneCODE

Biotechnology and Microsoft collaborated in launch an immuneCODE that is an open database to share an immune response toward COVID-19 blood samples from patients around the world. The database contains information details on "T" cells, which specifically recognize features of the virus with unprecedented scale and speed. This cell has trove of information that can provide one consistent trackable measure of immune response. In addition, it can help in diagnosing and managing COVID-19 and provide accurate assessment of immunity. As a result, data from the immuneCODE will speed up vaccination development, provide better diagnose, and reduce the spread of the virus (Microsoft, 2020). According to Kevin Scott (2020), Microsoft is using similar supercomputing capacity that have been used before for natural language process to run molecular simulation to identify potential therapy for COVID-19.

5.6 Case F: Facebook Fighting Misinformation

Facebook uses AI model to detect and track false news written in text and images effectively. The software is trained to find duplicated or slightly modified version of that content as it spread across the platform in different languages (Statt, 2020). It can recognize and track both the copy and the original image with perhaps one changed word in the post. It can recognize whether the images contain false claims or misleading information about COVID-19 and apply warning label automatically (Statt, 2020). The system is applied to every image that has been uploaded on each platform, Instagram, and Facebook, which means billions of images are being checked per day in their database.

6 Analysis

6.1 Case A

BlueDot was able to identify the crisis and the cities that will be affected by this disease that gives it the advantage of early prediction of such pandemic. It alerted the Canadian entity about this pandemic 8 days before the WHO announcement, which presents its effectiveness in early prediction (BlueDot, n.d.). It also assisted in understanding how disease might scatter to different parts of the world and then determined the potential impacts. It pointed out which cities had the risk of transmitted COVID-19 despite having no official cases (BlueDot, n.d.).

It required human interpretation and providing context to recognize the threat. In fact, even in the case of BlueDot, human remains central in evaluating and interpreting its output. Therefore, it is correct to stress that human input across disciplines is needed for the optimal application of AI.

6.2 Case B

Case B used IOT devices as CCTV based on AI and machine learning algorithm. It was able to detect infected people. In addition, it was used to track those who are not following the guidelines and report them. The data that was collected was interpreted and transferred to the concerned person in the organization for interpreting them, conducting results, and creating an action plan. Their main goal was to identify areas of vulnerability in early stages to avoid surprises by managing potential aspects, which can lead to occurrence of risk overtime. The shown AI system takes a whole CCTV as an input and runs a quick diagnosis to be able to provide the abnormal cases as an output.

Licensed to (putm@utm.my)

6.3 Case C

In Case C, they used AI to track people who got the permission in advance along with the ability of taking a decision regarding the fines, whether it is eligible or should be removed. The new understanding of the technology can be result in evaluating the current situation and making sense of a complex pattern of different aspects. Their aim was to produce a fast-reactive mechanism to various changes and pro-act to them. The effectiveness of their method was depending on the speed of analyzing the vehicle data. This system assisted in automating the validation processes, which in usual cases take days to be verified and can sometimes include human error (UAE Government, n.d.).

6.4 Case D

Case D used machine learning to enable chatbots to interact with people and take decisions in responding to different inquiries from them later on. In addition, it automates the call center work to speed up the efficiency of this service and effectively carry out the process. The success of this mechanism depends on the level of maturity of the organization in feeding up the basic knowledge and questions to the AI. As well as, expanding the sharing data for more than 12 countries for better proactive responding. Effectiveness and coverage are the two measures that provide the overall performance of Watson. With COVID-19, it succeeded because of its capability in responding to most inquiries well (Benvie et al., 2020).

6.5 Case E

Azure ML empowers researchers and medical organizations in responding to COVID-19 and it accelerated solutions to react against the global pandemic. The accuracy of the immune response will be continuously enhanced and updated online in real time as extra samples are sequenced by using MS Azure cloud and ML capabilities. The objective of this collaboration is to speed up the vaccination research and identify the patterns of this virus in timely manner.

6.6 Case F

Facebook AI system's goal is to reduce the spread of misleading information across the program. In addition, it helps them to demonstrate their commitment to keep

Table 1 Summary of AI contribution

Case	Decision Making	Early prediction	Tracking and detection	Automation processes	Cost efficiency
Case A	•	•	•	•	•
Case B	•	•	•	•	•
Case C	•		•	•	•
Case D	•			•	•
Case E	•	•	•	•	•
Case F	•	•	•	•	•

Facebook and Instagram safe and genuine with the content uploaded in these platforms. It uses the three-pronged strategy of informing, reducing, and removing. It starts with informing users of recognizing false news. Then, it reduced the distribution and appearance of false news that has been labeled. Finally, it removes the fake posts and disable the accounts. According to Facebook Community Standards Enforcement Report, the fake accounts represent approximately 5% of their users and were around 1.5 billion accounts in the second quarter of 2020. In addition, 99.6% accounts were flagged with through their system before the other users reported them (Facebook, n.d.).

After analyzing, we came up with five main tangible roles that AI played in COVID-19. Table 1 illustrates the identified influences in each case.

Another analysis was done to demonstrate the AI contribution in each risk management process based on analyzing the six case studies. The results were based on correlating between the functionality AI provided in each case with the elements of each risk management processes as shown in Table 2. It is clearly shown that AI can help in developing a consistent, and integrated risk management methodology to help determine how best to identify, manage, and mitigate significant risk through the organizations.

6.7 Effectiveness of AI

Table 3 addresses the six cases with using and without using AI for measuring the effectiveness of utilizing AI in COVID-19 and any future unknown events.

In addition, we did a quantitative measurement of using AI technology in respect to the following metrics: speed, adoption, response, availability, and cost reduction. The scale of assessment will be from 1 to 5 where 5 presents excellent and 1 is low. The scores are based on the researcher's point of views from each case.

Table 4 illustrates that the five measurements reveal the effectiveness of utilizing AI in mitigating unknown risk. As shown in Table 4 most of the scores were between 3 and 5 which indicate that AI has a strong potential in mitigating unknown unknown risks. AI based systems are always available and were not impacted by working

Table 2 AI in risk management processes

Sr	Case	Planning risk management	Risk identification	Qualitative analysis	Quantitative analysis	Planning risk response	Implement risk response	Monitor risk
1	Case A	•	•	•	•	•		•
2	Case B	•		•	•		•	•
3	Case C	•		•	•		•	
4	Case D	•		•	•	•	•	
5	Case E		•	•	•			•
6	Case F		•	•	•	•	•	

from a distance and being on lockdown. AI quickly adapted the change with the pandemic and assisted in reducing the cost of operations that required human involvement such as responding to customer questions, monitoring people's movement, and checking the logs of violators. Moreover, it contributed in automation of many repetitive and manual processes that have been impacted by implementing working from a distance. In addition, AI participated in the better understanding of this unknown risk through analyzing the patterns and turning it to become known as well as provided recommendations on how to react in different stages of this disease.

7 Discussion of Results

After analyzing the six case studies, the results that were obtained within the previously described method for each case of using AI technology can be summarized in the main roles of rapid response, namely, decision making, early prediction, automate processes, and detection and tracking. We can consider AI as a game changer for accelerating cognitive abilities and economic benefits. AI and machine learning can help proactively prepare for unknown unknown risk. In the COVID-19 case, we found that most companies have focused so far on reactive measures, but now it is the perfect time to take transformative action and be proactive. Companies that have already introduced AI should press ahead immediately in order to achieve maximum advantage in the near term. They should not hesitate to scale up because AI will be a significant level that can help them manage this crisis and future unknown unknown risk. The following are the main AI roles found in mitigating unknown unknown risk:

Table 3 Measuring AI effectiveness—qualitative

Case	Without AI	With AI
Case A	Human needs time and effort to analyze and find the pattern to predict the pandemic as well as he will be observing and waiting for other countries to report the infected cases. WHO took 9 days after BlueDot results to announce the pandemic	Predicted the pandemic before the WHO announcement and reported the top 20 cities that will have the virus thorough correlating between the airlines' tickets and infected cases in city Wuhan. 11 cities were correct from the list
Case B	CCTV will not be able to detect and take actions against any infected cases and it will require human intervention to verify the videos and report the violators	AI directly detected the infected cases once they passed through the CCTV as well as identified the violators who are not wearing masks
Case C	Requires human review that will take more than a week to verify each video recorded and map it to the permissions	AI could identify the violators within seconds and take the decision to issue fines
Case D	The customer service agent will take time to ask for the answer and respond to the phone call inquiries and sometimes the responsible person is not available to answer and that can take more than one day	A direct response is available to any inquiries because of the data that has been fed to the machine learning and any unknown question will be reported to a higher level as a quick reaction
Case E	The process of analyzing the T cell will be very slow and it will require time and efforts to study all the samples and find the common pattern which in some cases requires months. Even sharing data will require many approvals and permissions. This will lead to put huge pressure on medical organizations which are already overwhelmed with infected cases	AI speed up the analyzing process because of the open public database to find the common attributes of the virus as well as it provided better diagnose. It helped to drive model in a day instead of months which is normally required using older technique
Case F	The process of tracking the source of fake news requires times as well as it is very hard to identify the news if its true or fake	AI speed up the process of verification and assisted in tracking the sources of fake news in seconds instead of weeks. In addition to its capability to automatically takes the decision to remove the news

Table 4 Measuring AI effectiveness—quantitative

Case	Metric				
	Speed	Adoption	Response	Availability	Reduce cost
Case A	5	4	4	5	4
Case B	4	4	4	5	4
Case C	4	4	5	5	5
Case D	4	4	3	5	4
Case E	4	3	4	5	4
Case F	4	4	5	5	3

7.1 Rapid Response

During any pandemic, the role of technology rises and shines. For example, in COVID-19, AI and big data showed an extraordinary role in solving problems and increasing the potential for response to any future circumstances. It played a significant role in diagnosing coronavirus patients. Thus, AI enabled rapid and ongoing adaption and recognition to the new abnormal and can be open to change (Alnazer et al., 2017; Haitham Alzoubi & Ahmed, 2019). It improves the adaptability required to address changing conditions at every step of the unknown unknown risks. It is able to process the combination of structured and unstructured data in a massive amount, which shows the patterns and results in decision-making.

7.2 Decision Making

AI is a decision support system that allows domain experts to generate diverse alternative scenarios of the future and imagine different possible outcomes including unlikely, but potentially impactful future (FERMA, 2019). Any unknown risk has an impact on any business and the effect can be long-term, so utilizing technology that can think and learn is a great opportunity. The top management can benefit from the technology through better decision-making, providing great productive insights and visibility of risk that can be delivered by AI. The organizations that benefited from the AI vital role in fighting against COVID-19 will assist the future developments in their decision-making strategy (Alzoubi et al., 2020a, 2020b). AI technology has the ability to use secondary data to provide reference suggestions when people are unsure or when there are multiple decisions (Jin et al., 2020).

7.3 Improve Cost Efficiency

AI helps organizations to improve their work efficiency through reducing cost of the processes by automating day-to-day assistance and guidance in the risk management process (FERMA, 2019). For a small organization with few resources, AI can propose a method to achieve rapid and accurate risk assessment, which result in proper allocation of the limited resources. This means that AI led to substantial savings in term of human resources and improved emergency repair, efficiency, and decreased the risk of infection for individuals within the organization (Alzoubi & Yanamandra, 2020; Mehmood et al., 2019). The ability of adapting to different requirements can be considered as a benefit in the resources.

7.4 Early Prediction

Unknown risk has warning signs and if we can identify them and act against minor events, then perhaps we can avoid losses. It is important to obtain an early indication of negative risk development that will become noticeable in the future (Hajikazemi et al., 2016). AI can be used to identify abnormalities in certain areas of data storage. With the huge amount of data, you would not see them as a person, whereas the machine now is enabling us to notice them. It has the potential to exceed humans, not only through speed, but also by dictating patterns, which humans have overlooked. These patterns will be taken under consideration and will generate many different scenarios exploring a variety of possible outcomes (Alzoubi & Yanamandra, 2020; Joghee et al., 2020). The top management roles come to prepare the organization to deal with realistic circumstances for both expected and unexpected futures.

7.5 Automate Processes

Automate repetitive tasks that a human does every day, but in doing so we are going to create work that will allow people to do more complex and judgment-based pieces of work that will enhance their ability to engage in the job. It conducts enterprise risk assessment through identifying risk materials in the organization, by calculating inherent risks using likelihood, impact, and analysis model. Second, it evaluates and redeems the risks by using context models to determine an action, such as accepting, monitoring, or treating. Then it performs residual risk analysis after controls are applied. Finally, it schedules risk assessment by running periodic risk assessment for analysis and evaluation. Not to mention, it has a self-learning feature which means the embedded self-learning feature of AI will keep learning for accurate results in the future. AI technology has shown good performance during the pandemic and can be used with different diagnosis levels, according to different policies that humans teach it. The system will keep learning and reach to experienced levels, which later on will automatically produce the output of the matter (Alshurideh et al., 2020; Alzoubi et al., 2020a, 2020b; Jin et al., 2020).

7.6 Detection and Tracking

Organizations need to analyze their risk profile through the competence of their risk management framework. The insufficient knowledge and the complete lack of awareness about their existence can make it hard on organizations to detect. This may lead to losses due to inadequate experience and interaction with the available risk management system (Emerging). Detecting and tracking symptoms with AI can lower the possibility of losses and will lead to the creation of a relevant credible

management model. This creates the opportunity to plan different scenarios and strategic foresight, which must go beyond the conventional approaches due to the emerging risk occurring from the complex and interrelated event. For example, in the COVID-19 pandemic, AI technology was able to track the suspicious cases and forecast the nature of the virus from the feed up data about the risk infection and the likelihood of spreading (Alnuaimi et al., 2021). The monitoring feature resulted in predicting the possible positive cases and the regions in which they are likely to be present. Thus, it provided daily updated information, which aided in giving the possible measurements to prevent the virus from spreading accordingly.

8 Limitation

Many papers admitted that AI in some cases struggled due to lack of data. In fact, the successful implementation of artificial intelligence is dependent upon the data set and creativity of the humans who are deploying it to mitigate the unknown unknown risk. The value of AI and its application in exceptional times like the coronavirus pandemic stems from the human input that goes into its design process (Alzoubi & Aziz, 2021; Alzoubi et al., 2021). To realize the full potential of AI, it is necessary to marry innovation and human action together, so that we can win the war against any type of unknown risk with reduced losses.

9 Recommendations

The following are recommendations to enhance the role of AI in risk mitigation.

- Governments must put in place the necessary supporting technology, regulations, and governance to enable large-scale adoption in response to unknown unknown risk.
- Promote co-operation, and data exchange both on a national scale and globally by the AI community, and policy makers to contribute in preparing for the problem, recognizing important data and launching datasets for unknown unknown risk.
- Dedicate research on AI technologies that can understand from limited data.
- Build AI-powered monitoring tools that empower research without affecting privacy.
- Initiating emerging risk governance framework that contains new approaches to the risk management strategy, operational processes, and measurement of exposure to them.
- Integration AI with other technologies such as blockchain, big data, and cloud to achieve better efficiency in reacting to pre and post unknown unknown risk.

10 Conclusion

In conclusion, it is clearly seen that AI can be a game changer for mitigating unknown unknown risk. The capability of this technology, which was proven during the COVID-19 pandemic, is that it could be a valuable source to combat black swan events. In this research, we have presented a state by utilizing AI technology to address numerous challenges posed by the coronavirus pandemic. Six main applications of AI potentials for coping with COVID-19 crisis have been analyzed all through (Ali et al., 2021; Ghazal et al., 2021a). As a result, this research acknowledged that AI and machine-learning technology are enabling the shift by providing the tools to support remote communication, enable telemedicine, and protect food security. In addition to its capability of early prediction, tracking and detecting, decision-making, and process automation, we believe AI-driven algorithms could deliver valuable predictions and readings in the future. Companies do not require completely new processes for dealing with AI, but they will need to improve existing ones to consider AI and fill the necessary gaps (Alhamad et al., 2021; Kurdi et al., 2021). For best utilization, it is recommended to increase data sharing, in addition to having access to different historical data with the ability of pulling data from the right sources. However, the biggest challenge is to create a convincing and reliable global data set of different risks identified among the nations with possible different metrics. Adoption of AI requires from companies to go through a learning journey and to work in a more scientific mind-set.

The Role and Impact of Big Data in Organizational Risk Management

Mounir El Khatib, Ahmad Ankit, Ishaq Al Ameeri, Hamad Al Zaabi, Rehab Al Marqab, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract Technological advancement has exposed companies to various risks. With the adoption of technological infrastructures in many companies, various processes have been rendered vulnerable to different forms of threats. Evidence from the current empirical studies on organizational management indicates effective risk assessment is a crucial aspect in any organization. Global technological advancement has equally redefined risk assessment and management strategies. Global leading technology companies such as Apple Inc., Amazon Inc., and Google are leveraging modern technology to unlock hidden data to aid in risk assessment and management. As evidenced in this research report, the use of big data has revolutionized risk assessment in many companies across the world. Big data technology has enabled organizations to collect, store, and assess huge information to aid in risk assessment and management. The processes of risk identification, assessment, mitigation, monitoring, and reporting have been redefined due to the adoption of big data analytical technology. As a result, this research reviews the specific roles played by big data in organizational risks management. The research carries out a comparative case study analysis among three companies that utilize big data in risk management. Specifically, the roles of big data technology in risk management at Apple Inc., Amazon Inc., and at Google are identified. Results from this comparative analysis are used in formulating recommendations for various organizations that desire to adopt big data analytical technology in risk management.

Keywords Big data · Big data analytics · Organizational risk management · Project risk management

1 Introduction

Over the years, organizations have been implementing various risk assessment strategies to identify and prevent threats that hinder competitiveness. Risk assessment has been a central aspect in many organizations based on its ability to identify factors undermining performance. The proliferation of digital technology has redefined the need for risk assessment in many organizations. The incorporation of technological infrastructures has influenced many organizations to prioritize risk assessment due to various threats (Alshurideh et al., 2019; Agha et al., 2021; Kurdi et al., 2020). The advent of digital technology has exposed many organizations to several risks. Arguably, unlike in the analogue era, organizations are currently utilizing modern technology to formulate effective risk assessment tools. Presently, technological risk analytic and data mining tools such as big data have been adopted to help organizations identity, assess, mitigate, monitor, and report the progress of various threats. Global-leading technology companies such as Apple Inc., Amazon Inc., and Google rely on data mining tools such as big data in assessing and managing risks (Al Shebli et al., 2021; Lee et al., 2022a, 2022b; Naqvi et al., 2021). While several data mining techniques are used by organizations in risk assessment, the use of big data has proved to be effective because it unlocks hidden information enabling an organization to make accurate and data-driven risk management decisions (Al Alwan & Alshurideh, 2022; Batayneh et al., 2021; Tariq et al., 2022a, 2022b).

2 Background

Organizations in the current world have adopted digital technology in almost all of their processes. Apart from leading to efficient, reliable, and accurate product and service delivery, technological adoption has led to the collection of information (Ahmed et al., 2021; Almaazmi et al., 2021; Dicuonzo et al., 2019). Also known as big data, the collected information has been valuable in enabling organizations to formulate customer-centric business models (Ahmad et al., 2021; Alshurideh et al., 2022). Guided by the importance of data in the contemporary world, Almeida (2017) argues that risks assessment can effectively utilize big data technology.

Big data has been a crucial aspect of risk management because it has helped organizations to collect, store, evaluate, and apply data originating from different sources. The approach adopted in big data analytical strategies has enabled many organizations to detect, assess, mitigate, monitor, and report all forms of risks that might hinder continuous operations (Alshurideh, 2022; Shabbir & Waheed, 2020).

Defined as a structured and unstructured software that is used in collecting information during the daily operations of an organization, big data has proved to be a vital risk assessment tool due to its ability to unlock some hidden information (Ahmad et al., 2021a, 2021b, 2021c; Ali et al., 2022).

According to Tang and Karim Khondkar (2017), the effectiveness of risk analytics is determined by the ability of an organization to carry out a holistic assessment. This process should assess and determine some of the hidden risks that might affect seamless operations. Notably, adopting data-driving analytical strategies enables organizations to unlock some hidden and crucial information that leads to the formulation of an effective risks assessment strategy (Alshraideh et al., 2017; Ben-Abdallah et al., 2022; Hanaysha et al., 2021a, 2021b). Guided by the vital roles played by big data in risk management, it is essential to carry out research that will provide a practical application of this data-driven technology in preventing various organizational threats.

2.1 Research Problem

Technological advancement has exposed several organizations to numerous risks. Apart from fostering efficient, reliable, and convenient products and services provision, the digital technology being used by organizations has exposed them to several risks. Unlike in the analogue era, the increased risks facing organizations have led to the demand for the formulation of a more accurate and data-driven strategy that can effectively assess and manage various risks. An increase in technological risks faced by organizations has led to the demand for a more effective management strategy (Tang & Karim Khondkar, 2017). As a result, this research focused on solving the current challenge of increasing cases of technological risks faced by organizations by analyzing the roles played by big data. Specifically, this research reviews the use of big data analytical technology in solving various risks faced by organizations (Alhamad et al., 2021; Shamout et al., 2022a, 2022b). With reference to the application of big data technology in leading companies, this research formulates effect strategies that should be utilized by organizations to identify, assess, mitigate, monitor, and report various risks (Alshurideh et al., 2021; Amarneh et al., 2021).

2.2 Research Objectives

The primary objective of this research was "*To determine the roles played by big data in organizational risks management*". Other objectives of the research were "*To determine the practical applicability of risks assessment in leading organizations*" and "*To determine how big data is used in risk identification, assessment, mitigation, monitoring, and reporting*". Achieving these objectives was effective in solving the

research problem and enabling the researchers to identify the critical roles played by big data in organizational risk management.

2.3 Research Questions

The whole of the research process aimed at answering the following four questions.

i. What is the role of big data in organizational risk management?
ii. How is big data applied in the management of risks at Apple Inc.?
iii. How does Amazon Inc. utilize data mining technologies such as big data to assess and mitigate various risks?
iv. How does Google utilize big data in risk management?

Notably, answering the above four research questions was vital in enabling the researchers to formulate effective risks management strategies that organizations can utilize to overcome various risks. Specifically, the questions were significant in analyzing the practical application of big data technology in organizational risk management in the contemporary world.

2.4 Significance of the Research

Despite the existence of literature on the use of big data in achieving effective customer management, there is a dearth of data detailing the role of big data in organizational risk management. In effect, this research was vital in filling the existing gap by analyzing how big data is utilized in assessing and managing organizational risks (Dicuonzo et al., 2019). literature from this research will be vital in filling the existing research gap. Researchers will build on the findings of this study to carry out further analysis on the application of data mining technologies in organizational risks management.

Moreover, this research is very important because it formulates strategies that can be applied by organizational management and the risks management departments in the course of assessing and managing various threats (Hanaysha et al., 2021a, 2021b). Guided by the advent of digitalization in many organizations, the findings of this research will be used as a guide that will influence the adoption of big data analytical technology in risk assessment and management. Notably, carrying out this study is vital in identifying the roles and benefits of using big data mining technology in organizational risks management.

Lastly, the comparative case study analysis approach adopted in this research was vital in enabling the researcher to solve the current problem of technological risks being witnessed in various organizations. The adoption of digital technology in many organizations has exposed many processes to various risks (Hamadneh et al., 2021; Rui et al., 2022). These risks can only be solved by adopting a data-driven risk

management strategy (Shabbir & Waheed, 2020). Adopting big data analytics fosters the aspects of accuracy during risk identification, assessment, mitigation, monitoring, and reporting. As a result, the comparative case study analysis carried out in this research was vital in creating practical applicability of big data in organizational risk management.

3 Literature Review

Technological advancement in the contemporary world has influenced scholars to carry out studies to identify the roles played by big data in organizational risks assessment and management (Lee et al., 2022a, 2022b). Evidence from the studies by Kumari (2018) indicates data mining technologies such as big data analytics have revolutionized organizational risk management. On the other hand, Shabbir and Waheed (2020) postulate that the application of big data analytics in risks management has enabling organizations to uncover critical data that has led to the formulation of a more accurate and applicable risk management strategy. The studies by Tang and Karim Khondkar (2017) justify the use of big data technologies in organizational risk management by holding that this approach enables managers to make accurate and data-driven decisions (AlHamad et al., 2022). Literature from the current studies identifies various roles played by big data analytics in enabling organizations to assess and manage different risks (Ali et al., 2021). Some of these roles are discussed in the subsequent sections.

3.1 Big Data Analytics is Used in Fraud Prevention

Studies by Shabbir and Waheed (2020) analyzed the role of big data analytics in preventing various forms of frauds experienced in organizations. Evidence from this study indicated that big data analytics have the capability of detecting different forms of fraud. Organizations in the contemporary world experience various forms of financial frauds caused by employees and other stakeholders. However, Jin and Liad (2021) suggest that big data analytics enables an organization to collect big volumes of data that detect and prevent any form of fraud in an organization (Shamout et al., 2022a, 2022b). On this regard, organizations should consider adopting big data analytics to prevent the rising cases of fraud.

3.2 *Big Data Analytic Help Organizations to Manage Various Risks Associated with Third Parties*

Most organization outsource different services from third party companies. According to Choi et al. (2018), some of these third parties end up causing significant risks to organizations. For instance, an organization outsourcing technological services such as cloud computing from third-party providers' risk facing challenges related to cybersecurity (Choi et al., 2018). On the other hand, an organization that deals with different vendors is always prone to several risks originating from these third party suppliers (Kumari, 2018). As explained by Kumari (2018), risks originating from third parties can easily lead to the collapse of an organization (Alnuaimi et al., 2021). Big data analytics has been crucial in enabling organizations to collect a huge volume of data that can easily detect any form of external threat (Alzoubi et al., 2022). The collected data has been utilized in assessing threats from third party companies and formulating effective mitigation strategies (Kumari, 2018). Results from the studies by Jin and Liad (2021) indicates that organizations that depend on big data analytics have well-established risk management approaches that prevent any form of external threat.

3.3 *Big Data Analytics Have Been Vital in Reducing High Customer Churn Rates and Preventing High Employee Attrition*

Customers and employees are two vital stakeholders in any organizations that determine its growth and development. According to Dicuonzo et al. (2019), organizations that achieve customer loyalty and retention register continuous growth and development due to the increased sales (Joghee et al., 2020). On the other hand, Cole et al. (2015) hold that employees are a driving force that ensures continuous operations in any organization. In this regard, increased customer churn rates pose critical risks that might result in the collapse of an organization. As explained by Cole et al. (2015), the increased customer churn rate reduces the total market share of an organization rendering it uncompetitive. Similarly, high employee attrition leads to low-quality service delivering hindering an organization from meeting its objectives. Consequently, the research by Almeida (2017) concludes that the adoption of big data analytics prevents the risks associated with increased customer churn rates and employee attrition. By applying big data analytics, organizations collect numerous information based on different customer segments (Alnazer et al., 2017). The company counters the risks of high customer churn rates by identifying various factors that hindering customer satisfaction (De Mauro et al., 2018). Additionally, high attrition rates among employees can be easily detected, analyzed, and manipulated by using big data analytics (Alzoubi & Aziz, 2021). The adopted big data

Licensed to (putm@utm.my)

analytics identify the specific needs of employees and formulates ways of fostering retention.

3.4 Big Data Analytics Foster Operational Assessment and Enables Organizations to Manage Various Forms of Digital Risks

Big data technology enables organizations to collect, store, analyze, and apply big chunks of data in the course of assessing and managing different forms of risks. Operational risks are some of the common threats facing organizations in the contemporary world. Companies experience different risks originating from different organizational processes (De Mauro et al., 2018). Ineffective management of these risks threatens the stability of any organization. In this regard, the adoption of big data analytics has proved to be effective in handling various operational management threats. Similarly, research by Vassakis et al. (2018) revealed that adopting digital technology has led to the existence of several risks in the contemporary world. However, Jin and Liad (2021) established that relying on big data analytics has proved to be effective in dealing with various threats associated with digitalization (Ghazal et al., 2021). Notably, organizations should consider adopting big data technologies in achieving accurate, data-driven, and appropriate risk assessment and management.

4 Methodological Approach

4.1 The Research Design

The methodological approaches adopted in any research determine the effectiveness and viability of the research findings, conclusions and recommendations. As explained by Schoonenboom and Burke (2017), the methodological approaches adopted in any research are equally important in determining the accuracy of the collected data. This research adopted a hybrid research strategy that collected both qualitative and quantitative data. The hybrid or mixed-method research design adopted a case study analysis. The comparative case studies aimed at determining the specific roles played by big data in organizational risk management (Alzoubi et al., 2021). As evidenced below, qualitative and qualitative secondary data was collected from the case studies on how Apple Inc., Amazon Inc., and Google utilize the data mining technology of big data analytics in managing various forms of risks.

4.2 Case Study Analysis

Guided by the developed research design, researchers carried out a comparative analysis that reviewed the application of big data analytics in risk management in Apple Inc. Amazon Inc., and at Google. The comparative analysis aimed at establishing the specific roles played by big data analytics in assessing and managing various risks.

4.2.1 Case Study 1: The Role of Big Data in Risk Management at Apple Inc.

The utilization of big data has proved to effective in managing various forms of risks at Apple Inc., as explained by PathakJan (2021). Apple Inc. adopts a Siri voice recognition big data technology that collects, stores, analysis, and applies the collected data. According to PathakJan (2021). Apple Inc. has been relying on its big data collection and analytical strategy to improve counter various risks. Just like other leading technology companies, Apple Inc. utilizes the big collected data to identify, assess, mitigate, monitor, and report various risks (Alzoubi et al., 2020a, 2020b). For instance, internal risks associated with financial transactions, employee attrition, high customer churn rates, and threats posed by third-party organizations (AppleInc, 2021). As of the leading technology companies, Apple Inc. has shifted to the use of data mining analytics to accurately assess and manage various risks (Alshurideh et al., 2020). The *Siri* voice recognition technology is utilized by this company in collecting big data has been essential in detecting different forms of risks and formulating mitigating strategies before occurrence. As explained by Sun et al. (2020), apart from enhancing customer relationships management, the big data analytics used by Apple Inc. have been vital in formulating recovery strategies that foster continuous growth and development. Similar to the risks management strategies used by both Amazon Inc. and Google, Apple Inc. has been utilizing this big data technology in unlocking some of the hidden information that threatens seamless operations in the company.

4.2.2 Case Study 2: The Role of Big Data in Risk Management at Amazon Inc.

The business model adopted by Amazon Inc. has exposed it to numerous risks. As a company that relies mostly on third-party vendors, Amazon Inc. is always vulnerable to various risks (Alzoubi & Ahmed, 2019). However, the company has been utilizing effective data mining technologies to detect, assess, mitigate, monitor, and report various forms of internal and external risks (Amazon, 2021). Ranked among the global leading technology companies, Amazon Inc. collects, stores, analyses and applies big data in all of its business processes (Mehmood et al., 2019). The

cloud computing technology adopted by Amazon Inc. utilizes the *AWS* big data software to assess and manage different forms of risks, essential in collecting, storing, processing, and applying big data (Amazon, 2021). According to Galea-Pace (2021), the application of big data at Amazon Inc. has been vital in mitigating risks associated with business strategy, compliance and regulatory risks, financial risks, and other operational risks. As the leading e-commerce platform in the world, the big data collected by Amazon Inc. has been vital in enabling it to make accurate and data-driven risks management decisions. Just like Apple Inc. Amazon Inc. has been utilizing big data analytics to prevent various forms of internal and external fraud, lower retention and churn rates from employees and customers, respectively. Moreover, big data analytics used at Amazon Inc. have been vital in managing third-party risks and mitigating threats associated with operational processes.

4.2.3 Case Study 3: The Role of Big Data in Risk Management at Google

Google is the global-leading technology company that offers different products and services. As a global leading technology company, Google faced both internal and external risks that require effective management approaches (Aziz & Aftab, 2021). According to Sun et al. (2020), technological advancement has led to the adoption of big data analytics at Google. Apart from enabling the company to offer customer-centric products and services, the big data analytics adopted by Google Inc. has been essential in assessing and managing various forms of risks. Google collects big data using different software (Alzoubi et al., 2020a, 2020b). The collected data is then stored, analyzed, and applied in managing different forms of risks (Google, 2021). Google has prioritized the use of big data in risk assessment by identifying risks at an early stage and crafting effective mitigation strategies (Radwan & Farouk, 2021). According to Sun et al. (2020), the use of big data at Google has enabled this company to prevent risks associated with fraud and those originating from third party companies. Just like Apple Inc. and Amazon Inc., the use of big data at Google has been vital in mitigating operational risks that threaten the competitiveness of this company (Cruz, 2021). Notably, big data has proved to be effective because Google is among companies that detect and manage different forms of risks at an early stage.

5 Results and Discussions

It is evidenced from the comparative case study analysis that big data plays vital roles in organizational risk management (Eli, 2021). Guided by the data collected in this research, big data analytics is an essential data mining technology that is used in leading organizations such as Apple Inc., Amazon Inc., and Google to detect, assess, mitigate, monitor, and report various risks (Lee & Ahmed, 2021). As evidenced in

the concepts developed in the literature review, big data analytics plays the following risk assessment and management roles.

Firstly, big data analytics collects large sums of data that is used in detecting and preventing any form of internal and external fraud (Kashif et al., 2021). As evidenced in a study by Almeida (2017), big data technologies have been essential in detecting any form of internal and external fraud in organizations (Akhtar et al., 2021). The detected threat is quickly analyzed, and accurate data-driven mitigation strategies are implemented. Secondly, evidence from this research showed that organizational risks associated with third-party service providers or vendors could effectively be management by big data technologies (Alzoubi & Yanamandra, 2020). According to Dicuonzo et al. (2019), technological adoption in many organizations has led to increased outsourcing. Leading companies like Amazon Inc. rely heavily on external vendors and other third-party product and service providers. Such companies are always exposed to several risks that can be effectively mitigated by big data analytics (Alsharari, 2021). The data mining technology of big data collects large sums of data that can easily detect and manage risks associated with third-party companies and customers (Mehmood, 2021).

Thirdly, evidence from this research shows that big data analytics has been vital in reducing employee attrition rates and countering the increasing customer churn rates. As stated by Shabbir and Waheed (2020), employees and customers are vital stakeholders in any organization. Any risks that prompt either employees or customers to lose interest or loyal in an organization causes detrimental effects (Tang & Karim Khondkar, 2017). In this regard, the adoption of big data analytics enables organizations to assess various factors that lead to increased rates of employee attrition and craft effective mitigation strategies (Miller, 2021). Similarly, big data technologies are used to collect data on different customer segments (Khan, 2021). The collected data is analyzed to determine factors leading to the increased rates of customer churns. Effective strategies are equally established to mitigate these challenges.

Lastly, results from this research showed that adopting big data analytics is crucial in assessing and managing risks associated with organizational processes and other digital threats (Mondol, 2021). As stated above, technological advancement has led to increased demand for digital technology. Most of the organizational processes are currently executed using digital technology (Cole et al., 2015). Despite being effective in fostering the aspects of reliability, convenience and efficiency, digitalization has caused numerous risks in many organizations (De Mauro et al., 2018). Many of the organizational processes have been exposed to both internal and external risks caused by digital technology (Alzoubi, 2021a). However, big data analytics has been crucial in enabling companies to counter risks associated with organizational processes and other digital infrastructures (Guergov & Radwan, 2021). As evidenced in this research, big data analytics detect, analyze, mitigate, monitor, and report different form of risks associated with organizational processes and digital technology.

6 Conclusion and Recommendations

It is evidenced from this research that organizations have been implementing various risk assessment strategies to identify and prevent threats that hinder competitiveness. The effectiveness of these strategies has been based on their ability to timely identify, analyze, mitigate, monitor, and report various risks facing organizations (Al Ali, 2021). With the growth of digital technology, the demand for data mining software such as big data has been on the rise (Farouk, 2021). As shown in this research, big data has been vital in enabling organizations to craft customer-centric business models. Apart from helping companies customize their products and services in various markets, big data has been vital in organizational risk management. It is shown that big data analytics enables organizations to identify and mitigate various forms of risks (Obaid, 2021). As a result, while several data mining techniques are used by organizations in risk assessment, the use of big data has proved to be effective because it unlocks hidden information enabling an organization to make accurate and data-driven risk management decisions.

Guided by the findings of this research, it is vital for companies to consider utilizing big data analytics in solving various risks associated with organizational management. Implementing big data risks management strategies will enable organizations to make data-driven decisions in the course of solving various threats (Alzoubi, 2021b). Additionally, big data technologies will be essential in enabling organizational managers and risk management officers to detect risks at the early stages and utilize accurate mitigation strategies.

labeled five-stars hotels in Jordanian cities and tourism locations (Amman, Dead Sea, Petra and Aqaba). Non-random (purposive) sample was used to collect data and a structured questionnaire was distributed to (460) hotel customers, (412) of which were retrieved and (367) were valid for analysis with a response rate of (79.78%). A set of statistical methods were used through the (SPSS v23) program and results showed only two of the dimensions of green marketing mix had a high level of customer awareness. These dimensions were green product and green price. The overall level of customers' environmental concern was moderate along with the rest of the green marketing dimensions (promotion, place, process, people, and physical evidence). Based on results, it is recommended that hotel managers and marketers carefully design their business and marketing plans to truly develop credible green hotel image, avoid misrepresentation and green washing, and encourage customers to participate in protecting the environment.

Keywords Customer awareness · Green marketing mix · 5-star hotels · Jordan

1 Introduction

The vast development in the hospitality industry in recent years had a huge contribution to the environmental damage and global warming due to the massive amounts of water supply, energy, and natural resources consumed (Alshurideh et al., 2019; Leonidou et al., 2013). During this time, and specifically in the early 90's, an emerging movement for protecting the environment has developed. This movement forced the hotels managements shift their direction to this cause as an attempt to attract the novel segment of green customers and urge them into adopting a variety of green marketing activities (Joghee et al., 2021; Shishan et al., 2022; Tariq et al., 2022). The green marketing mix in hotels range from designing products that reduce emissions and hazards, altering the pricing strategies in exchange of the environmental commitment, developing online third-party partnerships to reduce transport pollution, expressing the hotel orientation through related marketing messages and promotions, providing appropriate training for employees, altering and redesigning the internal processes, and validating customer's expectations through physical evidence (Al-Hawary & Mohammad, 2011; Metabis & Al-Hawary, 2013).

The outcome of customers' awareness regarding a hotel's green marketing mix include influencing the buying behavior (Altarifi et al., 2015; Al-Hawary & Alhajri, 2020; Al-Nady et al., 2016), portraying a source of competitive advantage (Al-Hawary & Al-Hamwan, 2017; Al-Hawary & Ismael, 2010; Al-Hawary et al., 2011; Nadanyiova & Gajanova, 2018), affect the customers' willing to pay premium (Dimara et al., 2015) and increase customer loyalty (Al-Hawary & Al-Fassed, 2021; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Harahsheh, 2014; Al-Hawary & Hussien, 2017; Al-Hawary, 2013a, 2013b; Martinez, 2015).

This study discusses one of the most important issues at present. It fills a gap in giving precise measurements of using green marketing mix by hotels and the degree of customers' awareness of these practices. The study will provide guidance to hotels that need to develop new marketing mix practices for satisfying current customers and attracting new ones. It also explores the customers' needs and desires when they choose a hotel. And importantly, this research will educate hotels in deciding on whether this new approach (green marketing) is really fulfilling its purpose or not.

Given the importance of environmental protection, Green Hotels Association (GHA) made tremendous efforts to transform hotels into green entities. Not only providing extra positive publicity, but green marketing also helped increasing the competitive advantage, brand loyalty, and sustainable development. 5-star hotels begun leaning towards the green and sustainable trends and are most committed to the governmental regulations concerning energy and water conservation and proper waste management (Alketbi et al., 2020; Al-Quran et al., 2020).

This study identifies to hotels' managers and marketers the extent of customer awareness and knowledge of their hotels regarding the green hotel initiatives and consequently encourages marketers to develop successful green marketing strategies matching customers' requirements. This study examines the degree of customers' awareness of green marketing mix at the hotels in Jordan.

2 Theoretical Framework

2.1 Green Marketing Concept

When it comes to Green Marketing, the majority associate it with merely promoting or advertising the environmentally friendly products. The green marketing trend first began in the late '70 s when the Marketing Association of America conducted the first ecological-issues workshop. This workshop resulted in a book called "Ecological Marketing" by Heniun and Keny in 1979. These results weren't taken seriously until the late '80 s due to the growing movements to increase public awareness and urging customers to purchase green products. Later, the green marketing phenomena have gained distinctive importance in the modern market and have emerged in both developed and developing countries while being seen as a fundamental approach to aid sustainable development (Al-Hawary & Abu-Laimon, 2013; Al-Hawary & Aldaihani, 2016; Al-Hawary & Al-Syasneh, 2020; Al-Hawary, 2013a, 2013b; Alolayyan et al., 2018; Alshurideh et al., 2017a, 2017b; Lekhanya, 2014).

The relevant literature review showed a lack of sufficient research and the absence of a unique and defined definition. The American Marketing Association defined ecological marketing as studying both the positive and negative effects of pollution by carbon depletion and resources degradation by various marketing practices. Herbig and Butler (1993) defined green marketing as all products and associated packaging manufactured with criteria that are less toxic, durable, reusable and recyclable.

Then, green marketing was broadly defined by (Polonsky, 1994) who described green marketing as the practices intended to generate and facilitate human needs with a minimal harm to the environment. Later, Peattie (1995) defined green marketing as the holistic managerial process that distinguishes, predicts, and fulfils customer sustainable requirements. While the techniques used to promote products in terms of green marketing were described by Prakash (2002) as the use of ecological statements, either on the characteristics and features of the products or about the processes, policies, and systems of the companies that manufacture or sell these products. Jain and Kaur (2004) defined green marketing is all those marketing activities that companies undertake to create a positive impact or lessen the negative impact of their products or services on the environment. Chen and Chai (2010) stretched the definition of green marketing to include practices by companies that are apprehensive about environmental or green issues and are therefore selling products or services that are environmentally responsible to satisfy customers and society in general. Table 1 summarize the research papers used green marketing mix dimensions through their research.

Green products are percieved as valuable marketing tools, with many hoteliers attempting to offer green products that draw customer interest (Jones et al., 2014). Herberger first defined green products as products that have an ecological

Table 1 Green marketing mix dimensions (7Ps)

orientation, where its environmental viability is perceived, recognized, and understood. This definition was followed by many, but it rarely is a clear definition. Perhaps it was considered as a common term that is already well-known. For example, (Chen & Chai, 2010) simply defined green products as ecological product or environmental friendly product. A wildly mentioned definition is of who defined the green product development as greening the entire production process starting with the manufacturing phase and resulting in disposal. In their research, De Medeiros and Ribeiro (2017) proposed a different approach in defining green products. They suggested that sustainable products are those capable of reducing customer stress related to the environmental responsibility without affecting the overall product quality. In a green hotel context, we find customers also identify features, design, brand name, service quality, corporate image, and credibility before selecting a final hotel destination (Jones et al., 2014).

Green Price: The debate of whether green hotels charge premium or not is never ending due to its direct relation to whether customers are willing to pay extra or not. According to D'Souza et al. (2006) eco-friendly products should be expected to require premium charges in exchange. However, Yazdanifard and Mercy (2011) argue that premium green prices need to be reasonable and justifiable for customers. However, Roos and Nyrud (2008) contradict this argument as they mentioned that the green customers are less price sensitive that traditional customers. On the contrary, research indicates a link between willing to pay premium and the level of environment concern. Price was briefly defined by Engel et al. (2008) as the value offered in exchange of a product. It is considered the most critical dimension as most customers are only willing to pay additional value in exchange of additional product value and attributes. Such attributes might include improved performance, design, and visual appeal. Prakash (2002) stated that customers are not always ready to pay extra for green products. The author also mentioned that during inconvenience, customers perceive price as a huge barrier.

Green place plays a significant role in deciding the eco-friendly place channels for any green product. Rivera-Camino (2007) defined green place as the system that adheres to the green attributes of green products and ensures the environmental characteristics.

According to Eneizan et al. (2016) green place implies the method of selecting the place routes that result in a less environmental damage, since the majority of harm occurs during transportation. Green place highlights the importance of reducing the carbon footprint by rearranging and managing logistics and transportation emissions (Shil, 2012).

In order for green hoteliers to optimize their marketing efforts effectively, they need to decide where and how to position their place routs. It is therefore essential to place their place channels in the right place and time for the right target, which is the green customers (Kotler et al., 2012). It is no doubt that the internet is a powerful communication medium which is often utilized to educate the target market about the hotels' commitment to the cause and the operational sustainable practices. Websites are one wildly used media where a hotel can display all their credentials, awards, environmental programs, and policies. This allows hotelier to be directly in touch

with their customers to actively decrease the number of customers visiting the hotel or any related partner for more information.

Green promotion: Kamath et al. (2016) stated that green promotion refers to a type of advertising that promotes the organization's sustainable policies, their eco-friendly operations, and the environmental measures adopted. This involves developing the necessary promotional tools, such as advertising, marketing materials, signage, web sites, videos and presentations while remaining environmentally friendly (Al Kurdi & Alshurideh, 2021; Al-Dmour & Al-Shraideh, 2008; Alshurideh et al., 2016, 2018). According to Polonsky and Mintu (1997) green promotion helps customers to overcome the lack of environmental information. While Zint & Frederick suggested that customers are not to be assumed knowledgeable regarding the environmental damage and hazards. However, green promotion as explained by Ankit and Mayur (2013) and Alshurideh et al., (2017a, 2017b), might increase and satisfy the demand of green customers with environmental concerns.

Green process was defined as the methodology the service will be provided with minimum harm to the environment (Larashati, 2012). The author suggested greening the entire procedure line, if possible, to establish an overall green plan. Eneizan et al. (2016) argued that some changes to internal processes are expected by businesses who plan to implement green marketing as a business strategy. The company's processes might require some fundamental changes which can be achieved by using less energy, removing damaged products, and less destruction to the natural resources (Alsalaymeh, 2013). This can reflect sequential measures taken by a variety of different workers when seeking to fulfil a job which is incredibly important for the company objectives and procedures to comply. According to research, green process is determined based on possessing little to no potential in harming the environment starting with production, usage, and disposal. Green process should also contribute to saving non-renewable resources and energy. Lapian and Tumbel (2018) clarified that energy-efficient equipment involved in a hotel's operational procedures are of great necessity.

Green people: According to Larashati (2012), people are usually the employees of the company who contribute to both providing and marketing green services and products. It is also essential to possess a green mindset to reflect credibility in their duties. Sangeeta explains that when employees and management are aware of the probable damage to the environment and their role in minimizing this damage, the pro-environmental results and image are more visible. Involving the employees is more efficient and reduces the costs and expenses of the marketing efforts. In their research, Welmilla, and Ranasinghe (2020) explained that employees should be well educated on ecological issues, highly motivated and with a positive attitude, as the credibility of the company lies in their hands. **Green Physical Evidence**: According to (Pomering, 2017) green physical evidence is the environment where the service provided takes place and the customer-employee interaction occurs. Ivy (2008) explained that a potential overlapping between the physical evidence variable in the marketing mix and processes is possible. This strengthens the efforts of green hotels to convey their beliefs and persuades customers at the same time. The Chartered Institute of Marketing stated that the physical evidence provided by the

company will validate the customer's expectations. For example, the physical setting of the reception will display the hotel's green intentions in a desirable fashion. The space should be designed with elegant and innovative furniture, recycled materials, or reused products. The lobby should be equipped with digital reading materials instead of paper format to help hotel's customers read these digital materials via their computers or smartphones. Satisfaction and loyalty for a hotel could be highly improved by incorporating green physical evidence.

2.2 Customer Awareness

Despite its importance to governments, organizations, and scholars, customer awareness seems to be poorly discussed in a proper manner in literature. The term itself is usually misleadingly used in articles with vague discussions and definitions (Rhein & Schmid, 2020). The available literature typically associate customer awareness with either environmental concerns or customers purchase decisions amongst alternatives (Alshurideh, 2022; Alshurideh et al., 2020; Alzoubi et al., 2022). According to Hammami et al. (2017) these studies barely measure the environmental concerns and fail to capture the entire complete dimensions of the customer awareness. Regarding this study context, the last three decades witnessed a rise in customer awareness of the environment, as it has evolved from a secondary concern to a primary one. This has been the result of a variety of causes, including increasing media attention, growing knowledge of environmental issues, the rise of advocacy campaigns and strict regulation (national and international) and the influence of industrial incidents on public opinion (Abuhashesh et al., 2021; Alkitbi et al., 2020; Alshurideh, 2019).

The green customer is known to be someone whose actions are motivated by environmental issues. Peattie (2001) describes a green customer as anyone who willingly participates in environmentally sustainable practices approved by researchers. Critical customers have started to emerge as a new driver in green customers, requiring corporate social responsibility (Maheshwari, 2014). Gradually, the emergence of sustainable customer society has contributed to an ever-wider definition of consumption called ethical customers which refers to customer behaviour that expresses concerns about problems arising from illegal and discriminatory global trade (Hamelin et al., 2013). These behaviours might include abusing human rights, trafficking with animals, child labor, trade union repression, pollution, low-paid labour, and inequality in trade relations. When the mid 90's witnessed the advent of both the green customers and ethical customers, customers demanded an opinion in the manufacturing processes starting from production, place and even the resources allocation. Charter and Polonsky (2017) stated the anticipation of this ongoing disruption of customers, by advocating for sustainable marketing by academics. They also defined sustainability marketing as creation and preservation of a healthy relationship between customers and the environment (Charter & Polonsky, 2017). On the other hand, Rousseau and Venter (1995) defined the customer awareness as the customers' levels of alertness regarding their rights and their obligations in the marketplace.

This definition was further explained by five distinct forces as follows: bargain hunting, general customer knowledge, product knowledge, information search and price consciousness (Rousseau & Venter, 1996).

3 The Study Methodology

3.1 Study Population and Sample

The study population consisted of customers of 5-star hotels in Jordan to recognize their awareness toward green marketing mix in these hotels, where the number of hotels of this category reached 16 hotels in Jordan, most of them in Amman. Due to the large number of hotel customers, it was not possible to conduct a complete census of all customers, so the non-random (purposive) sample was used to collect data related to the study. The study instrument was distributed to (460) hotel customers to achieve the appropriate response rate. A retrieved questionnaire (412) where it was found that (45) were not suitable for statistical analysis due to its incompleteness or the similarity of the answers. Consequently, the analyzed questionnaires were (367) which constitutes a response percentage (79.78%) of the distributed questionnaires.

3.2 Study Instrument

The questionnaire was used as a basic instrument to collect data from the target study sample, where this questionnaire consisted of two parts, the first part contains an introductory introduction about the nature of the study as well as questions related to demographic variables (gender, age, educational level, and familiar with the study variables). The second part, it consists of (50) items related to the variable represented by the customers' awareness of green marketing mix, which was developed based on appendix (3). This variable is formed by eight dimensions that were: general environmental concern which was measured by items (Q1–Q9), green product which was measured by items (Q10–Q16), green prices which was measured by items (Q17–Q22), green promotion which was measured by items (Q23–Q29), green place which was measured by items (Q30–Q33), green process which was measured by items (Q34–Q39), green people which was measured by items (Q40–Q44), green physical evidence which was measured by items (Q45–Q50).

3.3 Validity and Reliability

To verify of face validity of the study instrument and its suitability for conducting the study, the tool was presented to a number of referees from the academic doctors in order to identify the belonging of the items to their latent variables and their good linguistic formulation. In addition, the exploratory factor analysis (EFA) was used as a statistical method used to identify the validity and reliability of the instrument through the values of the average variance extracted (AVE) to test the convergent validity, and compared the values of the average variance extracted (AVE) with the maximum shared variance (MSV) to test the discriminate validity. Moreover, the reliability of the instrument was tested using McDonald's Omega coefficient (C.R) to evaluate composite reliability of the study instrument. The results of these tests are presented in Table 2.

The results in Table 2 showed that the values of items loadings on their latent variables ranged between (0.681–0.769) which was greater than the lowest acceptable value of 0.50 (Al-Hawary et al., 2018; Haig, 2018), and the values of the average variance extracted (AVE) within the ambit (0.507–0.558) which were higher than the minimum threshold for judging convergent validity (Howard, 2018). In addition, the obtained average variance extracted (AVE) were greater than the values of maximum shared variance (MSV), which indicates the achievement of the discriminate validity. In terms of reliability, the results listed in the table (1) showed that the values of McDonald's Omega coefficients (C.R) ranged between (0.813–0.905) that were higher than 0.70 which is the minimum acceptable value for the composite stability (Heale & Twycross, 2015).

4 Data Analysis

4.1 Correlation

Table 3 shows the results of Pearson's correlation matrix to exhibit the relationship between the study variables and ensuring that the data free of a multicollinearity problem.

Through the results shown in Table 3 that that the study variables are related to each other, where the values of the correlation coefficients within the range (0.126–0.650) and they were all statistically significant at a significance level less than 0.05. Furthermore, the results show that the data is free from the problem of multicollinearity where the correlation coefficients values were less than 0.80 (Senaviratna & Cooray, 2019).

4.2 Descriptive Statistics

This section is providing a detailed presentation of data analysis that was collected through the study instrument, which was distributed to the study sample, as well as it also answers to the study questions and achieving its objectives. Table 4 displays the results of means and standard deviations used to answer the major question that was "What is the level of customers' awareness toward green marketing mix in the five stars hotels in Jordan?"

Table 4 Results of statistics related to green marketing mix

Dimensions	Means	SD	Rank	Level
Green prices	3.74	0.589	1	High
Green product	3.68	0.565	2	High
Green people	3.65	0.615	3	Moderate
General environmental concern	3.57	0.552	4	Moderate
Green physical evidence	3.56	0.574	5	Moderate
Green promotion	3.56	0.566	6	Moderate
Green process	3.55	0.629	7	Moderate
Green place	3.54	0.621	8	Moderate
Green marketing mix	3.61	0.352	–	Moderate

The results in Table 4 indicate that means of the responses of the study sample ranged between (3.54–3.74) with standard deviations between (0.552–0.629). These results referred that the relative importance of green marketing mix dimensions ranged between high and moderate level, where the dimension of green prices came in first rank with a mean (3.74) with a standard deviation (0.589), where it indicates to a high level, followed by the dimension of green product with a mean (3.68) with a standard deviation (0.565) that was refereed also to a high level, while the dimension of green place ranked in the last place with a mean (3.54) with a standard deviation (0.621) which was at a moderate level. Moreover, the results demonstrated that customers' awareness toward green marketing mix in the five stars hotels in Jordan was at a moderate level, where mean was (3.61) with a standard deviation (0.352). Besides, one sample t-test was conducted on the study instrument related to customers' awareness toward green marketing mix in the five stars hotels in Jordan by assuming the hypothetical mean is 3, where the table 5 shows the results obtained.

The results in Table 5 indicated that the calculated t value was (32.930) at a significance level (0.000) which was less than 0.05. Therefore, customers' awareness toward green marketing mix in the five stars hotels in Jordan was at a moderate level and has a statistically significant. One sample t-test was conducted on the study instrument related to customers' awareness toward each dimension of green marketing mix in the five stars hotels in Jordan by assuming the hypothetical mean is 3, where the Table 6 shows the results obtained.

Based on the calculated t value and the significance level which were for all less than 0.05. Therefore, the customers' awareness toward green product, Green Promotion, Green Place, Green Process, Green People, general environmental concern and

Table 5 Results of one-sample t test for green marketing mix

Variable	Mean	SD	t-value	df	P-value*
Green marketing mix	3.61	0.352	32.930	366	0.000

Note *Refers to a significance level ($P \leq 0.05$)

Table 6 Results of one-sample t test for green product

Variable	Mean	SD	t-value	df	P-value*
Green product	3.68	0.565	22.977	366	0.000
Green prices	3.74	0.589	24.042	366	0.000
Green promotion	3.55	0.566	18.905	366	0.000
Green place	3.54	0.621	16.571	366	0.000
Green process	3.55	0.629	16.809	366	0.000
Green people	3.65	0.615	20.350	366	0.000
Green physical evidence	3.56	0.574	18.767	366	0.000
General environmental concern	3.57	0.552	19.652	366	0.000

Note *Refers to a significance level ($P \leq 0.05$)

Green Physical Evidence in the five stars hotels in Jordan was at a high level and has a statistically significant, while customers' awareness toward green prices in the five stars hotels in Jordan was at a high level and has a statistically significant.

5 Discussion, Conclusion and Recommendations

5.1 Results Discussion

Based on the statistical results, it was found that the Jordanian green hotels' customers have mixed beliefs when it comes to green hotels' practices as only (56.40%) of the study sample stated that they were familiar with these practices. When compared to the general environmental concern part of the questionnaire, obtained data showed moderate levels of awareness. According to literature, these two factors are positively engaged and are highly related to each other, as the higher the environmental concern the higher the level of familiarity of green practices. In order for hotel managers and marketers to benefit from the positive publicity, competitive advantage and brand loyalty, they need to identify the level of customers awareness not only regarding the environmental conservation but also the green hotel marketing mix. This helps them to better elevate or promote their efforts to their guests and also measure the effectiveness of these efforts.

According to this study, we have been able to answer this question by identifying the level of green marketing mix awareness and found it was moderate. This would consequently encourage marketers to develop successful green marketing strategies to match their customers' requirements and needs. This result was based on measuring the sub questions of green marketing mix dimensions which include (product, price, place, promotion, process, people, and physical evidence).

Findings related to these questions clearly show that the level of customers' awareness regarding prices was the highest. Respondents stated that they were willing to

pay extra to green hotels especially if it was helping reducing pollution and being invested in eco-services. Price is also incredibly important to hoteliers as it provides insights regarding the competitive advantage and sufficient revenue. Green hotel managers will need to coordinate the prices they charge their customers with the additional costs associated to green technologies, processes, and promotion.

The second green marketing dimension to rank high in this study was green products. Respondents showed high interest in using eco-friendly products, expressing their understanding of the environmental phrases, symbols, and green claims. Respondents also stated that they enjoy environmentally friendly products and healthy amenities provided by green hotels. As the second most important dimension to customers, hoteliers need to constantly provide authentic green products along with environmentally friendly facilities to please customers and emphasize differentiation.

The remaining green marketing mix dimensions showed similar moderate awareness level results. According to questionnaire respondents, hotels usually fail to make their green promotions noticeable by clients and they expect to be informed regarding the hotel's green activities. The respondents also stated that when they are educated regarding the hotel's green policies, they will advise their friends and families to visit such hotels. As customers are probably suspicious regarding hotels honest eco-claims. Promotion plays a huge role in translating the hoteliers' efforts in conserving the environment. Promotion further aids customers in easily finding green hotels, their products, and facilities without wasting money, time and efforts.

Like promotion, green place dimension also plays a role when it comes to convenience. According to respondents, the hotel location needs to be in alignment to the green claims. Online booking services are usually preferred by customers as it provides all the information required regarding staying at a green hotel. Partners and vendors are required to have sufficient information regarding the greenness of a hotel as it helps maintain the hotel brand image.

As stated above, the green process showed moderate awareness levels amongst respondents. They were able to acknowledge that their hotels implement e-commerce to preserve the environment. They expressed that paperless interactions and water preservation are visible and effective approaches. Literature states that green processes can highly improve the financial performance. Eco-equipment and technology -although somewhat expensive- ultimately prove efficient in reducing cost as it reduces the overall natural resources consumption and effectively reduces the associated waste.

Green hotels' employees are a major asset to the hotel management as they are the frontline with customers. According to hotels' customers, having well trained employees who are ready to answer inquiries regarding green products, services, facilities, process or even green activities is of importance. Approaching these customers with positive and motivational green attitude is also recommended.

And finally, the green physical evidence translates all the above without human–human interaction. Green buildings are not only an architectural trend, but it also helps expressing the level of hotel greenness. Placing digital or recyclable green materials

is preferable by customers. The general atmosphere, furniture and accessories should also reflect the nature and the eco-friendly efforts by hoteliers.

5.2 Conclusion

Looking back to literature, we can notice the majority highlighting the importance of customer concern towards the environment and the impact of customer awareness of the hotel green marketing mix on several behaviours ranging from attitude, purchase intention and word of mouth.

Based on the above discussion, we can confidently claim that the possibility of having more environmentally friendly hotels with better service quality and benefits as the customer general environment concern and awareness grow. Even though the respondents were not able to prove they fully understand the green marketing mix implications, but the overall idea of the concept shows a certain level of awareness. Naturally, we can't emphasise more the importance of reducing customer doubt and the potential mistrust of the green hotels as it increases the susceptibility of damaging the brand image by constantly promoting real actions and strategies while providing the sufficient training for the staff.

In conclusion, many hotels have begun to transform their objectives into greener ones to attract new customer segments and generate revenue. It is also essential to correctly promote these objectives and practices to increase the customer awareness and motivate purchase decisions. Hoteliers are also advised not to take advantage of the customers' confusion regarding the hotel's environmental claims and to righteously explain these claims to eliminate green washing. Developing guides signage to self-explain the ecological terms and claims might prove beneficial. This might be implemented after examining the hotel's surrounding environment (nature), the workflow processes and policies, the technology and innovation in accordance with natural resources, renewable energy and waste management.

As a growing concept in Jordan, green marketing is gaining a shy popularity in the hospitality industry as several hotels are adopting the concept with minimal efforts of promotions and advertisements as a source of gaining the knowledge and increasing the customers awareness. Making the hotels practices more visible to the public benefits the hotels, customers and finally the environment.

5.3 Marketing Practical Implications and Recommendations

Based on all of the above, we can positively state that the interest in green hotels will grow in the near future. In this study, specific recommendations and measures are suggested for an efficient and effective green policy implementation in the hotel sector in Jordan:

1. Hotel managers and marketers are suggested to carefully design their business and marketing plans to truly develop credible green hotel image and avoid misrepresentation. In addition, acquiring international green awards and accreditation enhances customers' trust and confidence regarding the hotels' green products and services, increase loyalty, and differentiates hotels by achieving a competitive advantage.
2. The utilization of a holistic sustainable framework in hotels results in higher efficiency in operations. For instance, improved efficiency in the use of energy and natural resources results in substantial cost savings, and a better waste management system will not only reduce the amount of waste but will also ensure its safe disposal.
3. The main purpose of green products is to provide benefit and value without harming the environment. Green hotels are suggested to alter their hotel equipment in rooms and hotel amenities into more efficiently energy conservative equipment and minimize waste. They can also provide organic food at restaurants and source from local markets, present ecological cleaning products with less plastic and distribute garbage separating bins.
4. Hotels can implement a new promotional and branding strategy while protecting the environment by providing branded reusable water bottles to their guests and placing water-filling stations throughout the hotel. They can also involve the local community and surrounding environment in the promotional ad campaigns, events and celebrations to encourage customers to make local purchases from vendors, promote tourism and benefit the community.
5. Digital marketing plays a major role nowadays. Incorporating social media, websites and online booking reduces the amount of paper consumed by both the hotel staff and the hotel customers and helps customers be closer to the information they require prior their arrival which eventually helps reduce the carbon footprint.
6. For customers to pay premium prices at green hotels they need to perceive great value in exchange. Hotels are advised to keep hotel guests happy, satisfied and actively engaged in the sustainable practices provided. Conducting interactive workshops, activities and minigames attracts more customers and satisfies the existing ones.
7. Hotel staff play a major role in providing necessary information regarding environment preservation and hotel procedures to their guests. Frequently providing the required relevant training is highly recommended as it reflects in their day-to-day work activities. Sufficient training also gives the staff confidence in responding to customers regarding the green hotel practices without the need to consult with the management.
8. The physical environment also plays a major role in translating sustainability. Wood furniture, greenery sights, natural aromas are some of the first interactions with hotel customers. Consulting with architects and interior designers to reflect the sustainability in hotels will prove beneficial on the long run.

The sample of the study consisted of patients and visitors of three private hospitals (Jordan Hospital, Istishari Hospital, AlKhalidi Hospital),100 patients and visitors from each hospital, the total number of patients and visitors are three hundred. Those patients and visitors are randomly selected, three hundred questionnaires were distributed by hand, out of them 210 questionnaires are returned complete with a response rate of 70%. This study identifies to managers and decision-makers in private hospitals that to which extent the patients and visitors of private hospitals perceive their social responsibility programs and consequently encourages them to develop successful social responsibility programs which compatible with customer's perceptions and preferences. The results show that all dimensions of social responsibility are moderately perceived by patients and visitors of private hospitals in Greater Amman.

Keywords Social responsibility · Private hospital · Customers' perception · Amman

1 Introduction

The healthcare sector has a variety of challenges such as stringent regulatory compliance, intense labor shortages in nursing, increased and costly technological advancements, implementation of international quality standards, and substantial community dependence (Al-Hawary, 2012; Al-Hawary et al., 2011; Abu Qaaud et al., 2011; Al-Hawary et al., 2011; Al-Hawary et al., 2017; Al-Hawary & Al-Namlan, 2018; Mohammad et al., 2020). Corporate social responsibility could play a major role in this context that's why hospitals with the mission of providing medical services, should engage in social responsibility programs effectively (Al-Hawary & Al-Khazaleh, 2020; Alhalalmeh et al., 2020; Abu Zayyad et al., 2021).

Social responsibility programs in hospitals range from voluntary programs and partnerships to mitigate the environmental impact of industrial plants and production methods to the development of sourcing and marketing initiatives that protect social welfare and commit to environmental benefits (Alshurideh et al. 2016, 2019a, b). In turn, the outcomes of social responsibility programs include achieving competitive advantage (Sen et al., 2006), gauging corporate reputation (Ellen et al., 2006), positive corporate financial outcomes and increased market value (Peloza & Shang, 2011), and increased willing to pay premium (Parsa et al., 2015; Alshurideh et al., 2021).

This study discusses one of the most important issues at present. The importance raised by many factors which are: evolved new concerns and expectations of citizens, customers, public authorities, and investors about corporate social responsibility, increased concerns about the harm caused by economic practices to the environment, and transparency of business activities brought by the media and modern information and communication technologies (Almazrouei et al., 2020; Aljumah et al., 2021; Al-Maroof et al., 2021; Khasawneh et al., 2021a, 2021b; Kurdi et al., 2021; Shamout et al., 2022; Vallaster et al., 2012). With a view to those factors, service providers are

allocating significant resources to manifest their commitment, as well as their ethical vision and socially responsible behavior. The first main objective is determining the patients' and visitors' perception of social responsibility dimensions in private hospitals in Greater Amman.

2 Theoretical Framework

2.1 Social Responsibility

There have been different definitions of social responsibility offered in the literature which represents different conceptualizations (Maignan & Ferrell, 2004). The social responsibility has emerged as a key concept in the management, ethical, marketing, and communication literatures (AlShehhi et al., 2020; Alshurideh et al., 2017; Alyammahi et al., 2020; Zadek, 2006). Bolton and Mattila (2015) defined corporate social responsibility as "a company's commitment to minimizing or eliminating any harmful effects and maximizing its long-run beneficial impact on society". Chen (2016) defined corporate social responsibility as "the extent to which the social responsibility actions contribute to customers' perceptions on corporate social responsibility commitment, values-driven motives, customer orientation, and trustworthiness".

Jin et al. (2017) defined social responsibility as "the responsibility of an organization for the impacts of its decisions and activities on society and the environment, through transparent and ethical behavior that contributes to sustainable development including the health and the welfare of society, takes into account the expectations of stakeholders, is in compliance with applicable law and consistent with international norms of behavior, and is integrated throughout the organization and practiced in its relationships". Finally, Schwartz and Carroll (2018) defined social responsibility by three domain approach which presents in three core domains of social responsibility: economic, legal, and ethical responsibilities.

In literatures social responsibility examined as multi-dimensional, where its initiatives vary from voluntary programs and partnerships to mitigate the environmental impact of industrial plants and production methods to the development of initiatives which protect social welfare and commit to environmental benefits. This study will discuss six dimensions of social responsibility as follows:

- **Economic Responsibility**: Bello et al. (2016) defines economic responsibility as corporate responsibility to make decisions that will enhance the shareholders' wealth and found jobs with fair wages, while at the same time, producing quality products that are needed and desired by customers and also sell those products at a reasonable price. Moreover, Schwartz and Carroll (2018) in three domain approach embraces two types of economic activities direct and indirect. Direct economic activities include actions intended to increase sales or avoid litigation. Indirect economic activities include activities that are designed

to improve employees' morals or the company's public image (Al-Jarrah et al., 2012; Al-Gasaymeh et al., 2015, 2020; Assad and Alshurideh, 2020a, 2020b).

- **Legal Responsibility**: Bello et al. (2016) defined legal responsibility as the responsibility of the company to operate within the laws, rules and regulations set down by recognized institutions in the society. Schwartz and Carroll (2018) in three domain approach explain that "the legal category of corporate social responsibility relates to the corporate response to legal anticipations imposed and expected by society as emerged in case law".
- **Ethical Responsibility**: The ethical dimension of social responsibility encompasses those activities that are based on their adherence to a set of ethical or moral standards or principles. Interestingly, Nussbaum (2009) mentioned ethical corporate social responsibility activities as follow: publish a detailed (annual report) on the CSR activities of its members, partnerships between locals' investments in awareness campaign, proactively go beyond what is only the legal thing to do, sticking to the core business of life-threatening diseases (support patient associations), and not giving up business ethics for commercial purposes.
- **Philanthropic Responsibility**: Corporate philanthropy is no longer a simple matter of donating money to a deserving cause. It is increasingly expected to serve long term business interests (Alshurideh et al., 2014; Rampal & Bawa, 2008). Accordingly, Peloza and Shang (2011) mentioned different types of philanthropic activities as follow cause-related marketing (where a charity donation is attached to a commercial exchange), donations of cash (different from cause-related marketing because donations are not attached to a sale), statements of support for charities without stating explicitly how that support is given, promotion of a social issue, donations of products, licensing, event sponsorship, customer donations and non-specific support for charities and employee volunteerism.
- **Environmental Contribution**: The environmental activities or green activities focus on firm activities that do not corrode natural resources through corporate environmental responsibility. Parsa et al. (2015) identified different types of environmental practices as follows: incorporating product features that are environmentally friendly (green products), minimizing waste (recycling program), energy conservation (power and water conservation), reduction of pollutants (reduction of fluorocarbons and Styrofoam), and good-neighbor activities such as (neighborhood clean- up).
- **Customer Protection**: Customers are noted to be the main stakeholder group whose continuous protection is essential for the continuance of business. The customers also have notable interactions with corporations on a consistent basis and this leads to raising the possibilities for potential conflicts between the two parties, especially on the issues relating to non-observance of customers' rights by the corporation's (Al-Hawary & Hussien, 2017; Al-Hawary & Obiadat, 2021; Alolayyan et al., 2018). Thus, issues relating to corporate social responsibility and customer protection have remained contemporary topics in the marketing literature (Bello et al., 2016). Sun and price (2016) mentioned stakeholder theory which argues that corporate social responsibility contributes to customer satisfaction by establishing customer relationships and meeting customer needs.

2.2 Customer Perception

It is important to differentiate between customers' expectations of social responsibility and customers' perceptions of social responsibility. Golob et al. (2008) found that customers have high expectations of corporate social responsibility, especially in the legal and ethical-philanthropic domains. Moreover, expectations for the ethical-philanthropic dimension of CSR are higher amongst customers holding high self-transcendent values and practicing high involvement. Gleim (2011) represented that the environmental sustainability is becoming increasingly important to customers, it is critical that firms understand the role that it can have with regards to perceptions of the firm.

JIN et al. (2017) examined the effect of corporate social responsibility on customer behavior and found significant differences in brand attitude and perception of credibility when companies did not engage in corporate social responsibility activities. Su et al. (2017) found that corporate social responsibility positively affects perceived corporate reputation and customer satisfaction, which in turn, significantly affects customer commitment and behavioral responses (i.e., loyalty intentions and word-of-mouth) (Alzoubi et al., 2020; Sweiss et al., 2021).

3 Study Methodology

3.1 Population and Sample of the Study

The population of the study consisted of all patients and visitors of private hospitals in Greater Amman. The sample of the study was selected from patients and visitors of three private hospitals (Jordan Hospital, Istishari Hospital, AlKhalidi Hospital), 100 patients and visitors from each hospital. the total number of study participants are 300 individuals. Those participants are randomly selected.

4 Data Analysis

4.1 Exploratory Factor Analysis (EFA)

To verify the psychometric properties of the questionnaire, an exploratory factor analysis (EFA) was conducted. Table 1 shows the rotation matrix for the items of the questionnaire.

The results in Table 1 show that the factor loadings of all items are ranged from (0.734) to (0.941). Factor loadings greater than (0.4) were identified as acceptable. Factorability of questionnaire items was identified based on KMO (KMO = 0.686,

Table 1 Results of exploratory factor analysis

Items	Factors					
	1	2	3	4	5	6
1	0.852					
2	0.845					
3	0.888					
4	0.842					
5	0.91					
6	0.734					
7		0.865				
8		0.852				
9		0.921				
10		0.742				
11			0.924			
12			0.854			
13			0.889			
14			0.778			
15				0.931		
16				0.852		
17				0.863		
18				0.859		
19				0.738		
20					0.941	
21					0.854	
22					0.821	
23					0.886	
24					0.773	
25						0.854
26						0.894
27						0.932
28						0.784
29						0.852
30						0.861
31						0.841
32						0.863
33						0.766

Determinant = 0.005, KMO = 0.686, Bartlett's Test significant at $\alpha \leq 0.05$

greater than 0.05) and Bartlett's Test (Significant at $\alpha \leq 0.05$). The table illustrates that the items of the questionnaire were loaded on six factors: Factor 1 (6 items), factor 2 (4 items), factor 3 (4 items), factor 4 (5 items), factor 5 (5 items) and factor 6 (9 items).

4.2 Confirmatory Factor Analysis (CFA)

In order to examine the goodness-of-fit of the measurement model, confirmatory factor analysis (CFA) was used. The results in Fig. 1 show that the goodness-of-fit of the measurement model is adequate (Chi-square = 1.778 < 2.0, GFI = 0.933 > 0.90, CFI = 0.917 > 0.90 and RMSEA = 0.068 < 0.08).

4.3 Testing Validity and Reliability

In order to validate the research instrument, the researchers have presented the questionnaire to panel composed of marketing professors. Each of them on read and / or contributed to the instrument to ensure the questions were representative of the purpose of the study. Based on the feedback provided, the researcher made the necessary modifications to the newly developed instrument, including editing the content and order of the survey instrument. After they have confirmed the instruments in Arabic language, it was distributed to a sample of (10) patients and visitors to ensure it is understandable and easy to read.

Reliability is defined as "the degree to which majors are free from error and therefore yield consistent roles". The researcher used Petrick test, which is an indicator of consistency that is believed to determine the correlations between the items of the scales from which the questionnaire has been composed. The scale is considered reliable when it has Petrick test (Composite Reliability) of (≥ 0.70). For the purpose of this study, researcher used SPSS package to determine Petrick test (Composite Reliability) for the scale questions. The results in Table 2 confirm that the study tool is reliable to be used for data collection.

As the data presented in Table 2, the scale is reliable and set of items are closely related to a group.

5 Data Analysis

To test this hypothesis, descriptive statistics means and standard deviations were used in measuring the customers' perception of social responsibility and its dimensions.

Table 3 shows the means scores for the total perceived social responsibility and its dimensions.

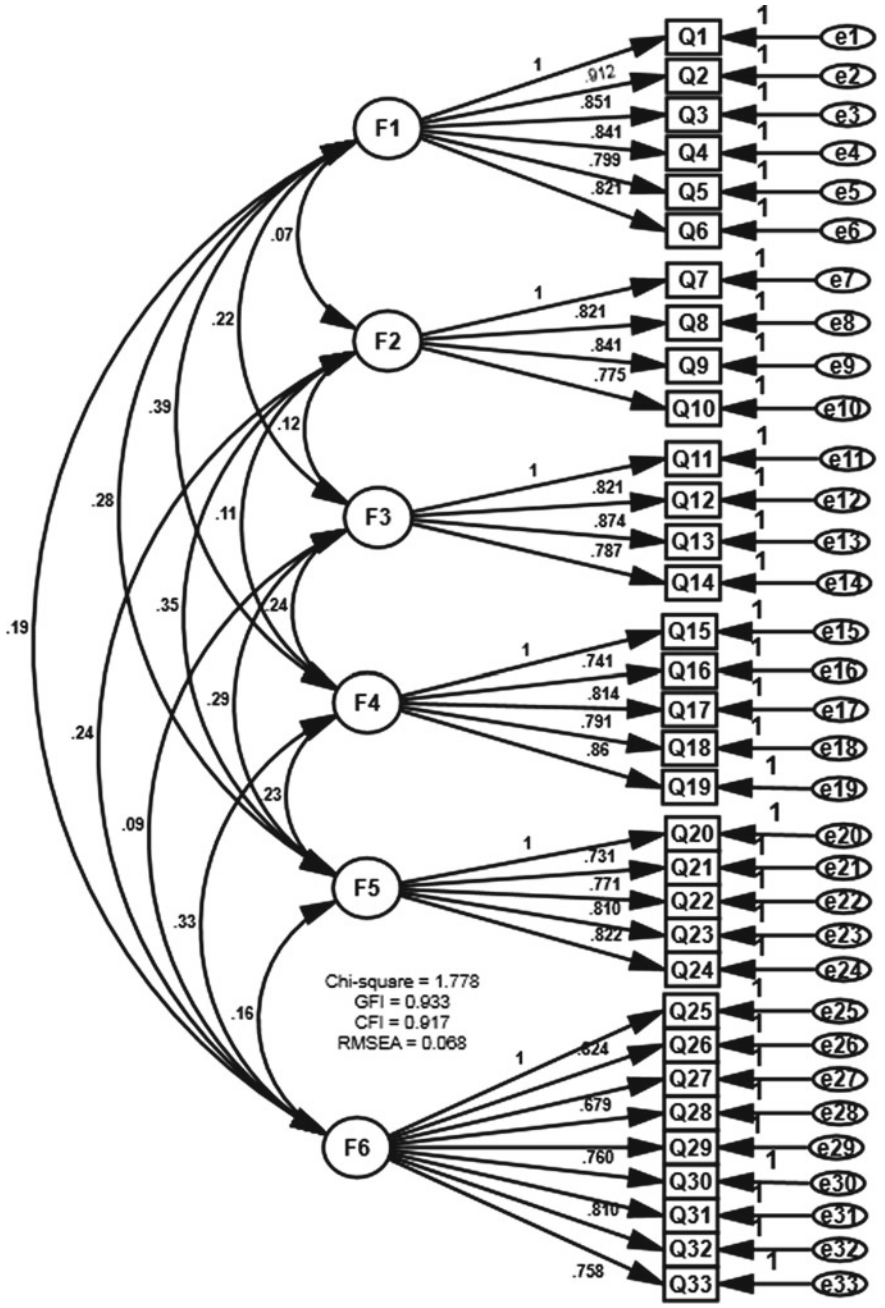

Fig. 1 Results of CFA of social responsibility items

Table 2 Results of validity and reliability test (Petrick test)

Dimensions	Reliability
	Petrick test (composite reliability)
Philanthropic responsibility	0.938
Ethical responsibility	0.910
Legal responsibility	0.921
Economic responsibility	0.929
Environmental contribution	0.932
Customer protection	0.959

Table 3 Mean and standard deviations of social responsibility dimensions

Dimensions	Mean	Std. deviation	t-value	P-value
Philanthropic responsibility	2.79	0.74	14.03	0.000
Ethical responsibility	3.53	0.61	12.42	0.000
Legal responsibility	3.59	0.65	13.12	0.000
Economic responsibility	3.58	0.56	14.89	0.000
Environmental contribution	3.39	0.56	10.15	0.000
Customer protection	3.54	0.59	13.29	0.000
Grand mean	3.40	Moderate		

In order to measure the customers' perception of social responsibility in the private hospitals in Greater Amman, the grand mean (3.40) was matched with the statistical rational formula and it was found that it is in the second category (2.34—less than 3.68), which means that the level of customers' perception of social responsibility in the private hospitals in Greater Amman is moderate.

6 Conclusion and Discussion

The private sector is gaining a much bigger role and responsibility for economic development globally. This responsibility is not limited to economic issues but must also include social and environmental contribution. Hospitals that fail to recognize this responsibility are at the risk of being denied the social acceptance that comes from the community. Without this acceptance, hospitals can never function in a profitable and sustainable manner. Utilization of a holistic corporate social responsibility framework in hospitals can result in higher efficiency in operations, for instance, improved efficiency in the use of energy and natural resources can result in substantial cost savings. A better waste management system will not only reduce the amount of waste but will also ensure its safe disposal.

Reputational risk is considered as one of the most crucial threats facing an organization and is even more critical for a hospital. This includes risks not only to loss of patients, but goes beyond to hospital itself, and may even impact the whole industry. In case of a reputational crisis involving the hospital, the consequences could be huge in terms of lost trust, legal costs and patient loyalty. A damaged reputation might require years to rebuild and cost a large sum of money. A hospital which has a sound corporate social responsibility mechanism and a history of exceptional service to society and environment often does not suffer as much as a hospital with no corporate social responsibility plans, in the incidence of a reputation crisis.

Patients need to be able to trust a hospital in order to recommend it to someone. Trust is probably the most valuable currency in the healthcare industry and it doesn't come easy. In order for hospitals to earn patient trust and loyalty, they need to go beyond healthcare services and create an emotional bond with the patient through ethical business practices. Patient loyalty goes a long way in contributing towards sustainable business growth of a hospital. When competitors adopt less costly but not socially responsible and ethically sound healthcare solutions, a hospital should take advantage of this challenge and explore new innovative and green solutions. This raises the barriers to entry and will make CSR as the industry norm with your company being the pioneer.

Investors no more only rely on financial data but also look at how a company deals with the relevant social and environmental issues. If a company is not prudent enough to pay any attention to these issues, with time it will lose credibility and no investor wants to invest in a company that has no credibility or stakeholder trust. In order for a healthcare service provider to attract investors who can fund their expansion, they need to focus on social, environmental and economic performance in addition to financial performance.

people who visited five-star hotels in Amman, Aqaba and the Dead Sea. To achieve the objective of the study, and to test hypotheses, the researcher used statistical program of social Sciences (SPSS) and (AMOS). The study results revealed that there is a statistical significant impact of brand loyalty determinants on tourists' choice in five stars hotel in Jordan, based on the study results the researchers recommends managers and decision makers should provide a superior service quality also training the staff and every person who would contact the tourists, finally they should undertake promotional and informational marketing activities. Thus, the guest has wonderful experience which will ultimately lead customer to be loyalty to the brand and repeat their visits to the same hotel.

Keywords Brand loyalty (BL) · Customer satisfaction (SC) · Price sensitivity (PS) · Word of mouth (WOM) · Tourists choice · Five stars hotels · Amman · Aqaba and Dead Sea—Jordan

1 Introduction

The hotel industry is growing very fast in the whole world. Competition is increasing among the hotel operators. Therefore, managers are concerned about increasing the profitability of hotels. Earlier, hotel operators were only interested in attracting new customers but now the trend is changing. Now, retaining an existing customer is more important than attracting new customers (Alshurideh et al., 2020; Alzoubi et al., 2022). Therefore, managers are concerned with making existing customers loyal to the hotel and they want to create repurchase intent in the customers.

The loyalty and the impacts on the customer choice have attracted interest in many empirical as well as exploratory investigations (Alshurideh, 2019, 2022). Researchers have created several constructs to refer to as well as look into the part of impact as well as loyalty incidents working with an assortment of conceptual frameworks (Alshurideh et al., 2012, 2017a, 2017b). Marketing research as well as marketing methods has compensated growing focus on procedures related to creating a good connection between consumer and brand (Aljumah et al., 2021; Hamadneh et al., 2021; Sweiss et al., 2021). It's frequently believed the brand would be the best asset of every business (Abu Zayyad et al., 2021; Tariq et al., 2022; Vukasovic, 2015). Therefore, this study is dedicated to investigate the impact of brand loyalty determinants on the tourists' choice of five stars hotels in Jordan.

2 Theoretical Framework and Hypotheses Development

2.1 The Brand Loyalty Concept

Brand is a name, sign, term, symbol, design or signaling combination that is intended to identify the products and services (Kotler & Armstrong, 2010). American Marketing Association (AMA, 2011) defined brand as "A brand is a "name, sign, term, symbol, or design, or a combination of them, intended to identify the products and services of one seller or group of sellers and to differentiate them from their competitor"." According to Tumewu et al. (2017) identified the brand as a factor for helping the customer by making data about the quality of the product; a customer who always purchases a product with specific brands knows well that these products will have, advantages, characteristics and qualities. Reviewing the literature, Kotler and Keller (2015), defined that a brand is "anything that identifies a seller's goods or services and distinguishes them from others". However, brand recognized as the apparent quality about the brand's segment, the express or the deceptive (Al-Hawary & Harahsheh, 2014; Alwan & Alshurideh, 2022).

Generally, the brand is a gathering of behaviors, the brand's customers and individuals from the association's channels which have the brand, empower the firm to has unendingly and competitive advantage, gets the brand's an incentive from its origins which comprises of the brand's notoriety, its apparent quality, picture, and its guess to the purchasers (Al-Hawary, 2013a, 2013b; Alshurideh et al., 2015).

American Marketing Association (AMA, 2011) defined brand loyalty as "the situation in which a consumer generally buys the same manufacturer-originated product or service repeatedly over time rather than buying from multiple suppliers within the category". Brand loyalty is also defined as the degree of consumer's attachment to a specific brand (Lee & Kang, 2012). However, Ali and Muqadas (2015) defined brand loyalty as a concept related to re-purchase intention and psychological commitment while Dehdashti et al. (2012) defined brand loyalty as a long-term relationship grounded on a customer's re-purchase intention and continuous commitment towards a brand. In this regard Wulandari (2016) adopted Oliver's (2010) definition of brand loyalty in which the concept identified as a variable with two sub-factors: a customer commitment to re-purchase and to re-patronize a good or a service. Moreover, Bozok et al. (2015) defined brand loyalty dependent on the behavior methodology accentuate the real addiction coming from the buy inclinations of customers, the definitions based on the attitudinal viewpoint center around the loyalty of consumer requests to the brand.

A review of the literature brand loyalty, as one of brand value basic dimensions, is defined as "the degree to which consumers buy a brand of product." In other words, it is the shoppers' inclination to continually pick a particular brand among restricting brands and dismissing the others. Most of studies that focused on brand loyalty, which is an important element of brand equation, take some concepts into consideration such as the brand customer value, the eagerness of consumers to purchase the brand, the price, and the attractiveness of the brand in the consumers eyes (Kautish, 2010).

Moreover, Rather (2018) reported that brand loyalty represents customer's positive attitude towards a brand or offering, in addition to repeat buying behaviour. Liu et al. (2012) find out that affective loyalty is positively related to attitudes toward co-branded products.

Previous research suggests that there are two dimensions of brand loyalty: attitude and behaviour (Chiu et al., 2013). Attitudinal loyalty is defined as the internal and psychological feeling of a consumer, such as liking, emotion, and obligation to a specific brand in the hope to engage continued buying without showing the actual purchase action (Yasmin & Raju, 2020). The attitude-based method is interested in discovering the influencing factors on purchase behavior, preference, commitment, word of mouth recommendation, and customer willingness to pay a higher price are how attitudinal loyalty is commonly measured (Shahzad et al., 2020).

Moreover, attitudinal loyalty is also seen as the extent of the client's psychological attachments, and the ability to help the business (Forgas et al., 2010). Accordingly, loyalty to attitudes requires strong word of mouth, the ability to refer to others and inspire them to use the products and services of an organization (Becker et al., 2016). Tomalieh (2015) pointed out that to increase sales and revenue, a company has to take behavioural loyalty into account since it is one of the core outcomes of the customer-company relationship. It is important to know this impact because attitudinal and behavioural loyalty has different impacts on brand performance or the firm performance (Farrukh et al., 2020).

2.2 The Tourists' Choice

It is a crucial of understanding why consumers will in general choose a specific destination and what kind of components impacts those (Wu & Lee, 2011). According to Kumar and Singh (2014) as contrast with the more youthful more established consumers are more loyal the brand where they use to stay while making a trip to a particular destination, as they are more conscious about the services of these hotel brands and it is very hard to change this discernment.

Moreover, Mueller and Szolnoki (2010), Almli et al. (2011) and Rahman reported that consumers are shaping quality desires based on quality signals during the buy choice cycle, henceforth extraneous attributes (for brand name, instance price, country of origin, etc.) are liable for buy choice, while natural attributes will influence preferring an item or service and influence brand loyalty. A generous assortment of consumer research affirms that extraneous item signals, for example, branding and packaging impact the buyers' item assessment on explicit item bunch like food, articles of clothing, etc.

Furthermore, Baruca and Čivre (2012) defined selection between alternatives important to consumers because they have to choose between two or more alternatives; otherwise, they are forced to buy a particular product or service. Consumers seek to obtain information about products and services and use them as part of logical problem solving in the decision-making process. Traditionally, these purchases

required brochures and contacts with a travel agent, however, today all the required information can be found on the Internet and consumers can compare the information relatively easily. Although before the final purchase decision, consumers evaluate various alternatives based on information received. The evaluation process becomes particularly difficult when the product is a hotel residence, because the hospitality service is intangible in nature. If a hotel is chosen, this information will depend on the characteristics of the product or service, quality, price, facilities, location, reputation, etc. When making a real buying decision, consumers weigh which of these traits gives them greater relevance and concern related to their personal values, needs and preferences. Stylos et al. (2016) destination choice includes choosing a particular place by assessing guests' emotions about another alternatives.

Kozak and Baloglu (2010) Consumer discernments may impact the choice of a location, the utilization of products and services while in holiday, and the choice to return. Since consistently, guests are offered a more noteworthy assortment of destinations, more choice of convenience, a more extensive scope of activities, and visits which are intended for explicit interests, it has now gotten genuinely hard for a person to choose where and how to go and where to remain, accordingly, the utilization of choice sets has gotten fundamental in buyer dynamic about the travel industry, friendliness, and recreation administrations.

Kim et al. (2012) explained the consideration of competitiveness of destination in various choice sets could also be significant in understanding the brand value of destination, including brand awareness, brand image, brand identity, brand loyalty.

2.3 Determinants of Brand Loyalty that Affect the Tourist's Choice

The researchers examined the factors affecting brand loyalty from different perspectives, shown in the following table.

Based on the above-reported determinants, three determinants were chosen for the purpose of the current study. These determinants are customer satisfaction, price sensitivity and word of mouth. The following paragraphs of the current section are dedicated to clarify these determinants.

Customer Satisfaction: According to Jana and Chandra (2016), customer satisfaction has become an important point in the hotel industry, unlike other industries; the hotel industry thrives due to customer retention. A hotel can only retain its customers through customer satisfaction. Customer loyalty depends mainly on the quality of services they receive at the hotel. Moreover, the hospitality industry has experienced the entry of many investors wanting to meet their customers' needs. Therefore, guests will look for better services if they were not satisfied with the services they receive from the hotel they lodge in (Jana & Chandra, 2016). Moreover, satisfaction has been defined as "satisfaction is a consumer's fulfilment response. It is a judgment that a product/service feature, or the product or service itself, provided

Licensed to (putm@utm.my)

a pleasurable level of consumption related loyalty, including level of under or over loyalty" (Oliver, 2010).

Moreover, Bianchi et al (2014), stated that higher satisfaction would result from trust on the brand. Therefore, customer satisfaction with said brand is a primary driver of loyalty. According to Han et al. (2011), customer satisfaction depends on the feeling about product compares with expectations of customers. If satisfaction is lower than expectation, the buyer is not satisfied; if expectation is appropriate, customer will be satisfaction. To measure customer satisfaction with the product/service, it is based on a comparison between the products/services feeling and service expectations.

Subagio and Dimyati stated the customer satisfaction is linked with customers' expectations concerning products or services perceived performance. Gaskari and Naeimavi examine customer satisfaction between the perceptual experiences of the overall performance of a product with all the expectations. Adhitama et al. (2017) stated that customer satisfaction of a product might be described through looking at the expectations of service with his knowledge of the services provided. If provided services exceed customer expectations, they're known as service that is outstanding. Based on above literature the hypotheses can be as:

H1: Customer Satisfaction has a significant impact on tourists' choice of five stars hotel in Jordan

Price Sensitivity: Kotler and Armstrong (2010) define price as "the amount of money that is collected for a product or service". Levy and Weitz (2012) defined price as the money that customers exchange in terms of service or product, or the value they receive (Kotler & Armstrong, 2010). It is important for the company to retain loyal customers who are willing to pay higher prices for their favourite brand and not buy on a low price basis (Alzoubi et al., 2020; Alshurideh et al., 2021). Brand loyalty customers are eager to pay more money and are less price sensitive.

According to Malc et al. (2016) examined the effects of a consumer's perception of price fairness on his buying decision and referred to it as an appropriate indicator of a consumer's buying decision. Also, Khuraim stated that price has a significant effect on brand loyalty which in turn affects the buying intent of the customers. Consequently, and according to the discussions. Moreover, Beristain and Zorrilla (2011) proof affirms that price is a significant determinants of customer loyalty to a specific brand and the customer loyalty to a brand is significantly affected by the way that shoppers see the purchase of these brands as value for the money, and the higher price sensitivity affectability of customer intensity of brand loyalty. Based on above literature the hypotheses can be as:

H2: Price Sensitivity has a significant impact on tourists' choice of five stars hotel in Jordan

Word of Mouth: Customer WOM is arguably the most important outcome of customer–firm relationships as a relational outcome in a business context. Customers consider verbal information reliable because the company cannot tamper with it, so it attracts the interest of potential clients, as a reliable source of information, due to its personalized transmission, content and context that reflects personal experiences. Scholars citing the importance of word of mouth acknowledge that it serves as peers'

advice, which can influence consumer choice, as well as product evaluations and purchase decisions (Zhang et al., 2010).

Whether intentional or not, if WOM receives positive, communication between customer can go beyond sharing direct experiences, to become storytelling and folklore, then narrative discourse about the company shapes the "truth" about the company in customers' minds. WOM communication appears reliable and impartial because the sender of the information usually does not earn it if the recipient decides to make a purchase (Cheung and Thadani, 2012). Furthermore, customer to customer interactions is increasingly important, which has considerable implications for firms; the exchange of information about customers' experiences influences each party's attitudes and behaviours (Blazevic et al., 2013). Through their extensive meta-analytic review of antecedents of WOM communication illustrate the important roles of satisfaction, loyalty, quality, commitment, trust and perceived value. WOM connections are also co-produced in consumer networks. However, customers who interact with a brand and/or service provider are expected to build positive attitudes more immediately than customers who do not engage with the brand or provider (Harrigan et al., 2016; Kurdi et al., 2020; So et al., 2014). Such attitudes are expected to be favorable which may lead to increased loyalty and/or favouritism intent (Al Kurdi et al., 2020; Hollebeek et al., 2016).

Kher et al., WOM provided by customers, online or offline, positive or negative, is closely reviewed by potential clients, making it a powerful marketing tool, such that trust in customer relationships and engagement with the company is a necessary strategic focus to companies. Loyal customer often act as trusted advocates through social media (e-WOM), informally linking networks of friends, relatives, and other potential clients with the organization (Khasawneh et al., 2021). Based on above literature the hypotheses can be as:

H3: Word of Mouth has a significant impact on tourists' choice of five stars hotel in Jordan

3 Study Model

Figure 1 shows the conceptual model of the study, in which three independent variables' (i.e., Brand Loyalty determinants: Customer Satisfaction, Price Sensitivity and Word of Mouth) were assumed to have significant impact on tourists choice. Studies that used to develop the model are shown in Table 1.

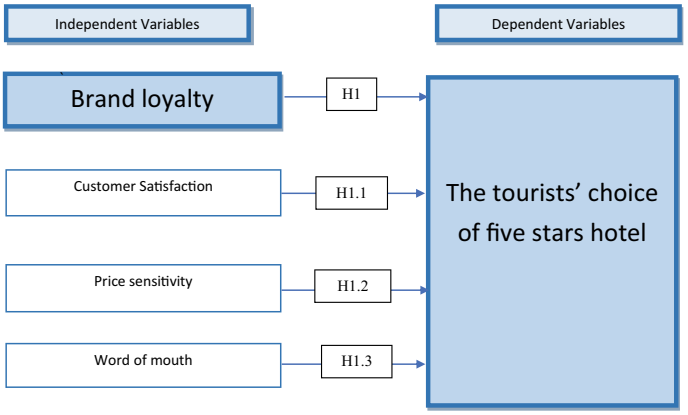

Fig. 1 Study conceptual model. *Source* This model has been prepared by the researcher based on these sources

4 Study Methodology

4.1 Study Population

The current study focuses on an important sector in the Jordanian economy, which is the luxury hotel industry in Amman, Aqaba, and the Dead Sea. The study population consists of people over 20 years old who frequent select these hotels to stay and eat, whether they are families, business owners or employees that require their job is to visit hotels to perform their duties. Since the large size of the study population and the inability to conduct a complete census, the study data were collected using the

non-random sampling method, where (400) questionnaires were distributed to people who visited five-star hotels in Amman, Aqaba and the Dead Sea. The questionnaires were distributed in both languages' Arabic and English due to some of the hotel's visitors are not realizing Arabic. Moreover, the questionnaires were distributed on two ways (150) paper questionnaires and (250) electronic questionnaires through Google forms. The retrieved questionnaires were (367) questionnaires, while it was found that (15) questionnaires were incomplete and not suitable for statistical analysis. Therefore, (352) questionnaires were used for statistical analysis, which represents a response rate (88%).

4.2 Study Instrument

The questionnaire was designed as a basic instrument to accomplish the study's purposes for identifying the impact of brand loyalty determinants on tourists' choice of five stars hotels in Jordan. This questionnaire consisted of three parts: the first part was composed of the introductory and questions related to demographic variables represented by (gender, age, educational level, and nationality). The second part was devoted to measuring the independent variable represented by brand loyalty determinants, which was developed by (Al-Hawary & Al-Khazaleh, 2020; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Alhajri, 2020; Al-Hawary & Hussien, 2017; Al-Hawary & Metabis, 2012; Al-Hawary & Obiadat, 2021; Al-Hawary et al., 2011, 2017; Alić et al., 2019; Alolayyan et al., 2018; Alshurideh et al., 2017a, 2017b; Cetin & Dincer, 2013; Metabis & Al-Hawary, 2013), where this variable divided into customer satisfaction measured through items (Q1–Q11), price sensitivity which was measured by items (Q12–Q16), and word of mouth which was measured by items (Q17–Q21). While the third part used to measure the dependent variable, which is the tourists' choice, where this variable's items were developed by (Unurlu & Uca, 2017), which was measured by items (Q22–Q25) used for this purpose.

4.3 Validity and Reliability

For identifying the validity and reliability of the study instrument, a set of methods were used that began to identify the face validity by presenting the questionnaire to a number of academic doctoral of various ranks and those with specialization in the field of study for determining the degree of phrases suitability to measure the study variables and linguistic validation in order to be able respondents easily understood it, where their names, academic ranks, and their work place listed in appendix (1). In addition, exploratory factor analysis (EFA) was used to test the convergent validity of the study instrument through the values of the average variance extracted (AVE), as well as the discriminant validity test by comparing the values of the average variance

extracted (AVE) with both maximum shared variance (MSV) and square root of average variance extracted ($\sqrt{}$AVE). The reliability of the study instrument was also confirmed by using Cronbach Alpha coefficient (α) to ensure internal consistency and McDonald's Omega coefficient (ω) to ensure the composite reliability. The results of these tests demonstrated in Table 2.

The results listed in Table 2 showed that the values of the items' loadings on the variables associated with them ranged between (0.704–0.814) which were higher than the minimum threshold for retaining the item represented by the value of 0.50 (Haig, 2018). The results also showed that the values of the average variance extracted (AVE) were higher than the minimum value for accepted of 0.50, where it was within the range (0.548–0.613) that is an indication of the convergent validity (Antunes et al., 2017). Moreover, the values of average variance extracted (AVE) of the latent

Table 2 Exploratory factor analysis results

Variables	Items	Loadings	AVE	MSV	$\sqrt{}$AVE	ω	α
Customer satisfaction	Q1	0.814	0.613	0.530	0.746	0.934	0.945
	Q2	0.734					
	Q3	0.782					
	Q4	0.775					
	Q5	0.786					
	Q6	0.779					
	Q7	0.776					
	Q8	0.784					
	Q9	0.787					
	Q10	0.791					
	Q11	0.789					
Price sensitivity	Q12	0.774	0.548	0.365	0.755	0.858	0.859
	Q13	0.729					
	Q14	0.704					
	Q15	0.759					
	Q16	0.733					
Word of mouth	Q17	0.767	0.574	0.327	0.776	0.876	0.871
	Q18	0.764					
	Q19	0.751					
	Q20	0721					
	Q21	0.785					
Tourists' choice	Q22	0.745	0.586	0.530	0.738	0.850	0.848
	Q23	0.786					
	Q24	0.738					
	Q25	0.791					

variables were greater than the maximum shared variance (MSV), as well as the values of square root average variance extracted ($\sqrt{}$AVE) were higher than the values of the correlation with the rest of the latent variables, where these are indicators of achieving discriminant validity (Crego & Widiger, 2016).

Regarding to reliability of the study instrument, the results presented in Table 2 indicate that the values of Cronbach Alpha coefficient (α) were within the range (0.848–0.945) which were higher than 0.70, which is the minimum value for realizing the internal consistency of the study instrument (Heale & Twycross, 2015). Further, the results stated that the values of McDonald's Omega coefficient (ω) that were ranged (0.850–0.934), thus it is greater than 0.80 the minimum limit for considering the instrument having a composite reliability (Zhang & Yuan, 2016).

Together with exploratory factor analysis (EFA), confirmatory factor analysis (CFA) was used to test the structural validity of the study model used through a bundle of indicators represented by the chi-square ratio (CMIN/DF), goodness of fit index (GFI), comparative fit index (CFI), Tucker-Lewis coefficient (TLI), and root mean square error of approximation (RMSEA). Figure 2 shows the results obtained by confirmatory factor analysis.

The results in Fig. 1 showed that the chi-square ratio (CMIN/DF) was (1.574) that was greater than 3 that expresses the high acceptable value for this indicator, and that the value of each of goodness of fit index (GFI), comparative fit index (CFI), and Tucker-Lewis coefficient (TLI) was higher than the acceptable minimum limit of 0.90. Moreover, the results illustrated that the value of root mean square error of approximation (RMSEA) reached (0.040) which is smaller than the acceptable upper threshold of 0.050, thus the study model has a structural validity (Gu et al., 2017).

5 Testing Hypotheses

Structural equation modelling is one of the statistical methods used to analyze the structural relationship between measured variables and latent structures, as well as to testing studies hypotheses. This statistical method was used for testing the current study hypotheses, where the Fig. 3 illustrates the structural model used to test the impact of brand loyalty determinants on tourists' choice of five stars hotels in Jordan.

Moreover, Table 3 shows the results of the main study hypothesis test that was "There is no statistically significant impact of brand loyalty on tourists' choice of five stars hotel in Jordan".

The results in Table 3 indicate that the value of the correlation coefficient (R) between brand loyalty determinants and the tourists' choice (0.653), and the value of the determination coefficient (R^2) that was (0.427), this value indicates that (42.7%) of the variance in the tourists' choice was due to the change in brand loyalty determinants of five stars hotel in Jordan. Also, the probability value (*P*) was less than 0.05, thus the null hypothesis was rejected and the alternative hypothesis that referred to "There is a statistically significant impact of brand loyalty determinants on tourists'

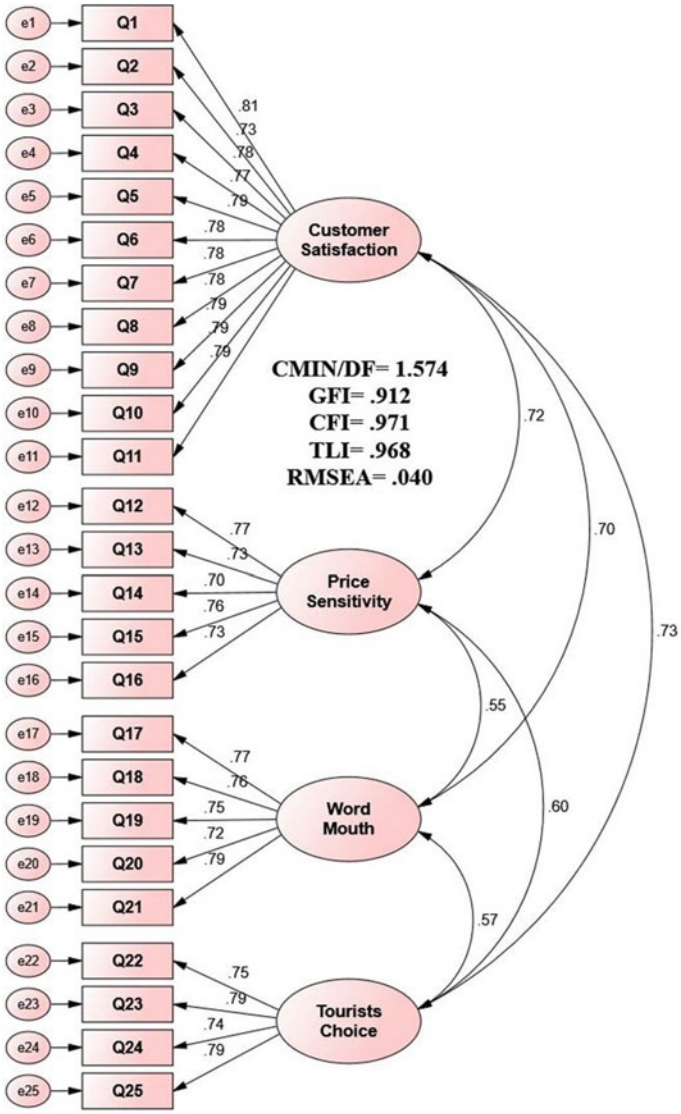

Fig. 2 Result of confirmatory factor analysis for the measurement model

choice of five stars hotel in Jordan" was accepted, and the standard impact value (β) was (0.653).

In addition to testing the main hypothesis, the sub-hypotheses of the study were tested that were referring to "There is no statistically significant impact of brand loyalty determinants dimensions on tourists' choice of five stars hotel in Jordan" (Fig. 4). Figure 3 shows the structural model used for that.

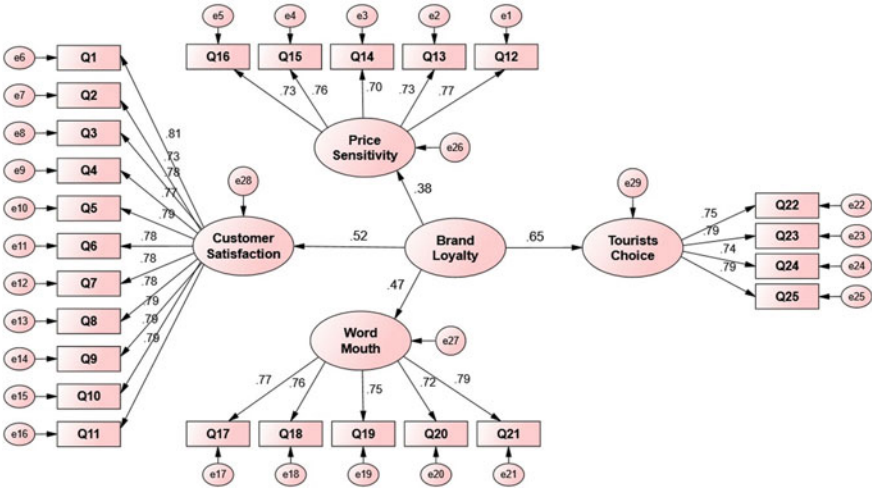

Fig. 3 SEM for testing the impact of brand loyalty determinants on tourists' choice

Table 4 shows the results obtained using the structural equation modelling (SEM) method to test the impact of customer satisfaction, price sensitivity, and word of mouth on the tourists' choice of five-star hotels in Jordan.

The results in Table 4 indicate that the value of the correlation coefficient (R) between brand loyalty determinants dimensions and the tourists' choice (0.672), and the value of the determination coefficient (R^2) that was (0.452), this value indicates that (45.2%) of the variance in the tourists' choice was due to the change in the dimensions of brand loyalty determinants of five stars hotel in Jordan. Moreover, the probability values (*P*) of all dimensions of brand loyalty determinants were less than 0.05, thus the null sub-hypotheses were rejected and the alternative hypotheses that referred to "There is a statistically significant impact of brand loyalty determinants dimensions on tourists' choice of five stars hotel in Jordan" was accepted, where the first rank was for the dimension of customer satisfaction with standard impact value (β) which was (0.486), followed by the dimension of price sensitivity with standard impact value (β) that was (0.147), while the last rank for the dimension of word of mouth with standard impact value (β) which was (0.118).

6 Discussion and Conclusion

The aim of this study was to investigate the impact of brand loyalty determinants on the tourists' choice of five stars hotel in Jordan. The independent variable (brand loyalty) was measured by using three determinants variables, i.e., customer satisfaction, price sensitivity and word of mouth. It was hypothesized that there is a significant positive impact of brand loyalty on the tourists' choice. More specifically, the three

Table 3 Result of testing the impact of brand loyalty determinants on tourists' choice

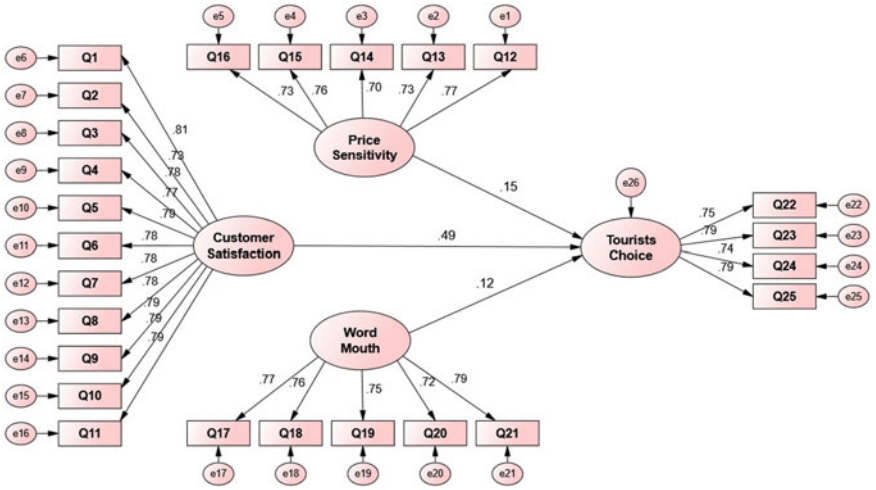

Fig. 4 SEM used to test the impact of brand loyalty determinants dimensions on tourists' choice

determinants of the brand loyalty were assumed to have significant positive impacts on the tourists' choice. On the basis of the results reached by the current study, it was concluded that brand loyalty as measured by the determinants of brand loyalty: customer satisfaction, price sensitivity and word of mouth has a significant impact on tourists' choice. Price sensitivity is highest determinant in the tourist choice process. When it comes to the quality of the service the hotel provide which should satisfy the guest of the hotel and meet the guest expectations that will drive the guest to spread word of mouth positively in front of others.

However, numerous studies have been accepted the hypothesis that there is a significant and positive impact of brand loyalty on tourists' choice. Bozok et al. (2015) examined the dimension of brand equity in choosing a hotel and found an impact of brand loyalty on customer choice. Alhedhaif et al. indicate that Saudi consumers of cosmetics product have significant brand loyalty towards their choice. Malik et al. (2012) analysed that brand loyalty have positive association with Intention to buy.

The results of the study showed that the customer satisfaction has a significant and positive impact on tourists' choice. The participants assessed customer satisfaction at a medium level. This means the services that the hotel provides moderately meets customer expectation. This moderate degree of customer satisfaction revealed in the current study can be explained by looking at the measure customer satisfaction with the service, it is based on a comparison between the services feeling and service expectations. In other words, the quality that the customer gets from the service. Suhartanto (2011) indicates that, satisfied guests will not automatically become behaviourally loyal (i.e., resettle in the future) unless they realize the hotel performs better on key features than other hotels. Tourist satisfaction positively affects the intention to return to place, local authorities may implement policies

Path			R	R^2	Unstandardized coefficients		Standardized coefficients	C.R.	*P*
					Estimate	S.E.	β		
Customer Satisfaction	→	Tourists' Choice	0.672	0.452	0.507	0.062	0.486	8.207	***
Price Sensitivity	→	Tourists' Choice			0.159	0.057	0.147	2.815	**
Word of Mouth	→	Tourists' Choice			0.123	0.053	0.118	2.301	**

Note * Refers to significance level $P < 0.05$, ** Refers to significance level $P < 0.01$, *** Refers to significance level $P < 0.001$

to control the perceived quality of the tourism experience, improve services and security, and compare destinations in terms of performance.

In a study conducted by Souri to determine the factors that involved in the customer satisfaction that leads to competitive advantages and finally customer loyalty and repeat purchase. According to Liata et al. Customers who are satisfied with the services provided by the hotel are very likely to be satisfied with the services experienced, which in turn will create loyalty among them.

On the basis of the data used in the current study, it was acknowledged that there was a significant positive impact of price sensitivity on tourists' choice. Price sensitivity studied in this study was evaluated by respondents was fairly evaluated. This may be due to the fact that in a consumer's mind, a high price is often associated with high quality. Price and quality is a reason to prefer a certain provider.

Concerning the significant impact of price sensitivity on tourists' choice, numerous previous studies confirmed this result. In a study conducted by Madupu and Cooley brand loyalty related to a consumer's brand attitude, as it reflects a consumer's commitment to the brand and their likelihood to repeatedly purchase and pay high prices to stay with the brand. In the same context, consumers' loyalty like intention to revisit and willingness to pay high prices are developed through their long-term interactions with the brand.

The results of the study showed that word of mouth has a significant positive impact on tourists' choice. Word of mouth as a determinant of brand loyalty was moderately rated by respondents. Brand loyalty described by the consumer behaviour of spreading positive word-of-mouth. A consumer's intention to advocate for the brand and spread positive word-of-mouth was found to sustain the consumer's brand loyalty and potentially to help the brand expand its market share Madupu and Cooley. Word of mouth it serves as peers' advice, which can influence consumer decision-making, as well as product evaluations and purchase decisions Zhang et al. (2010). Moreover, word of mouth is a type of direct reference for consumers, and its effect on brand attributes, on consumers' perceptions and attitudes when consumers select tourism destinations.

7 Recommendations

In light of its findings, on the basis of the results reached by the current study, it was concluded that brand loyalty as measured by satisfaction, price and word of mouth has a significant impact on tourists' choice; the researcher recommends five-star hotel managers to Provide a superior service quality with emphasizing on the staff ability to increase guest confidence, serve at the right time, and understanding the individual needs of the hotel guests. Undertake promotional and informational marketing activities via advertising tools and integrated marketing communication efforts. And Train the staff and every person who would contact the tourists, so the guest has wonderful experience in culture tourism which may turn into positive word of mouth.

sampling by taking 2035 active users of the on-line applications from 70,251 downloader; 500 questionnaires were distributed randomly. To achieve the objective of the study, and to test hypotheses, the researcher used statistical program of social studies (SPSS) & (AMOS). The study results revealed that there is a statistically effect of using branded mobile applications on customer loyalty, based on the study results the researcher recommends managers and decision makers to improving the system of customer services in order to improve their loyalty, by reviewing the system after receiving feedback from customers through mobile applications. Also enhancing the quality of system information by ensuring that the content is relevant to customer requirements. and improving the perceived quality of the customer by identifying the expectations of the customers and seeking to achieve these expectations, so that the gap between what they expect and what they actually get.

Keywords Branded mobile applications (BMA) · Customer loyalty (CL) · Healthcare technologies · Amman-Jordan

1 Introduction

After the booming of smart phones and tablets that helping people not only to contacting each other but doing their jobs and tasks through it, the on-line smart phones' applications take place as a service for the community starting from using applications for work and ending with gaming and socialization applications at home, in another word it's became a life style. This wide spread of the mobile devices is due to the extensive usage of the mobile phone's applications (Al Dmour et al., 2014; Alshurideh et al., 2019a, 2019b). Mobile applications are currently used by companies to help and serve their customer and clients without being on the spot. This action will save time and decrease the level of human contact within the services given (Akour et al., 2021; Alshurideh et al., 2021).

Medical sector and pharmacies are investing with the mobile applications to have a direct contact with patients and increase their compliance to medications. Also, is used as an informative reference for clients about health tips and drug-drug interactions and other related services. Chain of Pharmacies today are launching their own branded mobile applications to have a loyal customer and increase their sales through it.

Consumers' behavior has been observed during their usage of different mobile devices, results showed that consumers had positive emotion toward the responses they receive when visiting the mobile site which is considered as basic application of the pharmacies systems (Alshurideh et al., 2012a, 2012b; Al-Hamad et al., 2021).

D. B. Al Kurdi
Department of Marketing, Faculty of Economics and Administrative Sciences, The Hashemite University, Zarqa, Jordan
e-mail: barween@hu.edu.jo

In pharmaceutical sector, there are many applications of mobile devices, there usage has led to useful changes in pharmacy practices, this refers to the fact that many of the pharmacy daily activities can be achieved by using the mobile devices, according to the vision statement issued by the American Association of the pharmacists of the Health system regarding the proposed role of information technology in practicing pharmacy. There are many features through which technology can participate in improving the pharmacy general performance (Aburayya et al., 2020a, 2020b; Taryam et al., 2020; Ghazal et al., 2021; Svoboda et al., 2021).

But there are advantages and disadvantages of using the mobile devices, applications with positive and tangible impact on the pharmaceutical products should be studied, this increasing trend towards using the mobile devices as instruments to manage the health information in a better way requires more education of the consumers (users), and in some cases might need placing some laws. The used mobile devices applications have been developed remarkably in the medical clinical practice with a number of applications for the clinical practitioners. Determining and selecting the reliable application from thousands of medical applications available on the internet or the applications stores a basic factor in assuring the effectiveness of these devices.

In summary, this research concerned itself with the impact of using branded mobile applications on customer loyalty in chain of pharmacies (a case study on Pharmacy One) in Jordan, Understanding customers responses to each of branded mobile applications sub variable (Service information quality, Service system quality, Awareness about mobile application and Perceived quality about mobile phone application) in order to help firm to measure the impact of this application and whether its' helpful and useful for their clients, and how important it is to invest in this online technology to formulate a new marketing plan and strategy to get the customer loyalty.

2 Theoretical Frame and Hypotheses Development

2.1 The Brand

The trade mark known to the customers makes them feel secure toward the use of the product, in a severe competing business environment, which contributes to high share to the brand, and placing high value to the product in the customer's mind (Hamadneh et al., 2021; Sweiss et al., 2021). The consumer distrust the brand if it quality changes, since the perceived quality is not the real product quality, it is the customer personal evaluation which shows the product's real quality, since quality represents the images established in the customer's mind, since he does not have enough information to evaluate the quality, the price is placed as a positive indicator with the perceived quality. Brand offers multiple benefits to the organization; these benefits include increased the likely hood to select the brand which leads to customers loyalty (Alwan & Alshurideh, 2022; Tariq et al., 2022). Also, brand expands to

Licensed to (putm@utm.my)

products from other categories, increases the product/ service market value because customers are ready to pay high prices (Abu Zayyad et al., 2021; Aljumah et al., 2021).

2.2 Branded Mobile Applications

In 2008, Apple opened its iOS App Store that was the primary application distribution service. This set the quality for applications distribution services for alternative mobile firms. This led to shopper's exploitation their mobile devices as the way of connecting to the online. Consequently, mobile phones began to be referred to as smartphone because of their various capabilities. Mobile and software package developers accomplished that they might take mobile web site capabilities up with new applications named mobile applications. The applications would have identical functions and capabilities as websites designed for a desktop or laptop computer. The websites were scaled down so they'd work mobile devices. This led to anover plus of mobile applications being developed and enforced. In 2010, the word "app" was listed because the "word of the year" by the yank idiom Society (2011). Early applications for mobile apps were for email, calendars, contacts, the securities market, and weather data. High demand from users led to mobile applications being employed in mobile games, factory automation, banking, order-tracking, and price ticket purchases.

The mobile business has continuing to grow quickly, with a complete of 3.6 billion unique mobile subscribers at the top of 2014 associated an addition of one billion subscribers predicted by 2020 globally. Branded Mobile Applications may be defined as the software that is downloadable and available on online stores for mobile phones and tablets, carrying the name or the brand of an existing firm to deliver products and services through it**.** In the theoretical frame, the study has addressed and demonstrated both the independent and dependent variable, the independent variable (branded mobile application) with its dimension (service information quality, service system quality, perceived quality of the trade mark and awareness about the mobile phone trade mark). The study has benefited from some these previous studies mainly that have addressed these dimensions, like (Monica et al., 2017); (Francisquinho, 2013).

Service System Quality: The researcher defines quality of the system as a general performance statement of the system, which can be measured by the customer's point of view and the degree of ease of use in marketing and satisfaction with the system. Quality of service, customer satisfaction and customer loyalty are three key elements for business organizations to strive to focus on (Al-Dmour et al., 2021; Alshurideh, 2022). An organization that does not focus on quality is not successful in its business, so, quality is an important tool for strong competitive advantage market. (Tehrani & Jamshidi, 2015; Alzoubi et al., 2020).

Service Information Quality: If the provided information by the mobile phone applications are inaccurate, insufficient and without visibility, or uncompleted, this will contribute to reduction in customers satisfaction. The researcher sees that the

availability of high quality information brings and attract more customers because of their loyalty to the quality of the information provided by the different applications for the pharmaceutical sector. Service Information Quality may be defined as the quality level of processes and procedures provided through the service whether it is available at the time needed for and work smoothly or not.

Awareness about the Mobile Phone Application: Awareness about the brand is identified as "the prospected buyer's ability to remember the brand in a product type". (Chen & Ching, 2007).Also identified as "the customer's ability to know the brand in the different conditions" while Ross identified it as "strength of the brand's presence in the customers mind".

The researcher sees that the consumer's ability to remember and distinguish some components of the brand within different conditions and provisions is considered basic and important condition to create the awareness about the brand. Awareness about the Mobile Phone Application may be defined as the level of consumer concessions about the brand of the mobile phone application and to which extent they can recall or recognize it.

The Perceived Quality about the Mobile Phone Application: Perceived quality is identified as "the consumer perception of the total quality or superiority of the product or the service". Swinker & Hines classify the perceived quality to four categories; essential, external, appearance and performance. Perceived quality and brand's image are determinants of loyalty to the brand. Many studies have indicated at the positive influence of the perceived quality on buying intention. The Perceived Quality about the Mobile Phone Application may be defined as the customer's judgment and perception about the total quality of the mobile phone application and its superiority to another.

2.3 Brand Loyalty

Loyalty to the brand is considered one of the important factors in the success of the commercial businesses since studying the client's loyalty through his behavior and the attitudes are basic methods in building the client's loyalty. Attitudes about loyalty were identified as the degree of the behavioral commitment regarding the unique correlations regarding their kind with the brand's value (Suhartanto & Noor, 2013: 65). Several researches believe that loyalty in the attitudes affecting the clients purchase repetition of the brand. Brand Loyalty may be defined as Deep commitment of customer to a product or service despite situational influences and marketing efforts having the potential to cause switching to another product or service.

Attitudinal Brand Loyalty: Attitudinal method issued in order to measure the clients' loyalty to the brand and increasing the number of the new clients. The clients' perspective method about the client's loyalty and the intention to re-buy the product or recommending it (Kandampully & Hu, 2007). So, the researcher sees that many studies use this kind of instruments to perform the customer's loyalty to the brand but measuring the loyalty to the brand with one instrument is an effective measure to

loyalty compared to customer satisfaction on level of retaining them. Also, attitudinal method issued in order to measure the clients' loyalty to the brand and increasing the number of the new clients. The clients' perspective method about the client's loyalty and the intention to re-buy the product or recommending it (Kandampully & Hu, 2007). So, the researcher sees that many studies use this kind of instruments to perform the customers loyalty to the brand but measuring the loyalty to the brand with one instrument is an effective measure to loyalty compared to customer satisfaction on level of retaining them.

Behavioral Brand Loyalty: From an analytical study conducted by (Glasman & Albarracin, 2006), the study indicated that the attitude greatly predicts the future behavior and understanding loyalty by the client is basic factor for the businesses because it helps marketing directors in designing programs to modify the clients' behavior in the future, especially changing the behavior from one specific brand to another. To find the motive for buying behavior, directors need understanding the clients' cognitive mechanisms which are considered important part of these attitude (Back, 2005).

Rewards programs issued by the companies to promote the client's loyalty to its brands increase the client's loyalty to that brand, because the client might depend on his loyalty to the brand on specific and desired behaviors and provide him with comfort. It the customer attitude to the brand is positive, the percentage of his loyalty to the brand will be higher because his attitude will contribute to be as an advertisement and promotion to the brand, also, those attitudes in loyalty will contribute to creating long-term loyalty relationship between the brand and the client (Meyer-Waarden, 2015). The researcher sees that, in order to achieve specific behavior from the client, there should be process to control the clients' behaviors in the relationship between the brand and the client, by including the client's psychological factor and his attitude. So, the researcher sees that, one group of behavioral intentions can be design as positive behavioral intentions. one of this is loyalty, and certain behaviors signal that customer are forging bond with a company, and when customer praise the firm, express preference for the company over other, recommend the company of service to other.

2.4 Branded Mobile Applications and Loyalty

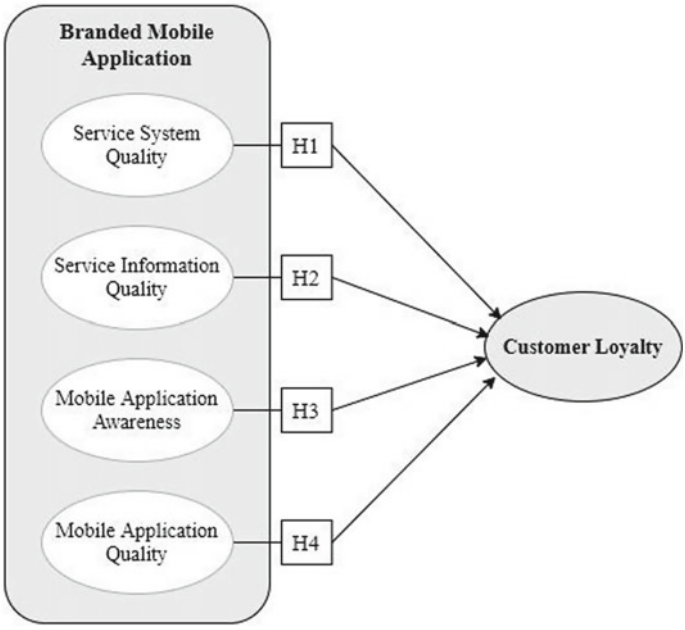
Bellman et al. (2011) have investigated the effect of branded mobile applications, including information and experimental applications related to attitudes toward the brand, and buying intention, results from their study showed that brand applications had positive impact of the attitude towards the brand, but less impact on the buying intention, also, found that the branded applications are new form of interaction information means, such as the websites, but differ from the advertisements thorough the internet because of the applications that characterizes by high level of the customers participation. Yu has investigated the influences of the mobile advertisement messages in building positive attitudes toward the band and the customer's

buying intentions. Results of his study showed that the mobile phone advertisements with interactive features have led to positive attitudes toward the brand and the buying intentions. Hoogendoorn study has proved the extent of the impact of the mobile applications with brand on the brand's cognitive and emotional shares and found that the interaction with branded applications has resulted in an increase in the positive aspects of the brand. Also, the results of that study showed that the interaction in the mobile applications with brand improved the brand's cognitive share.

Xie et al. study found that design of the mobile devices such as the screen's size, advertisement size and ease of uses influence the customers' emotional response to the mobile advertisements that might generate the positive emotions and increasing the customers buying intention. Kumar and Mukherjee have explained the attitudes of the mobile phone users in the shopping and purchase intention through the devices and found that the mobile phone does not always push the users to buy. Based on the above literature the study hypotheses can be formulated as:

H01: There is a significant impact of branded mobile applications) on customer loyalty of Pharmacy One

3 Research Model



4 Methodology

4.1 Population and Sample Selection

The sample of the study is defined as part of the sample that contains appropriate information about the study population. The study population was 70,251 downloaders of the mobile application. In order to obtain the appropriate information owned by some members of the population, the best technique to select the sample is the purposive sampling. According to Sekaran and Bougie (2016), a purposive sample is the one that contains individuals who are able to provide the desired information. Since the current study seeks to collect data from online users of the application, a purposive sample consisted of 2035 real active users of the mobile application, 500 users were randomly selected. Out of them, 423 users were accepted since they download and activate the intended application and answers the questionnaire form link.

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (19) items to measure branded mobile applications based on (Abbad & Al-Hawary, 2011; Abu Qaaud et al., 2011; Al-Hawary, 2012; Al-Hawary & Al-Fassed, 2021; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Hussien, 2017; Al-Hawary & Metabis, 2012; Al-Hawary et al., 2011, 2012; Alolayyan et al., 2018; Metabis & Al-Hawary, 2013). These questions were distributed into dimensions as follows: five items dedicated for measuring service system quality, five items dedicated for measuring service information quality, four items dedicated for measuring Mobile Application Awareness, and five items dedicated for measuring Mobile Application Quality. Whereas the second section included nine items developed to measure customer loyalty according to what was pointed by (Monica et al., 2017; Francisquinho, 2013).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.624–0.872), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approachis based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of

Table 1 Results of validity and reliability tests

Constructs	1	2	3	4	5
Service system quality	**0.755**				
Service information quality	0.564	**0.760**			
Mobile application Awareness	0.612	0.538	**0.762**		
Mobile application quality	0.488	0.542	0.493	**0.722**	
Customer loyalty	0.692	0.689	0.665	0.677	**0.748**
VIF	5	5	4	5	9
Loadings range	0.622–0.822	0.638–0.854	0.624–0.866	0.682–0.766	0.631–0.872
AVE	0.570	0.577	0.580	0.521	0.559
MSV	0.511	0.502	0.488	0.469	0.509
Internal consistency	0.866	0.868	0.841	0.840	0.915
Composite reliability	0.868	0.871	0.845	0.844	0.918

Note VIF: variance inflation factor, AVE: average variance extracted, MSV: maximum shared variance, Bold numbers refer to $\sqrt{\text{AVE}}$

square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity.The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 *Structural Model*

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017).This result is supported by the values of model fit indices shown in Fig. 1.

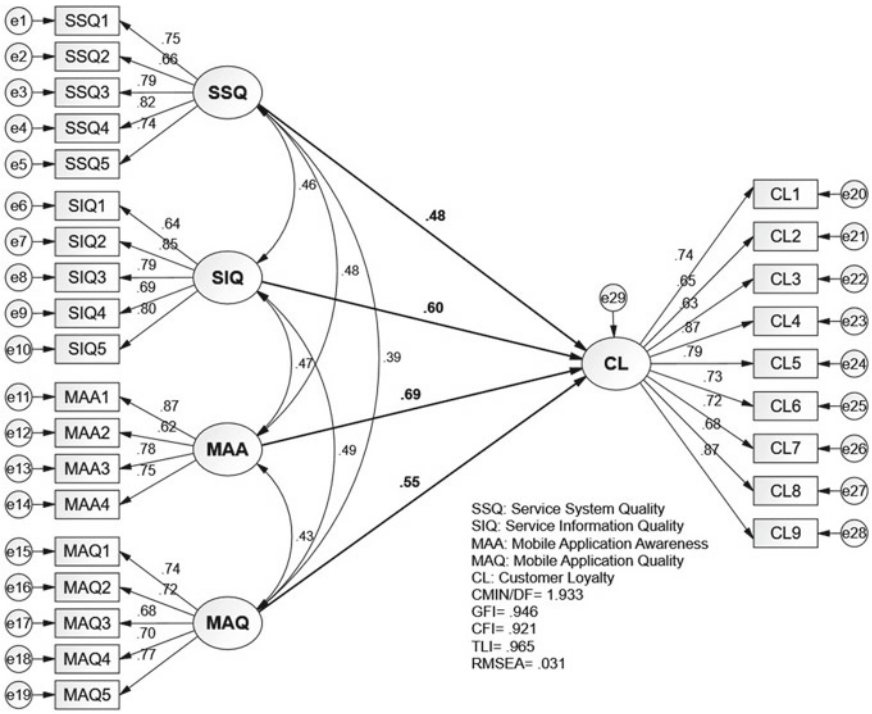


Fig. 1 SEM results of the branded mobile applicationseffect on customer loyalty

Table 2 Hypothesis testing

Hyp	Relation			Standard beta	*t* value	*p* value
H1	Service system quality	→	Customer Loyalty	0.483	20.04*	0.03
H2	Service information quality	→	Customer Loyalty	0.609	27.83**	0.002
H3	Mobile application awareness	→	Customer Loyalty	0.692	30.72***	0.000
H4	Mobile application quality	→	Customer Loyalty	0.550	25.37**	0.005

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

The results in Fig. 1 indicated that the chi-square to degrees of freedom (CMIN/DF) was 1.933, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.031, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that mobile application awareness has the greatest positive impact on customer loyalty ($\beta = 0.692$, $t = 30.72$, $p = 0.000$), followed by service information quality ($\beta = 0.609$, $t = 27.83$, $p = 0.002$), then mobile application quality ($\beta = 0.550$, $t = 25.37$, $p = 0.005$), and finally the lowest impact was for service system quality ($\beta = 0.483$, $t = 20.04$, $p = 0.03$). Thus, all the minor hypotheses of the study were supported based on these results.

6 Discussion

The main hypothesis presumed that there is a significant and positive effect of the branded mobile applications on customer loyalty. This hypothesis was tested based on the data collected from the respondents. The branded mobile application was measured using the items (1–19) of the questionnaire, while customer loyalty was measured by the items (20–28) of the questionnaire. Since the independent variable, the branded mobile applications consisted of four dimensions in the current study, which were the dimensions used in the sub-hypotheses, the discussion of the main hypothesis was combined with the discussion of the sub-hypotheses.

However, numerous studies have been accepted the hypothesis that there is a significant and positive impact of branded mobile applications on customer; loyalty.

Lin and Wang examined the determinants of customer loyalty in mobile commerce contexts and found an impact of perceived value of mobile applications on customer loyalty. Aydin and Özer analyzed the antecedents of customer loyalty in mobile telecommunication in Turkey and revealed a significant effect of perceived service quality on customer loyalty. One of the most pivotal intangible advantages of mobile applications is the improved customer service.

7 Recommendations

In light of its findings, the researchers recommend managers and decision makers to improve the system of customer services in order to improve their loyalty, by reviewing the system after receiving feedback from customers, and enhancing the quality of system information by ensuring that the content is relevant to customer requirements, the timing of the information and its practical usefulness to customers. Also Raising customer awareness by focusing on advertising, promoting and benefiting from the applications provided and encouraging customers to download and use them. The service provider can use the rewards to achieve this goal. Finally Improving the perceived quality of the customer by identifying the expectations of the customers and seeking to achieve these expectations, so that the gap between what they expect and what they actually get.

Impact of Internal Marketing Practices on Intention to Stay in Commercial Banks in Jordan

Mohammad Issa Ghafel Alkhawaldeh, Faraj Mazyed Faraj Aldaihani, Bahaa Addin Ali Al-Zyoud, Sulieman Ibraheem Shelash Al-Hawary, Nancy Abdullah Shamaileh, Anber Abraheem Shlash Mohammad, Muhammad Turki Alshurideh, and Omar Atallah Ali Al-Adamat

Abstract The study aimed at identifying the impact of internal marketing practices on the intention to stay in commercial banks in Jordan. The internal marketing practices represented by (empowerment, training programs, incentives and rewards, internal communication and administrative support). The study population consists of employees of Commercial Banks in the northern region of Jordan; a sample was taken from the study population. The questionnaire was distributed to 550 of study samples, 521 were valid for statistical analysis. To achieve the objectives of the study and test hypotheses statistical analysis programs (IBM SPSS 24) and (SMARTPSLS, v. 3.2.6) were used. The study found that there is a statistically significant effect of internal marketing practices on Intention to stay in commercial banks in Jordan. Based on the study results, the researcher recommended the managers and decision makers in the commercial banks in Jordan to emphasize the importance of job

1 Introduction

Internal marketing practices concept emerged to allow organizations to prove themselves and achieve success, and since organizations are the main pillar in the service sector depends mainly on human resources, therefore, employees and trying to retain them are considered the organization success cornerstone. Service providers are more interactive with the customer, with employees bearing the brunt of success. Accordingly, marketing directed towards employees within organizations is considered one of the essentials for the organizations work success (Al-Hawary & Obiadat, 2021; Al-Hawary & Alhajri, 2020; Al-Hawary, 2013; Al-Hawary & Batayneh, 2010; Al-Hawary et al., 2013a, b, 2017; Altarifi et al., 2015; Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Al-Hawary & Harahsheh, 2014; Al-Hawary & Hussien, 2017; Alolayyan et al., 2018; Alshurideh et al., 2017). And since each organization sets a set of goals and strives to achieve them through the application of activities carried out by employees who have specific qualifications and capabilities, and make their efforts to achieve the goals of the bank and in return they get many benefits from it that satisfy their needs, so it can be said that the relationship between employees and the bank is an integrated relationship (Al-Hawary & Al-Syasneh, 2020; AlTaweel & Al-Hawary, 2021; Al-Hawary et al., 2020; Alhalalmeh et al., 2020; Al-Nady et al., 2016; Al-Hawary & Nusair, 2017; Al-Lozi, et al., 2018; Al-Hawary & Al-Namlan, 2018; Al-Hawary & Mohammed, 2017; Al-Lozi, et al., 2017; Al-Hawary et al., 2012; Al-Hawary & Alajmi, 2017). For the organization to achieve goals, it must retain competent employees and set up appropriate compensation programs in order to ensure their commitment and survival (Alshurideh et al., 2020; Kurdi et al., 2020). Successful organizations are those who can harness their human resources to develop their products and their customers desires, and work to provide all material and moral capabilities that help these resources to develop and be creative in carrying out the required tasks, and always strive to preserve these resources due to their cost and high value in helping the organization achieve its goals, through research briefing, its found that commercial banks strive to secure an encouraging and attractive work environment, which motivates employees to stay and continue working for these banks (Al Kurdi et al., 2020; Alshamsi et al., 2020; Alshurideh, 2022). Therefore, this study came to determine the extent of the impact of internal marketing practices on the intention to stay in commercial banks in Jordan.

2 Literature Review and Hypotheses Development

2.1 Internal Marketing

A new concept of marketing appeared in the early eighties of the last century, called internal marketing, where the interest in the human resource increased significantly, in order to reach the quality level required of customers (Al-Hawary & Abu-Laimon, 2013; Al-Hawary et al., 2013a, b; Metabis & Al-Hawary, 2013; Mohammad et al., 2020). Participation processes between different departments had a prominent role in building and strengthening the relationship between employees through successful internal marketing practices application, and the internal marketing concept confirms that collective work among employees in all departments is an important development factor, and a method to maintain the continued organization success (ELSamen & Alshurideh, 2012; Alkitbi et al., 2020). It also indicates that the relationship between the organization and its employees must be a positive relationship, which in turn can lead to the development of understanding among employees and enhance their sense of belonging, as well as providing products and services to employees and building a long-term relationship with them (Alameeri et al., 2020; Khasawneh, 2016).

Internal marketing stresses the importance of the marketing within the company by focusing on the employee and providing a source of competitive advantage (AlShehhi et al., 2020; Alshurideh et al., 2015). Through the internal marketing strategy, employees are treated as internal customers who must be convinced of the company's vision and value just as strongly as external customers (Alsuwaidi et al., 2020; Al-bawaia et al., 2022). Thus, satisfied employees are those who have a high commitment to roles within the organization in terms of achieving organizational goals, and the implementation of internal marketing may be some kind of difficulty if internal customers are not satisfied, and therefore there will be difficulty in providing good service to external customers from internal customers (Aburayya et al., 2020; Alzoubi et al., 2022). Those who are not satisfied, and this will affect the organizations productivity (Al-Khayyal et al., 2020, 2021; Solomon, 2017).

It is necessary to establish a long-term relationship with employees, and consider them internal customers, models have been developed based on the idea of making the worker's job attractive; because employee satisfaction will lead to customer satisfaction, and make employees more loyal to their organizations, and this works to attract better employees, and increases their motivation (Alshurideh, 2019; Al-Dhuhouri et al., 2020). Thus, the increased recognition of the employee's importance role in the service industry prompted organizations to adopt the internal marketing concept, and thus treat them as internal customers. Meeting the internal customer needs makes the business in a better position; to provide the quality required to satisfy external customers (Alshurideh et al., 2016; Svoboda et al., 2021). Establishing internal marketing involves developing and retaining successful employees and demonstrating a positive relationship between organizations and their employees (Aljumah et al., 2021; Hayajneh et al., 2021). Internal marketing is a complement to human resource management; good internal programs create employee satisfaction,

and this inevitably leads to external customer satisfaction (Shehada & Omar, 2015; Khasawneh et al., 2021a, b).

It should be noted the advantages that internal marketing gives organizations: encourage employees to perform better, empower the employee so that they are able to accept powers and assume responsibilities, achieve a greater understanding of the organization's goals, policies, procedures, and directions, and encourage the employee to provide distinguished service to customers, by commending their contribution to the organization successes, and achieving a better level of coordination and cooperation between the various organization departments and divisions (Abu Hamra, 2017; Lee et al., 2022a, b).

Many studies came to show the internal marketing dimensions, and these dimensions differed according to the different researchers viewpoints. Empowerment is a transfer of responsibility and authority, and an invitation to organization employees to participate in the information and knowledge provided by the organization through the database and decision-making, and therefore in the decision-making power becomes responsible for the quality of what he decides or what he performs, which leads to the transfer of powers from the president to employees (Alzoubi et al., 2022; Metabis & Al-Hawary, 2013; Tariq et al., 2022). Training programs are the systematic development of employees' knowledge, skills and attitudes required by employees; to perform sufficiently in a particular task or function. (Ramos, 2015; Alshraideh et al., 2017) and organizations resort to training their employee; In order to qualify him for the work that he will perform within the organization, or in order to raise his production capacity, or work to provide him with the necessary skills that appear due to environmental and technical changes that require new skills, Rewards and incentives are some driving force within the employees through which they try to achieve some goals in order to satisfy some needs, it is a feeling or desire to do or not to do something to satisfy a certain need (Abidin et al., 2017; Alshurideh et al., 2022). Internal communication is the work of internal communication that facilitates transactions between individuals and groups within the organization, and obtaining correct, reliable and timely information for the employee, in order to enhance knowledge, in addition to providing a healthy work environment that promotes motivation, creativity, effectiveness, and cooperation through the culture components, values and organizational assumptions, that develops a sense of belonging and loyalty among all employees (Alshura et al., 2016; Alyammahi et al., 2020; Sweiss et al., 2021).

2.2 Intention to Stay

Many researchers have noticed the lack of specific and clear definitions of intentions to stay at work in much of the literature that talks about the intention to stay at work or even leave it, and there are some researchers who have explained this; Since they considered intentions to remain in work a self-explanatory factor without the need to set definitions, Many researchers consider the intentions to stay at work or leave

it as the last step in the decision-making process towards staying at work within the organization.

Leaving work is one of the tendencies that lead to complete separation from belonging to a particular social system at the exclusive and personal initiative of the employee (Mohammad et al., 2020; AlHamad et al., 2022). Halawa (2015) adds that in contrast to the intention to stay at work, there is a feeling that some employees may have job instability; If the employee feels dissatisfaction, his future career is threatened in the organization in which he works, and the unknown makes him doubt whether he will stay within the organization or leave it, and this feeling will always provoke the employee to a continuous review his survival in his works, and trying to search for a better job to improve his conditions, and provide him with work stability and tranquility (Al-Dmour et al., 2021; Allozi et al., 2022; Shamout et al., 2022).

Sadiq (2018) adds that the intention to stay or leave work is affected by organizational commitment, as it plays a key role in the employee's continuation to work within the organization, as organizational commitment works to reduce the levels of some negative phenomena in organizations such as absence, leaving work, and evading performance of duties. The researcher believes that the role of internal marketing shines through at this stage; As the internal marketing and the dimensions that it contains, such as employees training, the system of rewards and incentives, administrative support, and internal communications between the manager and employees and among the employees themselves, play an important role in influencing the employees psychology, which inevitably leads them to organizational commitment, improving the their work quality and their performance, Thus, this improves the organization reputation in which they work, and increases the customer satisfaction outside the organization, and at this moment, the employee can only expect everything that is wonderful, so the employee has that wonderful feeling that accompanies him all the time that he does not want to leave this organization, which provided all the material and moral support his needs; thus puts all his energy into trying to stay in his job.

2.3 Relationship Between Internal Marketing and Intent to Stay

Internal marketing practices lead to employees' adherence and increased desire to stay in the workplace, and to achieve organizational commitment that generates a sense of belonging to the organization, which in turn is considered the motivation for innovation and maximum energies. Internal marketing is also considered as a strategic direction concerned with providing a suitable work environment for employee. The success in applying internal marketing practices is reflected positively on external marketing practices, as training and motivating employees and securing a suitable work environment for them makes them capable of their best to serve customers (Alshura et al., 2016; Hasan et al., 2022).

Also, internal marketing has a significant and clear impact on organizational processes, an important factor that led to employee commitment is behavior with employees as internal organizational clients, in order to enhance and improve employee commitment and engagement. Al-Majali et al. (2016) add, that internal marketing is a social process through the organization's application to manage the communication process, and the interactions that take place between the organization and its employees, friendship, the needs of respect between the manager and the employees, in addition to the needs of self-realization such as promotion to a higher position, all of which can only be achieved through the application of internal marketing; Internal marketing is an integrated administrative process among all functions in the organization, which mainly focuses on that all employees possess the experience and skill, to implement operations to satisfy the external customers needs and desires, and this is only done by preparing and motivating them to perform their work effectively and efficiently.

Al-Omari and Al-Yafi (2017) add that there are some things that affect the individual's feeling of wanting to stay in his work or leave; The work environment has a great impact on the employee's desire to stay in his work within the organization, and many organizations have sought to make basic changes in the work environment to make it more comfortable for employees; to keep the inner feeling that he is seriously willing to remain in his organization, The work environment includes several aspects, including what is material, psychological, and social. During the development of industrial psychology, the physical environment for work was given high importance that it has a significant and important impact on employee productivity. The work environment does not consist only of the physical components, but also includes the psychological and social aspect. Accordingly, the research hypothesis can be formulated as follows.

There is a statistically significant impact of internal marketing practices on the intention to stay in the commercial banks in Jordan.

3 Study Model

See Fig. 1.

4 Methodology

4.1 Study Population

The study population represented all employees of commercial banks in the northern region of Jordan in the governorates of (Irbid, Mafraq, Jerash and Ajloun). The researcher used a Convenience Sampling represented by workers in commercial

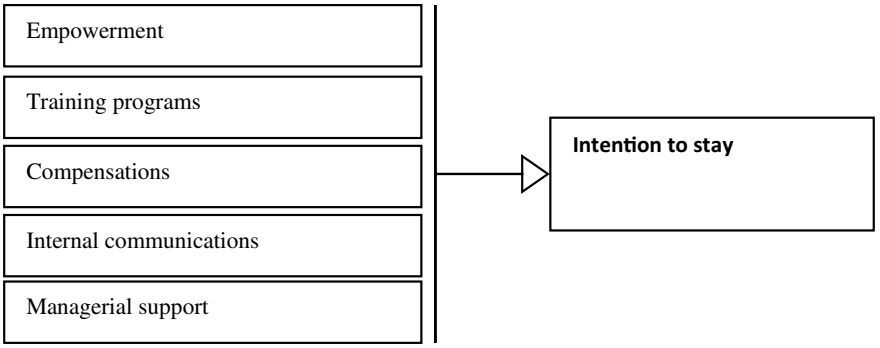

Fig. 1 Theoretical model

banks in the northern region who cooperated with the researcher in distributing the questionnaire. To achieve some criteria such as ease of access to the study sample of workers, and coverage of the northern region in Jordan. The study tool was distributed to the sample with 550 questionnaires, (521) questionnaires capable of statistical analysis were retrieved.

4.2 Study Tool

The study tool included four sections: the first section was for the purpose of collecting data on the demographic factors of the study sample represented by (gender, age, educational qualification, years of experience), while the second section related to the internal marketing practices with its dimensions (empowerment, training programs, and compensations, internal communication, and managerial support). In order to develop this section, the researcher used studies (Khasawneh, 2016; Toa & Martin, 2015; Wilmark, 2018). The third section is represented by the intention to stay based on studies (Hyun-Woom & Yuan, 2015).

4.3 Validity and Reliability

The researcher used the Cronbach's alpha coefficient test to verify the internal consistency of the study tool, in order to verify the reliability of the tool. Convergent Validity and Discriminant Validity were also used to verify the validity of the tool.

Factor loading: To ensure the reliability of the questionnaire statements by examining the path loadings values in order to ensure the existence of a relationship between indicators with latent variables or the absence of (latent variables) for each of them, the researcher also used factor analysis to assess the ability of the factors model to express data. The accepted value is the one with loading values (0.55) or

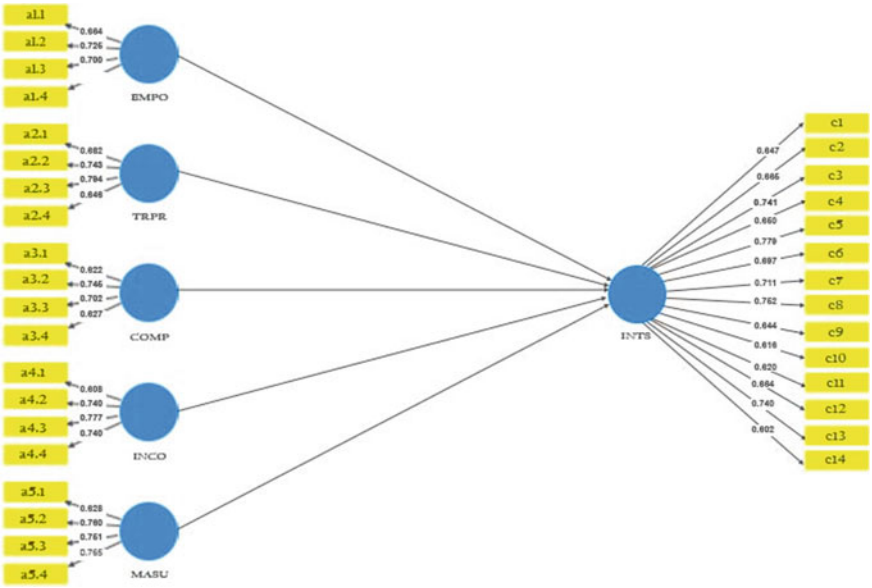

Fig. 2 Factor loading: the proposed model after deleting the statements

higher (de Leeuw et al., 2019). All of the questionnaire statements were accepted except for two statements for the variable (intent to stay) (C13, C14), which got less than (0.55), while the rest of the statements got values higher than (0.55 ≤ Path Loading-Factors Analysis Result-), which are accepted as greater values from (0.55), shown in Fig. 2.

Discriminant Validity: The discriminant validity test measures the degree of divergence of the variables of the study from each other, and based on that judgment is that there is no similarity between the variables and that each variable represents itself, by verifying that there is no level of linear correlation with a high degree (Multicollinearity) between the domains of the independent variable and the domains of the dependent using the criterion Fornell–Larcker Criterion) and using (Squared Average Variance Extracted) and as shown in Table 1.

The square root of the values of the test coefficient of confidence (AVE): Average Variance Extracted must be higher than the values of the correlation of the corresponding row and column variables up to half of the study tool with its differential validity (Hair et al., 2017), and this shows that the square roots of (AVE) values It is higher than the values of the correlation coefficient between the row dimensions and the corresponding columns, which reflects that the tool is characterized by its discriminant validity. Therefore, the results of the tests (convergent validity and discriminant validity) showed the validity and reliability of all measures of the study tool. The results, as they are in Table 1, indicate that the degree of correlation

Licensed to (putm@utm.my)

Table 1 The (Fornell–Larcker criterion for multicollinearity) between the dimensions of the independent variable

	Empowerment	Training programs	Compensations	Internal communications	Managerial support
Empowerment	0.880				
Training programs	0.650	0.870			
Compensations	0.660	0.550	0.854		
Internal communications	0.590	0.731	0.831	0.863	
Managerial support	0.570	0.717	0.849	0.666	1

is medium between the independent study variables, and the values of the correlation coefficients ranged between the independent variables (0.55–0.88) and the significance level ($\alpha \leq 0.05$) for all correlation coefficients.

Composite Reliability (CR): The analysis was used to ensure that all the variables of the proposed model are reliable. This test is considered to be better compared to Cronbach's alpha test because it takes all path loading values into account, unlike Cronbach's alpha test, which considers all path loading values to be equal. And constant for all indicators (Rimkeviciene et al., 2017), the values of the study variables showed acceptance (CR $\geq$ 0.70), because all values (CR) greater than (0.70), and this is an indication of the stability of the test results. The application of this tool results in the ability to generalize the results of the study in light of its practical limitations.

Average Variance Extracted (AVE): This test is used in order to verify that all study variables in the model are reliable, and (AVE) values are acceptable if the values are greater than (0.50) (Rimkeviciene et al., 2017), and all (AVE) values are greater than (0.50). This is an indication of the acceptance of the reliability of the variables of the proposed model. Table 2 shows the summary of the values of (AVE) which is greater than (0.5) and also the (CR) values of the model variables, which are greater than the values (0.70) and indicate the acceptance of the reliability of the model variables and reflects the convergent validity of the study tool.

Table 2 Results of (AVE), (CR) and (Cronbach's alpha) test

	(AVE)	CR	Cronbach's alpha
Empowerment	0.57	0.853	0.837
Training programs	0.600	0.90	0.881
Compensations	0.741	0.891	0.874
Internal communications	0.630	0.840	0.892
Managerial support	0.54	0.799	0.822
Empowerment	0.540	0.900	0.902

Table 3 Results of the variance inflation factor (VIF)

	VIF
Empowerment	2.331
Training programs	1.893
Compensations	3.422
Internal communications	2.589
Managerial support	2.173

Table 4 Quality indicators of conformity to the study data model (Model Fit)

Indicators	Acceptance indicator	Result
Standardized root mean square residual (SRMR)	Less than 0.08	Accepted
(NFI)	More than 0.90	Accepted
(RMS_theta)	Less than 0.12	Accepted

Autocorrelation test: The researcher used the Variance Inflation Factor (VIF) test to identify the degree of Autocorrelation between the independent variables. The results show as they are in Table 3 that the independent study variables do not suffer from the problem of Autocorrelation, as the values of the variance inflation factor (VIF) are less from (5).

5 Model Fit

Table 4 shows that all the values of indicators used in evaluating the validity of the model were acceptable, as the SRMR ratio reached (0.035) and appears to be less than (0.08), and the NFI value was (0.91) which is greater than the value The minimum permissible value is (0.90), and the value of the square root of the approach error (RMS_theta) is (0.06), which is also less than (0.12).

6 Testing Hypotheses

Table 5 shows that internal marketing practices affect, with statistical significance, the intention to stay in commercial banks in Jordan, with a value of F (30,881). It is a statistically significant value ($\alpha \leq 0.05$), and the R^2 value of (788.) indicates that internal marketing practices explain (78.8%) of the changes in survival intention, and the correlation coefficient reached $R =$ (62.2%), and this indicates the existence of a relationship Between internal marketing practices and the intention to stay, and the results of the partial analysis of this hypothesis showed that

Table 5 Hypothesis testing

Relation	Standard beta	*t* value	*p* value	Result
Empowerment → intention to stay	0.105	1.200	0.363	Not supported
Training programs → intention to stay	−0.224	−2.511	0.033	Supported
Compensations → intention to stay	0.490	5.587	0.000	Supported
Internal communications → intention to stay	0.268	2.793	0.004	Supported
Managerial support → intention to stay	0.210	2.151	0.059	Not supported

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

internal marketing practices (internal communication, managerial support, training programs) contribute to the direct impact on the intention to stay, and this is shown through the (β) values of (0.105), (0.224), (490.), (268.) respectively at the level of ($0.05 \geq \alpha$), As for each of the practices (empowerment, incentives, and rewards), their effect was not statistically significant, as the significance level reached (0.363) (0.059), respectively, and explained above. The significance ($\alpha \leq 0.05$) of internal marketing practices (empowerment, training programs, managerial support, internal communication, incentives and rewards) in the intention to stay in commercial banks in Jordan.

7 Discussions

Study results showed that Jordanian commercial banks encourage communication, interaction and participation between departments as a major key to achieving and strengthening the relationship between employees through the application of internal marketing concepts, as internal marketing emphasizes teamwork among employees, which is an important factor in their development and maintaining successful business in them. study results also showed that the intention to stay works to reduce many negative phenomena such as the leaving work, absenteeism, and evasion from performing work, increases the level of belonging, leads to increased productivity, and reduces the cost resulting from employee absenteeism, as it creates a feeling that this bank provides, a better career path, better workers effort, plus workers usually believe that there is no discrimination in reward or distribution of other fringe benefits. The study results indicate that there is an impact of internal marketing practices on the intention to stay at work, that the process of empowering the employee and involving him in decision-making has an impact on the intention to stay at work by activating his role as a member of the decision-making process and this enhances the employee's desire to maintain his membership within the organization, When transferring responsibility and authority to the employee, transferring and inviting employees to share information and knowledge, the employee generates a kind of job stability. Because it helps with continuous communication between employees and to ensure that individuals are committed to staying for a longer period of time,

and that they have the desire to work, and internal communication works to identify employees who seek to achieve the work system goals. Administrative support also reflects the individual's sense of commitment to work, as he feels the need to continue working, and usually the bank seeks to make basic changes in the work environment to make it more comfortable for employees, and the employee remains with an internal feeling that he seriously wants to stay. The results showed that the training programs carried out by the bank have an impact on the intention to stay in the work by helping the employee, developing skills, improving abilities to perform the tasks assigned to him in a better way, helping to know and taking a lot of new information, and providing him with serious methods for better performance, this generates his ability to perform the duties assigned to him and thus remains attached to the organization and does not want to leave.

8 Recommendations

Based on the results, the study recommends that managers and decision-makers in commercial banks in Jordan invite employees in banks to share the information and knowledge provided by banks through the database and take the necessary decisions. Working on employees' systematic development knowledge, skills and attitudes required by the management of the study sample; In order to qualify them for the work, and in order to raise their production capabilities, or to work on providing them with the necessary skills that appear due to environmental and technical changes that require new skills. The study also recommends giving great attention to the internal communication of the study sample, which can lead to increased employee dedication, exchange and sharing of knowledge and skill, improve overall performance, and communication with the aim of providing a greater information understanding. And working to arouse employee's desire and intent with complete determination without any feelings of doubt to remain within the banks, which generates the desire to stay at work, a positive and comfortable feeling that the employee has towards a particular job or a certain environment.

developed and distributed to (440) clients of insurance companies affiliated with the Jordanian Federation of Insurance Companies, which numbered (22) companies in Jordan. The study reached several results, the most important of which are: There is an impact of e-marketing on customer satisfaction, and the study concluded a number of recommendations, including: A focus on their website to be designed in an easy-to-use way and to provide all the required information about the company that pertain to the customer and the requirements of his transactions, leading to its progression more and more instead of regressing.

Keywords E-marketing · Customer satisfaction · Insurance companies · Jordan

1 Introduction

This era is witnessing a lot of developments in many fields; Perhaps the most important of them is technological development, as this development has led to differences in human needs on the one hand, and the growth of companies and their business management on the other hand, in addition to their reliance on electronic marketing, which has become widely used instead of traditional methods of marketing, which provides many services to customers and companies on both (Al-Hawary & Mohammad, 2011; Al-Hawary & Obiadat, 2021; Al-Hawary et al., 2011a, 2011b).

The insurance sector is one of the sectors concerned with customer satisfaction and loyalty; hence, it is necessary to use the best methods to reach them and provide the best services, especially insurance companies in Jordan, as they have tended to adopt electronic marketing to keep pace with the development of customers' needs and meet their desires in a more effective manner (Aburayya et al., 2020; Al-Dmour et al., 2021; Alshurideh, 2022; Alshurideh et al., 2012; Alzoubi et al., 2022; Kurdi et al., 2020). Insurance companies are concerned with the rights, duties, penalties and transactions of individuals. Individuals prefer to resort to insurance companies out of a sense of safety from any expected or actual damage; As a result of vehicle accidents, fire, theft, and others, which are circumstances beyond their control, insurance comes with the least losses to the customer. The insurance also preserves the relations between members of society from conflicts and disagreements as much as possible.

Insurance companies seek to know the extent of customer satisfaction with their services provided to him, especially with the increase in competition, so they try to adopt everything new to improve customer satisfaction (Allozi et al., 2022; Alzoubi et al., 2020; Sultan et al., 2021). E-marketing may play an important role in gaining customer satisfaction, which is one of the important indicators of the success of that organization and enhancing its market share (Al-Khayyal et al., 2021; Alshurideh, 2019; Alshurideh et al., 2021). Through the review of the previous studies, it became

e-mail: barween@hu.edu.jo

clear that there is a dearth of studies that dealt with the issue of the impact of electronic marketing on achieving customer satisfaction in the insurance sector in developing countries, including Jordan. The study also attempts to verify the extent to which electronic marketing is employed in the insurance sector in Jordan, and to reach customer satisfaction in order to meet their needs and satisfy their desires in conducting their transactions and the procedures followed. It will also help decision makers in the insurance sector to take the best means and channels used in e-marketing. Therefore, this study attempts to study the impact of electronic marketing on customer satisfaction for insurance companies in Jordan.

2 Theoretical Framework and Hypothesis Building

2.1 Electronic Marketing

Electronic marketing has the largest share in the field of marketing compared to traditional marketing, and with the passage of time and the communications revolution and the tremendous development in technology, electronic marketing has become of great importance in the business sectors as a whole, and it is the cornerstone in order to increase its market share (Al-Hawary & Alhajri, 2020; Al-Hawary & Hussien, 2017; AlHamad et al., 2022). E-marketing is the latest way to promote goods and services, and companies have to find a direction in order to follow up on the buyer's requirements and know their opinions (Alwan & Alshurideh, 2022; Tariq et al., 2022a, 2022b). However, this creates competitive capabilities for them, enabling them to achieve a competitive advantage that would increase their market share and thus provide the best products of goods and services at competitive prices and fast services, and quality (Al Kurdi & Alshurideh, 2021; Al-Hawary et al., 2011a, 2011b; Aljumah et al., 2021).

There are many concepts of e-marketing by different researchers, this is due to the multiplicity of electronic technologies that can be used in building electronic marketing and the methods and forms that it may take, but they are similar in their content. Electronic marketing has been defined as: the use of a market without being governed by local or temporal behaviors, so that the Internet is used as a platform for institutions to adapt to the needs of customer while minimizing costs (Al-Hawary & Al-Menhaly, 2016; Al-Hawary & Al-Smeran, 2017; Watson et al., 2002). Tawfiq and Omar (2020), see it as a technology of change because it witnessed transformations in the philosophy and applications of marketing, as it is an activity that uses media technology, especially the Internet, to market products of goods and services without direct contact. Accordingly, e-marketing can be considered as a group of activities managed through electronic tools and technologies provided by the Internet at a low cost, less effort and a shorter time than in traditional marketing, with the aim

of achieving common interests between organizations and individuals within well-studied strategies to reach the desired goals and required visions (Al-Hawary et al., 2013; Al-Nady et al., 2016; Alshurideh et al., 2016).

The importance of e-marketing lies in the fact that it is a double relationship between the seller and the buyer, as e-marketing addresses many of the problems of traditional marketing, especially with regard to crowded markets and the remoteness of the site. It has become possible to access goods and services without having to leave the house, with the opportunity to get to know what the customer wants before buying and what is being traded in the market for goods and services on the one hand, On the other hand, organizations and stores work to deliver products of goods and services to the consumer wherever he is through networks of advanced delivery systems and through systems supporting e-marketing, and e-marketing helps to support any new product or commodity in its various stages, e-marketing is one of the electronic works within a group of the businesses that constitute an integrated approach, such as production, finance, human resources, research and development, and information technology, which led to the establishment of the so-called electronic economy (Al-Hawary & Abu-Laimon, 2013; Al-Lozi et al., 2017, 2018; Alkalha et al., 2012; Alshurideh et al., 2022; Shamout et al., 2022).

One of the main goals of organizations is to reach customers in easy ways, communicate with them and know their needs and desires constantly, and provide them with the best products and services. This is not done in electronic marketing except through tools that provide many advantages; Such as low cost, and reduces the time to complete operations (Al-Hawary, 2013, 2015; Al-Hawary & Al-Syasneh, 2020; Al-Hawary & Alwan, 2016). Therefore, organizations resort to taking benefit of the advantages of electronic marketing tools and its role in developing the relationship with customers, communicating with them and maintaining them in the long term, by achieving value for them. This study also shows the most important of these tools as follows:

E-mail: E-mail is one of the tools that has kept pace with change well. E-mail marketing has become one of the largest platforms for successfully and profitably marketing products and services. One of the most important companies that use e-commerce to increase purchases of their products is Amazon (Al-Masaeed, 2021).

Website design: The first step that organizations which rely on the Internet is to design a website, with amazing technical methods and characteristics; So that it is a site that displays the strengths of the organization in its products and services, and the way of displaying the information in easy way to access for customers, companies offer through the site many benefits to customers such as pricing and means of payment, so organizations must ensure that it is of real benefit and not just a site that carries only name only.

Social networks: It is a set of Internet-based applications that rely on the ideological and technological foundations of the Web, which allow the creation and exchange of content as an important form of new media, social media has been dedicated to social interactions as well (Alshurideh et al., 2019; Khasawneh et al., 2021a, 2021b; Kurdi et al., 2021 Shen & Bissell, 2013).

Mobile applications: Mobile applications are meant as different mobile platforms running different operating systems in smart mobile devices, multimedia and communication functions as well as access to phones that support those systems (Sansour, 2016). Applications were the way to conduct the necessary transactions and procedures in insurance companies, especially during the period of the Corona pandemic, as the Jordanian Insurance Federation launched several programs, including "Safe in Your Car" and it was a program that prevents customers from mixing and crowding during the pandemic (JIF, 2021).

Internet advertisements: These advertisements are interactive between what the organization offers and customer reactions, with the least effort, cost and time period (Draz and Muslim, 2015). The interest in e-marketing has started in recent years remarkably, especially during the Corona pandemic, as insurance companies affiliated with the Jordan Insurance Federation adopted many tools to market their services electronically, as they launched the (Safe in Your Car) program, which was announced on their website and Facebook page. This program made the task easier for customers, protecting them from Corona at this time, so e-marketing was more successful in reaching the largest segment of customers and clarifying the program for all of them at the same time.

2.2 Customers' Satisfaction

Customer satisfaction is known through his reaction to the product. In marketing, customer satisfaction is the difference between the quality level of the product and his expectations. The organization must give it priority, since the customer and his satisfaction have a positive impact on profit and non-profit organizations, focusing on that, which was Satisfied the customer in the past, does not satisfy him today; This is due to the fluctuations of the market and its change, and the change of customers by what affects those around them (AlTaweel & Al-Hawary, 2021). Companies that follow electronic marketing in their transactions through Internet advertisements via websites must be characterized by credibility in the content of the advertisement first, and then complete an approach that suits the customer by providing information and supplying them with it to discover the characteristics of the product, whatever it is a good or service. Advertisement on unconventional rigid texts creates a type of entertainment that contributes to attracting the consumer, all of which is sufficient to gain customer satisfaction, and increases his purchase intention (Al-Hawary et al., 2011a, 2011b; Google, 2015; Shishan et al., 2022).

2.3 Electronic Marketing and Customer Satisfaction

The researchers dealt with the relationship between e-marketing and customer satisfaction in important economic, service and industrial sectors, where Mahmood &

Mahmood (2021) found a positive impact of e-marketing dimensions in achieving customer satisfaction of the Iraqi Oil Distribution Company. As confirmed by Bizhanova et al. (2019) On the impact of electronic marketing on entrepreneurship, the researcher also found that the increasing digitization leads to serious problems for executives in the field of marketing, as they face growing, complex and rapidly changing markets that are out of their control, as a result, companies have realized these changes and how to deal with them, as Electronic marketing is used for the regular review, analysis, interpretation and promotion process**,** It helps create strong consumer and brand relationships through search engine optimization, promotion, email, mailing list, contextual advertising and advertising in social networks, all of which increase sales while facilitating the purchase of goods and services. The findings of the Nakra and Pandey study (2019) underscore the importance of assisting hospital administration, governments, and other organizations in formulating appropriate policy for the use of smartphones by healthcare professionals. To find out the impact of social media marketing activities, Khan (2019) conducted a study that confirmed that social media marketing activities significantly affect brand loyalty, purchase intentions, value awareness and brand awareness. Salehi (2018) also examined the impact of smartphone use on health care, and the investigation of the applicability of routine clinical smartphones, and it was found that (85%) of the participants, their smartphones contribute to improving the quality of health care communications and help clinicians to prioritize tasks among them. Al-Sharif and Nassraldeen (2017) explored the influence of branding on the relationship between social media marketing on customer satisfaction and emphasized the importance of social media dimensions on customer satisfaction. The study of Bekar (2016) in Turkey also added an emphasis on the impact of brand social media marketing on the intent to purchase fashion and emphasized the need for social media to convince customers of product excellence and thus influence their purchase intent. Based on the above, the study hypothesis can be formulated as follows:

There is a statistically significant effect of e-marketing on the satisfaction of insurance companies' customers in Jordan.

3 Study Model

See Fig. 1.

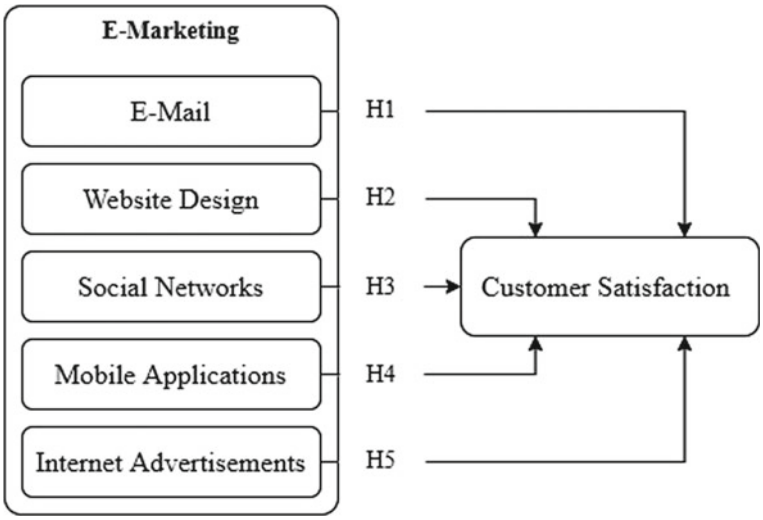

Fig. 1 Research model

4 Methodology

4.1 Population and Sample Selection

A qualitative method based on a questionnaire was used in this study for data collection and sample selection. The major aim of the study was to examine the impact of e-marketing on customer satisfaction. Therefore, it focused on Jordan-based companies operating in the insurance sector. Data were primarily gathered through self-reported questionnaires created by Google Forms which were distributed to a non-probability sample of companies' customers via email. In total, (463) responses were received including (23) invalid to statistical analysis due to uncompleted or inaccurate. Hence, the final sample contained (440) responses suitable to analysis requirements that were formed a response rate of (95%), where it proved to be sufficient to the extent that was predictable and allowed for a presumption of data saturation (Sekaran & Bougie, 2016a, 2016b).

4.2 Measurement Instrument

A self-reported questionnaire that consists of two main sections along with a section regarding control variables was used as the measurement instrument. Control variables considered as categorical measures were composed of gender, age group, educational level, and experience. The two main sections were dealt with a five-point Likert

scale (from 1 = strongly disagree to 5 = strongly agree). The first section contained (20) items to measure e-marketing based on (Gazi, 2020; Qtaishat, 2022). These questions were distributed into dimensions as follows: four items dedicated for measuring e-mail, four items dedicated for measuring website design, four items dedicated for measuring social networks, four items dedicated for measuring mobile applications, and four items dedicated for measuring internet advertisement. Whereas the second section included seven items developed to measure customer satisfaction according to what was pointed by (Al-Hawary & Harahsheh, 2014; Al-Hawary et al., 2017; Alolayyan et al., 2018; Alshurideh et al., 2017; Fan et al., 2021; Slack et al., 2020).

5 Findings

5.1 Measurement Model Evaluation

This study was conducted structural equation modeling (SEM) to test hypotheses, which represents a contemporary statistical technique for testing and estimating the relationship between factors and variables (Al-Adamat et al., 2020; Al-Gasawneh and Al-Adamat, 2020; Wang & Rhemtulla, 2021). Accordingly, the reliability and validity of the constructs were tested using confirmatory factor analysis (CFA) through the statistical program AMOSv24. Table 1 summarizes the results of convergent and discriminant validity, as well the indicators of reliability.

Table 1 shows that the standard loading values for the individual items were within the domain (0.674–0.873), these values greater than the minimum retention of the elements based on their standard loads (Al-Lozi et al., 2018; Sung et al., 2019). Average variance extracted (AVE) is a summary indicator of the convergent validity of constructs that must be above 0.50 (Howard, 2018). The results indicate that the AVE values were greater than 0.50 for all constructs, thus the used measurement model has an appropriate convergent validity. Rimkeviciene et al. (2017) suggested the comparison approach as a way to deal with discriminant validity assessment in covariance-based SEM. This approach is based on comparing the values of maximum shared variance (MSV) with the values of AVE, as well as comparing the values of square root of AVE ($\sqrt{}$AVE) with the correlation between the rest of the structures. The results show that the values of MSV were smaller than the values of AVE, and that the values of $\sqrt{}$AVE were higher than the correlation values among the rest of the constructs. Therefore, the measurement model used is characterized by discriminative validity. The internal consistency measured through Cronbach's Alpha coefficient (α) and compound reliability by McDonald's Omega coefficient (ω) was conducted as indicators to evaluate measurement model. The results listed in Table 1 demonstrated that both values of Cronbach's Alpha coefficient and McDonald's Omega coefficient were greater than 0.70, which is the lowest limit for judging on measurement reliability (De Leeuw et al., 2019).

5.2 Structural Model

The structural model illustrated no multicollinearity issue among predictor constructs because variance inflation factor (VIF) values are below the threshold of 5, as shown in Table 1 (Hair et al., 2017). This result is supported by the values of model fit indices shown in Fig. 1.

The results in Fig. 2 indicated that the chi-square to degrees of freedom (CMIN/DF) was 2.466, which is less than 3 the upper limit of this indicator. The values of the goodness of fit index (GFI), the comparative fit index (CFI), and the Tucker-Lewis index (TLI) were upper than the minimum accepted threshold of 0.90. Moreover, the result of root mean square error of approximation (RMSEA) indicated to value 0.051, this value is a reasonable error of approximation because it is less than the higher limit of 0.08. Consequently, the structural model used in this study was recognized as a fit model for predicting the DEP and generalization of its result (Ahmad et al., 2016; Shi et al., 2019). To verify the results of testing the study hypotheses, structural equation modeling (SEM) was used, the results of which are listed in Table 2.

The results demonstrated in Table 2 show that all e-marketing dimensions had a positive impact relationship on customer satisfaction except website design ($\beta = -0.029, t = -0.0568, p = 0.571$). On another hand, the results indicated that the highest

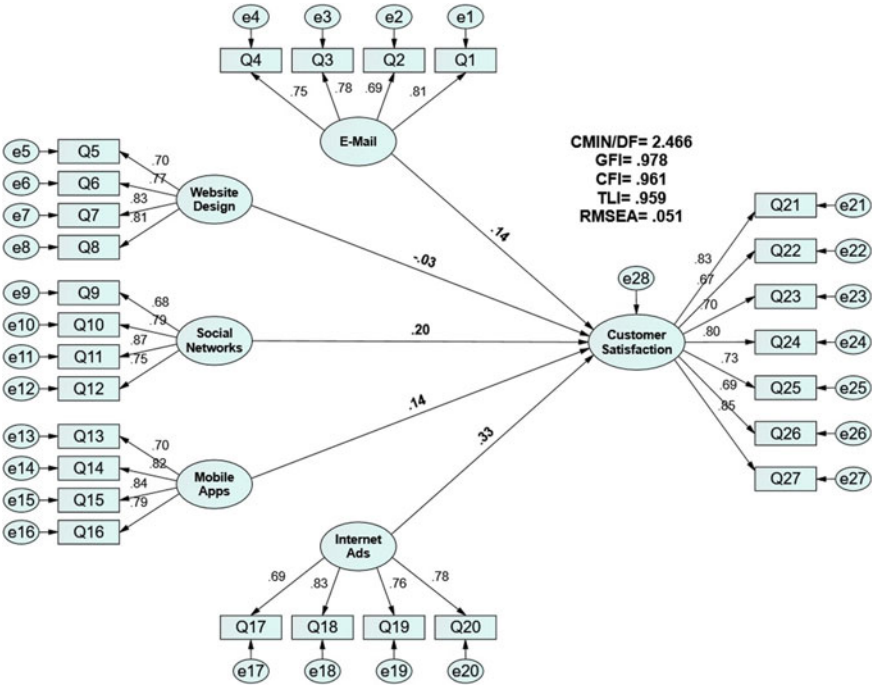

Fig. 2 SEM results of the e-marketing effect on customer satisfaction

Table 2 Hypothesis testing

Hypothesis	Relation	Standard beta	*t* value	*p* value
H1	e-mail → customer satisfaction	0.143	2.880	0.004
H2	website design → customer satisfaction	−0.029	−0.568	0.571
H3	social networks → customer satisfaction	0.203	3.826	0.000
H4	mobile applications → customer satisfaction	0.141	2.602	0.010
H5	internet advertisements → customer satisfaction	0.332	6.373	0.000

Note * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

impact was for internet advertisements ($\beta = 0.332$, $t = 6.373$, $p = 0.000$), followed by social networks ($\beta = 0.203$, $t = 3.826$, $p = 0.000$), then e-mail ($\beta = 0.143$, $t = 2.880$, $p = 0.004$), and finally the lowest impact was for mobile applications ($\beta = 0.141$, $t = 2.602$, $p = 0.010$). Thus, most the minor hypotheses of the study were supported based on these results.

6 Discussion

The results of the analysis revealed that there is an impact of electronic marketing on customer satisfaction of the insurance companies in Jordan, and this result may be due to the fact that electronic marketing help insurance companies to manage their marketing programs and ways of presenting their advertisements to customers to display their services in line with customers' needs and desires and to deal with them easily. And this is what most companies aspire to marketing their products through the Internet, which is now occupying the world with its electronic services, more than traditional marketing. It was also found that there is an impact of e-mail on customer satisfaction of insurance companies in Jordan. The results of the analysis indicated that e-mail is a safe tool for collecting information related to insurance company customer, who preserves the privacy of customers compared to other marketing tools, and e-mail allows more interaction between the insurance company and its customer with recent electronic publications quickly**.** It was also found that there is no statistically significant effect of website design on customer satisfaction of the insurance companies in Jordan. This result is due to the fact that the website is designed in a somewhat complex manner and is not easy to use by customers, and this makes insurance companies reconsider their website and design method; In order to make it serve customers better, and perform the goal for which it was designed more, the site must be easier and more attractive to customers, and this result agrees with the study of Al-Sabbagh.

The results of the study showed that there is an impact of social networks on customer satisfaction of the insurance companies in Jordan, and this result may be due to the fact that social networks are characterized by always sticking to customers; Therefore, insurance companies have found that these networks are an excellent platform to reach customers easily to market their services and manage their dealings with customers, and insurance companies publish on social networks as a media about their activities and events for their customers, and this result is consistent with Al-Sharif and Nassraldeen (2017). The results of the data analysis added that there is an impact of mobile applications on the satisfaction of insurance companies' customers in Jordan, and this result is due to the fact that the use of mobile applications saves time and effort, especially if they are effectively managed as insurance companies do, as they rely on social networks as a marketing tool to market its services to customers, and this is what the customer prefers, especially if those applications are easy to use, and this result agrees with Salehi (2018) and Nakra and Pandey (2019). The results of the study add that there is an impact of Internet advertisements on customer satisfaction of the insurance companies in Jordan, and this result may be due to the fact that Internet advertisements via social networks help in choosing the appropriate service for customers to conduct insurance in the appropriate manner, and whenever the advertisement online is continuously updated and in a timely manner, whenever it is a tool that targets the desired customers, and directs their behavior towards the concerned institution well, and the result agrees with Al-Sharif and Nassraldeen (2017).

7 Recommendations

In light of the findings of the study, the study recommends that insurance companies need to constantly develop their tools used in electronic marketing, keep pace with contemporary updates for each of them, and link all insurance companies affiliated with the Jordanian Federation on one website, with a focus on being designed in an easy-to-use way and providing all information Required about the companies that pertain to the customer and the requirements of his transactions, the study also recommends employing mobile applications to send notifications of its activities to customers constantly and at the appropriate times in order to achieve the desired goal, and not be satisfied with the programs used, but rather convert them into applications used through smart phones. Finally, insurance companies should intensify their advertisements on various social media sites, promote them to reach the largest segment of customers, and work to intensify control on the insurance companies' website, to check the information presented about the insurance company and the service provided, and to ensure that it matches reality.

Share Your Beautiful Journey: Investigating User Generated Content (UGC) and Webrooming Among Malaysian Online Shoppers

Wan Nadiah Mohd Nadzri, Azreen Jihan Che Hashim, Muhammad Majid, Nur Aina Abdul Jalil, Haitham M. Alzoubi, and Muhammad T. Alshurideh

Abstract The electric commerce (e-commerce) platform in Malaysia has been growing exponentially since the spread of Coronavirus Disease 2019 (COVID-19) pandemic. Many local businesses were badly affected when the first phase of Movement Control Order (MCO) was implemented for several weeks. The increasing number of social media platform users stems from wide internet accessibility and smartphone ownership. As such, this study investigated online purchasing behaviour in Malaysia by linking webrooming and user generated content (UGC) with brand experience and brand engagement. Essentially, this study unravelled consumer purchasing behaviour during the COVID-19 pandemic. This study explored the effects of UGC and webrooming on brand experience and brand engagement among

Malaysian online consumers who purchased beauty product. As a result, UGC and webrooming displayed positive correlation with brand experience. However, brand experience was insignificant for brand engagement. Additionally, brand experience was unsuitable to function as a mediator. Thus, the impact of social influencers and shoppertainment on brand engagement should be assessed. Future studies may look into webrooming from the light of Stimulus-Organism-Response (SOR) Theory. Lastly, fake reviews, fake accounts, and bots that influence online purchasing behaviour among Malaysians should be investigated as well.

Keywords E-commerce · Online shopping · User generated content · Webrooming · Brand experience · Brand engagement

1 Introduction

With higher digital service awareness and easier access to internet connectivity, online shopping becomes a norm and disregards the traditional brick-and-mortar retail outlets that demands engagement with customers. Customers have taken a liking and have been adapting rapidly the online shopping model due to its ease of use, flexibility, controllable, and reference to rich information prior to making a decision to purchase tangible or intangible service or goods. Online shopping has been progressing since the past two decades, while simultaneously improving automated processing, ordering system, and integrated logistics companies that offer customers seamless purchase experience at a minimum cost.

The Malaysian government is a supporting pillar that drives the growth of electric commerce (e-commerce) business, whereby customers have been actively purchasing online for various products and services over the years. The Malaysian Department of Statistics reported higher adoption rate of e-commerce in 2019 than the previous years with double-digit growth. As stated in the Usage of Information and Communication Technology (ICT) in 2020 report, higher percentages of business-to-business (B2B) rates were recorded at 13, 53, and 22.6% from 2017 to 2019 (Department of Statistics Malaysia, 2021). This was due to the surge in ICT consumption and availability of internet access, which encouraged the growth of e-commerce amidst local and global players. A statistical study conducted by Hootsuite in 2019 identified some top-rated products purchased online, including fashion and beauty items, electronics, and sports-related products. The growing preference to shop online was motivated by consumers' perception that vast information is available, which aids or facilitates the decision-making process.

The COVID-19 pandemic has immensely affected everyone worldwide, particularly the retail industry ecosystem. A study forecasted the closure of 20,000 high street retail outlets in the UK due to the COVID-19 lockdown. During the troubled period of COVID-19 pandemic from 2020 to 2021, consumer behaviour was driven more towards e-commerce or online purchase, thus exerting drastic changes to and impacts on businesses across the globe. Businesses with e-commerce facility may

reap benefits, while those without any online facility are bound to suffer from loss unless they urgently adapt to change. With higher online shopping adaption, more Malaysians have begun adopting the spending habit during the lockdown period. The surge in Malaysian online spending is due to work at home and more consumption of time online with better internet accessibility.

The Malaysian government has extensively facilitated local businesses to venture into e-commerce. Interestingly, many local businesses are positively forced to change their nature of selling into e-commerce and social media. A recent study showed that 76% of Malaysians paid additional 5% premium on the product for value, convenience, and benefits. Online shopping helps them to purchase products without the hassle of going out and getting infected by COVID-19. Therefore, it is imminent to investigate the factors that influence Malaysian consumers to purchase online and to understand how consumers engaged with the community via social media platform.

2 Study Importance and Objectives

The e-commerce platform in Malaysia has grown rapidly due to the COVID-19 pandemic. In the beginning, the local businesses had problems in their operation during the first phase of Movement Control Order (MCO) implemented for several weeks. Such scenario had forced the local businesses to invest in e-commerce, thus driving consumers to purchase online. Statista in 2021 reported that the most clicked e-commerce platform in Malaysia 2020 was Shopee, followed by Lazada, PG Mall, Zalora, eBay, GoShop, Lelong, Sephora, Wowshop, and Applecrumby. Furthermore, 91% of Malaysians appeared to be avid users of the internet with high rate of smartphone consumption. The e-commerce platform is favourable among Gen Y and Gen Z (Muda et al., 2016) mainly because online purchase has become easier, faster, and more transparent. These younger generations are adopting shopping as a lifestyle and as an escapism mechanism from their daily routine. They would spend longer time and money to shop online. Besides, Malaysians working at home are expected to spend more as stated by Pricewaterhouse Coopers (PWC) in 2021. A survey by Rakuten Insight in 2020 reported that Malaysia imported beauty and skincare products from France ($67.6 million), followed by the US and South Korea. Hence, it is crucial to decipher the behaviour of Malaysian consumers who purchase beauty products via online platform.

The social media has grown into a platform to gather information about goods and services (Department of Statistics Malaysia, 2021). Internet consumption has changed as more consumers are spending more time using video, messaging applications, and social media platform. This paradigm shift has continued to increase as more Malaysians practice social distancing stated by PWC in 2020 and work from home. More people are exploring the social media due to the COVID-19 pandemic. Malaysians use social media to conduct product research based on reviews, feedback, and comments as stated by Malaysian Communication and Multimedia Commission (MCMC) in 2020 Mostly, individuals use the social media to interact, engage, and

share brand experiences about a particular product. At present, people are getting more creative in developing their own contents and sharing them widely on the social media platform. The increasing number of users using the social media platform is a result of better internet accessibility and smartphone ownership (Arif et al., 2020). Therefore, more people rely on user generated content (UGC) as reference before purchasing as they feel that the information shared on social media is trustworthy and credible. They believe more in the experience of other consumers, instead of the e-commerce platform due to lack of trust, security, and confidence. As suggested by Herrero et al. (2015), more studies should assess the synergy between credibility of a source and worthiness of information on consumer behaviour. Additionally, it is important to decipher the videos and contents generated by users that influence purchasing decision.

In reference to consumer research online prior to purchase, webrooming has an important role in the decision-making process. About 70% of consumers worldwide had conducted product research online before purchasing as stated by PWC in 2015. With the expansion of smartphones and internet, webrooming is becoming favourable among consumers. While many consumers visit the e-commerce platform (e.g., websites & social media) prior to purchase decision making, studies on this research area are in scarcity (Arora & Sahney, 2019; Flavián et al., 2016). Hence, it is crucial to investigate the importance of UGC and webrooming variables in the context of purchasing online beauty products by Malaysians.

This study assessed the online purchasing behaviour in the context of Malaysians by linking webrooming and UGC with brand experience and brand engagement during this COVID-19 pandemic. The objectives of this study are listed in the following:

1. To investigate factors that influence brand experience that lead to brand engagement through SOR Theory
2. To analyse the mediating effect of brand experience and brand engagement
3. To explore the direct relationship between user generated content (UGC) and brand engagement
4. To examine the direct effect between webrooming and brand engagement.

3 Literature Review

3.1 SOR Theory and Brand Experience

Brand experience refers to one's experience interacting with a product or service through brand-related stimuli that evokes emotions, such as pleasure, arousal, dominance, and intelligence. In return, such emotions alleviate the brand value. Notably, brand experiences are "sensations, feelings, cognitions, and behavioural responses evoked by brand-related stimuli that are part of a brand's design and identity, packaging, communications, and environments" (Brakus et al., 2009).

The SOR Theory introduced by Mehrabian and Russell (1974) enables the investigation of cognitive and effective impacts on consumer behaviour. The underlying dimensions of SOR are stimuli, organism, and response. Stimuli denote the external factors that stimulate one's evaluation. Organism reflects the internal emotions derived from environment stimuli. Response is the final consequence if one should approach or avoid certain behaviour. Turning to this present study, the SOR Theory was deployed in the Malaysian online shopping scenario due to the limited studies in doing so.

The fundamental of the SOR Theory is to identify consumer emotions that influence consumer response (Ha & Lennon, 2010) such as purchase intention (Giovanis et al., 2014). Consumers who experience positive emotional state have the tendency or willingness to purchase**.** However, more researchers need to investigate the environmental cues that may influence brand experience quality, especially in e-commerce landscape. With the context of experience, it is essential to measure the emotional scale in response to environmental stimuli. Based on the literature gaps, more studies are required to examine environmental cues that evoke brand experience quality. Therefore, this study assessed the effect of environmental stimuli (UGC and webrooming) on brand experience using the SOR Theory. In reference to this present study, brand experience reflects a customer's experience influenced by virtual experience, which in turn, affects their online engagement towards online communities, such as Facebook and Instagram. Brand experience elements have three basic dimensions of emotions, namely pleasure, dominance, and arousal, in responses to environmental stimuli (Mehrabian & Russell, 1974). It is crucial to decipher the effect of webrooming and UGC on brand experience towards brand engagement.

3.2 Webrooming

Webrooming is a process of product information seeking behaviour by consumers via online channels, continued by verification of information, and finally, the actual purchase at physical stores (Aw et al., 2021). Webrooming denotes consumers gathering information about a product from online platform, but the real purchase happens in a physical store (Pimentel et al., 2019).

Many studies have assessed the role of webrooming and other factors in strengthening certain behaviour (Herrero-Crespo et al., 2021). The four drivers linked with webrooming are psychographic, shopping motivation, channel-related, and product-related variables (Kleinlercher et al., 2020). The literature depicts a broad range of reasons on why consumers webroom. Webrooming helps consumers minimise the risks of buying products online (Chiu et al., 2011).

Consumers webroom to gain information from the online platform by reading online reviews in order to make clearer and better choices. This decrease worries that one would feel in process of online purchase (Flavián et al., 2016). Webroom boosts selection trust and confidence towards purchasing products from physical stores as a result of gathering product-knowledge via reviews accessible online. Some

Licensed to (putm@utm.my)

consumers webroom to limit their selection before purchasing products from physical stores (Wolny & Charoensuksai, 2014). The webrooming behaviour is conceptualised only lately (Arora & Sahney, 2019; Aw, 2020) and the academic research on this concept is still in its infancy stage.

Flavián et al. (2019) emphasised on the importance of expanding approaches to enhance consumer confidence especially when it comes to purchase process. Studies have highlighted those marketers should seek to improve consumers' participation and engagements towards brand, product, and proses situation. The proses situation is associated with emotional attachment to the representational meaning of purchase (Balasubramanian et al., 2005) that leads to consumer confidence in purchase selection. Based on data retrieved from 302 customers in Hong Kong, (Cheung et al., 2020) found that ongoing information search behaviour by consumers is the key driver of brand engagement. They verified the role of enduring involvement to improve continuous search behaviour and brand engagement. Consumer brand engagement and the importance of customer involvement is based on the argument that consumers are more likely to be engaged, to expend more cognitive effort, and to participate more resources in ongoing information search about their product selection.

According to Flavián et al. (2016), consumers webroom to acquire information online, while the contrary was reported by Phan et al. The latter found that information readiness was insignificant for brand engagement. Consumers actively participate in multiple brand-related activities to satisfy their individual needs. Consumers' utilitarian benefits are related to information availability. According to Chahal and Rani (2017), customers are engaged with a brand more likely to satisfy their demands. Rohm et al. (2013) stated that product information expands customers' connection, such as social media and engagement with brands (brand engagement).

According to Aw (2020), Shankar and Jain (2021), studies on webrooming behaviour trend is in its initial stages. Thus, this present study assessed the links among webrooming, UGC, brand experience, and brand engagement in the Malaysian online shopping context.

3.3 User Generated Content (UGC)

Social media platform, such as Facebook, Instagram, and Snapchat, offer an outlet for companies to expand their successful brands. The UGC has gained popularity among online users as companies recognise the importance of UGC to engage with costumers. This development has urged many studies to reveal the more significant relevance of digital platform (e.g., Instagram & Facebook) when compared to conventional marketing (Oliveira & Casais, 2019). The present trend shows that consumers spend more time on UGC and create contents, such as videos, reviews, and attractive images, to be shared online, as well as gain more followers and popularity. Some online consumers explore the social media platform to become social media influencers.

As marketers acknowledge the importance of UGC in social media, they provide limitless opportunity for social media users to share videos, post photos, and leave comments about their experiences consuming a particular product (Raji Ridwan et al., 2017). Interestingly, the e-commerce platform offers UGC features, such as review, rate, and comment sections, for users to share their brand experience. This valuable tool influences consumers in future purchasing decisions as they gather content at the platform. Lazada Malaysia, for instance, provides these features that allow consumers to share UGC with the community. This helps the e-commerce platform to gain confidence from consumers, which in turn, generates higher sales.

The advent of social media has changed the dynamics of disseminating information. The UGC was designed as a new type of brand communication for companies. In order to maintain the UGC (content) quality, marketers constantly monitor their content from malicious comments and negative content by unanimous users (Kim et al., 2012). The UGC platform serves as a marketing tool managed by influencers or marketing team. Marketers and influencers use their social media platform to target a specific target market, such as Tiktok among Gen Z and Gen Alpha. Thus, it is imminent to investigate the behaviour of young generations towards UGC usage as their avenue. Essentially, it is timely to unravel the influence of UGC on brand experience and brand engagement among young savvy Malaysians who indulged in online purchasing activities.

3.4 Brand Engagement

A brand is no longer what customers are told, but it is what the customers are telling themselves. The use of a combination of social media for marketing has never been more important than the present time. Generally, branding consists of several perception concepts, namely perceived knowledge and attitude, where assessment of consumers' perceptions is integral for they shape their brand attitudes (Hollebeek, 2011). Consumer brand experience is a critical factor for a business to succeed in the social media setting. The branding process has been the subject of a great deal of scientific debate since the past few decades (Kramoliš & Kopečková, 2013). As products and services have their lifecycles; consistent quality, credibility, and experience are vital.

Brand is a value and many businesses automatically add brand to their balance sheets due to its positive association. Creating a brand as a 'trademark' is not just applying a logo or graphic, mainly because brand blankets the overall customer experience. It is inevitable to track and talk about brand experience, as a good and strong brand does not flow from each other (Wroblowská, 2016). Brand creation is important in the online environment (Hollebeek et al., 2014) because the social media make brand more visible and available. Strategic branding work ensures customers have positive feeling towards a brand in their experience.

Past studies have established that brand leads to purchase intention (Chou et al., 2016). The famous the brand; the higher the tendency for customers to purchase

the brand due to the trust they have built towards the brand (Chou et al., 2016). As such, the brand becomes the first choice during purchase process. Brand has been extensively linked with loyalty. Loyalty has turned into the goal for each brand in the market because retaining the existing customers is easier than seeking new. According to Hollebeek (2011), customers who are loyal to a brand will influence others to try out the offer and share similar feeling and experience.

During this period of transition and adjustment to the digital economy, a new marketing approach is sought to help marketers anticipate and capitalise on disruptive technology platforms to increase brand engagement of skincare product. Does brand continue to play a critical role in engaging with customers? According to Kotler et al. (2017), globalisation breaks down the boundaries between large and small businesses. To date, new, smaller, younger, and local businesses can compete with the biggest, the oldest, and global companies with strong brand.

Instead of being highly dominating, a company is more competitive if it can connect with client and partner communities for co-creation, as well as with competitors for co-operatives. In the past, companies believed that innovation should spark from brand support, while focusing on research and market development (Kotler et al., 2017). Consequently, they realised that in-house innovation rate was insufficient to compete in a constantly changing market. Procter & Gamble (P&G), for example, found out in early 2000 when its sales of new products flattened out. Next, the company turned its R&D model into a connection-development model. This also happened to Unilever, which evolved in the same direction where innovation is now horizontal, where the market generates ideas and the companies commercialise idea. Such new internal strategy builds positive or negative brand experience, thus leading to brand engagement. This study established the much-sought links of UGC, webrooming, and brand experience with brand engagement on social media in order to identify the path to engage customers with skincare product brands.

4 Theoretical Framework

The Stimulus-Organism-Response (SOR) Theory was implemented in this study as it assessed organisational characteristics (e.g., UGC & webrooming) as stimuli and responses (e.g., brand experience & brand engagement). The SOR Theory initiated by Woodworth in 1929 incorporated stimuli (S)—response (R) characters. (Mehrabian & Russell, 1974) expanded the theory by inculcating organism (O) human cognitive and affective elements that influence the stimuli response ecosystem. Scholars, including (Musa et al., 2020; Wang et al., 2020), who adopted the SOR Theory had explored the social media setting. Nonetheless, only a handful of studies have assessed webrooming (Arora & Sahney, 2017; Flavián et al., 2016). Very few UGC studies (Arif et al., 2020; Mohammad et al., 2020) had assessed emotional and functional elements in social media during COVID-19 pandemic.

Accordingly, this study investigated the SOR Theory within the online beauty industry in the context of Malaysia. Figure 1 illustrates the conceptual framework

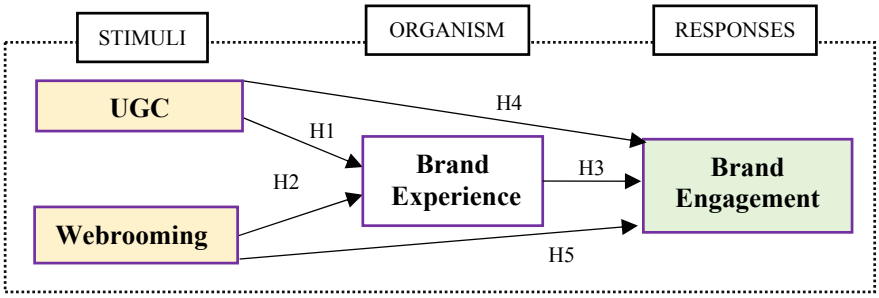

Fig. 1 Conceptual framework

adapted from Mehrabian and Russell (1974), Wan Nadiah Mohd Nadzri (2017). This present study has incorporated new variables to suit the COVID-19 pandemic context. Despite the past studies on consumer online purchase behaviour, more studies have recommended to investigate the SOR Theory within the beauty industry.

5 Formation of Hypotheses and Constructs

The growing demand for shopping online by Malaysians is driven by accessible internet, high smartphone usage, and boundless information that aid consumers to make decision prior to online purchase. Malaysians love to indulge in online purchasing as they spend longer time browsing through the vast social media platform during the pandemic. The pandemic has changed the consumers' purchase pattern as they continue to work remotely from home. Consumers have more time to conduct online research by referring to reviews, videos, and stories posted across the social media platform. Influential information can entice consumers to purchase a particular product. Thus, it is relevant to unravel elements such as UGC (H1) and webrooming (H2). A well-researched consumer will influence brand experience (H3) that leads to brand engagement. Consumers willingly share authentic recommendations to online communities (H4) in order to build brand engagement. Website browsing, such as webrooming (H5), may influence consumers to share their experiences by engaging with communities. Hence, the following hypotheses are proposed:

H1: User generated content is positively related to brand experience.
H2: Webrooming is positively related to brand experience.
H3: Brand experience is positively related to brand engagement.
H4: User generated content is positively related to brand engagement.
H5: Webrooming is positively related to brand engagement.

6 Research Methodology

This study explored the effects of UGC and webrooming on brand experience and brand engagement among Malaysian online consumers purchasing beauty products. Brand experience served as the mediator to inculcate several elements, such as pleasure and intelligence. Figure 1 shows consumer affective and cognitive characteristics in brand experience that trigger consumer brand engagement.

Since a large sample size of Malaysian online consumers was selected for this study, the non-probability sampling technique was deployed as the respondents were not given an equal opportunity to participate (Etikan & Bala, 2017). Data were collected from Malaysians experienced in using the social media platform or e-commerce to purchase beauty products. Malaysians are a technology savvy society and are highly influenced by social media, particularly online shopping (Mohd Fudzi et al., 2021). The respondents must be users of smartphone and had internet access. Hence, the purposive sampling method was employed. Due to MCO restriction and social distancing, the questionnaire was distributed via online using Google Form in English version. Although the suitable sample size for this study is 250, 276 usable questionnaires were used based on the study by Mohd Fudzi et al. (2021) that involved 267 Malaysians who purchased online.

The questionnaire has two sections: Section A emphasises on items that measure UGC, webrooming, brand experience, and brand engagement. Section B focuses on demographic information, such as gender, age, and education level. The respondents were required to rate their disagreement or agreement on a seven-point Likert scale ranging from 1 = Very strongly disagree to 7 = Very strongly agree; adopted from Mohd Nadzri (2017). The UGC was measured based on Kim et al. (2012) webrooming was obtained from Vasudevan and Arokiasamy (2021), while brand experience and brand engagement were adopted from Bansal et al. (2005). The next step was data collection and analysis using software. The outcomes are presented in the next section.

7 Research Findings

This section explains the three stages of findings derived from descriptive, measurement model, and structural model analyses. In light of descriptive analysis, most of the respondents were females (87%) at the age of 18–30 years old (74.6%). They were mostly single (78.3%) and possessed a Bachelor's Degree (55.1%). As for beauty products, the respondents mostly purchased toner, serums, and moisturisers (66.7%) via online platform. Interestingly, the respondents referred to Instagram (70.3%) to gather information prior to purchase. The details are tabulated in Table 1.

The data were analysed using IBM SPSS and Smart PLS version 3. The results showed that the data did not have multivariate normality based on Mardia's multivariate skewness ($\beta = 2.667$, $p < 0.01$) and Mardia's multivariate kurtosis ($\beta = 30.86$,

$p < 0.01$), as extracted from IBM SPSS. The results of multivariate skewness and kurtosis were assessed as prescribed by Nadzri and Musa (2017), Hair et al. (2017). The link is given in the following:

- https://webpower.psychstat.org/models/kurtosis/results.php?url=fb9771ad65087c96bdc6a313929fa338

Smart PLS is a non-parametric software analysis and is beneficial for studies that have relatively large or small sample size (Hair et al., 2011). Besides, Smart PLS is suitable for studies with limited theory available in the literature, as the case of this present study. In order to analyse the research model, two steps of analytical procedure were executed (Anderson & Gerbing, 1988). In Step 1, the measurement model was assessed to investigate convergent validity and discriminant validity. Next, Step 2 assessed the structural model that tested the formulated hypotheses. In order to identify the significance of path coefficient of each construct and its loadings, the bootstrapping method was performed with 5000 resamples as suggested by Hair et al. (2017).

7.1 Measurement Model Analysis

The measurement model was analysed for its convergent validity and discriminant validity. As depicted by Nadzri and Musa (2017), convergent validity examines average variance extracted (AVE), loadings, and composite reliability. Based on Table 2, both loadings and composite reliability exceeded 0.708 (Nadzri & Musa, 2017), except for several loadings. The items were not deleted as they affected both AVE and composite reliability of the variables. The AVE for all constructs exceeded 0.5, as prescribed by Nadzri and Musa (2017), Hair et al. (2017).

Table 3 tabulates the discriminant validity for this study based on Fornell and Larcker (1981) although several studies Henseler et al. (2016) criticised its reliability in analysing discriminant validity while prescribing the Monte Carlo simulation. Table 4 shows the HTMT values below HTMT0.85 value of 0.85 (Kline, 2011) and HTMT0.90 value of 0.90 (Ramayah et al., 2017). Thus, there was no discriminant validity issue using (Fornell & Larcker, 1981) in this present study.

7.2 Structural Model Analysis

The last step was analysing the structural model. To test the model fitness, Normed Fit Index (NFI) and Standardised Root Mean Square Residual (SRMR) were deployed. The model displayed SRMR = 0.064 that indicated good fit as the value is below 0.08 (Hair et al., 2011). The value of NFI that exceeds 0.9 represents acceptable fit.

In assessing the structural model, a bootstrapping procedure with 5000 resamples (Hair et al., 2017) was conducted to investigate R^2, beta (β), and t-value (see results

in Table 5 and Fig. 2). Table 5 presents the results of UGC ($\beta = 0.259$, $t = 3.334$, $p < 0.01$), webrooming ($\beta = 0.619$, $t = 9.220$, $p < 0.01$), and brand experience ($\beta = 0.069$, $t = 0.522$, $p > 0.01$). Referring to Table 6, brand experience was unsuitable to serve as a mediator for the following links: UGC → Brand Experience → Brand Engagement, and Webrooming → Brand Experience → Brand Engagement. However, no direct effect was noted for Hypothesis H4 (UGC → Brand Engagement), while Hypothesis H5 (Webrooming → Brand Engagement) exhibited a direct relationship.

8 Discussion and Conclusion

In reference to descriptive analysis, most of the respondents were 18–30 years old Malaysians literate in technology and social media. A similar age pattern was also reported by Arora and Sahney (2018). Generation Alpha (born 2010–2025) and Gen Z (18–25 years old) are inclined to be proficient in technology (Karasek & Hysa, 2020). Interestingly, these generations cannot function well daily without digital technology or social media platform. Despite their efficiency in researching information via online, these young generations face problem focusing on a specific activity (Grenčíková & Vojtovič, 2017). The behaviour of Gen Z and Generation Alpha promotes online shopping and e-commerce as they serve as a crucial marketing segmentation strategy.

This study assessed the impact of webrooming and UGC on brand experience towards brand engagement. It also investigated the direct relationship between UGC and webrooming towards brand engagement, as reflected in Hypotheses H4 and H5. As a result, UGC displayed a positive relationship with brand experience. Similarly, (Arif et al., 2020; Cheung et al., 2020) reported that UGC influenced emotion response towards consumers' decision-making process. Emotional responses, such as pleasure and intelligence, triggered Malaysians to share their experiences with their family and friends. However, UGC exerted a negative impact on brand engagement in this present study. This contradicts with that reported by Yasin et al. (2020), in which brand engagement positively impacted UGC. The result retrieved in this present study revealed that the customers were overwhelmed by the massive information retrieved from reviews, testimonials, tutorials, and videos. Additionally, fake news or irrelevant information that circulated across the social media platform affected the consumers' decision-making process. However, irrelevant or fake information was seldom shared due to fear of spreading unauthentic facts that may get them in hot water by the Malaysian Communications and Multimedia Commission (MCMC). The existence of fake reviews, fake accounts, bots, and fake content can adversely affect company revenue (Katona, 2018).

In this study, webrooming exhibited a positive impact on brand experience. Similarly, Aw (2020), Hollebeek et al. (2014), Shankar and Jain (2021) highlighted that webrooming behaviour can lead to purchase intention. However, only a handful of studies have assessed webrooming and brand experience. Turning to this present study, most consumers preferred gathering information directly from website as

65.9% of the respondents relied on e-commerce (official website). The advantages of researching and browsing e-commerce websites are that they have more experiential tools, such as live-chat customer service support, friendly user navigation tools, specific information on product offer, current promotions, and authentic information. When consumers face issues about a particular product or inquiry, they can chat with the customer service representative to gain prompt reply. Essentially, the product and customer service team eases the purchase decision-making process. Consumers would feel more engaged with the company website as they feel that the e-commerce platform is indeed trustworthy and credible to be shared within their circle of network.

Brand experience appeared to be unfit to function as a mediating variable in this study. Brand experience had no significant relationship with brand engagement, which contradicted to that reported by Nadzri and Musa (2017), Katona (2018). This showed that consumers relied on social media influencers with higher followers and popularity. Marketers tend to hire social media influencers to increase their company revenue (Katona, 2018). Younger generations, such as Gen Z and Generation Alpha, are more exposed to influencers with the most followers. The more the followers, the greater is the impact of a brand on consumers. Hence, consumers highly depend on influencers when compared to brand name. The digital marketing landscape that incorporates social media influencers has higher impact on brand image, in comparison to brand experience.

9 Theoretical and Practical Implications

The framework for this study was adopted and adapted from SOR Theory and brand experience. Since brand experience had no significant effect as a mediator, it did not have an important role in the society. However, social media influencers have the power to increase brand awareness and conversion rate (Keller & Fay, 2016). Most studies have acknowledged the importance of social media influencers to have a greater impact as they are followed by millions of followers. Marketers have begun showering social media influencers with product endorsements so that the latter can create product content and post the content in the social media platform. Besides, consumers' preference has changed as they rely more on the experiences of influential people as their guide in purchase decision-making process.

Apart from theoretical contributions, this study unravels the importance of webrooming towards consumer experience and engagement. This suggests that marketers should focus on the timeliness aspect, while keeping their website content current. Transparency and credibility enhance both user experience and brand engagement among consumers. The quality of e-commerce platform can be enhanced by displaying quality seal badge, friendly user navigation tool, as well as display review quantity and quality. It is crucial to invest in Google Page rank that measures the quality and the quantity of the website content. Marketers can enhance brand engagement for online consumers by developing a mobile friendly user navigation tool as many consumers prefer web-browsing using their smartphones. Eye

catching images, interactive polls, and rich content enable better accessibility with smartphone.

Marketers should also invest in stimulating the senses of consumers to elevate consumer brand experience. The colour of the website layout, interactive videos (GIF or flash videos), and readable font sizes help to evoke the sight senses. Marketers should monitor the information circulating across the social media platform to avoid fake news that might tarnish the brand image of the company. Leveraging quality content and authentic information via social media platform or websites may aid companies to increase their growth and help consumers to feel confident when purchasing online.

10 Limitations and Future Research

Moving forward, future studies should investigate the effect of social influencers and shoppertainment upon brand engagement. The shoppertainment phenomenon draws more consumers as it is fun and addictively engaging with consumers via e-commerce platform or social media. The e-commerce platform, such as Lazada and Shoppee, has invested a lot in their live-streaming channel, thus shaping the future of shopping globally. With the expansion of online shopping, assessing the purchasing behavioural of Generation Alpha and their shopping motivation is imminent. This is relevant as the younger generations embrace social media and digital technology more than the older generations.

Future studies should also evaluate webrooming that inculcates the SOR Theory. It will be interesting to improve the webrooming construct by studying the credibility of online reviews and interactive navigation tools. This can help companies to improve their websites in portraying a reputable image to the consumers. A longitudinal study on this topic would be interesting as it will look into diversified demographic and geographical area to better understand other cultural differences. Finally, future researchers are invited to investigate how fake reviews, fake accounts, and bots influence the online purchasing behaviour among Malaysians.

Sustaining Competitive Advantage During COVID-19 Pandemic: A Study of Aerospace Manufacturing Industry in Malaysia

Masnita Abdul Ghani, Nurhanan Syafiah Abdul Razak, Putri Rozita Tahir, and Muhammad Alshurideh

Abstract This study is one of the very few studies investigating the aerospace manufacturing industries hit severely by the coronavirus (COVID-19) pandemic, focusing on one of Malaysia's aerospace players. In addition, this study emphasises how an action is engaged to minimise or overcome the impact and effectiveness of strategic moves. PLS-SEM method is used to analyse data gathered from a survey. 30 leadership and executives have been chosen in this survey. Through a comprehensive literature study and survey, this paper presents a guide that illustrates general concepts and processes execution, allowing strategic management personnel to comprehend their market position and identify their long-term objectives. It is an approach to sustained competitive advantages by deliberate internal and external influences towards the change that scribe the marketplace competitive advantage landscape.

Keywords Competitive advantages · Strategic management · Internal influence · External influence · Aerospace manufacturer

1 Introduction

A company's strategic purpose and a deep understanding of its principal strengths and assets reflect successful strategies. Successful businesses understand their customers' needs and want, their rivals' strengths and weaknesses, and how they can generate value for their stakeholders (Alketbi et al., 2020; Al-Khayyala et al., 2020; Alshamsi et al., 2020). The approach intends to position a company for competitive advantage (Altamony et al., 2012; Kluyver & Pearce, 2015; Obeidat et al., 2021). It results from executive decisions about what to provide, where to participate, and how to win to optimise long-term value (Alshurideh, 2019; Alzoubi et al., 2020; Joghee et al., 2021a).

The set of basic marketing principles that guide businesses in competitive markets defines marketing's role in leading and shaping strategic management (Alshurideh et al., 2020; Hooley et al., 2018; Kurdi et al., 2020). It is creating a marketing plan implemented, including defining where the company will engage and how it will compete.

Aside from the requirement for strategy as a single, interdependent process, the fourth industrial revolution necessitates agility and coordination of internal and external environment changes (Wiraeus & Creelman, 2019). While keeping a strong emphasis on strategy and the client, an agile business can evolve, driving transformation change, and be versatile (Ahmad et al., 2021a; Alaali, et al., 2021; Al-Dmour et al., 2021a; Alshraideh et al., 2017; Altamony et al., 2012; Ben-Abdallah et al., 2021; Shakhour et al., 2021).

1.1 Overview of Selected Company

The selected company CTRM Aero Composited Sdn Bhd is a manufacturer that fabricates composite components, named CTRM AC, along with this article. CTRM AC is a composite component manufacturer specialising in aircraft applications, mainly on nacelle and wing components. The CTRM AC's ultimate goal and commitment are to foster people, capabilities, and markets in Malaysia's advanced composites industry (CTRM AC, 2016).

Due to airline cancellations and reduced global production, this national composite vendor have adjusted their manufacturing rates. CTRM AC supplies wing and engine cover panels to Airbus SE and Boeing Co. As a result, delayed or cancelled aircraft production affects CTRM AC. Boeing announced 60 cancellations of 737 Max orders in June, on top of the previous 47. At the same time, customers cancelled 355 737 Max orders in the first half of 2020. Airbus plans to eliminate 15,000 jobs over two years and reduce production by 40% (Shan, 2020). It is also hard to see the direct impact, like order cancellations. Pandemic COVID-19 had significant effects on the firm revenue generation and forecast (Ahmad et al., 2021b; Akour et al., 2021; Alameeri et al., 2021; Al-Dmour et al., 2021b; Alshurideh et al., 2021; Amarneh

et al., 2021; Leo et al., 2021; Nuseir et al., 2021a; Shah et al., 2021; Taryam et al., 2020). Before the pandemic happened, CTRM AC was forecasted to gain around 919 Million for Financial Year 2020. However, the post-pandemic impact brings down the demand; thus, the adjusted revenue forecasted for Financial Year 2020 will only be around 531.4 Million (CTRM AC, 2020). Overall revenue forecast declined by 42.2%, from 919 Million to 531.4 Million.

1.2 Overview of Covid-19 Lingerie Impact Towards Aerospace Manufacturer

The COVID-19 evidence predicts that the crisis will lead to market restructuring and a significant reduction in interest in air travel. Airflight is vulnerable to oil shortages, force majeure, war, terror acts, global depressions, and outbreaks. In addition, demand severely weakened due to lower disposable income and behavioural changes (Suau-sanchez et al., 2020). Previous outbreaks apex around one to three months and back to the earlier situation in the next seven months. There are two possible outcomes expected from this situation. In 2020, the 'Limited Spread' scenario predicted a $63 billion loss in passenger revenues (11%), while the 'Extensive Spread' scenario predicted a $113 billion loss in passenger revenues worldwide (19%) (Pearce, 2020). In addition, stock markets are now expecting a substantial drop in airline profits internationally, far beyond the influence of SARS (Fig. 1).

The International Civil Aviation Organisation (ICAO) reported a 60% reduction in airline passengers (both regional and international) in 2020 compared to 2019, with a total decrease of 1,376 million passengers, or 74%. Loss of $250 billion in

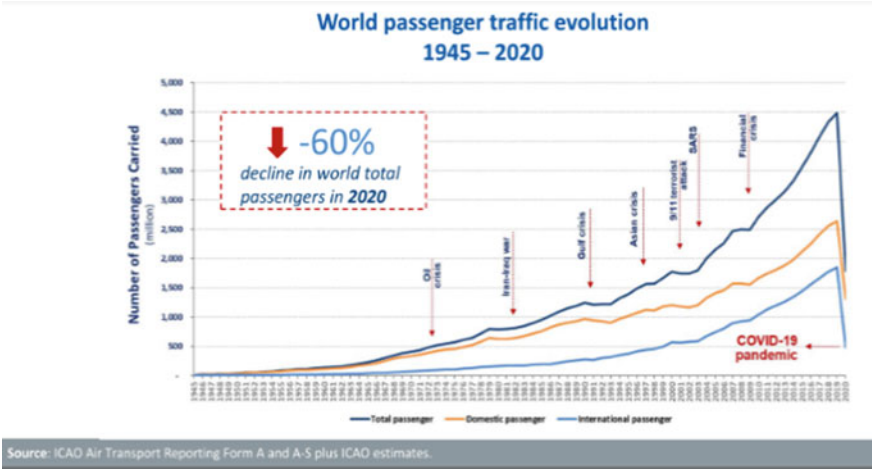

Fig. 1 World passenger traffic (*Source* ICAO)

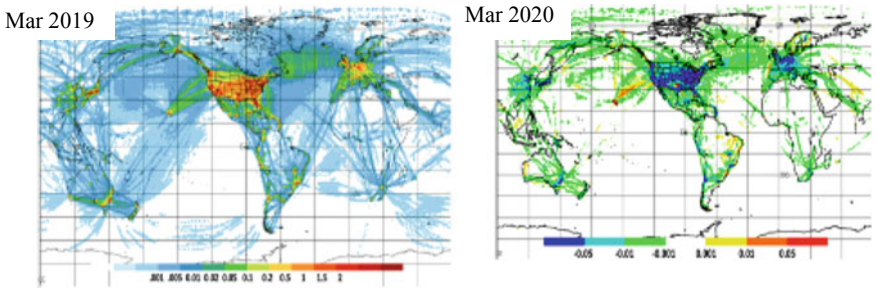

Fig. 2 March 2019 versus 2020 on Global ABO coverage observation (*Source* James et al., 2020)

gross operating income for airlines due to lower passenger numbers (Air Transport Bureau, 2020). According to the Airports Council International (ACI), 40% of traffic passengers and 50% of the terminal income by 2020 could wipe out due to COVID-19 (Airports Council International, 2020).

The plane observation range is densest over Europe and, Northern America subsequently followed by East Asia and Australia (James et al., 2020). 665 airports had at minimum one daily climb, 400 from European or Northern American terminals in late November 2019. However, flight cancellations due to the pandemic reduced aircraft observations by 80% by late April 2020.

Global COVID-19 flight reductions are shown in Fig. 2. Information coverage amid March 2019 and 2020 resulted in reduced air traffic worldwide. However, several flight routes and terminals have had coverage increased (James et al., 2020). The most affected industry is related to the airline industry (Haydon & Kumar, 2020). Commercial traffic fell 42.4% in October 2020, and traffic was 43% below 2019 levels in September and August, an insignificant gain (−45.2%). In contrast, traffic fell 1.67% from September to October this year. Commercial traffic was depressed 73.7% in April (Petchenik, 2020).

Far ahead, reducing air transport demand and impact on the aircraft manufacturer. Following the COVID-19 crisis, Boeing lifted the lid for the very first time in the early twentieth century, revealing a substantial decrease for the coming decade. In 2020–2029, it anticipated 18,350 deliveries, declining 10.7% from an informal prediction of 20,550 (Johnson & Hepher, 2020). According to the 2020 BMO (Boeing Market Outlook), revenue for 18,350 passenger airliners will be 11% lesser in the next decade than the corresponding 2019 prediction of $US2.9 trillion (Ratings, 2020). As a result, Boeing will decrease its 2020 passenger aircraft sales volumes, as reported by S&P Global Market Intelligence. In addition, major airlines postpone new jet orders and delivery dates corresponding to reducing passengers spurred by the COVID-19 pandemic. According to a statement, Boeing said it might reduce aircraft production rates for 787 models to 10 units from 14 units per month in 2020, with an additional reduction to 7 units per month by 2022 (Lazzaro, 2020). In the first quarter, the 787 models accounted for 58% of Boeing's overall demand.

Licensed to (putm@utm.my)

Based on (Oestergaard, 2020), Airbus has slashed output on several programs and aims to keep the primary plane yield at 40% below levels before the pandemic for the next two years. Boeing reduced the production capacity of 787 jet models from 14 to 10 per month in 2020 and a further drop to 7 aircraft in 2022 (Lazzaro, 2020). As a result of the COVID-19, another aircraft OEM, Airbus, will reduce output across its entire manufacturing line. According to Garcia (2020), Airbus is cutting main aircraft models by a third to combat the COVID-19. 40 A320s will be built per month, down from 6. A330s will be produced at a rate of two per month instead of six. Likewise, A350 production will drop to six per month from ten aircraft sets.

COVID-19 spread has substantial waves on global production and supply chain networks. Manufacturing facilities have closed or reduced capacity, and the raw and finished product supply chains are disrupted by trading and transportation issues. This pandemic has a major influence on reintegrating industrial workers. It reduced human resources, lowering manufacturing process efficiency. Proper safety measures are required to consider social distance in the workplace and implement frequent health monitoring for employees to enhance the human aspect of production. Supply chain disruptions included (a) decreased demand for goods (automobiles, public transportation, and textiles), (b) decreased demand for services (temperature scanners, ventilation systems, face masks, disinfectants, protective clothing, and essential food products), and (c) distribution failures and unpredictability in raw materials, (d) Reducing the ability to deliver and obtain goods on time inadequate supply and transportation constraints; and (e) Assure employees capability to construct and transport goods (Kumar et al., 2020). The pandemic virus affects all industries, particularly aviation, passenger and cargo airlines, airline food caterers, airport authorities, aircraft parts manufacturers, travel agents, and MROs (Rahman et al., 2020). The virus's spread has varying effects on the aviation industry. The virus reduced airline capacity by nearly 50%. It is happening in nearly every country.

Despite the background and list of critical factors that could influence aerospace manufacturer demand reduction, it also represents a general insight into national aerospace composite manufacturers currently struggling due to demand reduction from the COVID-19 outbreak impacts. The delivery demand is pushed out to the right and with an increase of concern on ordering cancellation due to airline bankruptcy (AlShurideh et al., 2019; Hamadneh et al., 2021; Joghee et al., 2021b; Lazzaro, 2020; Oestergaard, 2020). This outbreak badly affects aircraft manufacturer's revenue and faces high inventory levels. Nevertheless, the manufacturer obliges to manage in-transit material, ordering material with a long lead-time, and several government commendations and requirements that affect different global manufacturing production flow to remain resilient in market share.

1.2.1 Impact of COVID-19 on the Aviation Players

Rahman et al. (2020) investigated the impact of COVID-19 on aviation such as airlines, airport authorities, air cargo providers, in-flight food caterers, aircraft manufacturers, maintenance, repair, and overhaul organisation. Their study recommended

empirical research on COVID-19 and its impact on the aviation business. Due to COVID-19, research can focus on business improvement initiatives and current strategies to improve the performance of aviation organisations. Each aeronautical business can explore micro, macro, and meso factors to define key measurements. They also recommend future research on the relationship between foreign and local regulators to identify the best business practices for aviation players.

While (Thorbecke, 2020) used sectoral stock price responses to study the COVID-19 crisis' impact on the US economy, affected industries include funerals and airlines. Massive areas of the economy whose recovery is dependent on pandemic control rather than macroeconomic conditions. It will be interesting to see how other countries' stocks have responded and how industrial structures, development levels, and macroeconomic policy responses differ across countries.

(Mhalla, 2020) examined the COVID-19 consequences on the worldwide economy, focusing on oil and air travel. The long-term effects of the coronavirus are still unknown, but demand is expected to remain weak as the epidemic spreads to other major regional economies. In addition, due to the new coronavirus epidemic, many European airlines are reducing flight schedules and cutting costs. As a result, the major airlines will have to decide whether to ground planes or redeploy them.

An airline, airport, aircraft manufacturer, and other industry-specific issues are discussed in the Liptakova article. (Liptakova et al., 2020) believed that recovering from the current aviation crisis will require economic recovery and regaining public confidence. Nobody knows how long this will go on. Travel volumes will not resume for 3 to 5 years, according to IATA. However, the present predicament may purge the manufacturing in multiple approaches, such as eliminating weak airlines, as recent airline bankruptcies have shown.

1.2.2 Responsive Towards Firm Resilient

Xu et al. (2020) investigate the global supply chain's efficiency and reaction and propose a set of managerial strategies to reduce threats and improve agility in different manufacturing segments. An article discusses the implications of COVID-19's lengthier period, marketplace, and scope. The COVID-19 pandemic has reportedly disrupted major global supply chains in pharmaceuticals, food, electronics, and the automotive industries. Temporary closures of industries and shops, travel restrictions, and compulsory quarantine of citizens were used to stop the spread of COVID-19. Shortages of human resources, active ingredients, and raw materials resulted. Tightening controls exacerbated the issue. Delays and inventory shortages result in global supply chains, making two long-term competitiveness enablers recommendations. Understanding critical vulnerabilities and monitoring disruptive risks in real-time is the first. The subsequent endorsement collaborates with internal stakeholders and strategic and critical suppliers to develop risk management strategies (Ahmad et al., 2021c; Alshurideh, 2017; Alshurideh et al., 2019).

Aviation is currently focused on short endurance. An expectation of this "new normal" in this way must happen now, to take into account change over the next six

to two years. The aerospace industry is seeing widespread requests for crisis state assistance and, more importantly, legislative intervention. Deregulation in aviation must be adequately managed to avoid twisted rivalry (Singh, 2020).

According to Hader (2020), firms and governments must thoroughly ensure the critical industrial skills are occupied to avoid driving the entire sector at risk. As a result, the industry must quickly agree on the "new normal" manufacturing rates, develop a mutual strategy for transforming the sector to the "new normal", recognise and support vulnerable components in the transition process.

Various industries have evolved immensely. The need to propagate massive R&D investments across many markets drove the globalisation of the aircraft manufacturing industry. Monitoring globalisation is an essential strategic management undertaking. Even more important is knowing how to use that data to gain an advantage (David et al., 2017). The ability to gain and hold a competitive advantage is critical to long-term success. A company's competitive advantage typically lasts only a short time due to competitor copying and weakening.

Typically, COVID-19 focused on the perspective of tourism, medical science, and airlines services as mentioned by Suau-sanchez et al. (2020); Rahman et al., 2020; Mhalla, 2020; Sun et al., 2020; Iacus et al., 2020; Madi Odeh et al., 2021). In contrast, a clear industrial organisation perspective of COVID-19 is inattentive. Only some researchers, which is (Singh, 2020), emphasised COVID-19 impact on aerospace, which conducts investigations to determine various methodologies embraced to determine the market impact and showcase the aerospace industry's development rate and downturn patterns because of the COVID-19 pandemic. So far, limited study has worked on the implementation to overcome the lingering COVID-19 effects, specifically on aerospace manufacturers in Malaysia and how the related firm reacts to sustain its competitive advantages and remain resilient.

2 Literature Review

2.1 Competitive Advantages

Corporate competition is inevitable. To compete, one must constantly distinguish, understand the market, consumer needs, and their variations. It is essential to consider and control a wide range of resources (Kuncoro & Suriani, 2018). Competitive advantages occur when companies outperform rivals economically (Allozi et al., 2021; Kabrilyants et al., 2021; Shamout et al., 2021). Financial value is the difference between a consumer's perceived benefits and the total cost of the goods or services (Al-Jarrah et al., 2012; Assad & Alshurideh, 2020a, 2020b; Barney & Hesterly, 2018; Shah et al., 2020). The study of heterogeneous firm features necessitated various methods to identify, measure, and comprehend firm resources and capabilities. In the resource-based approach, supporters argue that each firm has unique resources and skills to maintain competitive advantages (Dagnino & Cinici, 2016). Each theory

relies on observations and predictions about how competition in this industry will evolve to gain a competitive advantage. The more accurately these theories and statements reflect current competitiveness in this sector, the more likely it will achieve a strategic edge by applying its strategies. If these conclusions and theories are incorrect, a firm's tactics are unlikely to provide a competitive advantage. Difficulty in predicting market competition, determining a company's strategy is challenging.

The five reasons that propel strong growth companies are human capital, human resource management, strategy, skills, and creativity (Al Kurdi et al., 2021; Demir et al., 2017; Harahsheh et al., 2021; Nuseir et al., 2021b). Competitiveness measure by past success or future competitiveness. Examples are financial performance (profit, earnings growth, returns on investment), non-financial performance (customer retention, employee growth), benchmarking balanced scorecard, metrics like earnings, pricing, productivity, and market share were used (Sachitra, 2016). A competitive advantage allows a company to outperform its competitors. Thus, profitability is a key indicator for assessing competition, and turnover is a key profit margin. However, efficiency, market share, and profitability are insufficient to determine firm-level competitive advantage.

Competitive advantage is assessed by comparing the results of strategic attempts to firm profitability or market share stabilisation. Although competition appears to revert corporate performance to the mean, long-term competitive advantages ensure great returns (Maury, 2016). A company's financial stability allows it to make prudent financial decisions and maintain or reduce market competition. According to Kliestik et al. (2020), interim financial stability reduces future financial threats. A company's overall financial strength is determined by the ratios listed above and other factors such as its size, industry, and location. Profits and losses are the most critical indicators of a firm's performance, especially compared to other manufacturing representatives. The results show that the liquidity ratios that measure a firm's ability to repay short-term debt obligations are crucial. The current ratio measures a company's ability to pay short-term obligations using current assets. A higher current ratio is better than a lower current ratio because it shows the firm pays a current debt. In the following period, short-term liabilities are outstanding. The liabilities-to-total-assets ratio measures the number of assets hidden by liabilities. The ratio of liabilities to total assets is high, indicating low stockholder equity and potential creditworthiness issues. Liabilities-to-total-assets ratios are high in distressed firms. Then there are the total sales to total assets ratio, which measures corporate efficiency by comparing assets to revenue. The higher the ratio, the healthier the firm. Finally, the equity-to-asset ratio regulates a firm's financial leverage. A higher equity-to-asset ratio is required to convince creditors that a firm is sustainable and low-risk.

Long-term success requires gaining and maintaining a competitive advantage. A company's competitive advantage typically lasts only a short time due to competitor copying and weakening. So gaining a competitive advantage is not enough. Assemble, implement, and evaluate plans that capitalise on external and internal variables to achieve long-term competitive advantage. Different industries go global for various reasons. The need to propagate R&D investments across many markets drove the globalisation of the aircraft manufacturing industry (David et al.,

2017). Monitoring industry globalisation is a strategic management task. Even more crucial knows how to use that data to acquire or optimise advantages.

A wide range of methods for assessing an enterprise's competitiveness and market position are being investigated, such as PEST analysis, McKinsey, Model Boston Consultative Group, GAP analysis, Michael Porter, situational analysis (SWOT analysis), expert assessment method, financial and economic method, and others (Khanenko, 2019).

Companies that can maintain a competitive advantage provide sustained benefits. They help a company's reputation by associating it with a long-lasting, appealing offer. A company can create a competitive advantage by combining a temporary competitive advantage (TCA) and a sustainable competitive advantage (SCA). This benefit adapts to changes in the company's background. Another management implication is that combining SCA and TCA does not guarantee a competitive advantage. By combining its strengths, the company can seize new opportunities while maintaining its core business. This method necessitates the establishment of fundamental assumptions (Sołoducho-Pelc & Sulich, 2020). Following these principles increases the likelihood of achieving outstanding short- and long-term results. Having an SCA and TCA focused not only on economic values but also on social and environmental issues may be reasonable.

Nobody has unlimited resources, and they must assess the company's value of various options. An organisation's long-term strategy decisions bind it to specific goods and markets. To win in the long run, strategists can help decision-makers predict significant events that could impact the company. To make assumptions, one needs to know what is coming up in the company's business. Strategists must adjust if actual events differ significantly from forecasts. No policy can be made without rational expectations. Accurate assumptions are a competitive advantage for well-informed firms (David et al., 2017). Only after competitors attempted to copy a firm's strategy have stalled or failed can a firm claim one or more critical strategic benefits. Also, no competitive advantage is permanent. How a competitor's responsiveness to obtain the abilities to imitate a company's value-creating strategy defines the duration a competitive advantage can last (Hitt et al., 2017).

According to Barney and Hesterly (2018), the best way for a firm to choose its strategy is to follow strategic management principles. The strategic management framework is a set of evaluations and decisions that will help the firm find a competitive advantage. The strategic management method of a series collection of analyses and choices will improve the probability of a company selecting a successful approach that produces competitive advantages, as shown in Fig. 3 below.

(Gurel & Tat, 2017) and (Zu'bi et al., 2012) suggested that the external and internal forces' assessment is one core element in strategic management. An external review should help the company identify key competitive risks and opportunities. It also points out that the world of competition is changing, posing new challenges and opportunities for businesses. An internal review identifies a company's strengths and weaknesses. It also shows a company's strengths and resources as sources of competitive advantage rather than gains.

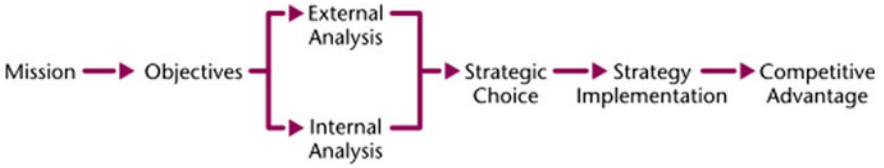

Fig. 3 Strategic management process (*Source* Hesterly & Barney, 2008)

2.2 Scanning Internal and External Influence

Many firms' success or failure is determined by the factors that influence their operations. Scanning the internal and external environments is critical for business planning and organisational analysis (Amuna et al., 2017). It is vital to both for-profit and charitable companies' business practices. However, it is challenging to plan excellent strategy management without considering environmental influences.

According to Rahman et al. (2020), to remain competitive, the company should carefully evaluate its external and internal factors. The approach is linking a company to its environment, both internal and external. These findings were reflected in the SWOT analysis (Guerras-Martín et al., 2014). Complex political, social, economic, technological, and cultural changes are now the norm. In a complex environment, an entity that is not responsive cannot survive. An environmental scan is a method of analysing the climate that is dependent on several variables. External factors include political, economic, scientific, technological factors. The internal environment includes resources, capability, culture, management style, and structure. This study's Independent variable is a latent variable, environment factor that influences business landscape. A competitive market will derive from PEST (Political, Economic, Social, and Technology) and SWOT analysis to assess CTRM AC key external and internal factors (Fig. 4).

2.2.1 Relationship Between Internal Influence and Competitive Advantages

Internal analysis is a third aspect of the strategic planning process that describes the successes besides limitations. Recognising the magnitude and nature of a business's tools and expertise and structure, particular talents, and company-specific or distinctive capabilities are addressed when investigating the origins of successful adviewing (Petchenik, 2020). Build and maintain a competitive advantage entails a business attaining superior performance, consistency, creativity, and responsiveness for its consumers. The company's strength contributes to outstanding performance, while its limitations interpret as unsatisfactory performance. The internal analysis supports a firm in identifying its strengths and weaknesses (Haydon & Kumar, 2020). It also assistances in understanding that its resources and capabilities are likely to be competitively advantageous and less likely to be the source of such advantages.

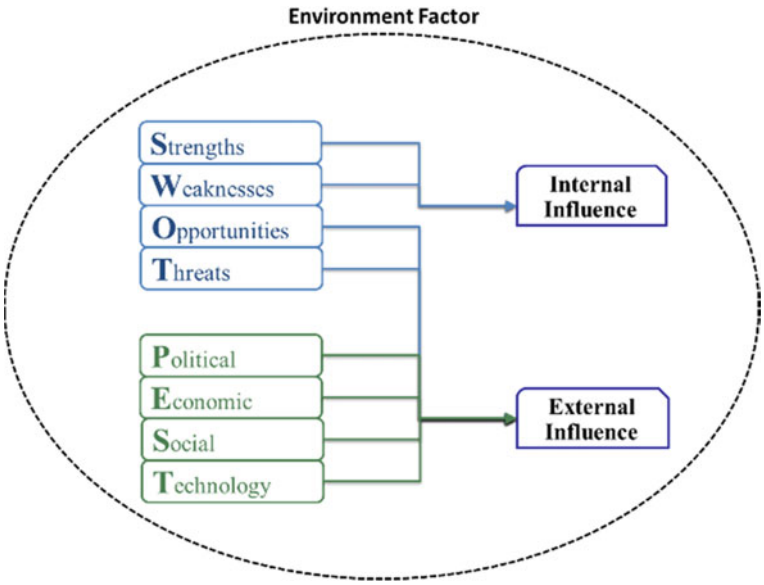

Fig. 4 Correlation between SWOT and PEST towards internal and external influence

H_1: Internal factors possess a direct positive influence on competitive advantages

2.2.2 Relationship Between External Influence and Competitive Advantages

External analysis is a second aspect of the strategic management phase in studying the firms' exterior operational climate. External evaluation's primary goal is to recognise strategic prospects and risks in the firms' operating atmosphere that could influence how it pursues its task. The firm recognises critical threats and opportunities in its competitive environment by conducting an external analysis (Haydon & Kumar, 2020). It scrutinises how the rivalry is likely to develop in this environment and its consequences for a firm's threats and opportunities.

H_2: External factors possess a direct positive influence on competitive advantages

2.2.3 Relationship Between Strategic Management and Competitive Advantages

The strategic management method is a sequential collection of analyses and choices which improve the probability of a company selecting a successful approach to produces competitive advantages (Barney & Hesterly, 2018). The approaches define

a company's productivity in meeting customer needs, and executives are heavily responsible. High-level skills are required to protect and grow future corporate strengths. Top management is in charge of allocating staff and financial resources. These findings often determine the fate of entire industries and businesses. Strategic Management enables companies to add value, build, discover, improve, and conquer their competitive position by demonstrating the necessary actions. Organisations can use strategies to determine future addresses or treatment plans, actions to be taken, timetables, and internal leadership to position themselves for growth (Ratings, 2020). They define how efficiently a company meets customer needs, and executives are heavily liable. High-level skills are required to ensure long-term corporate strength preservation and expansion. Management makes essential decisions about staffing and budgeting. Strategic Management enables businesses to add value, build, discover, improve, and conquer their competitive position by demonstrating the necessary actions (Lazzaro, 2020).

H_3: Strategic Management possesses a direct positive influence on competitive advantages

2.2.4 Relationship Between Environment Factor, Strategic Management and Competitive Advantages

According to Oestergaard (2020), strategic management is a cognitive science that intersects with sociology, economics, psychology, finance, and marketing. The current state of the field can present a complex picture of numerous approaches and paradigms. As a result, there is no conclusive general theory that encompasses strategic management. In strategic management, decisions are made. Strategic decisions are those that determine a company's strategic direction. Their mission is to ensure the company's long-term success, which includes: (a) recognising and understanding path dependencies, (b) responding to current change dynamics, and (c) implementing strategic programs on the previous two points' foundations. Each resolution's action will define future growth. It includes (a) external and internal climate appraisal, (b) strategy formulation (focus on the long-term planning), and (c) strategy implementation (Strategic management focuses on managing and accessing potential threats and opportunities while taking into account a company's strengths and weaknesses). Companies must constantly update their organisation and search for new strategic goals and execution approaches to keep up with the changing climate (Garcia, 2020). The global market's ability to sustain competitive resources may be another competitive factor. Global affiliates or strategic alliances should learn these techniques. Concepts and ideas, especially international coalition methodologies, continue to shape market competition.

H_4: Strategic Management mediates the relationship between environmental factors and competitive advantages

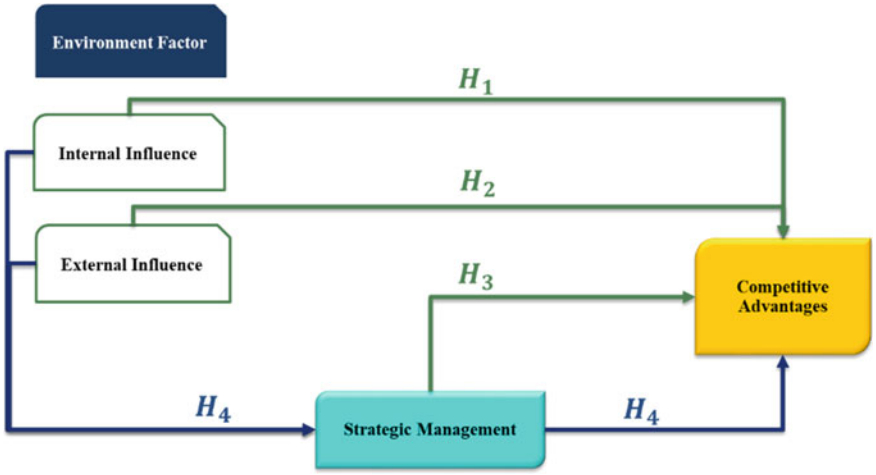

Fig. 5 Research framework

2.3 Research Framework

See Fig. 5.

3 Methodology

3.1 Research Method

The study utilises a quantitative approach by using the survey and literature method to discuss the research topic to determine the mediation effect of strategic management on the relationship between environmental influence and competitive advantages.

(a) Survey:

The questionnaires were adapted and modified from the previous study by Borges and Gaia (2010); Sigalas et al., 2013; Bismark et al., 2018). Five Likert-point scales use to measure and evaluate response. The environment influences are the exogenous latent variable, while competitive advantages represent the endogenous latent variable and strategic management is the mediating latent variable in this study. The survey will be distributed online amongst 30 personnel directly involved with strategic management activities.

(b) Literature:

Comprehend articles (from media and relevant websites) and company reports, archives, and presentations.

3.2 Data Analysis Method

Data collection emphasis the competitive environment factors inquiry will be collected. The PLS-SEM is then used to investigate the causal relationship between the variables and the mediator. SmartPLS statistical software employs hypothesis testing to investigate the causal and effect relationship between independent and dependent variables in theory. (Astrachan et al., 2014; Hair et al., 2019; Hanafi & Fadilah, 2017). PLS-SEM outperforms traditional SPSS; flexible sample does not require normality assumptions and provides solutions with small sample sizes due to a small population. (Avkiran & Ringle, 2018; Fornell & Bookstein, 1982; Hair et al., 2017, 2019; Hanafi & Fadilah, 2017).

4 Conclusion

The study's scope focuses on the environment's influence and lingering effects of the uncertainties from the COVID-19 pandemic to market share, disregarding other associate factors such as bailout, policy changes, and government austerity drive.

This study is one of the few that focuses on the aerospace manufacturing industries that have been significantly impacted by the coronavirus (COVID-19) outbreak by focusing on one of Malaysia's aerospace players. Furthermore, this research reflects how action could reduce or eliminate the impact and effectiveness of the strategic decision.

Competitiveness has evolved into the economic criterion for orienting and evaluating the company's performance from the inside out. The organisation must understand and determine which approaches are most likely to provide a competitive advantage over its rivals based on internal and external influences. Through a comprehensive literature study, this paper presents a guide that illustrates how general concepts and processes can be done, allowing strategic management personnel to understand their market position and, from there, identify where they hunger to reach in the future. Strategic Management enables businesses to provide value, build, discover, strengthen, and maintain competitive advantages by specifying what measures to achieve this position. It enables firms to stand out the addresses or course of action in the future, identifying the action rules, tracking behaviour in time, and outlining the company's internal leadership to set the organisation in the best competitive environment to achieve success. Business success necessitates a company's constant adaptation to its surroundings. Although it is not a guarantee of success, it enables organisations to make long-term decisions, put them into practice effectively, and initiate corrective steps as appropriate. Integration of intuition and analysis is essential for realistic strategic judgement.

Barriers to Reverse Logistic on Implementation of Reverse Logistic: A Case of Malaysian Small and Medium Enterprise

Mohamad Arif Izuddin Rahmat, Nurhanan Syafiah Abdul Razak, Suriati Deraman, and Muhammad Alshurideh

Abstract Globally, reverse logistics is gaining traction due to increased awareness and as a result of resource depletion and climate deterioration. Firms have obstacles implementing reverse logistics from a variety of stakeholders, both internal and external. This study covers a quantitative research method. The target respondents of this study are small and medium enterprises facing barriers to reverse logistic implementation. In this research, the number of respondents is 113 out of a sample size of 81. The collection method is carried out through an email questionnaire. Considering the nature of the study, SPSS version 23 is used to analyse the quantitative data. As a reminder to researchers, future research initiatives may expand this model to include different types of businesses and industries, as well as a broader demographic, which will have an effect on reverse logistics implementation.

1 Introduction

The rapid population growth worldwide and the booming technological progress have increased the manufacture and consumption of short-lived goods. As a result, more raw materials have been consumed by rapid production, thus contributing to the growth and sustainment of sites. Therefore, companies in their supply chain management need to integrate strategies that deal effectively and efficiently with sustainability issues.

A lack of top-level management interest, insufficient time commitment, shifting priorities within and across companies, and an inability to establish a corporate supply chain planning target for reverse logistics are among the reasons firms believe reverse logistics is undervalued in supply chain management general (AlShurideh et al., 2019; Hamadneh et al., 2021; Joghee et al., 2021; Vieira et al., 2020).

In practice, it has been demonstrated that the most effective reverse logistics operations result in increased sales income and decreased operational costs (Pacheco et al., 2018). Additionally, researchers have identified several potential benefits of reverse logistics, including improved resource utilisation and environmental preservation (Abbas, 2018). That is why this paper aims to investigate the most dominant factor of barriers in the implementation of reverse logistics within the small and medium enterprises in Pahang, Malaysia.

1.1 Background of the Study

This study presents an empirical analysis of the obstacles to reverse logistics by small and medium enterprises. These barriers are the main obstacle in the way the barriers function. The Reverse Logistics implementation has various obstacles. The Four barriers and twenty-nine sub-barriers are essential for implementing Reverse Logistics by small and medium enterprises.

According to Waqas et al. (2018), Kaviani et al., (2020a), the Four general categories of main barriers that block businesses from following reverse logistical practice are financial, knowledge, law and regulation, and management. Some of the barriers used by companies to enforce reverse logistics have been clarified. According to these companies, reverse logistics activities were implemented either to gain the economic advantages included in the competitive advantage or compelled by government law and public environmental knowledge. These four variables, 'traditional economic theory,' are necessary to understand, and their sole goal is to produce as much income as possible so that their shareholders are pleased (Rubio et al., 2019).

1.2 Research Discussion and Research Gap

This study presents an empirical analysis of the obstacles to reverse logistics by small and medium enterprises. These barriers are the main obstacle in the way the barriers function. The Reverse Logistics implementation has various obstacles. There are four barriers and twenty-nine sub-barriers necessary for implementing the Reverse Logistics by small and medium enterprise that has been compiled from multiple studies in the past.

The study outlines barriers to reverse logistics adoption in the world's leading sector. The purpose of this study is to look at the variables that prohibit businesses from adopting reverse logistics and to identify the primary hurdles that affect these businesses. According to Ritzén and Sandström (2017), the three general categories of main barriers that block businesses to follow reverse logistical practice are economic, legal and corporate citizenship. Some of the barriers used by companies to enforce reverse logistics have been clarified. According to these companies, reverse logistics activities were implemented either to gain the economic advantages included in the competitive advantage or compelled by government law and public environmental knowledge. These three variables, 'traditional economic theory,' are necessary to understand, and their sole goal is to produce as much income as possible so that their shareholders are pleased (Frei et al., 2016; Ritzén & Sandström, 2017; Yin, 2017). Even the company's role in the management of social responsibility diverges from its main aim to make money.

Prior research has examined the constraints to reverse logistics solely to ascertain its sustainability (Vieira et al., 2020). However, as environmental awareness rises, corporations face significant pressure from stakeholders, including government and customers, to mitigate their negative ecological consequences (Yin, 2017). Indeed, the private sector must consider integrating market practices with sustainability and manufacturing to maintain competitiveness (Frei et al., 2016; Ritzén & Sandström, 2017). In addition, global warming, climate change, trash, and air pollution have increased in recent decades, prompting specialists worldwide to be more ecologically friendly and seek the most acceptable feasible solution (Škapa, 2011).

In addition, several studies (Badenhorst, 2016; Kaviani et al., 2020b; Meyer et al., 2017; Sari et al., 2018; Škapa, 2011) have demonstrated the importance of reverse procedures in improving the performance of a firm's supply chain. Small and medium enterprises in Pahang, Malaysia, focused on this study paper's analysis of reverse logistics practices. A small and medium enterprise is a very unexplored and complex topic because of the requirements enterprises must meet. Using proven quantitative methods, the study has attempted to analyse reverse logistics activities in small and medium-sized enterprises towards the implementation.

2 Literature Review

2.1 Reverse Logistics

Reverse logistics consists of practices including material recycling, reuse, reduction, and replacement (Badenhorst, 2016). Furthermore, according to Sari et al. (2018), In light of all the new laws and regulations that have emerged in recent years, a method called reverse logistics has been making its mark among numerous industries. This approach helps these organisations achieve their profitability and growth share strategic goals by reducing their potential impacts and increasing their environmental sustainability. Therefore, knowledge and learning management practices are vital to the concept of informational boundaries for an organisation (Yin, 2017).

Besides that, most top-performing businesses understand the competitive advantage comes from effective distribution and supply chain operations. According to Meyer et al. (2017), the display of an efficient supply chain comes from an information system that predetermines the customer's satisfaction without obstacles during the initial process. According to Waqas et al. (2018), During transport, reusable containers can minimise waste products and product damage, helping to reduce ergonomic and safety issues further. The product development process will aid the 3R Recycling, Reuse, and Restoration principle. To minimise unnecessary packaging, 3R should be considered in product design.

2.2 Reverse Logistics Barriers

Over the past decade, environmental problems have increased, to ecological issues have been noted. They also thought that reverse logistics could contribute to industrial growth in conjunction with supply chain management (Chileshe et al., 2015). Therefore, green supply chains need to sustain global market competitiveness (Meyer et al., 2017).

Greening the supply chain can be inhibited by numerous police and government sectors around the world. Several environmental problems in India are driven by the rapidly increasing population and economic growth because of the growing and massive intensification of farming, the unregulated development of urbanisation, industrialisation, and forest destruction (Ravi & Shankar, 2015). (Kirchherr, et al., 2017) Have identified vital barriers encountered in reverse logistics: higher costs, poorly trusted policies, lack of knowledge, resources and supplier expertise, and lack of policy by the government.

According to Aryal (2020), literature reviews show that many researchers found barriers to effective implementation of reverse logistics systems that need to be established and explored. A comprehensive analysis has been done to identify the barriers that are currently impeding a total return to logistics system implementation and determine the fundamental barriers that lack management understanding and

support. They underlined the fiscal, technical, and management systems constraints that prevent the effective implementation of sustainable processes.

2.3 Relationship Between Financial Related Barriers and Reverse Logistics Implementation

First of all, (Younas & Bajwa, 2019) analysed the 26 obstacles to reverse logistics theories implementation. Barriers are described as one of the most impacting walls, namely high investment and lower return on investment.

Direct and transaction costs include environmental management costs (Sari et al., 2018). These two prices serve as an essential barrier to sustainable practice implementation. Adoption of state-of-the-art technology, construction of IT infrastructure, and recruitment of highly skilled workers all go toward providing knowledge and training to sustainability workers. The key barriers are high investment start-ups, slow return on investment, and low-profit margins (Shao et al., 2019).

There are no consultants, green architects, green developers, contractors, and specialists among the corporate departments. Thus, this is the "lack of consultants, green architects, green developers, contractors, and specialists". A high-quality implementation offers new concepts for the organisation's overall growth, learns innovative technologies, and efficiently communicates knowledge, making it easier to incorporate sustainable practices. However, attracting high-quality staff is a barrier to financial restrictions. It also lacks IT infrastructure networks, a lack of waste management technology, reuse, and recycling. On the other hand, the utilisation of IT infrastructure decreases the substantial use of paper and time consumption (Shohan et al., 2020).

If the implementation of sustainable practices fails, the organisation will be deemed worthless. In addition, the brand value and competitiveness of the business may be affected (Singh et al., 2016). The goal of reverse logistics practices is to strengthen their environmental and financial efficiency, IR, eco-design, or ecological practices design. The emphasis on business organisation's sustainability is that today the company's environment is being transformed (Sivakumar et al., 2018).

Heavy investment is needed in reverse logistics programs concerning infrastructure, technology, and necessary software that is a significant impediment in small and medium enterprises to reverse logistics programs (Škapa, 2011). For example, it is estimated that relocating a product from consumer to the manufacturer was nine times the cost of relocating a product from supplier to customer. Financial constraints thus serve as a significant obstacle to reverse logistics.

According to Starostka-Patyk et al. (2014), several technological changes that demand high investment may be needed to introduce the reverse logistics industry successfully. However, investors should note the returns and the recovery of the investment. It has been a considerable challenge for technology to introduce new technologies and save investment costs professionally. Often because of economic

Licensed to (putm@utm.my)

constraints, the implementation of reverse logistics was met with obstacles. For example, one of the biggest problems in the chemical industry is toxic goods. Therefore, the introduction of reverse logistics becomes troublesome because the cost increases and the reverse knowledge is missing.

Successful reverse logistics requires staff training (Tesfaye & Kitaw, 2020). However, this training calls for financial resources, which can or may not be available for the organisation. This makes it very difficult for the company to handle reverse logistical activities. Therefore, training and education are the key demands for an organisation's success; the more significant the reverse logistics operation's productivity, the more skilled personnel available.

H1: There is a significant relationship between financial related barriers towards the implementation of reverse logistics.

2.4 Relationship Between Knowledge Related Barriers and Reverse Logistics Implementation

Apart from the financial factors, personnel and instruments are critical for executing related reverse logistics activities. Often essential are knowledge-based tools such as expertise and related knowledge relating to management capabilities and technology (Sivakumar et al., 2018). Therefore, the appropriate reverse logistics capital commitment will improve the logistics competence of an organisation.

Not only that, according to Bianchini et al. (2019), an organisation must need to have Data, method, commodity, or organisational support technologies deemed essential to the management of a green supply chain. Proper preparation and efficient human capital development are critical parts of the green supply chain. Small and medium enterprises encountered difficulties achieving adequate efficiency in their initiatives because of a shortage of human capital and internal innovation (Ormazabal et al., 2018). They also noted that many small and medium enterprises face new criteria, mainly because they lack information, skills, and financial and human capital.

Next, (Reddy & Audo, 2016) The absence of expertise in reverse logistics is a hindrance to proper implementation. In addition, the results demonstrate that reverse logistics is connected to knowledge and experience. In addition, it finds that reverse logistics has an enormous impact on a firm. Thus companies should also have a more robust understanding of reverse logistics' value.

(Moktadir et al., 2020) also suggest that reverse logistics awareness can carry economic advantages by taking back the commodity returned to use. Many of those who know the benefits of reverse logistics and what potentials or goods can be used in their companies are therefore essential to analyse the degree of awareness and perception. Besides that, according to Rubio et al. (2019), in the execution of related reverse logistics activities, workforce and capital are essential in addition to financial considerations. As a result, the hiring process must include knowledge-based instruments, such as talents and critical skills that are applicable to operating

resources and technology. Improving a company's logistics expertise will necessitate an appropriate role for staff involved in reverse logistics.

Also, (Sharma et al., 2011) suggest that consumers are unaware of eco-friendly goods and their advantages. The most basic form of external pressure for any company is customer requirements. When a customer requests an eco-friendly product, the company must modify or update the current infrastructure to meet the same criteria. Sustainable practices are tough to follow for companies because of the increasing operational costs. According to Nikmehr et al. (2017), the lack of client awareness contributes to the low acceptance of recycled items. As a consequence, they get lower returns for further investment.

Lastly, according to Dieckmann et al. (2020), most logistical information systems do not support the reverse flow of materials. The lack of sound information systems is one of the most critical issues facing organisations when adopting the reverse logistics. Good support for knowledge is a prerequisite in reverse logistics for successful decision-making. Many companies have sophisticated information and technology systems for forwarding logistics, but additional work is needed to support reverse logistics. Manual data recording is also required because errors can be introduced because of duplication of operations, equipment absence, and inadequate IT tools (Thiyagarajan & Ali, 2016).

H2: There is a significant relationship between knowledge related barriers towards the implementation of reverse logistics.

2.5 Relationship Between Law and Regulation Related Barriers and Reverse Logistics Implementation

First of all, according to Yin (2017), e-waste is illegal in developed countries because of the absence of appropriate legal measures. Therefore, all reverse logistics stakeholders are urgently required to establish an efficient long-term strategy for e-waste disposal and manage informal recycling. Regarded the lack of state assistance as the key obstacle to reverse logistics implementation.

To implement reverse logistics, governments must provide financial support and implement tax regulations. Governments will diminish an organisation's motivation to pursue reverse logistics if they fail to adopt environmental rules that can be implemented (Pacheco et al., 2018). In addition, fiscal policies and government financial assistance are also important. Propose that the government can implement reverse logistics strategies or incentives (Abbas & Farooquie, 2018). We must expect that subsidies from the government will encourage the implementation of reverse logistics. Legislation is a logistic element that goes in the other direction.

The method of analytical hierarchy is used to determine the barriers to implementing sustainable plastic purchasing and supply initiatives in India (Abbas, 2013). The most important of the barriers was considered a barrier, that is to say, government funding and policies. Using the ISM methodology, the main obstacle factors

of sustainability in Indian petroleum and gas industries have been identified and modelled (Raut et al., 2018). The findings showed that the lack of global warming pressure and ecological scarcity is the most critical barriers to other barriers.

According to Lototsky et al. (2019), the ten barriers to reverse logistics in the foundry industry have already been discussed. The most critical factors were present: barriers to progress and advancement were a lack of government control and legislation. There are established impediments and roadblocks for using reverse logistics strategies in Nigerian building enterprises (Dieckmann et al., 2020). The study showed that the lack of legal compliance and government constituted the primary barriers to reverse logistics practices.

It means that either the government does not follow industrial-friendly sustainability policies or offer organisation's unique advantages and incentives for applying them. The laws and regulations of the government are the required instruments for proper corporate governance (Shohan et al., 2020). The industry will inspire top manager companies to introduce reverse logistics in every industry sector by giving strict guidelines on reversing logistics practices and awarding the best reverse logistics guidelines (Kaviani et al., 2020a). The lack of supportive regulations and standards has also been appraised as a critical hurdle to reverse logistics in developing countries. When governments change, so do the guidelines, as witnessed in India. Specific norms and regulations are required to collaborate domestically and create a basic safety standard in the business.

Government laws and financial support can play an important role in reverse logistics practices within an organisation. For example, a lack of enforceable government environmental policy decreases motivation and encourages organisation's to reverse logistics procedures (Badenhorst, 2016). Furthermore, the lack of government fiscal policies and financial support to reverse logistics has disincentivised organisations. The goods returned to the reverse chain contribute to a high degree of tax complexity and exposure. Consequently, the most external effect on reverse logistics activities of a company is government policy.

H3: There is a significant relationship between law and regulation related barriers towards the implementation of reverse logistics.

2.6 Relationship Between Management Related Barriers and Reverse Logistics Implementation

Firstly, according to Starostka-Patyk et al. (2014), in management-related barriers, less cooperative partners within the supply chain are significant challenges in reverse logistics. Therefore, the supply chain could be revamped into the closed or a separate reverse supply chain. It indicated that enormous resources and finance require reverse logistical practices to be introduced.

Next, according to Reddy and Audo (2016), the analysed developing countries could not attain a reasonable recovery rate due to the reduced return volume. Noted

that there are barriers to the technology of reverse logistics practices in return tracking, collaborative with 3PL providers. In knowledge exchange activities such as seminars and conferences, collaborative supply chains are implemented to support practitioner training and growth efforts in environmental matters (Pacheco et al., 2018). The use can treat the waste of different management, such as landfill or waste incineration, and return valuable materials to the supply chain.

By partnering with manufacturers, shippers, retailers and consumers to coordinate green supply chain operations, companies may make significant changes in business efficiency (Ormazabal et al., 2018). They find that environmentally friendly logistics can be used to minimise costs and improve overall manufacturing. Effective reverse logistics networks have shown that good economic benefits can be achieved and corporate competitiveness increased.

As a result, the management's awareness as a strategic decision in developing countries is vital in promoting reverse logistics implementation (Waqas et al., 2018). Although policymakers are crucial for implementing the reverse logistics process, they are concerned about how an inverse logistics system can be initiated and enforced.

Above all, there are numerous impediments to implementing reverse logistics systems, classified as management difficulties in various studies (Aryal, 2020). He identified two significant limitations and drivers of reverse logistics in his research: a lack of understanding of reverse logistics activities and a lack of senior management engagement. Thus, critical impediments to reverse logistics have been discovered. The reasons for these difficulties include a lack of senior management involvement and a lack of concern for green supply chain management in the Indian manufacturing industry (Frei et al., 2016).

Furthermore (Sari et al., 2018), short-term and long-term strategic priorities and high waste disposal costs have also been misaligned because of the lack of a high-level management commitment to logistical sustainability and a top barrier to implementation. Depending on whether these barriers can be eliminated, some businesses can introduce reverse logistics using their self-support scheme, while some organisation's externalise their clients and recycle services to third-party logistics suppliers (Chileshe et al., 2015). A self-support system is suitable for manufacturing high-end electronic goods since it allows a business to gather practical product knowledge for continuous improvement (Ormazabal et al., 2018). It requires, however, considerable expenditure in money.

Top management support and dedication are essential to embrace, incorporate and excel in sustainable practices in every enterprise. Therefore, top management support is vital. In addition, senior management will support a new integrated sustainable structure through employee empowerment, benefits and promotions, training and communication networks through different departments and promoting teamwork (Sivakumar et al., 2018).

H4: There is a significant relationship between management related barriers towards the implementation of reverse logistics.

2.7 A Theoretical Model for Reverse Logistics Implementation

Over several types of research, numerous obstacles to the implementation of reverse logistics have been identified. Even though global awareness, policies, resources, and government backing for reverse logistics is there, most companies saw little to no advantage in applying reverse logistics strategies. While it is generally recognised that reverse logistics is not a necessary process in the majority of the globe, we identify many significant barriers to implementation in the European setting, including a lack of management attention and a lack of acknowledgement of reverse logistics as a competitive element. (Abbas & Farooquie, 2007; Vieira et al., 2020; Campos et al., 2020; Younas & Bajwa, 2019; Kumar, 2017; Lakshmi, 2017; Sivakumar et al., 2018). The above issues can be grouped as financial, knowledge, law and regulation, and finally management.

In Malaysia, the situation is much different. Customers place a higher priority on garbage disposal by contractors, with approximately 80 percent of rubbish generated being sold to individual private collectors and recycled informally (Nik Abdullah et al., 2011). Over 90% of Malaysians are reluctant to pay for waste recycling.

The two main waste collection routes include formal methods utilised by public buildings and more informal options, which involve individual components and raw material sellers. Since the start of informal recycling in numerous locations throughout the world, studies have shown environmental and human health benefits (Abbas, 2013; Vieira et al., 2020; Badenhorst, 2016; Younas & Bajwa, 2019; Raut et al., 2018). However, a high percentage of material in the informal sector never makes it official or formal recycling and disposal sites, limiting the economies of scale in manufacturers' use of reverse logistics procedures (Meyer et al., 2017).

We classify the barriers to reverse logistics implementation into four categories: financial, knowledge, legal and regulatory, and finally, management-related barriers. To investigate these concerns, we found many barriers to the proposed classification that have been described in the literature, which are mentioned below.

Firstly, financial barriers are primarily focused on reverse logistics activities, including a lack of initial capital, an inability to obtain bank loans, increased costs associated with adopting reverse logistics, a lack of funds for product return monitoring systems, a high initial investment with a low return on investment, and finally, expenditure on collecting used products. This is a crucial obstacle for firms seeking rapid advantages from reverse logistic implementation (Waqas et al., 2018).

Secondly, knowledge barriers will include a shortage of reverse logistics professionals, a lack of expertise, training, and experience, and a lack of awareness of reverse logistics practices. Minimal investment in knowledge management and data systems, inaccurate forecasts, a lack of reactivity to reverse logistics, and, finally, an excessively complex implementation. The researcher examines and discusses these barriers to determine the advantage (Tesfaye & Kitaw, 2020).

Thirdly, legal and regulatory barriers include a lack of supportive government policies for reverse logistics, changing regulations as a result of changing political

climates, a lack of restrictions imposed, a lack of enforceable laws requiring products to be returned at the end of their useful lives, customers not being informed about returned products, and finally, a lack of political commitment. These impediments are the subject of research by Chileshe et al. (2015).

Finally, management barriers also include a lack of management support, a poor corporate culture, coordination with third-party logistics providers, waste management issues, and management inefficiencies.

2.8 Theoretical Framework

Figure 1 above shows the relationship between barriers to reverse logistics and the implementation of reverse logistics itself. The independent variable of this study consists of Four (4) factors: financial, Knowledge, Law and regulation, and management-related barriers. Therefore, the dependent variable of this study is Reverse Logistics Implementation within the small and medium enterprises of Pahang. This is in line with the statement made by Waqas et al. (2018); Nik Abdullah et al., 2011; Abdulrahman et al., 2014).

3 Research Methodology

The research design looks at the overall strategy to include components of the analysis coherently and logically (Garbarino & Holland, 2009). For this study, the research design is quantitative. As defined by Sundram et al. (2018), this research is focused on a relationship between two variables in which to learn which variables are related to one another.

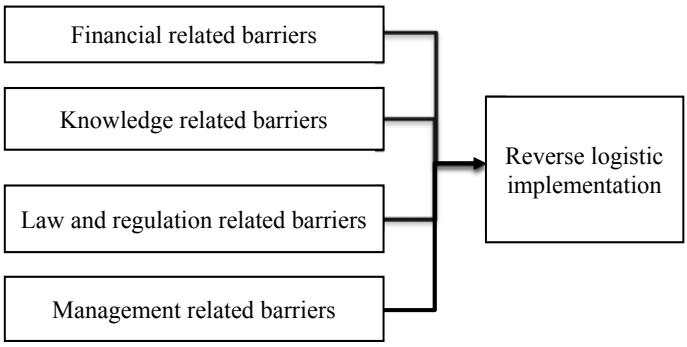

Fig. 1 Conceptual Framework

Descriptive analysis is used to define the characteristics of the population or phenomenon that decides the response to questions about who, what, where, and how (Nik Abdullah et al., 2011; Sundram et al., 2018; Waqas et al., 2018). The present study's objective is to identify barriers to the implementation of reverse logistics in the small and medium enterprise industry and identify types of barriers that primarily affect the industry within Pahang, Malaysia. A survey was used to understand the planned research aims. Questionnaires help researchers discover information from people in a wide variety of fields. (Lau & Wang, 2009).

3.1 Scale and Measures of Research

The first section of the survey assessed the respondent's information within the organisation of the study. The survey question rating scales were based on the Nominal scale, where the respondents will choose what information fits their positions.

The second section of the survey assessed the respondent's attitude about company readiness to reverse logistics implementation. The survey question was, "To what extent do you agree with the following statements for each type of reverse logistic related barriers?" Rating scales were based on a 5-point Likert scale, which one characterised Strongly Disagree, two represented Disagree, three marked either Agree or Disagree, four indicated Agree, and five characterised Strongly Agree. In completing this questionnaire, the respondents were required to think of a situation that they had been involved in or experienced closely.

According to Sundram et al. (2018), population refers to a broad community of people or activities for a researcher. This study's population was all 37,573 small and medium enterprises within the state of Pahang, Malaysia. In January 2019, the number of small and medium enterprise companies in Pahang, Malaysia, was 37,537, at 5.1% of the total number of small and medium enterprises within Malaysia. The sample size is the numerically reflected size of the group selected. The businesses of small and medium enterprises are sufficient to undertake this research. Since the population in this study is 37,573 Companies, a sample size of 81 respondents is appropriate for correlational studies. When it is impossible to obtain such a high return of questionnaires, Power Analysis and Sample Size (PASS2021) suggest that a minimum of 81 is suitable for retrieving data. Non-probability sampling is a kind of sampling where individuals have a zero probability of being chosen. This research used convenience sampling methods to obtain respondents in this survey. This sampling technique is to be used since we are explicitly targeting the population of Pahang.

Data obtained from the survey were reviewed in the last phase of this study. As input, although not used in data interpretation, the quantitative data was used as the sample. SPSS 23 examined quantitative survey results. Descriptive figures and research theories were evaluated for performance. This number of small and medium enterprises will be the base number for the population of this research. These companies' contact details were retrieved from the associated websites of

the Ministry of entrepreneur development and cooperatives (MEDAC) (http://dun.medac.gov.my/data-umum/).

4 Data Collection Method

The tool used for this research was a survey. A questionnaire is a research tool, according to Sundram et al. (2018), consisting of a list of knowledge collection questions. A significant number of participants can compile information within a limited period, and the questionnaires can typically be easily measured and rapidly collected. Therefore, the primary means of gathering data for the analysis was this method.

Survey methods gathered data. An initial email was sent to companies within the small and medium enterprises. Participants represented different industry roles, such as manufacturing, distribution, third party, and retail. Survey questions identified the barriers to Reverse Logistics implementation. Data were analysed by SPSS using the multivariate analysis method. Other aspects, such as company size and industry, were tested to see the difference in reverse logistics barriers and implementation.

Survey data was gathered using an online survey. For this method, Goggle Forms was used as the online survey tool. The key participants were workers employed at this company, such as supply chain managers, logistics analysts, industrial engineers, and the like, working closely to revert logistics projects and processes to find obstacles to reverse logistics. The research covers manufacturers, retailers, vendors, and businesses with services related to electronic goods.

4.1 Research Findings

This section examines the survey respondents' replies in detail. To understand the respondent's perspectives, an attempt was made to relate the participant replies to the theoretical backdrop. Since this research is based on a survey, the number of responses is vital to the study's outcome. Many companies were approached to get data on specific reverse logistics concepts. To begin, the survey data were analysed using descriptive statistics, alpha coefficients, and item-total mean. Next, the reverse logistics obstacles in the industries analysed were evaluated and ranked using factor analysis (FA). Reliability analysis confirmed the questionnaire's validity, with Cronbach alpha values exceeding 0.70, as recommended by [51]. Due to many barriers in our study, we employed descriptive statistics to discriminate between the most and least influential. As a result, the most significant barrier has the highest mean score, while the least important has the lowest mean score.

Firstly, for financial related barriers, the lowest mean was the statement "Higher costs of adopting reverse logistic." The highest mean was the statement, "Non-availability of bank loans to encourage green products processes.". Based on uncertain profit forecasts, the respondents were unable to obtain a bank loan. Reverse logistics implementation in Malaysia is unusual due to small and medium companies being cost-conscious to remain competitive locally and prioritising short-term advantages and profits above long-term benefits. Secondly, for knowledge-related barriers, the lowest mean was the statement "Lack of skilled professionals in reverse logistic." The highest mean was the statement, "Wrong forecasting.". Nevertheless, the largest group of respondents felt that wrong forecasting is within the barriers to implementing reverse logistics.

Thirdly, the lowest mean for law and regulation-related barriers was the statement "Lack of political commitment", and the highest mean, "Lack of enforceable laws on products' return of end-of-life.". However, the largest group of respondents was felt that the lack of enforceable laws and on products return of end-of-life effect the most since it will impact the whole industry. Lastly, the lowest mean for management-related barriers was the statement "Lack of understanding by the top management." The highest mean was the statement, "Lack of waste management practices.". Nonetheless, the largest group of respondents felt a lack of waste management practices that can boost the number of recycled materials to be processed.

5 Study Conclusion

Climate change impacts are becoming increasingly apparent as material costs rise, resources become scarce, and global awareness grows. Achieving a competitive edge while meeting evolving local and international environmental regulations is a common goal of proactive firms using reverse logistics strategies. Malaysian firms must participate in global manufacturing sustainability efforts as resources become limited. Malaysian small and medium enterprises do not sufficiently understand reverse logistics. This study looked at 113 Malaysian small and medium enterprises from various demographics. According to the research's data analysis, most firms included in this study participate in reverse logistics activities and processes ranging from product return collection through refurbishing or recycling. But reverse logistics is relatively new in Malaysia. A comprehensive item-by-item examination of reverse logistics finds investments, resources, and overall commitment to being average. The financial hurdles revealed indicate a lack of company commitment to reverse logistics—even management commitment scores below average. The most significant barrier to adoption is a lack of knowledge of reverse logistics.

According to this study, Malaysian firms, particularly Pahang, are still wary about using reverse logistics. This is due to a lack of awareness about reverse logistics. Despite management's recognition of the value of reverse logistics, the company's expenditures, resource allocation, and dedication remain below average. The most

common reverse logistics activity is collecting customer returns, whereas refurbishing, repackaging, and even recycling are rare operations in the sector. This study has helped firms in Pahang, Malaysia, understand the current level of reverse logistics usage. It also informs businesses, government agencies, lawmakers, managers, and researchers on essential issues that impede companies' use of reverse logistics. This study is also crucial since it tries to determine which reverse logistics operations this firm has implemented. It also shows the significant benefits gained by companies using reverse logistics. This should encourage companies who haven't embraced reverse logistics to do so since it may help them improve their competitiveness.

Reverse logistics implementation provides a wide range of research options. A future study may examine the state of performance in various companies. Although the breadth of reverse logistics deployment varies with every industry, whether independent or moderating and mediating variables, other variables that may influence a company's decision to participate in reverse logistics should be examined.

Notably, the data and results are from a survey exclusively performed in Pahang. Thus, the results do not reflect all Malaysian small and medium enterprises. The research included a limited time for collecting surveys. The questionnaire is distributed as an electronic survey (e-survey) through Google Forms. The inability to ask for a response on the spot or the same day had become a limitation. The data collection is dependent on the sample having time to answer the survey without any option to receive a quick response. A lack of past research studies on the subject revealed a lack of literature for a strong thesis since the number of studies that give the same independent and dependent variables is limited. Even while most research on reverse logistics implementation recommends additional variables be considered, the results of this study utilising reverse logistic barriers as a significant variable have proved to be highly beneficial.

Does Customer Loyalty Lead to Successful Automotive Industry? a Study of Malaysian Consumer

Mohd Syafiq Ruslan, Nurhanan Syafiah Abdul Razak, Musmuliadi Kamaruding, and Muhammad Alshurideh

Abstract Customer loyalty is the performance index that is being inspired by many companies to ensure their businesses are profitable, sustainable competitive, expandable, and practical in the current era. On a similar note, customer satisfaction plays a big role as indicators to connect the customer to a company in which expressed their experiences and values owning a brand new car from a company. Derived from customer satisfaction leads to customer loyalty which is a customer is likely loyal to a brand and inspired to buy a new car from the same brand. Competitive advantages are the key factors that contribute to customer satisfaction and customer loyalty. One of the challenges is related to market uniqueness in which a company required special strategies to offer a product that suits the demographic of the customer which will have a significant impact on the competitive advantages for a company. The research is to examine the correlation of competitive advantages towards customer loyalty specifically in Malaysian automotive industries. This correlation study will utilize quantitative methodology and the data will be analyzed and interpreted through IBM

Keywords Customer loyalty · Competitive advantages · Market uniqueness · Price Tag · Leadership · Product Feature

1 Introduction

In terms of automotive industries, vehicles are essential for everyone nowadays as transportation to commute from one place to another place. Due to the uprising demand for vehicles, automotive industries getting expand globally thus competition between car manufacturers are competitive. The automotive business already passes a century old, "yet it remains one of the most competitive businesses on earth" (MAA, 2020). Edward added that over the past few decades, the competition keeps competitive in the U.S industries where recent market entrants such as car brands from China and Korea making the road into the markets. This situation not only occurred in the U.S, but the whole region already faces the challenge condition which entrance of another foreign brand to the domestic market.

The performance of global automotive industries can be measured based on sales and production of vehicles. Ministry of International Trade and Industry (MITI) summarized and conclude the market situation and economic climate change from 2014 to 2018. Vehicles have been sold in the year 2018 have recorded 7.7% positive growth from 2014 to 2018 which the value from 85.3 million units to 91.9 million units. As for global production statistics, increasing from 87.6 to 95.2 million units from 2014 to 2018. The explanation above support by Fig. 1 shows the global sales and production achievements from the year 2014 to 2018 (MAA, 2020).

2 Background Study

The automotive industries in the ASEAN region growth by 12% for sold units and 10% for production vehicles from 2014 to 2018. This increasing trend is mainly due to ASEAN countries offers investment opportunities for distributors and manufacturers. Japanese-based OEM dominated the market segment in ASEAN. The result can be seen in Fig. 2.

Based on Fig. 3, total sales vehicles production in 2019 is 4,158,983 units in the ASEAN region which Thailand nominates the highest number of production followed by Indonesia and Malaysia.

Indonesia and Thailand are the automotive hub of ASEAN which almost of suppliers localize their parts in both of the countries especially for Japanese car manufacturers such as Toyota, Daihatsu, Honda, Mazda, and others (BOI, 2015).

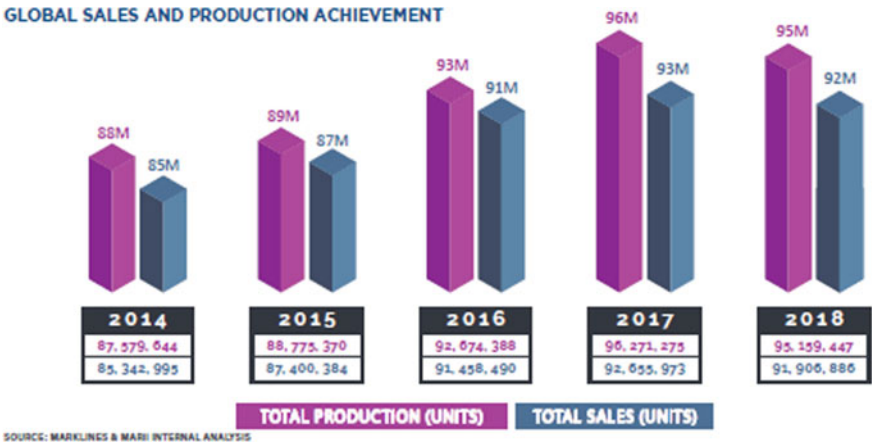

Fig. 1 Global sales and production achievement (MAA, 2020)

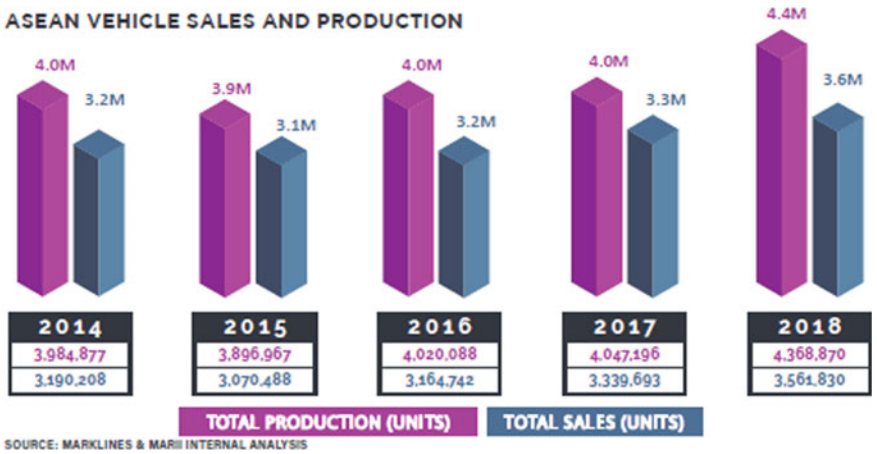

Fig. 2 ASEAN vehicles sales and production (MAA, 2020)

Hence, both of the countries enjoy the benefit of lesser tax imposed, high production volume thus contribute to high revenue. Competition between car manufacturer at Thailand and Indonesia are competitive since both of the countries are having open policies to any brands and don't have the policy to consider the impact towards national car compare to Malaysia (BOI, 2015).

The Malaysian automotive industries are unique compare to major automotive players which are national brands consist of Proton and Perodua. Figure 4 shows that Perodua holds 43.7% while Protons holds 18.2% in the year 2019. Thus, national car nominates more than 50% of the total industry volume (MAA, 2020).

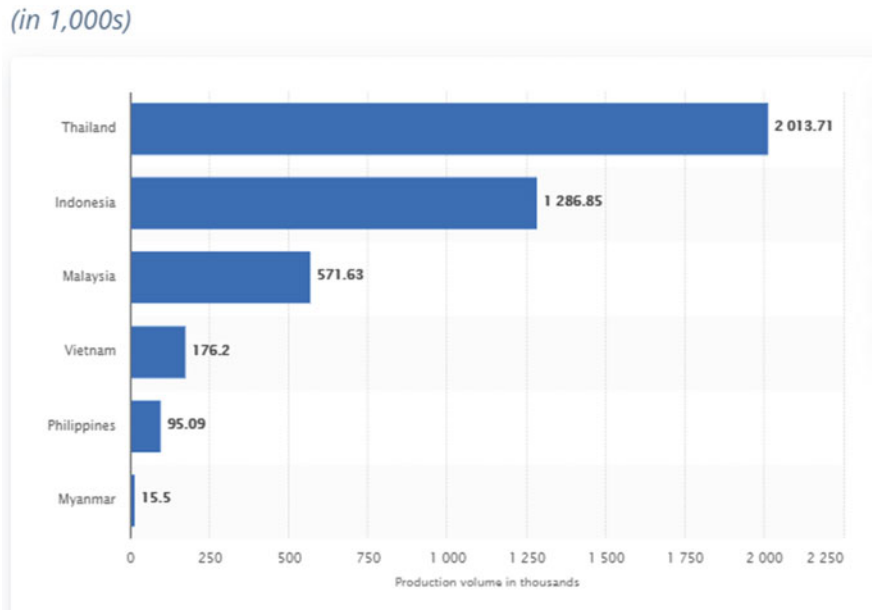

Fig. 3 Production volume in 2019 by country (MAA, 2020)

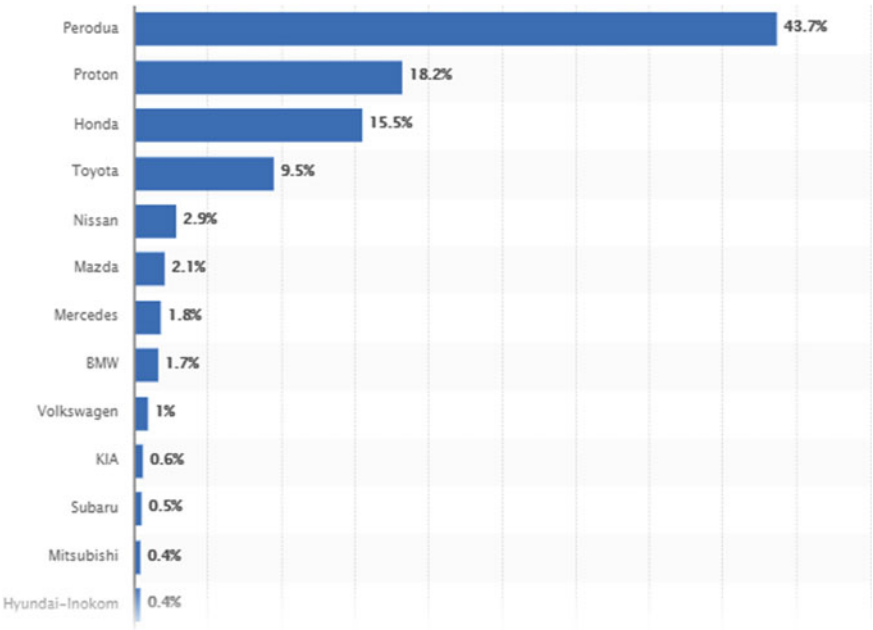

Fig. 4 Market share by brand 2019 (MAA, 2020)

The market share explained above shows that there are huge differences between total sales between national segments which are Proton and Perodua compare to other non-national brands. ABC Company which is a key player in the non-national segment in Malaysian automotive industries by holds a big percentage in market share in total industry volume especially in the non-national brand segment. Several achievements have been recorded for the years of 2020:

(a) ABC Company being nominated as number one for the non-national segment for six consecutive years from 2014 until 2020. (Awarded by MAA)
(b) ABC Company was nominated as first runner-up for Malaysia's 100 Leading Graduates for the automotive segment for the year 2020. (Awarded by GradMalaysia)
(c) ABC Company awarded as the Best Employer Brand Awards for the year 2020 (Awarded by Employer Branding Institute)
(d) ABC Company awarded as Most Attractive Graduate Employer to Work in 2021 (Award by Talentbank).

Despite recognition received by ABC Company, there is a little guarantee on the customer preference, market situation, customer demand, customer perception, and other factors that will determine either ABC Company will keep expanding as the customer loyalty increase or being overtaken by other competitors due to potential of customer brand switching. A previous study conducted by Ariffin and Sahid (2017) on the competitiveness analysis of ASEAN automotive industry, (Wad & Chandran Govindaraju, 2011) on the Malaysian automotive industry development assessment, (Tai & Ku, 2013) on the political-economic analysis of automotive industrial policies in Malaysia and Thailand, and other general study related to competitive advantage and customer loyalty either in Malaysia context or globally. There is a limited study conducted for non-national automotive industries in Malaysia especially in ABC Company on the dimension of competitive advantage that contributes to customer loyalty.

3 Literature Review

3.1 Customer Loyalty

Customer for current era and generation is different compare to previous decades since the customer has sort of information and choices for a product and services which every company tries to penetrate and emerging market over globally. According to Juanamasta et al. (2019), the role of customer service is essential to create customer loyalty by providing quality service to the customer by implementing Customer Relationship Management (CRM). CRM is a helpful tool to have communication with the customer is deemed very effective in delivering services to them. This can be the basis of acquiring new customers, care, maintaining, and

developing customers. Many problems faced by a company lead to a bad image and will reduce the level of customer loyalty. Service to the consumers is very important in increasing the satisfaction of them then increase the intention to re-purchase or have deals with the same company as a sign of loyalty (Juanamasta et al., 2019).

Another perception from a profound study conducted by Xhema et al. (2018), on the corporate image, switching cost, and product quality can affect customer loyalty in which companies are highly oriented customers and become a center of attention. Companies invest in the database which required huge amounts of money, so they can focus on customers that bring more profit to the company. Thus, many global companies focus on penetrating the market to gain new customers however new customers cost a lot of time and money due to required information on customer preferences, forecasts, databases, and find solutions. Alternatively, focusing on loyal customers seems to be difficult but can reduce costs and improve profitability. Thus, essential for a company to enhance its competitive advantages so that it can improve on customer loyalty.

In terms of automotive industries in Malaysia, there are relationships between service quality, customer loyalty, and brand image after sales at national automotive service centers in Malaysia (Saidin et al., 2020). According to the study, customer loyalty was affected 87% by brand image and service quality at the service center. Customer satisfaction in terms of service quality will directly correlate with customer loyalty. This will help to deter customers from switching to another brand. There are 27% of consumers reported switched to another brand due to not meet their expectations. This study is conducted on a national carmaker which is Proton. Proton was able to get the highest sales during the early years of introduction among ASEAN countries however, already fell to third place due to stiff competition with other brands.

Various study has been conducted previously prove that the behavior of customers changes drastically. Scherpen et al. explained in the research entitled customer experience management to leverage customer loyalty in the automotive industries, management plays a big role in the current digital age to reach sustainable enterprise and long-term customer loyalty. According to a survey conducted and Germany, France, and the United Kingdom about the relevance of customer experience management, 70% of the sample test believed that this approach was a central success factor for their company strategy in the digital age. Dr. Dieter Zetsche, Head of Mercedes-Benz Car and Chairman of the Board of Management of Daimler AG stated that: "We are transitioning from car manufacturer to networked mobility provider, whereby the focus is always on the individual—as customer and employee" (Daimler, 2016).

Based on the above literature mention that customer loyalty is the major factor that contributes to profitability and enterprise growth. Most of the studies conclude that after-sales quality, customer relations, corporate image, and others contribute to customer loyalty. However, there is a limited study related to customer behavior on purchase intention due to competitive advantages of a company based on product offer to them such as market uniqueness, price tag, leadership, product features, and promotion. Thus, essential to extend the study on this dimension to determine either have a positive correlation with customer loyalty.

3.2 Competitive Advantage

The automotive industry in ASEAN already passed thirty years under different automotive policies, regulations, and approaches leasing to variation of performance among the countries. Ariffin & Sahid, (2017), conducted a study related to comparative analysis of ASEAN automotive industries which compare between Malaysia and Thailand industries. The differences between both Malaysia and Thailand are mainly due to the policies adopted in which Malaysia utilizes independent development while Thailand utilizes dependency development (Wad & Chandran Govindaraju, 2011) as shown in Tables 1 and 2.

The 'Independent development" strategy is applied to establish a national brand while "dependency development" has made its domestic automotive industry as a part of the worldwide supply chain (Tai & Ku, 2013).

In the study utilizing Porter Five Forces analysis (Ariffin & Sahid, 2017), compare: (a) bargaining power of buyer, (b) bargaining power of supplier, (c) threat of substitute product, (d) threat of new entrant, and (d) intensity of rivalry which leads to the conclusion of Malaysian automotive industry is at the turning point which will see a huge potential for foreign investor or MNCs to invest and expand in Malaysia such as the latest condition on 2018 where a strategic partnership occurred between Geely Auto and Proton as China is the largest car manufacturer in Malaysia compare to Thailand which already saturated and dominated by Japanese and American manufacturers. Below Fig. 5 presented the comparison between Thailand and Malaysia.

According to a different researcher, (Wad & Chandran Govindaraju, 2011), argued on the assessment of Malaysian automotive industry development: (a) Why the Malaysian-controlled automotive industries have not become internationally competitive, and (b) whether Malaysian automotive sector can become a regional and global

Table 1 Automotive Policy /Strategy Malaysia vs Thailand (Wad & Chandran Govindaraju, 2011)

Automotive Policy 1 Strategy	Advantages	Disadvantages
Thailand Dependency Development!	• ••Smaller financial burden, on. the government • ••Less Pressure on she opea market	» Hie' automoave industry Ls dominated by foreign capital * More difficult to develop the economic scale of mass production § Cannot bring about the growth of rekted industries
Malay & La Independent Develop mean	• ••Protection brings mass production • ••More likely to support the growth of related industries • ••Can use th.fr home coimtiy[1]s resources	§ Greater financial burden on the government * Over-protection cannot res-pond no pressure from trade liberalization

Licensed to (putm@utm.my)

Table 2 Comparative Automotive Policy of Thailand and Malaysia (Tai & Ku, 2013)

Thailand	Malaysia
• Increasing Productivity by develop Thailand automotive industry to an industry wide lean supply chain and. creating production supply chain network to enable comparison of competitive advantage, thereby mate Thailand automotive industry highly competitive • Expanding domestic and ASEAN markets by developing smaLl passenger car together with maintain Thailand position as the production base for pick-up truck. Also develop infra sanctures to increase efficiency in transportation • Develop design and engineering Technology as a foundation of sustainable and systematic competitioa and value creation, using technology roadmap as an. esseatial tool to enable collaboration, oa research and. development and testing projects • Develop human resource by incus ay-wide development of human resource in management and production. Human, resource development is a key factor in. creating competitive advantage for Thailand automotive industry emphasising on formal education system, training system thai meet the industry demand • Promote domestic and. foreign Investment to promote the industry growth and linking to international Level	**To develop a competitive and capabLe domestic automotive incus ay *To develop Malaysia as the regional automotive hub m Energy Efficient Vehicle (EEV) **To Increase value-added activities in. a sustainable way while continuously developing dom^sac capabilities *To Inc rease exports of vehicle s. auto mo tiv e components, spare partis and related products In the manufacturing and after market sectors *To Increase the participation of competitive Bumiputera companies in the domestic automotive industry, meluding in the after-market sector *To safeguard consumer interests by offering safer and better quality products at c ompe titiv e p tic e *To enhance the ecosystem of the manufacturing and after mark en sectors of the domestic automotive industry

in the export industry? (Wad & Chandran Govindaraju, 2011) criticizes that the automotive industries still lack of product upgrading and technological specifically among parts and component supplier, weak global marketing capabilities and low level of skills among employee. Another criticizes for the stimulus packages offered by the government which targets the national automotive sector only, thus discriminate against the non-national brand and turning them not to invest in Malaysia.

Another perspective study conducted by Mohd Rosli (2012) on the Malaysian small and medium enterprises competitive strategy, there are several findings which are: (a) price setting, marketing, and promotion are the most competitive strategies emphasized by manufacturing SMEs, and (b) Less exposure and adoption of innovation and global orientation in their competitive strategies in which low investment on R&D and least emphasis on the application of internet in business to go global. The study conducted by Mohd Rosli (2012) may reflect on the local automotive supplier in which supplies to the car manufacturer however, the study more focus on food and beverages (F&B) and textile and clothing (T&C) industries.

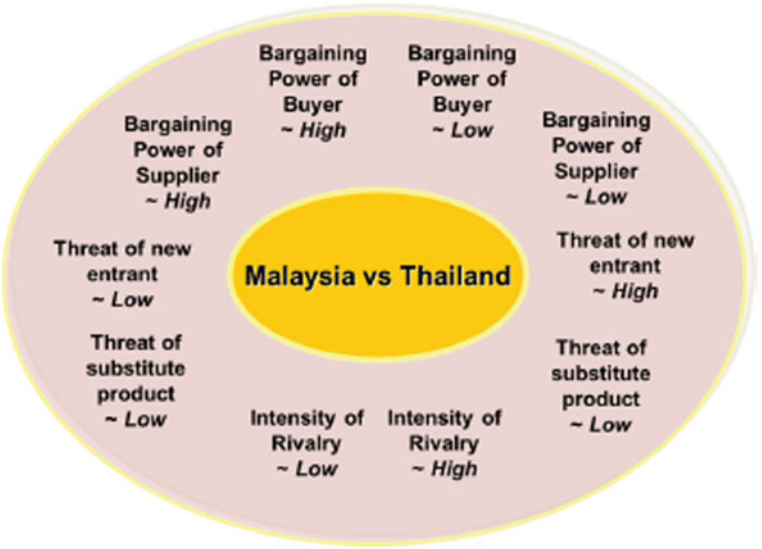

Fig. 5 The five competitive forces analysis for automotive components and parts industry (Ariffin & Sahid, 2017)

There were limited studies on the factors that contribute to the competitive advantage of automotive industries MNC in Malaysia. One of the researcher's objectives is to add to the existing theories or works of literature and to increase value to the body of knowledge especially in the automotive industry.

Previous studies on competitive advantages, a lot of dimensions have been tested towards customer loyalty in various industries such as policies adopted by the government in Malaysia (Ariffin & Sahid, 2017); 4Ps concept in related to influence customer (Büschken, 2007); market uniqueness and environment in ASEAN (BOI, 2015); inter-relation between price offer by a brand at a store with the perception of brand, perception of store and perception of price that will lead customer to have perceived of quality, thus customer will have perceived on the amount of sacrifice needed to purchase a product (Dodds et al., 1991); strategic alliances through good leadership conceptualized on how the China banking industry to keep competitive (Chia, 2009); assessment of automotive industry development in Malaysia that the combination of high marketing and high technology in the industrial policies will attract and nursing FDI in strategic sectors of economic development (Wad & Chandran Govindaraju, 2011); price setting, marketing and promotion, exposure and adoption of innovation and global orientation lead to low investment on research and development (Tai & Ku, 2013); dependency development or independent development adopted by government either protect national car or open market strategies (Tai & Ku, 2013); utilizing Porter Five Forces analysis to compare each competitors through: (a) bargaining power of buyer, (b) bargaining power of supplier, (c) threat

of substitute product, (d) threat of new entrant, and (d) intensity of rivalry which lead to the conclusion of Malaysian (Ariffin & Sahid, 2017).

Based on the literature explained above, the researcher extends this study in dimensions of competitive advantages which relevant to customer loyalty specifically in automotive industries such as: (a) market uniqueness, (b) price tag, (c) leadership, and (d) product features. The literature for the aforementioned dimensions will be elaborated on in the next section.

3.2.1 Market Uniqueness

Over the last three decades, the marketing literature focused on brand studies which are mostly due to brand image. If the company creates strong brand values, the customer will surely seek the value of the brand and reject other alternatives. However, in the current globalization era, consumers have a lot of brand selection with the most identical value, thus consumers have a lot of alternatives. According to Lanza, (2008) , in the automotive industry for the past 30 years in U.S automotive industry, car manufacturers over-manipulated their brands and made the marketplace confusing by offering conflict of brand image, therefore diluting all of the values offer by others and become the most desirable automotive brands.

According to Dodds et al. (1991) on the research related to effects of buyers' product evaluation based on the store information, price, and brand, there are key determinates of brand satisfaction is related to market uniqueness such as: (a) quality, (b) value, (c) equity, (d) brand commitment, (e) interact to discover brand loyalty and (f) repurchase intention. Specifically, (Dodds et al., 1991) point out that superior financial performance, loyalty, and customer retention are linking to brand satisfaction, quality, commitment, and value.

In the 1950s, marketing theories being developed to include the exploitation and manipulation of market demand by winning the battle for customer's choice (Gupta & Wang, 2007). Marketing mix strategies being adopted by MNCs as defined by Büschken (2007) related to influence customer demand. The 4Ps concepts which are: (a) the product or service, (b) the price imposed and the terms associated with the sale, (c) promotional, communication activities, and advertising, and (d) the place where the product was sold including the logistics and distributions process involved.

A profound study conducted by the Thailand Board of Investment, Thailand being nominated as the automotive hub of Asia as become the biggest automotive producer in ASEAN and also being number 12^{th} in the world. Thailand expects to increase its production by 3.5million units in 2020 or definitely increase 80% compared to 2016 (BOI, 2015). Thailand Board of Investment mention the market of Thailand is unique to other countries in ASEAN due to the uniqueness of the market and environment which are:

(a) The geographical advantage which Thailand is located at the center of Indochina Peninsular thus connected with 2 billion people in ASEAN and China by land and sea with world-class infrastructure provided. Furthermore, the third phase

extension of Laern Chabang deep-sea port is expected to provide capacity up to 3million cars being export.

(b) Eastern Economic Corridor (EEC) which Thailand promoted 13,285km^2 of EEC due to the advantage of automotive production is reinforced and developed by supporting facilities and special investment policies. An example of advantage is EEC will provide National Automotive Tire and Testing Centre which is the only testing center in ASEAN and ready for tire and carmakers in 2018.

(c) Abundant skilled labor which Thailand consists of 600,000 workers in automotive industries in 2016 with the advantage of 29 universities and other institutes which provide automotive and mechanical engineering programs that will lead to an adequate supply of graduates and forecasted by 2021, 61% of all workforces in Thailand industry are high-skilled labor.

(d) Research and development (R&D) which most of the car manufacturers in Thailand established their R&D such as: (1) Toyota Motor Asia Pacific Engineering and Manufacturing, (2) Nissan Technical Center South East Asia, (3) Isuzu Technical Center of Asia, (4) Honda R&D Asia Pacific and (5) Mitsubishi Motors Proving Ground.

(e) Investment incentives linked with national development activities which wide range of tax and non-taxable incentives being offered by the Thailand Board of Investment such as corporate income tax exemption for 8 years without a cap for research and development activities.

3.2.2 Price Tag

According to Gupta and Wang (2007), "designing products and services that can be manufactured and delivered at ultra-low prices while yielding satisfactory profit margins". This statement is supported by Knab (2008) on the research study going global by implementing re-invention that requires products and services that can be manufactured and delivered at ultralow prices while the profit margin is at a satisfactory level. Toyota Motor Corp.'s launched efforts to develop and manufacture an ultra-low-cost car for an emerging market such as India, China, and other emerging markets as an approach.

Knab (2008) on the same research found that most of MNCs focus on selling products identical and similar to those in their domestic markets, thus the product offers higher quality and sells at the higher price, therefore, targeted to the wealthy customers because of status associated with owning imports, their designer nature, and inherent quality. The draws by implementing this strategy only allow MNCs to capture a small percentage of the total market while they rather than focus on potential mass-market consumers at the bottom of the economic pyramid.

Based on the profound study by Juanamasta et al. (2019), there are inter-related between the price offered by a brand at a store with the perception of the brand, perception of the store, and perception of the price that will lead the customer to have perceived of quality. Then customers will have perceived the amount of sacrifice needed to purchase a product. Combining both perceived quality and price will

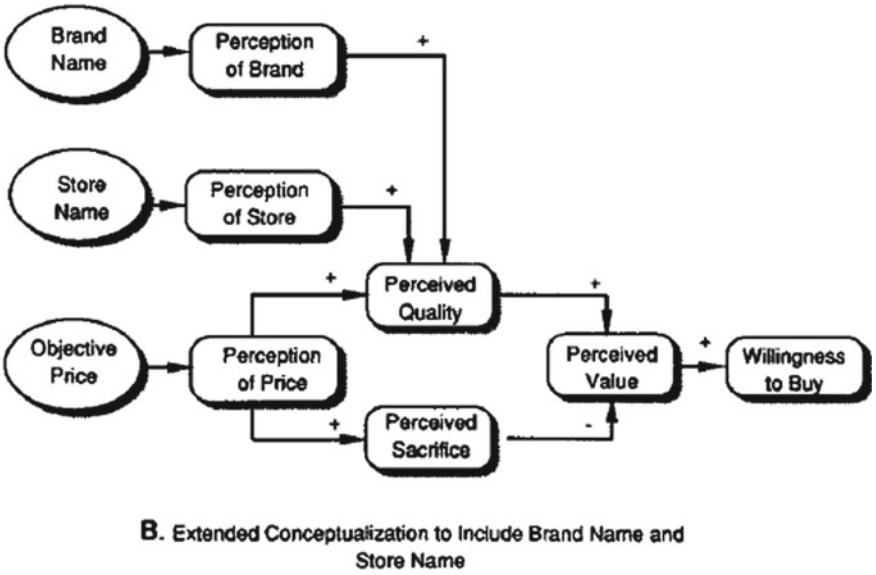

Fig. 6 Conceptualization of brand name, store name, and objective price (Juanamasta et al., 2019)

determine the perceived value that will turn directly influences willingness to buy. This correlation can be seen in Fig. 6.

According to Büschken (2007), although customers mostly seeking for low-priced, arguably cars do not fall into this category which cars represent almost a major percentage of household's consumption expenses and use for a longer period. In addition, certain aspects of new cars such as durability, maintenance cost, and resale value cannot be determined before purchase, thus can be concluded purchase of a new car is risky. Büschken (2007) conduct research on attributes that lead the customer to have purchase intention which are: (a) reliability, (b) workmanship, (c) price worthiness, and (d) service quality that brand's dealer.

According to Young (2014), there are two views on the price effect towards competitive advantages in study regarding competition between private labels and national brands for fresh milk. As for (a) competitive view, lower-priced for the private label will provide an incentive for a national brand to lower price to be competitive in the market. (b) Market segmentation view which the introduction of private labels leads to higher branded prices. (Young, 2014) explained most retailers have the ability on pricing power, so they have an incentive to raise their brand price and induce customers to switch from the national brand since retailers earn higher margins on their brand.

Ariffin & Sahid (2017) mentioned that interest rates for the car loan and fuel price also contribute to the price offer. Overall interest rate levels remain quite low and also easy to get loan approval to encourage many young graduates to manage to own

national cars for the first few years and the experience or other professional workers most likely upgrading from national car to non-national brands.

3.2.3 Leadership

According to Northouse (2012), there are four elements in leadership: (a) leadership is a process that leaders use to affect a group of people, not a trait or a characteristic of leaders nor a one-time event, (b) leadership involves influence to affect followers' behavior and minds (c) leadership occurs in a group situation, not in single person context, and (d) leadership involves the same goal with the team as a common goal.

Based on profound research conduct by Matsui (2013) related to leadership development of western companies in Japan, only 29% of the U.S workforce is properly engaged and almost 71% does not have proper engagement with leaders and management, thus influence organization productivity thus cost incurred huge amount of dollars every year. Besides productivity, employee disengagement leads to increase turnover cost which the cost impacts two times employees' annual salary. Matsui (2013) added that the impact goes worst with the industrial restructuring, series of specific changes in acquisitions and mergers on a global scale resulting in the weakened economic power of corporations. Effective leadership is one of the keys to increasing productivity and employee engagement.

According to Israel (2018), leadership is one of the major factors that contribute to a company which top executives are responsible towards that as well as designing conditions that can guarantee organization survival. Business organizations need leaders who understand how to handle organizational issues and work closely with culturally diverse employees and customers. There is the impact of strategic decisions fail due to mistakes of the top executive which are: (a) their personal interests interfere with their vision for the organization; (b) they are involved in, or accept, unethical behavior; (c) they have disregard for quality, innovation, and productivity, depending too much on intuition to the detriment of logical analysis; or (d) they allocate money and time injudiciously or irresponsibly.

Chia (2009) conceptualizes that in the globalization era and under exaggerate competitive environment, enhancing competitive advantages are the key towards that. Based on the profound research on the China banking industry to keep competitive, three variables contribute: (a) Strategic alliances by linking with a partner to acquire capabilities and resources could enhance competitive advantages, (b) relational asset enhancements by building relational capital with alliances that beneficial for learning, know-how transfer and, (c) linkage for assets exchange between alliances. Chia (2009) added that the foundation of relational capital includes relationship building, respect, friendship, and mutual trust in the alliances. Foreign banks could invest in the domestic bank as competitive advantages in the Chinese market which consists of a unique socio-economic environment and culture.

In terms of Malaysia perspective, (Ariffin & Sahid, 2017) explained in the threats of new entrants for the comparison between Malaysia and Thailand automotive industries, Thailand will continue with the domination of Japanese manufacturers, thus

allowing the potential for global Original Equipment Manufacturer (OEM) companies to invest in Malaysia. This correlation is proven by Ariffin and Sahid (2017) on the strategic alliances between Proton and China automotive Geely foresee the new entry of components manufacturer in Malaysia.

Tai & Ku (2013) added that the decision of strategic alliances by leaders will determine the competitive advantages of Malaysian automotive MNCs although the policies regulated is protective for the national brand such as Proton and Perodua. Examples of the strategic alliance such as DRB-Hicom and Honda, UMW and Toyota, Mazda and Bermaz, Naza with Kia, and Inokom with Hyundai. The strategic alliances offer competitive product offer to the local marketplace. The argument can be supported by the decision of manufacturers either to fully import completely build units (CBU) or manufacture in Malaysia through a complete knockdown scheme (CKD) in which the tax and incentive offer has a huge difference. Hence, local assemble CKD will have better advantages (MAA, 2020; MITI, 2014).

3.2.4 Product Feature

Wad & Chandran Govindaraju (2011) explained in the assessment of automotive industry development in Malaysia that the combination of high marketing and technology in the industrial policies will attract and nursing FDI in strategic sectors of economic development. Local manufacturers and firms are unable to excel in both high marketing and technologies except to increase their competitive advantages through import and adopt the technologies from a developed country such as Japan, United Kingdom, Germany, China, and others. Wad & Chandran Govindaraju (2011) added that average around 2% of investments in R&D and technology which are still low in Malaysia durin the period of 2000 to 2005 and spending only 0.14% on other equipment manufacturers.

According to Tai and Ku (2013) in a thesis related to the comparative political-economic analysis of automotive industrial policies between Thailand and Malaysia, criticize the automotive industries in Malaysia is way behind compared to Thailand. From the perspective of the economic point of view, the competitive advantages of Thailand automotive industries lie into following elements: (a) industrial technology, (b) export capabilities, (c) product cost, (d) manufacturing capacity, and other measures of industrial competitiveness. The details in Table 3 show the comparison between Malaysia and Thailand based on research by the Japanese Automotive Manufacturers Association (JAMA).

Tai & Ku (2013) added that the government keeps continuing its protection and intervention although Malaysia set up the industrial scale of automotive industries, Malaysia still not consider as industrial self-reliance. The policy of state protection caused complacency and laziness in operations, and the local management lacks the power to seek for cost optimization, thus lead to low production efficiency. On other hand, Thailand's automotive industries courted MNCs by brought capital and also advanced management and technology methods.

Table 3 JAMA Manufacturing Capacity Ratings for Thailand and Malaysia (Tai & Ku, 2013)

Item	Thailand	Malaysia
Engine	High	Low
Engine parts	Hifih	Low
Electronic systems	Hifth	Standard
Braking system	Standard	High
Interior	High	Low

The current study conducted by MITI (2014) as the review performance of NAP 2014 which is the third version after first introduced in 2006 and second revision in 2009 stated that the key objective of NAP 2014 was to be ASEAN hub for Energy Efficient Vehicles (EEV) through the R&D development, right-hand drive (RHD) vehicles development capabilities and associate technologies such as light material, fuel efficiency, telematics, component design, and tooling. The effort by the government to provide facilities for automotive technology by the establishment of Centers of Excellence (COE) which is the technology centers (MAA, 2020) such as (a) Malaysia Technology Center, (b) National Test Center to implement and educate supply chain and also car maker to utilize Industrial Revolution 4.0, and (c) Automotive design center.

In connection with above mentioned on the key achievement of Ariffin and Sahid (2017) supported that the third version of NAP will see a positive impact for foreign investors to invest in Malaysia after once dominated by the domestic market. This is due to the protective policies have been amended and strategic alliances between national brand, component manufacturers with foreign investor already emphasized towards the fourth revision of NAP which is NAP 2020. The NAP 2020 will continuously cultivate the participation of local car manufacturers and suppliers in both global and domestic supply chains, encourage R&D, and build capacity also capabilities of the local workforce, and enhancing investments, exports, and local production volume.

3.3 Relationship Between Competitive Advantages and Customer Loyalty

The aforementioned literature in the previous section explained the selected dimensions of competitive advantages such as: (a) market uniqueness (BOI, 2015; Gupta & Wang, 2007), (b) price tag (Ariffin & Sahid, 2017; Dodds et al., 1991; Young, 2014) (c) leadership (Israel, 2018; Matsui, 2013; Tai & Ku, 2013), and (d) product features (MAA, 2020; Wad & Chandran Govindaraju, 2011). Four hypotheses have been constructed to verify the correlation between the dimension of competitive advantages and customer loyalty:

H_1 Market uniqueness has a direct positive influence on customer loyalty.

H_2 Price tag has a direct positive influence on customer loyalty.

H_3 Leadership has a direct positive influence on customer loyalty.

H_4 Product features have a direct positive influence on customer loyalty.

4 Theoretical Framework

Customer loyalty is being utilized as an indicator of competitive advantages for a company. There is much literature, modern research on customer behavior in dealing with factors that contribute towards customer loyalty. The theories have been extracted from a theory explained by Shiftan et al. (2015) with research on measuring passenger loyalty to public transport modes. Customer loyalty is derived from three types of product values which are; (a) switching value which reflects the technical effort in switching from one product to another; (b) hedonic value which captures the reflection of emotion experienced by the consumer associated with the products in their mind; and (c) utilitarian value in which represent the functionality of the product to the consumer (Shiftan et al., 2015). The outcome obtained from the model yields the level of satisfaction and repeated choice of products. Satisfaction is the 'consumer fulfillment response … a judgment that a product or service feature, or the product or service itself, provided a pleasurable level of consumption…,' whereas loyalty is a 'deeply held commitment to re-buy or re-patronize a preferred product or service consistently in the future (Oliver, 1996), emphasis added).

Satisfaction is described as a short period judgment of the product, hence loyalty reflects the consumer's commitment and attitude toward the product in the long term. Loyalty creation has been divided into four stages (Oliver, 1996):

(a) Cognitive loyalty is described as knowing—the loyalty created after a short experience with the product, based on the level of satisfaction with the product's physical characteristics.
(b) Affective loyalty is described as an attitude—the creation of an attitude toward the product after a significant period of experience, including a personal commitment toward the product.
(c) Conative loyalty is described as intention—the creation of intention to re-buy the product and an emotional feeling toward the product.
(d) Action loyalty described as re-buy—the highest level of loyalty, involves automatic re-purchasing of the product and blindness to competitors.

Based on literature explained and underpinning theory related to the dimension of competitive advantages in relation to customer loyalty, a research conceptual framework has been constructed to test the direct correlation as below (Fig. 7).

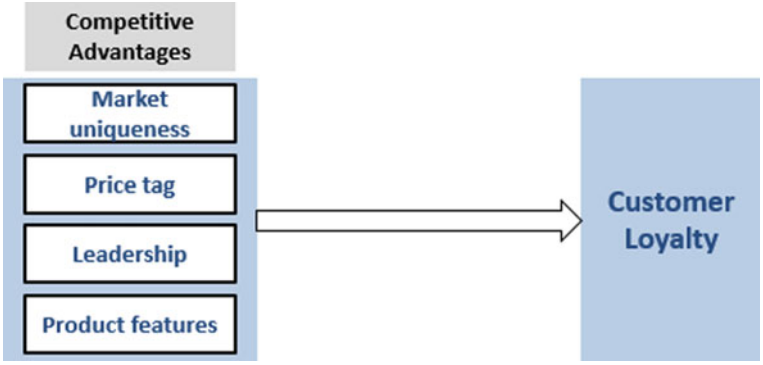

Fig. 7 Research conceptual framework

5 Research Methodology

This research objective is to study dimensions of competitive advantages towards customer loyalty for Malaysian automotive industries in Malaysia. Therefore, a non-experimental design method being implemented which correlation study was conducted to test dimension (independent variables) towards the customer loyalty (dependent variable). Research design is the key structure and strategy to be adopted by the researcher efficiently and effectively throughout the research (Hair et al., 2007).

Based on the previous literature as discussed in the following studies (Mohd Rosli, 2012; Ariffin & Sahid, 2017; Barney, 1995; Knab, 2008; Israel, 2018; Tai & Ku, 2013; Wad & Chandran Govindaraju, 2011), the researchers who had performed similar studies i.e. factors contribute to competitive advantage preferred to adopt the quantitative analysis method. According to Ticehurst (2000), the quantitative analysis method is dependent on numerical results and provides conclusions in systematic ways. Another advantage of utilizing the quantitative analysis technique provides a wide range of research coverage, and it is more efficient, effective, and economical.

All of the data gathered were verified and analyze through Statistical Package for Social Science (SPSS—Ver.22) tools, therefore the outcome such as correlation coefficient, reliability and validity, and multiple-regression are accurate (Ticehurst, 2000).

The methodology of this research is conducted and ends with validity and reliability. The purposive population is consists of 10,000 customers who still choose to maintain and service in ABC Company although their warranty already expired at Melaka region only through convenient sampling method. Thus, recommended sample based on (Krejcie & Morgan, 1970) is 370 respondents to obtain appropriate and accurate data. In the next study, the research design and data analysis method were executed and being performed to interpret the data to collect from the respondents. The data will be translated into figures, tables, and charts, thus easy to analyze and interpret.

Licensed to (putm@utm.my)

6 Conclusion

Based on the background study, literature from previous researchers and a pertinent study conducted on the customer loyalty, hypotheses, and research framework have been constructed to verify the correlation between the dimension of competitive advantages such as market uniqueness, price tag, leadership, and product features towards customer loyalty. This research is important to study the dimensions that lead to answering why the customers are loyal to a significant brand, thus ABC Company can have a special marketing strategy and improve their customer relationship in order to keep enterprise growth and sustainability in Malaysia.

Factors Influencing Car Buyers Purchase Decision During COVID-19 in Malaysia

Mohd Fadzly Suboh, Nurhanan Syafiah Abdul Razak, and Muhammad Alshurideh

Abstract Consumer behaviours are largely regulated by multiple factors from need recognition to search for products that would satisfy their requirements. The study in context to car purchase behaviour among the Malaysian consumer highlights increased car buying trends among the Malaysian consumers during the pandemic. Social distancing along with prohibiting the usage of public transport has increased difficulties of consumers thereby resulting in an increased tendency to opt for personal cars. Products features such as fuel consumption, reliability, comfort and performance that provide value and upgraded functionality plays a big role in purchase decision-making. Derived from the the product features leads to brand trust and inspired the decision to buy from the same brand. Affordable and acceptable ownership costs and the consequence purchase power plays important factors in influencing car purchase decision. Higher income people favouring more expensive cars and the subsequent high ownership costs. At the same time, social needs during the pandemic situation has prohibited individuals from close contacts and gatherings that further requires the consumers to purchase cars. COVID-19 pandemic that was known to be airborne and transmittable diseases had truly fundamental impact on purchase decision especially for car buyers. The research examine the correlation of consumer behaviour towards purchase decision specifically in Malaysian context. This research

can be used as guidance to map the consumer behavior while providing future and practical insights for carmakers towards reviving car industry that being one of the hardest hit by the pandemic.

Keywords Purchase decision · Consumer behaviour · Product features · Ownership costs · Social needs · Purchasing power · Brand trust

1 Introduction

The automobile industry was coping with the downshift in the global demand during COVID-19 pandemic. The lock-down scenarios during this pandemic led to widespread customer confidence loss which had a significant impact on the profitability and revenue of the automakers. The automobile companies in Malaysia also were forced to stop their investment in their continued operations. Funding in the R&D process was also ceased for which technological advancement had not taken place in this industry during this period. The global car sales declined by 20% in 2020 which is depicted in the below figure. In 2018, the automotive industry grew by 3% which was down to 1.9% in 2019 (Deshpande, 2019) (Fig. 1).

Different liquidity issues were also faced by the suppliers and therefore the condition of the market deteriorated. In 2018, around 25 M commercial cars and 70 M cars were made. The wellbeing of the citizens of the world, as well as the economy of the country, is dependent partially on these vehicles. The enhanced rate of car manufacturers increases the rate of employment of a country (Kim, 2020). Due to health concerns, the mobility behaviour changed as most of the customers worked from home while others stayed away from public transportation.

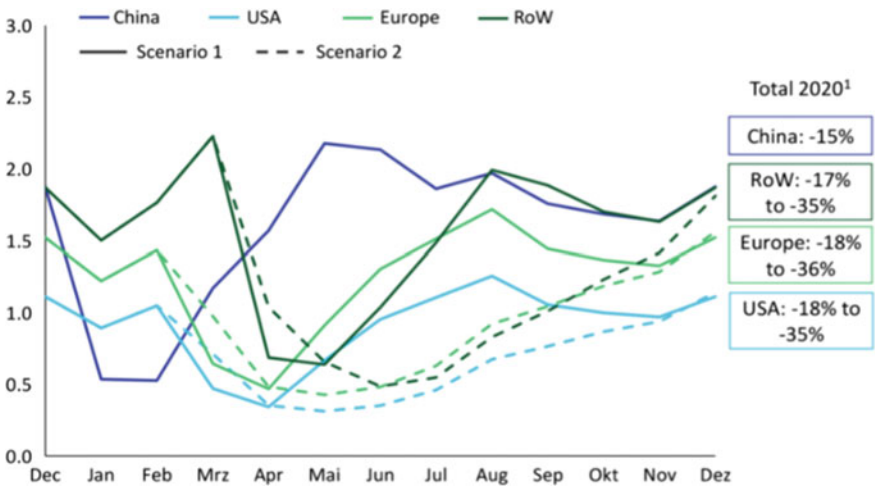

Fig. 1 COVID 19 impact on a global car sale, 2020. *Source* Deshpande (2019)

The car purchasing decisions of the customers are dependent on different factors such as product features, social needs, ownership costs, and brand trust. However, there was a severe and swift impact of COVID 19 on the global automobile industry in 2020. Hence, the large-scale manufacturing process was interrupted all across the world during the outbreak of this pandemic. Consumer behaviour during the pandemic includes lowering the perceived infection threat (Shakibaei et al., 2021). There were also some external factors such as unexpected health emergencies and internal factors such as personal life and attitude that changed the purchasing behaviour of consumers during the pandemic.

2 Background Study

The annual sales of the global automobile industry are predicted to reach 110 M units by 2022. In order to meet the short-term threats, the manufacturer may have to dedicate CAPEX (capital expenditure). It has been seen that the car purchasing rate is higher among the high-income households in Malaysia. As per the view of previous study on current situation, most of the customers are interested in contactless service (Tardivo et al., 2020) (Fig. 2).

The sales of the automobile industry fall to 70 M units in 2021 and it is expected that this industry will grow by 9 Trillion dollars by 2030.

Number of New Motor Vehicle Registration in Asia Before the Pandemic

In Table 1, the numbers of registered cars in Asia before the pandemic have been highlighted.

Background of Car Purchase Decision During COVID 19

In order to manage the challenging and serious situation, the government of Malaysia had taken different stimulus policies and among them, the most important policy was tax reduction in vehicle purchase (Kumar, 2020).

Figure 3 depicts that the car purchasing decisions of the customers are dependent on need recognition, information search, and alternative evaluation. The purchasing decision during the pandemic was declined as there was a low need for automobiles in the lockdown scenario (Esposti et al., 2021).

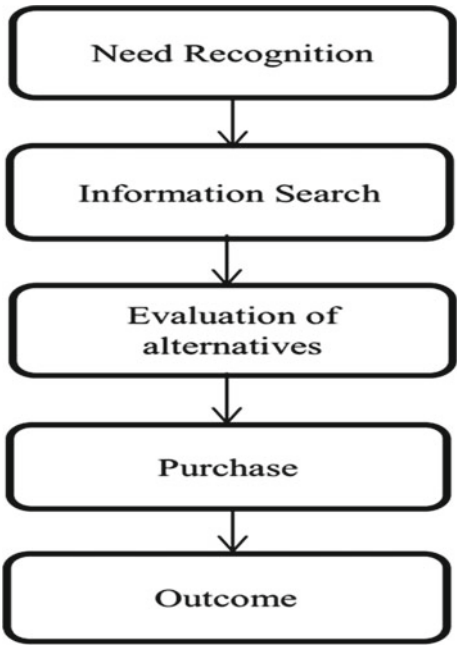

Fig. 3 Consumer decision-making model. *Source* Kumar (2020)

Background of the Car Purchasing Decision Influencing Factors

Consumer behaviour during the pandemic includes lowering the perceived infection threat (Shakibaei et al., 2021). There were also some external factors such as unexpected health emergencies and internal factors such as personal life and attitude that changed the purchasing behaviour of consumers during the pandemic.

As for **product features**, during the pandemic most of the consumers were seeking safety features such as remote vehicle diagnostic and emergency assistance in their vehicles (Awad-Núñez et al., 2021). In the meantime, consumers are attracted by the free and extra product benefits or features of the companies. The features that are in demand in the automobile industry include the availability of spare parts, technical support, and warranty (Bhaduri et al., 2020).

The car **ownership cost** notably includes a monthly repayment but also includes different factors such as petrol cost, road tax, and premium for car insurance (Sheth, 2020). According to recent research, the high car price had affected the purchasing decision of the customers (Garaus & Garaus, 2021).

It has been seen that the major **social need** during the pandemic was social distancing. Different social issues were raised during the pandemic such as lower Gross Domestic Product (GDP) rate as well as the unemployment rate (Abdullah et al., 2020). It has also been analysed that the rate of social media purchasing was increased during the pandemic. The Malaysia's GDP rate in 2020 was −5.59% while the unemployment rate was 4.55% in Malaysia as per (O'Neill, 2021). Thus, it is clear that this lower GDP and high unemployment rate significantly affected the car purchasing power of the customers.

It has been seen that during the COVID-19 pandemic, safety and health became the paramount concern. Thus, changes in the economic condition changed consumer's **purchasing power**. The rate of employees laid-off increased during the pandemic which has affected the purchasing power of the customers (Leow & Husin, 2015). It has been seen that the average income of the Malaysian people during this pandemic was RM 2093. The annual household income of this country fell by 15.5% in the year 2020 (Jabatan Perangkaan Malaysia, 2021). The customers had tuned concisely during the pandemic, it affected their purchasing power (Raza & Masmoudi, 2020).

The availability of service centres, waiting period, brand value as well as dealership reputation are considered as **brand trust** influencing factors (Leow & Husin, 2015). It has been seen that due to improved brand trust in Malaysia, the national carmaker Proton's sales volume was 108.52 thousand units in 2020 despite the outbreak of the COVID-19 pandemic (Müller, 2021).

Since the COVID-19 pandemic, there are little guarantee that factors such as product features, ownership cost, social need, purchasing power and brand trust will continue to have the same influence on car buyers behavior to purchase cars. Previous COVID-19 study focused on travel behavior and preference mode of transport such as Awad-Núñez et al. (2021), Bhaduri et al. (2020), Garaus and Garaus (2021), Kumar (2020), Shakibaei et al. (2021) and Abdullah et al. (2020). Meanwhile, previous researchers like Leow and Husin (2015) had emphasized on car buyers purchase decision during non pandemic period. However, there are some researchers such as

Raza and Masmoudi (2020) who focused on the scope of Bahrain's consumer vehicle purchase decision-making during COVID-19. There is a limited study conducted for car buyers in Malaysia especially during the pandemic on the dimension of consumer behaviour that contributes to purchase decision.

3 Literature Review

3.1 Purchase Decision

Purchase decision in context to availing cars among the Malaysian citizens is largely dependent upon numerous factors for instance Product Features (PF), Ownership Costs (OC), Social Needs (SN), Purchasing Power (PP) and Brand Trust (BT). Dependent variables are the effect whose values change according to the independent variables. In the current study, the purchase decision is the dependent variable as the consumer's intention to avail car depends upon the attractive products features and its utility. Advanced technological usage, multiple utility features, reasonable product prices create a positive impression among the consumers to opt for the products (Shetty, 2021). While on the other hand, decrease purchase power, limited product features, lack of brand trust and lower social requirements creates a negative attitude and belief among the consumers that further prevent them from availing products of their preferences.

3.2 Consumer Behaviour

The decision and action process of the customers for purchasing services and goods for personal consumption is referred to as consumer behavior. There are four types of consumer behaviors such as variety seeking, habitual buying, reducing the dissonance, and a complex behavior. During COVID-19, the behavior of the customers was associated with lowering perceived infection threat. On the other hand, unexpected health emergencies and personal life and attitude changed consumer behavior during the outbreak of the pandemic.

3.2.1 Product Features

Product features are the characteristic attributes that compel consumers to opt for the products of their choice. Product features include artistic components like shape, colour, space, the tone that successfully captures consumer attention (Kowang et al., 2018). Functional aspects, quality and experience associated with the products play a dominating role in determining the purchase behaviour of the consumers (Altaf &

Hashim, 2016). In context to car purchase behaviour of the consumers, product features for instance shape, color, tone of the car adds up to the aesthetic component of the products that result in shaping consumer purchase intention (Alganad et al., 2021). Furthermore, the functional attributes of the products indicate the benefits associated with utilizing a product. The pandemic situation has created trouble for consumers who preferably used public transport for movement. However, increased functionality, comfortable seating arrangements enhance positive experiences of the consumers that further positively enhances consumers buying decisions.

3.2.2 Ownership Costs

Ownership costs highlight the financial resource investment involved in product purchase, operational management and maintenance of the products. In context to availing cars, consumers are required to pay a heavy price for not only availing the products during the initial period but also involves financial investment including the present and future costs while posing the assets. Personal cars require maintenance and servicing costs that help consumers enjoy the services that further adds value to the prices they pay for availing the act of their preferences. As stated by Wadud (2017), often increased ownership costs prevent consumers from availing of cars and thus negatively affecting the purchase decisions of the consumers.

3.2.3 Social Needs

Human beings are social organisms and individuals who affect their purchase behaviour and decisions surround them. Maslow's hierarchical needs highlight that possession of products serve as a basis for the fulfilment of an individual's psychological, safety, belongingness, self-esteem and self-actualisation needs. Since individuals are constantly interacting with other social individuals they prefer to exhibit and perform actions that result in increasing their chances of being socially acceptable (Akar & Dalgic, 2018). However, the current pandemic situation has prohibited individuals from social gatherings evening in public transport that further compels them to adopt alternative strategies to resolve transport difficulties. Social requirements thus positively tend to increase the purchase of cars by consumers.

3.2.4 Purchasing Power

The purchasing power (PP) of the consumer is the ability of the consumer to avail the product of their choices. As opined by Jayaraman et al. (2018), the economy of the country affects the purchasing power of the consumers. Decrease in products prices, increased GDP, decreased inflation rate and increased average annual income of the consumer's results in increased PP of the consumers. Increased PP thus allows consumers to avail products according to their preferences. Thus, interrelationship

between PP and Purchase decision indicate higher PP contribute towards positive purchase intension and vice-versa while availing car by consumers.

3.2.5 Brand Trust

In the current competitive ambience, it is essential for the organization to implement innovative strategies to capture consumer attention that further contribute towards providing competitive benefits and increase brand trust. Brand trust (BT) ensures that consumers prefer the selected brand to all other competitors. Product and service quality, experience, perceived risk, brand reputation and security showcased by brand regulate consumer loyalty (Adzharuddin et al., 2017). Superior quality experiences, customer services, enhanced safety and security of the consumers delivered by the brands help consumers had better relate with the organizational goals. Thus, in context to the purchase decision of consumers, BT plays a dominating role in determining consumer preferences while opting for products from particular brands.

3.3 Interrelationship Between Product Features and Purchase Decision

Marketing activities from selling, distribution of goods and promotional strategies cluster around the products being sold by the organization. Product features include discrete areas of upgraded functionality that enhance consumer's value. Both tangible and intangible attributes associated with the products contribute towards determining the purchase behaviour of the consumers (Sahoo & Satpathy, 2020) (Fig. 4).

In the context of purchasing a car, consumers prioritize both the tangible and intangible aspects of the cars. For instance, consumers prefer to look at car size, colour, and material composition while availing a car of their choice. While on the other hand, intangible attributes associated with a car include exchange value, utility benefits. According to the recent report on the sales volume of Proton, the company has reported selling 108,524 cars in 2020 which is comparatively much more than 100,183 cars sold in 2019 (Lim, 2021). The car purchase intention of consumer's increases when the product satisfies their needs and are capable of mitigating the travel difficulties faced by the consumer's number during the pandemic (Peterson & Simkins, 2019). Enhanced utility values constitute increased consumer purchase intention. In context to the increased sales volume of the automobile industries in Malaysia thus sheds light upon the differential product features and highlights the innovative product attributes that are capable of differentiating products from other competitors.

H1: Product features possess a direct positive influence on purchase decision.

Licensed to (putm@utm.my)

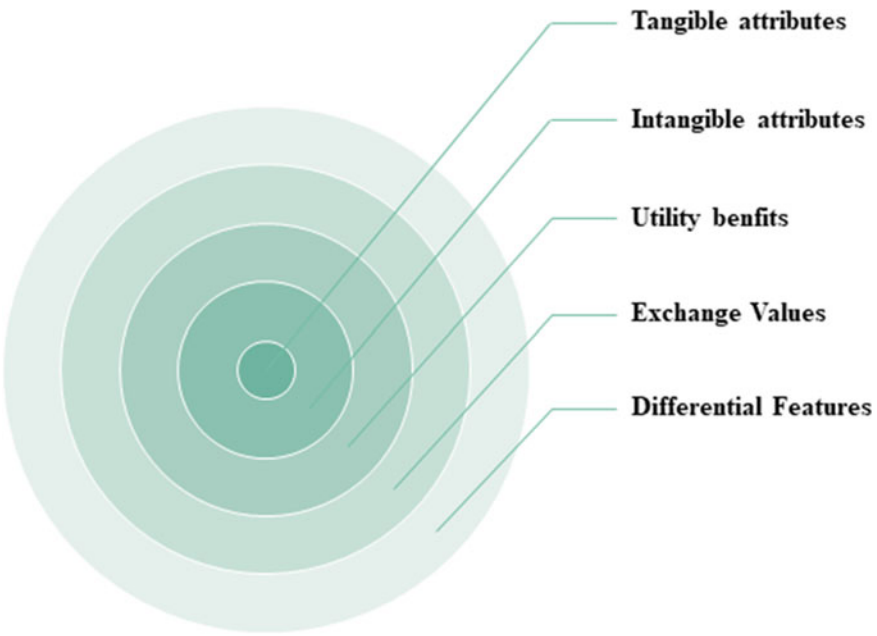

Fig. 4 Products features that affect consumer purchase decisions. *Source* Sahoo and Satpathy (2020)

3.3.1 Interrelationship Between Ownership Costs and Purchase Decision

Ownership cost highlights not only the short-term purchase cost associated with the product but also the long-term operating and maintenance cost associated with the products (Fig. 5).

Ownership cost highlights several factors from petrol price to depreciation cost, road tax and car insurance that must be considered by the consumer while availing the cars. As stated by Havidz and Mahaputra (2020), ownership cost estimation helps individuals obtain a comprehensive view of the products and the values associated with them. Consideration of the maintenance, petrol price, depreciation costs helps individuals to wisely undertake purchase decisions (Fig. 6).

According to the report on the ownership cost associated with the reputed automobile cars, the ownership cost of Perodua Myvi, Perodua Aruz reported to be RM 1579 and RM 2013 respectively. While ownership cost for Honda HRV and Proton is reported to be RM 2658 and RM 2842 respectively (Hasan, 2021). Increased ownership costs create a negative impression in the consumer's mind and adversely affect the purchase decision of the consumers.

H2: Ownership costs possess a direct negative influence on purchase decision.

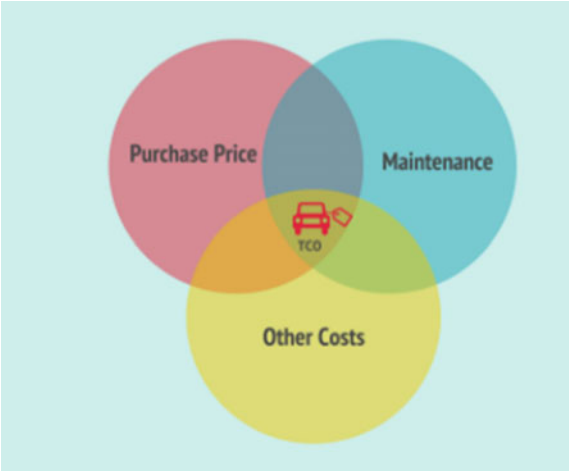

Fig. 5 Ownership costs and purchase decision. *Source* Havidz and Mahaputra (2020)

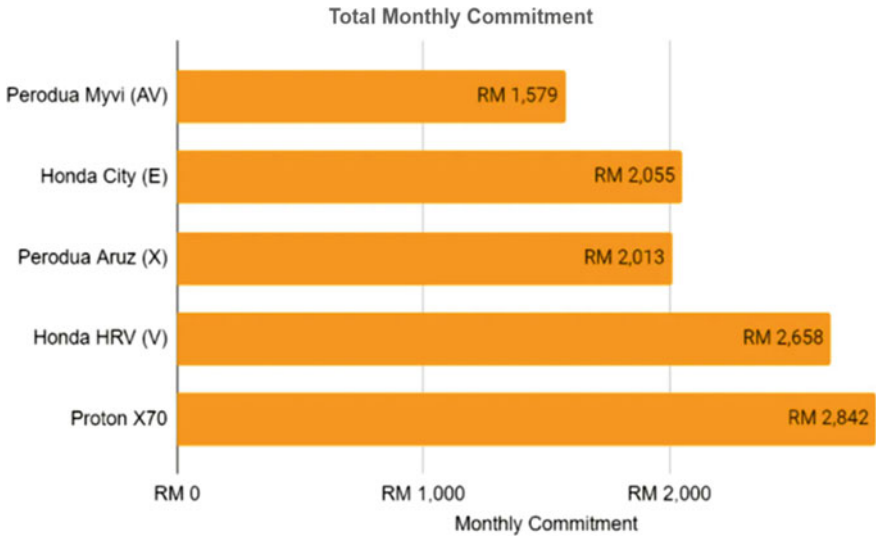

Fig. 6 Ownership costs and purchase decision. *Source* Hasan (2021)

3.3.2 Interrelationship Between Social Needs and Purchase Decision

Social needs highlight the exhibition of activities by the individuals that increase his or her chances of social acceptance. Lifestyle, income status, family requirements are the crucial factors that determine the purchase intention of the consumers. Product pricing strategy as determined by the marketers depends upon the current market trends, advanced technology usage and innovative product features (Dong

et al., 2017). Implementation of the latest technology to enhance product attributes results in higher car prices. The income status of an individual plays a significant role in determining whether the individual can afford a first hand or second-hand car. According to the report on the average monthly salary of Malaysian citizens, the average monthly salary is reported to be 3.2 thousand Malaysian ringgit in 2019 (Jabatan Perangkaan Malaysia, 2021). Furthermore, the salary of the individual may vary depending upon the educational qualification and nature of employment. Individuals with higher disposable income opt for first-hand cars with unique features in comparison to the individuals with lower disposable income who opt for second-hand cars (Du et al., 2018). While on the other hand, households with large families tend to purchase large cars that are spacious and are able to provide comfort to the users (Ali et al., 2019).

H3: Social needs possess a direct positive influence on purchase decision.

3.3.3 Interrelationship Between Purchasing Power and Purchase Decision

Purchasing power indicates the financial resources invested by the consumer while opting for the product of their preferences. The purchasing power of the consumer depends upon the country's GDP, inflation rate, and economic growth (Jannah & Supadmi, 2021). Enhanced economic growth of the country indicates increased GDP and employment within the country. Increased GDP further contributes towards the increased annual income of the citizens of the country thereby strengthening the purchase decisions. The inflation rate on the other hand has an influential role in determining the product price. High inflation rate results in a higher price of cars that can be afforded only by individuals with higher income. However, the reduced inflation rate positively guides consumer purchase intention of the consumers.

H4: Purchasing power possess a direct positive influence on purchase decision.

3.3.4 Interrelationship Between Brand Trust and Purchase Decision

Organizational reputation and culture are significant in the current competitive business ambience that facilitates enhanced corporate revenue. As opined by Novansa and Ali (2017), consumer loyalty is directly interlinked with brand trust. Brand trust allows consumers to avail products from the reputed brands dispensing upon the product and service quality. Provision of superior quality products along with reasonable prices, consideration of consumer safety and security issues plays a significant role in strengthening brand awareness and reputation. Sustainable aspects of products, superior quality consumer experiences and immediately addressing consumer issues generates a positive attitude among the consumer towards the brands thereby contributing towards enhanced purchase decisions among the consumers.

H5: Brand trust possess a direct positive influence on purchase decision.

4 Theoretical Framework

The consumer decision process is the broad aspect that encompasses multiple activities from increased consumer awareness to need recognition, accumulation of information to solve needs, evaluation of alternative options and finally undertaking purchase decisions. ***EKB model*** highlights the procedures and the factors that shape the consumer purchase behaviours and determine the process followed by the consumers while choosing among the alternatives.

The EKB (Engell–Kollat–Blackwell) model includes information inputs, information processing, decision process and external variables that affect their purchase decisions (Osei & Abenyin, 2016). In context to car purchase behaviours among Malaysian consumers, unique marketing strategies implemented by the marketers creates an urge within the consumers to avail themselves the luxurious cars at a reasonable price. Information processing further highlights memory retention of the attractive product features that further instigate the purchase decision of the consumers (Leljak & Dobrinic, 2019). Furthermore, the necessity of availing cars during pandemic situations would relieve consumers from the difficulties that they face in public transport thereby compelling them to meet their needs by availing personal vehicles that serve to resolve their problem at the earliest. However, evaluation of alternative products is largely influenced by several external variables like consumer attitudes, beliefs, lifestyle, cultural norms, family and group influences.

Consumer purchase intentions are not stable rather it changes according to the market demands, products feature and quality. The current pandemic situation has affected almost every aspect of human lives. Prohibition and limitation on public transportation have resulted in increased trouble for the office goers and has adversely affected their daily lives. Safety protocols in context to social distancing have compelled individuals to prevent social gatherings that threaten social life due to the spread of disease.

The current study has focused on highlighting the increased car purchase in Malaysia among consumers. According to the recent report on sales volume and market growth by Perodua, one of the leading automobile industries in Malaysia, market share has been reported to increase from 39.8% in 2019 to 41.6% in 2020 (Lim, 2021). Increased car sales by the automobile company in Malaysia during the pandemic highlights several factors that played a significant role in regulating the purchase decisions of the consumers. The research framework thus has been formulated keeping in mind the dimension of consumer behavior such as PF, OC, SN, PP and BT that regulates and relation that further affect purchase decisions (Fig. 7).

5 Research Methodology

Quantitative research design has been opted by their searcher to discover the thinking, acting or feeling process of the people in a particular way. It involves huge sample

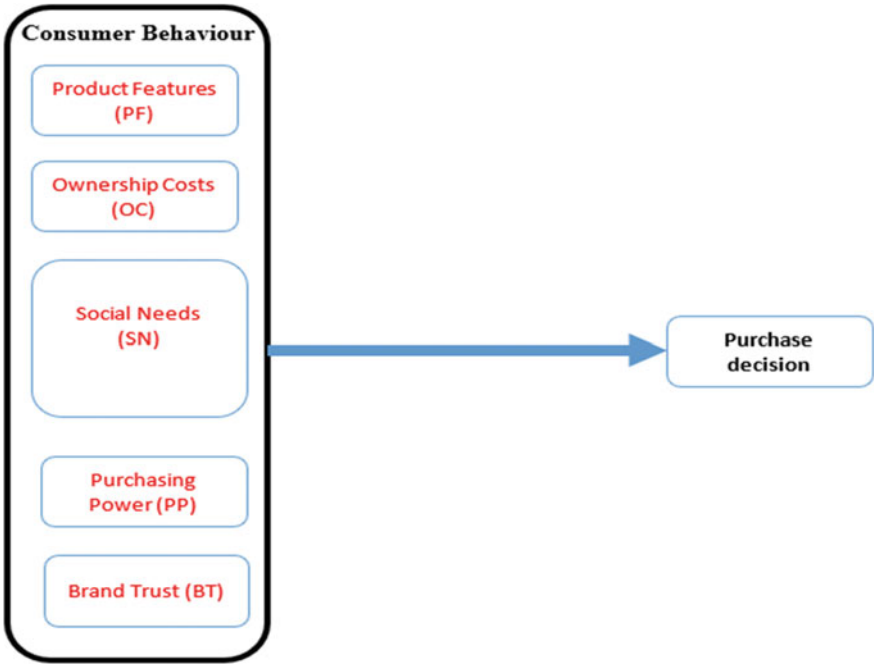

Fig. 7 Research framework (*Source* Created by the researcher)

sizes and concentrates on response quality. There are four main types of quantitative research design and these are correlation, causal-comparative, descriptive and experimental. Among them, the descriptive research design technique was followed by the researcher to conduct a true experiment. A ***descriptive research design*** enables a researcher to investigate the causal relationship among the variables (Rutberg & Bouikidis, 2018). Therefore, the casual relationship among the dependent variable purchasing decision of the customers and independent variable customers behaviours and Covid-19 has been analysed by the researcher appropriately. The major purpose of this research design is to generate knowledge and creating understanding regarding the social world.

The use of a scientific inquiry is dependent on the observed data for examining questions regarding the sample population (Chih-Pei & Chang, 2017). In this research design, the researcher used the statistical method to analyse the hypotheses. Large subject numbers have been included in this research design that helped the researcher to generate appropriate hypotheses, theories, and models. Imperial data have been collected by the researcher which increased the experimental control, variable manipulation, and improved the measurement methods. In this way, the researcher has gained the benefit to follow a structured method for this research. The outcome of this research is highly reliable and reusable. In this process, the research has gained different numerical outcomes (Rutberg & Bouikidis, 2018).

The researcher followed the simple random sampling technique in this research where a random portion of the entire population was selected. In ***simple random sampling***, the probability of being chosen by each of the members remains equal (Sharma, 2017). The first step of the random sampling technique is defining the population. The population that was selected in this study was ***potential car buyers in the Johor Bahru area***. In this way, the researcher collected information from all men and women of the selected sample. The second step of this research was deciding the sample size. The ***sample size*** of this research was ***80*** due to time constraints. The size of the sample was decided by using confidence level and standard deviation. The third stage was randomly selecting the samples. In order to complete this stage, the ***random numbered method*** was chosen by the researcher. The population subset was randomly picked by the use of a RAND (random number function) in MS Excel for generating random numbers. The last stage of this sampling technique was collecting accurate data from the sample. Dropped out questions by the respondents increases the biases in findings (Etikan & Bala, 2017). Thus, the researcher selected the respondents who completed the whole survey successfully.

All of the data gathered were verified and analyze through Statistical Package for Social Science (SPSS—Ver.22) tools, therefore the outcome such as correlation coefficient, reliability and validity, and multiple-regression are accurate (Ticehurst & Veal, 2000).

6 Conclusion

In the context of the purchase decision of the consumer opting for cars during Covid-19 highlights several factors that play a significant role in regulating consumer purchase decisions. The study has successfully shed light on the varied factors ranging from Product features, Ownership costs, Social needs, Purchasing power and Brand trust that has a certain impact on the buyer's purchase decisions. Product features from both tangible, intangible attributes along with other factors help consumers to select the products of their preferences. However, individual income along with the purchasing power of the customer is essential in determining the purchase intention of the consumer. Consumers with higher income are more likely to purchase expensive cars in comparison to the ones with lower income who would prefer a second-hand car or public transport. Hence, this study is one that focuses on the car buyers in Malaysia and the significant factors that impacted their purchase decisions at the time of the Coronavirus (COVID-19) outbreak.

Environmental Forces Influencing Perceived Acceptance of COVID-19 Vaccination: Social Responsibility as a Moderating Role

Ala'eddin M. Ahmad, Mohammad Abuhashesh, Nawras M. Nusairat, Majd AbedRabbo, Ra'ed Masa'deh, and Mohammad Al Khasawneh

Abstract The main objective of this research is to investigate the environmental forces influencing perceived acceptance of COVID-19 vaccination. Also, to investigate the moderating role of social Responsibility. The research independent variables consist of environmental forces (economic, political/legal, and social), the dependent variable is represented by perceived acceptance of COVID-19 vaccination. A quantitative method was using cross-sectional online research questionnaire to collect the primary data. A sample of (N = 2084) respondents who follow the social media platforms were selected. Therefore, a stratified simple random method was used in this research. The result shows a positive influence of political/legal and social on perceived acceptance of COVID-19 vaccination. In contrast, there is no influence of economic factor on perceived acceptance of COVID-19 vaccination. The research results are beneficial for formulating an effective polices and strategies for vaccination in Jordanian health market. The current research result recommends that Jordanian FDA and MOH, nationally authorized of COVID-19 vaccines, employer

powerful force and recommendations, friends and family, and positive words of mouth can all play an important role for vaccination acceptance and increase the percentages of Jordanian citizen to be vaccinated which was consistent with previous studies. The current research reflected the positive role of political/legal and social factors on perceived acceptance of COVID-19 vaccination among Jordanian people. Also, the research outcomes are beneficial for formulating an effective polices and strategies for vaccination in Jordanian health market.

1 Introduction

Since the emergent of corona virus from China in March 2020 which it quickly spread out into the rest of the world. The World Health Organization has declared that corona virus as pandemic disease. Corona virus has become a sever public health issue (Alameeri et al., 2021; Al-Dmour et al., 2020). Therefore, governments around the world have changed their health strategies to prevent further spread of COVID-19 (Ahmad et al., 2021; Akour et al., 2021). Governments put stricter rules and guidelines such as social distance, avoiding social gatherings, testing every suspected case, staying home, university and school closures, workplace distancing, and lockdowns were all introduced to reduce the impact of corona virus disease. Just like the rest of the world, Jordan has been suffering from the effect of COVID-19 on all aspect of life. Therefore, the Jordanian government took an extraordinary measures and strict emergency law to fight COVID-19 pandemic disease. Governments and their top medical labs, they all were racing to develop and deploy safe and effective vaccines. Vaccines work by training and preparing the body's natural defences—the immune system—to recognize and fight off the viruses and bacteria they target. After vaccination, if the body is later exposed to those disease-causing germs, the body is immediately ready to destroy them, preventing illness (The World Health Organization 2021). Different types of vaccines have been rolled out in many countries. Vaccines are a critical new tool in the battle against COVID-19 and it is hugely encouraging to see so many vaccines proving successful and going into development. Working as quickly as they can, scientists from across the world are collaborating and innovating to bring people tests, treatments, and vaccines that will collectively save lives and end COVID-19 pandemic disease (Abbas et al., 2020; Al Khasawneh et al., 2021a). One year has been passed since the beginning of the global pandemic of COVID-19 (Alshurideh et al., 2021; Nuseir et al., 2021). Today we have several vaccines to choose from to protect ourselves and prevent the further spread of this virus and its newer variations. Research on vaccine production has begun in early 2020 (Jordan et al., 2020). Also, governments around the world have been occupied with vaccinating its populations (Leo et al., 2021; Shah et al., 2021; Taryam et al., 2020). Kwok et al. (2020) Suggest a "a critical (minimum) herd-immunity threshold

of 67% to reach safety and go back to living previously accustomed to lifestyles. Also, (Lazarus et al., 2021) attempted a global survey of potential acceptance of a COVID-19 vaccine to measure the likelihood of the public taking the vaccine and whether employer recommendation to take the vaccine would affect this likelihood (Cobb et al., 2021). They state that 71.5% of its participants reported they would take the vaccine while 61.4% said they would take it if their employer requested them to take it (Lazarus et al., 2021).

Vaccine acceptance is a troubling area affected by several factors, such as cultural, trust, fear of future side-effects. Also, scientist plan to measure the effect of vaccine on economic, political/legal, social factors, and all aspect of human lives. Lazarus et al. (2021) Found that greater trust in government significantly affected the acceptance rate positively, as did employer advice. They measured a sample from 19 countries which comprised about 55% of the global population, consisting of 53.5% women, and 63.3% earned more than $32 per day, and 36.3% had a university degree, and 62.4% were between 25 and 54 years old, which is a similar age representation of the majority of Jordan's population. They found a 90% acceptance rate in China, compared to 55% in Russia. In this study, we plan to measure the acceptance rate in Jordan (Gates, 2020). Higher level of income and education populations were found to have more positive acceptance of the vaccine, while higher trust in government information also showed more positive acceptance as long as the information provided was detailed and clear, such as "explaining how vaccines work, as well as how they are developed, from recruitment to regulatory approval based on safety and efficacy. Effective campaigns should also aim to carefully explain a vaccine's level of effectiveness, the time needed for protection (with multiple doses, if required) and the importance of population-wide coverage to achieve public immunity" (Aljumah et al., 2021; Lazarus et al., 2021; Wise et al., 2020). Furthermore**,** Asian countries had the highest acceptance rate, while middle-income countries "such as Brazil, India and South Africa" also showed significantly high acceptance rates (Lazarus et al., 2021).

Another study conducted on COVID-19 vaccine acceptance in China by Wang et al. (2020) conducted an online survey among 2058 Chinese adults where a majority of 91.3% confirmed they would take the vaccine once available, where the questionnaire attempted to measure sociodemographic characteristics including education, employment status and income, in addition to risk perception and the impact of contractive COVID-19 on their lives, work and studies, as well as vaccination history of the seasonal flu-shot who are considered a higher risk group of infection. The study result revealed that 52% of the targeted population wanted to get the COVID-19 vaccine; however, the rest of the sample which is 48% would like to delay the vaccination until the side effect is safe (Huang et al., 2020).

Wang et al. (2020) also found that being male and married increased the possibility of taking the vaccine since they are perceived as higher risk group and are more likely to follow doctor recommendations, yet less likely to follow employer recommendations to take the vaccine. According to the study result were done by Kreps et al. (2020) showed that 79% of the sample selected a vaccine that has high efficiency and longer duration of protection.

Opel et al. (2020) Mentioned in their study to increase the acceptability of COVID-19 Vaccine, the US official needs to share and transparence data and they should increase informed consent considerations. In addition, Opel et al. (2020) urges frequent and visible communication with public in order to build trust and achieve confidence in COVID-19 Vaccines (Abuhashesh et al., 2021). Graffigna et al. (2020) studied the main factors that affect citizen decision making for taking or not taking COVID-19 vaccine. The study focused on perceived effectiveness, safety and side-effect concerns, vaccine benefits, and where the vaccine was originated. Furthermore, they research studied social factors such as recommendations from family members and health authorities. In addition, individuals also care about vaccination cost, vaccine availability, and accessibility.

A study was done by Tam et al. (2020), measure the differences between older adults and young adults, where older people has been prioritized for corona virus prevention and treatment. On the other hand, young people were less likely to comply with prevention practices and social distance (Fisher et al., 2020). A recent study in the US were done by Reiter et al. (2020) had mentioned the most factors that increase COVID-19 vaccine acceptance. The most important vaccine attribute for selection was increased efficacy, followed by a longer duration of protection and a significantly lower incidence of major adverse events. Also, US citizen were more likely to select a vaccine has an endorsement from the US centers. However, US participants were less likely to select a vaccine was developed outside of the United State, specially from China. Another key finding that US citizens have higher vaccine acceptability rates when endorsed by public health agencies. However, US citizens did not trust politicians' endorsements for public health issues. Opel et al. (2020) urge caution against interpreting the results as further evidence of vaccine hesitancy spreading, although they note that "vaccine hesitancy and a reluctance to accept a COVID-19 vaccine are not completely distinct" therefore, public health authorities should communicate and engage with public in order to encourage people to accept and trust COVID-19 vaccine acceptance (Czeisler et al., 2020; Dror et al., 2020).

In order for Jordanian health official to develop effective corona virus vaccine promotion strategies, it is very important for official to understand what factors would contribute to vaccine acceptance and what factors would result in vaccine rejection. For this reason, Jordanian health official needs to communicate the benefit of vaccines, safety concerns, side effects, vaccine accessibility, and availability in order to change the Jordanian citizens' belief and attitude toward the acceptance of COVID-19 vaccine (Irwin et al., 2017). This study aimed to investigate the factors (economic, political/legal, and social) influencing on perceived acceptance of COVID-19 vaccination among Jordanian people with the moderating role of social responsibility. The research outcomes might be beneficial for health decision makers to establish a concrete strategy for vaccination against epidemics and pandemics (Rosenstock, 1974).

2 Methods

2.1 Research Design, Sample

To test for causal relationships between the research variables, we adopted a quantitative method using cross-sectional online research questionnaire to collect the primary data. A sample of (N = 2084) respondents who follow the social media platforms were selected. Therefore, a stratified simple random method was used in this research.

2.2 Measures

The self-administered questionnaire was designed based on previous studies (Lazarus et al., 2021; Opel et al., 2020; Wang et al., 2020) to examine the influence of environmental forces on perceived acceptance of COVID-19 Vaccination. The research questionnaire consists of (1) socio-demographic characteristics, such as age, gender, occupation, working in medical field, income, and health condition; (2) environmental forces (economic, political/legal, and social) as an independent variable; (3) social responsibility as a moderating variable; (4) perceived acceptance of COVID-19 Vaccination as dependent variable. Both English and Arabic statements were presented in the questionnaire. The questionnaire contained five-point Likert scales 1 = strongly disagree and 5 strongly agree. The original sources of the main scale items are presented in Table 1.

3 Results

3.1 Demographic Examination

Despite the fact that the demographical age and gender factors are of minimal impact on the retrieved data, the researchers managed to collect data from different age groups, both gender, occupation, income level, working in the medical field industry, and health conditions. Table 2 describes the demographic distribution of the research sample.

Table 1 Construct operationalization

Item No	Construct	Source
Perceived economic effect on vaccine acceptance		
PE1	Vaccine price can affect my decision towards being vaccinated	Adopted from Lazarus et al. (2021), Wang et al. (2020)
PE2	The economies of taking the vaccine such as (distance to vaccination sites, waiting time etc.) plays a role in my decision to be vaccinated	
PE3	Costs associated with taking the vaccine influence my decision to take it	
Perceived political and legal effect on vaccine acceptance		
PPL1	FDA & MOH authorization is key to accept taking the vaccine	Adopted from Lazarus et al. (2021), Wang et al. (2020), Opel et al. (2020)
PPL2	Nationally authorized vaccines can provide me with reassurances to accept the vaccine	
PPL3	Employer powerful force and recommendation is an important factor in vaccination acceptance	
PPL4	National laws for vaccinations can play an important role in accepting the vaccine	
Perceived social effect on vaccine acceptance		
PS1	My friends and family play a role in accepting the vaccine	Adopted from Lazarus et al. (2021), Opel et al. (2020)
PS2	I am likely to be influenced by my friends and family's decision to take the vaccine	
PS3	Word of mouth from my social circle may influence my acceptance of the vaccine	
Social responsibility		
SR	Taking the COVID-19 vaccine is part of my social responsibility	Authors
Perceived acceptance of COVID-19 vaccination		

(continued)

3.2 Descriptive Analysis

The following test results are presented as shown in Table 3; descriptive analysis for the answers of all environmental forces dimensions (economic, political/legal, and social) and social responsibility as a moderating factor, and perceived acceptance of COVID-19 vaccination (PAV) as a dependent factor.

The descriptive statistics offered in Table 3 pointed to a positive and negative disposition towards the variables measured.

Table 1 (continued)

Item No	Construct	Source
PAV	How likely will you take a COVID-19 vaccine when it is available? The question was rated using a five-point Likert scale (1 = definitely not take it, 2 = not likely to take it, 3 = I don't know, 4 = likely to take it, and 5 = definitely take it) Based on their responses, participants were divided into three groups including (1) Refusal group, (participants with answers of '1' or '2'); (2) Hesitancy group (participants with answers of '3'); (3) Acceptance group (participants with answers of '4' or '5')	Authors

3.3 Reliability Analysis

Reliability analysis is defined by Wilkinson (1999), p. 598 as a psychometric property of a particular sample's response to a measure monitored under specific scenarios and conditions. Particularly, the recommended scale shall exhibit high extents of internal consistency in reference to Cronbach alpha or composite reliability (Hair et al., 2012). In fact, the accepted and agreed upon percentage of Cronbach alpha is (70%), whilst the composite reliability's advised percentage is (80%) (Streiner, 2003).

The current research shows that Cronbach alpha exceeded (70%) in the five scales variables (e.g., 0.792–0.831), and the composite reliability of each scale was above (80%) as of (0.827–0.907). Moreover, it has been suggested that convergent validity is related to the level of harmony and agreement between a conceptual theory such as the latent construct and its monitoring tool that may be referred to a number of elements that measure the implicit construct) (Hair et al., 2012). The aforementioned validity is reflected through the AVE (average variance extracted) which indicates the shared average variance between a variable and the items related to it.

Table 4 presents the AVE of the five variables which is more than the recommended threshold of (50%). More specifically, the AVE of the five variables was in the range of (0.593–0.636), indicating that the items of each scale are indeed related. Depending on the outcomes of these tests, the instrument of the study is useful, which allows the academics to manage statistical analysis.

Table 2 Demographic characteristics

		Frequency	Percentage
Age	18–30	1110	53.3
	31–40	456	21.9
	41–50	312	15.0
	51–60	150	7.2
	61 +	56	2.7
	Total	2084	100
Gender	Female	1182	56.7
	Male	902	43.3

	Unemployed	260	12.5
	Retired	132	6.3
	Part-time employee	114	5.5
	Full-time employee	798	38.3
	Total	2084	100
Working in medical field	No	1818	87.2
	Yes	266	12.8
	Total	2084	100
Income	300 JD and less	822	39.4
	301–700	504	24.2
	701–1100	296	14.2
	1101–1500	162	7.8
	More than 1500	300	14.4
	Total	2084	100
Health condition	No history of known medical conditions	1736	83.3
	I have history with certain medical conditions	256	12.3
	Prefer not to say	92	4.4
	Total	2084	100

Table 3 Descriptive analysis table

Items	Numbers	Mean	SD
Economic	2084	2.21	0.921
Political/legal	2084	3.91	0.897
Social	2084	3.27	0.915
Social responsibility	2084	3.72	0.926
PAV	2084	3.52	0.895

Table 4 Convergent validity and internal consistency of survey

Variables	Cronbach alpha (α)	AVE	CR
Economic	0.831	0.608	0.892
Political/legal	0.825	0.636	0.907
Social	0.810	0.613	0.866
Social responsibility	0.799	0.610	0.827
PAV	0.792	0.593	0.834

Table 5 Discriminant validity

Variables	E	PL	S	SR	PAV
Economic	**0.821**				
Political/legal	0.622	**0.812**			
Social	0.190	0.604	**0.806**		
Social responsibility	0.353	0.459	0.312	**0.801**	
PAV	0.366	0.314	0.290	0.310	**0.813**

3.4 Convergent and Discriminant Validity

The assessment of Discriminant Validity, as suggested by Fornell and Larcker (1981) is possible when comparing and contrasting the correlation between the coefficients of the construct along with the square roots of AVE, which ought to be higher than that of the other constructs, paving the way for the output results of the study model to be disseminated in the study population.

As stated in Table 5, the correlation between the coefficients of the construct is less than the square roots of AVE, reflecting its loadings to their latent construct to be higher than that of other constructs. As a consequence, the discriminant validity of the research model is proven to be satisfactory, enabling the possibility of reflecting the results derived from the study model on the study community. Herein, the discriminant validity is not an issue of concern.

3.5 Structural Model and Hypotheses Testing

With the intention of determining the possibility of accepting the research hypotheses, multiple linear regression tests were set. Besides, significance testing has been undertaken to detect if the hypotheses are accepted or not with a threshold percentage limit not to be exceeding 0.05 to facilitate the substitution of hypotheses and refuse the void ones, particularly due to the fact that the research applied the coefficient of determination to demonstrate the impact of the dependent variable on each responding independent one. In reference to the conceptual theory that declares the value of

Table 6 The results of the first hypothesis

Direct effect	Coefficient (β)	T-value	P-value $P \leq 0.05$	R^2	Decision
Economic → PAV	0.014	1.013	P = 0.925	0.392	Rejected
Political/Legal → PAV	0.342	4.321	P = 0.001		Accept
Social → PAV	0.332	4.278	P = 0.000		Accept
Environmental Forces → PAV	SigF = 0.001		F-Value = 12.119		Accept

R^2: 0.51 = Strong; 0.330 = Moderate; 0.20 = Weak
Effect size: 0.02 = Small effect; 0.15 = Moderate effect; 0.35 = Substantial effect

significance to be less than 0.05 ($p < 0.05$) for the hypotheses 'H' to be considered accepted, the statistical study applied various linear regressions tests that are presented in Table 6 for the first hypothesis.

Table 6 demonstrates the outcomes of multiple regressions of environmental forces dimensions and the way it can affect *perceived acceptance of COVID-19 vaccination* as follows:

H1: Environmental forces factors and social have a significant impact on perceived acceptance of COVID-19 vaccination at sig. level ≤ 0.05.

The results of the analysis support this hypothesis (Sig. F = 0.001; F = 12.119). Thus, the hypothesis is accepted. In other words, it is confirmed that if Jordanian Government apply theses dimensions, the Jordanian community will accept to take this vaccine.

H1a: Economic factors have a significant impact on perceived acceptance of COVID-19 vaccination at sig. level ≤ 0.05.

The results of the analysis do not support this hypothesis (Sig < 0.05, = 0.925; T-value = 1.013; β Coefficient = 0.014). Therefore, the hypothesis is rejected affirming the negative impact economic factor on the *perceived acceptance of COVID-19 vaccination.*

H1b: Political/legal factors have a significant impact on perceived acceptance of COVID-19 vaccination at sig. level ≤ 0.05.

The results of the analysis support this hypothesis (Sig < 0.05, = 0.001; T-value = 4.321; β Coefficient = 0.342). Accordingly, the hypothesis is accepted indicating that if political and legal factors are applied, then *perceived acceptance of COVID-19 vaccination* will increase.

H1c: Social factors have a significant impact on perceived acceptance of COVID-19 vaccination at sig. level ≤ 0.05.

The results of the analysis support this hypothesis (Sig < 0.05, = 0.000; T-value = 4.278; Coefficient = 0.332). Therefore, the hypothesis is accepted and this demonstrates that if social factor is applied, the *perceived acceptance of COVID-19 vaccination* will increase.

H2: social responsibility would moderate the relationship between environmental forces factors and PAV at sig. level ≤ 0.05.

Moreover, to test for H2 concerning social responsibility moderation between environmental forces factors and perceived acceptance of COVID-19 vaccination, (Hayes, 2017) process macro model was used. The product indicator method was used as it employs all the indicators of the latent predictor and moderator and all the pair combinations possible which serve the interaction term in the structural model. As seen in Table 3 there is a significant influence of social responsibility on the path between environmental forces factors and perceived acceptance of COVID-19 vaccination.

The results show that the significance level p- value is 0.011 ($P \leq 0.05$). Thus, the alternative hypothesis test is statistically accepted (supported).

Table 3 also shows that the R^2 rate is (0.421) which points to the precision in *perceived acceptance of COVID-19 vaccination* that relies on environmental forces dimensions (economic, political/ legal, and social), this value is moderated and reliable in the process of interpretation and prediction (Table 7, Fig. 1).

Table 7 The results of the second hypothesis

Indirect effect	Estimated coefficients	S.E	Std. Est. Coef	F2	P-Value	R^2	Hypothesis
Interaction term (Environmental forces factors * social responsibility) PVA	0.120	0.054	0.096	Substantial effect	0.011	0.421	Accepted

4 Discussions

The current study measures the acceptance rate of Jordanian citizen that would be vaccinated during the COVID-19 pandemic disease. The research stated high acceptance of COVID-19 vaccination among the Jordanian people during the pandemic disease. The study analysis showed that Jordanian with higher level of income and education were found to have more positive acceptance of COVID-19 vaccines. Moreover, the study results illustrate that people show more positive acceptance, when the government provide a trusted information such as the true effectiveness of the vaccine, the origin of the vaccine, the side effect of the vaccine, and how the vaccine works. Two out of three environmental forces affect perceived acceptance of COVID-19 vaccination namely political/legal and social factors. Whereas, economic factor shown no affect perceived acceptance of COVID-19 vaccination. The result of the study analysis supports the main hypothesis (H1), thus, H1 was accepted. Therefore, the study reported high acceptance of COVID-19 vaccination among Jordanian population if some conditions were applied. However, the study result did not support (H1a) hypothesis. The analysis showed that economic factors such as vaccine price, distance to vaccination sites, waiting time, and other related cost did not have an impact on Jordanian citizen to take the vaccine. Thus, the hypothesis (H1a) is rejected. The study analysis showed that political and legal factors have significant impact on vaccine acceptance. Therefore, the hypothesis (H1b) was accepted. Thus; national authorized, FDA & MOH authorization, and Employer powerful force play an important role for COVID-19 vaccine acceptance. The study analysis also showed that social factors have positive impact on citizen acceptance of COVID-19 vaccination. Consequently, family and friends can play a positive role in decision making to accept the vaccine. Moreover, positive word of mouth about the vaccination can influence people to accept the vaccine (Al Khasawneh et al., 2021b). Therefore, the study results accepted (H1c) hypothesis. In addition, the study analysis support (H2) hypothesis. Jordanian citizens believe that taking COVID-19 vaccine is part of their social responsibility in order to protect their community, to go back to their previous life, and to improve their economic conditions. For this reason, the current research confirmed the positive role of political/legal, economic and social factors moderated by social responsibility factors on perceived acceptance of COVID-19 vaccination among Jordanian people. In order for Jordanian health official to develop effective corona virus vaccine promotion strategies, it is very important for official to understand what factors would contribute to vaccine acceptance and what factors would result in vaccine rejection. For this reason, Jordanian health official needs to communicate the benefit of vaccines, safety concerns, side effects, vaccine accessibility, and availability in order to change the Jordanian citizens' belief and attitude toward the acceptance of COVID-19 vaccine (Gadoth et al., 2020).

The current study result recommends that FDA & MOH, nationally authorized of COVID-19 vaccines, employer powerful force and recommendations, friends and family, and positive words of mouth can all play an important role for vaccination acceptance and increase the percentages of Jordanian citizen to be vaccinated which

was consistent with previous studies. Moreover, after the high number of deaths among the Jordanian citizen and the hard conditions that people suffer during corona virus, majority of Jordanian citizen changed their attitude toward COVID-19 vaccination. Thus, high percentage of acceptance and positive attitude toward corona virus vaccination reflected the Jordanian people strong demand for COVID-19 vaccination and the high recognition of the importance of vaccines in order to control the pandemics disease (Tian et al., 2020). Furthermore, people started to think seriously about the pros and cons of the vaccinations (Karafillakis & Larson, 2017). Jordanian residents felt the negative impact on their daily life, work, income, and the disease severity on their health and their beloved one. Hence, the majority of the Jordanian citizens thought that COVID-19 vaccination is an effective way to control and prevent corona virus from spreading (Leung et al., 2020). The positive behaviors and attitude toward vaccine, explain the high percentage of vaccine acceptance (Kraemer et al., 2020). Jordanian adults and married citizens perceived the benefit from corona virus vaccine compared with the risk associated on their health and life style (Bone et al., 2010).

5 Conclusions

The current research reflected the positive role of political/legal and social factors on perceived acceptance of COVID-19 vaccination among Jordanian people. The study findings represented a good start in the process of achieving the coverage rate required to ensure herd immunity among the Jordanian residents. Also, the research results are beneficial for formulating an effective polices and strategies for vaccination in Jordanian health market. Firstly, Activate the role of Jordanian FDA & MOH authorization as a critical factor of accept taking the vaccine. Besides, the Jordanian national authorization and laws regarding motivated Jordanian people to accept the vaccination. Secondly, trigger the role of social medial and word of mouth of social circle may influence acceptance of the vaccine. Lastly, the Jordanian government and health bodies should be improving the accessibility of vaccination in terms of the economies of taking the vaccine such as (distance to vaccination sites, waiting time etc.) because of it plays a role in the decision to take the vaccine. Jordanian health official showed design an immunization programs that can remove barriers that hinder people from getting vaccination. As well, health official should communicate with people about any public concern such as vaccine safety (Cheney & John, 2013). Public concern about vaccine safety has frequently been reported as the major obstacle to vaccination decision-making. Some of the Jordanian residents delay their vaccinations until safety of COVID-19 vaccine is confirmed. Therefore, Jordanian health officials need to use all the available tools to persuade people to take the vaccine and to stop the hesitations. Some of the reasons that explain people delay and hesitation are the concerned that the vaccine still under development, no real data and information about vaccine negative side effect and safety. In addition, people concern about the different news and reports about the safety of the vaccine.

Also, negative testimonies from doctors and pharmaceuticals would lower the confidence among public concerns. Besides, our study showed that people who valued convenience tend to delay their vaccination. Thus, Jordanian health officials need to monitor reports that concern vaccine safety with the publics on regular basis. Furthermore, officials can increase doctor and pharmaceutical testimonies regarding safety and future concerns.

To be proactive and respond successfully for any possible epidemic or pandemics in the future, health governing bodies in Jordan (MOH, Royal Medical Services, and Private Sectors) should take in to consideration training programs in terms of vaccination and continuous education for health service providers in general and health providers who working in Epidemiology field in particular.

Ebb and Flow Theory in Tourism, Hospitality, and Event Management

Omar A. Alananzeh, Ra'ed Masa'deh, and Ibrahim K. Bazazo

Abstract This study aims to track the events that affected tourism in Jordan and presents the evolution of tourist inflows and outflows linked to these events. Accordingly, the Ebb and Flow Theory in the service industry is created and discussed. Many terminologies were used in the tourism industry to clarify the incoming and outgoing tourism movement, such as "peak period and recession period", "high–shoulder and low-shoulder", "high-season and low-season", and others. This study sheds light on a new insight that accurately and clearly describes what is happening in the tourism, hospitality, and events industry. It describes the period of prosperity and development in the tourism movement as the Flow, and the period of stagnation and confinement in the global tourist movement as the Ebb. Also, the fluctuation between these two periods is called solstice time. Understanding these periods helps organizations develop their strategies, achieve the desired benefit, improve and innovate in providing optimal service.

1 Introduction

The economy of many countries depends on a specific industry, but the tourism and hospitality industry are considered one of the basic industries in all countries of the world, regardless if this country is rich in its natural resources or has a scarcity of natural or human resources (Abu Zayyad et al., 2020; Abuhashesh et al., 2019; Alaali et al., 2021; Alananzeh, 2017; Mahmoud et al., 2021). It is undoubtedly one of the largest, most growing, and prosperous industries in the global economy, and it clearly competes with the petroleum or technological industries for some countries (Khan et al., 2020). It is expected that it will maintain its position in the future. Tourism is not a goal but a means to contribute to comprehensive national development, and it is by its nature a multi-lateral and interdependent industry (Mihalic, 2014). Nevertheless, the tourism industry is highly sensitive to various internal and external shocks and crises, such as economic fluctuations, natural disasters such as earthquakes, earthquakes, fires, health epidemics, terrorism, and interstate conflicts (Al-Dmour et al., 2017; Jiang et al., 2019; Sönmez et al., 1999).

It is no longer seen as a secondary sector in the economies of countries, due to its importance in GDP and its role in adjusting the balance of payments, which is usually done through the availability of foreign currencies that enables the country to import its basic needs (Manzoor et al., 2019). This industry witness's rapid growth and development in many countries that have done well to preserve the stability of this sector and immunize it against various natural, political, economic, and health shocks and crises (Breier et al., 2021; Chiu et al., 2019; Obeidat et al., 2017, 2019). Therefore, maintaining a stable and accelerated growth in the tourism sector is not a result of luck and chance in the countries that are successful in tourism, but rather the product of policies, strategies, and plans that are thoughtful and pre-placed within what is called tourism crisis management (Perles-Ribes et al., 2016), which examines the theories, variables, contributors and affected parties (Alshraideh et al., 2017), and procedures that can be taken to avoid or reduce the damage resulting from various crises and disasters before, during and after the crisis for the quick return, recovery, and advancement of tourism after any emergency (Al-Dmour et al., 2021; Alrowwad et al., 2020; Alzoubi et al., 2020, 2022; Masadeh et al., 2019; Masa'deh et al., 2013, 2019; Mashaqi et al., 2020; Tarhini et al., 2015).

That crisis management lies through protecting and preserving the various sectors of this industry and achieving the optimal use of the country's resources during the peak season, or the so-called high-season, as the tourist destination is witnessing a tremendous influx in the number of tourists, which will reflect positively on the prosperity and economic recovery of that tourist destination and at the same time cause some damage or negative effects to the tourist destination (Adamou & Clerides, 2009). And the safe speed of managing crises and risks to which the tourism industry may be exposed in a tourist country or countries of the whole world if that crisis is global as it is now in the Coronavirus pandemic (Covid-19) (Breier et al., 2021). Sometimes we need to manage the regular crisis, which is meant by the natural expectation of a decrease in the number of tourists resulting from natural causes such

as high or low temperatures that affect the attractiveness of the tourist destination or what is sometimes called a low-season, which is the decline in the number of tourists to that destination (Aqqad et al., 2019; Breier et al., 2021; Rossi, 2012; Sausmarez, 2007; Uysal & Kılıç, 2020). The impact of crises is also severe on hotel employees, as many companies are laying off a number of employees due to their economic conditions, and this affects the loyalty of employees as well as the orientation of the workforce towards the hospitality sector (Hunaiti et al., 2009; Masa'deh et al., 2017a, 2017b).

2 Ebb and Flow Theory

Ebb and flow (tides) are very long waves that move across the oceans under the influence of the moon and the sun, and when these waves advance towards the coast they appear as a regular rise and fall of sea water, and the reason for these waves is the earth's rotation around itself, and the moon's rotation around the earth. This is as a result of the gravitational pull of the moon water in the oceans towards it, and the tide occurs in the face of the moon, and the opposite side to it (National Ocean Service, 2021).

In other words, Flow is a temporary, gradual rise in the water level of an ocean or sea surface. Ebb is a temporary, gradual decrease in the water level of the surface of the ocean or the sea. The fisherman understands (sectors of the tourism and hospitality industry) from these fish (the tourism movement), they leave their dens (tourists' origin) to eat at the time of the flow (prosperity, prosperity, and peace) and return again at the time of the ebb (disasters and crises). This means that stakeholders of the tourism and hospitality industry must know how to make the most of the flow period and how to deal with strategic planning to manage crises and disasters in the ebb.

In the tourism and hospitality industry, tourism companies rely in particular on the theory of Ebb and Flow in their investments and prosperity. Where the flow indicates the influx of tourists, and therefore a large tourism activity that requires tourism movement and congestion in the means of tourist transport. From here, the tourism companies begin to provide competitive services and coordination with the providers of tourism and travel offices and other tourism companies. The flow is considered joy and prosperity season for tourist transport companies. But every flow must be followed any an ebb, which is a decrease in the number of tourists, or the so-called low season, and here companies must follow strategic plans to deal with the ebb. However, the Corona pandemic period was a long ebb, which required the government to intervene to save the transport sector until the flow came.

The main causes of the ebb in tourist transportation are world wars and the flu epidemic, starting from a year 1918 where there is a comparison between the results of the current pandemic and those disasters in a wide range of consequences. Unfortunately, we can expect other major disturbances in the future (Hendrickson & Rilett, 2020; Jiang et al., 2017).

The tourism industry has gone through many crises over the past 20 years (Ebb). In 2003 during the SARS epidemic, the events of September 11, 2001, and the global economic and financial crisis in 2009. But after these crises, the tourism and hospitality industry will return to its previous state, and perhaps much better, as it flourishes and revives strongly and quickly (Flow).

3 Importance of Ebb and Flow

Ebb and Flow movements are of great importance as they work to cleanse the seas and oceans of all impurities, as well as cleanse estuaries and ports of sediments, as they help ships to enter ports that are located in shallow areas. But the high flow may pose a threat to navigation, especially in the straits.

The phenomenon of Ebb and Flow is one of the natural phenomena that occur in all the seas of the world, and that the ratio of high flow and low ebb varies from the North Pole to the Antarctic through the equator, in some areas of the world it reaches more than 200 cm, and in other areas it does not exceed 30 cm. In other words, in some places, the difference between ebb and flow is not very large, and in others, the difference is huge.

Since ancient times, people have been alerted to the importance of the power of the ebb and flow and have used this in managing their mills to grind grain. The ruins of these mills are still found on the shores of Brittany, in northern France, since the twelfth century AD. The idea by which these mills operate is very simple and is summarized in reserving flow water in a reservoir during high tide, and when the reservoir is filled with water, special gates are closed so that the water level in the reservoir is higher than the sea level when the water begins to recede.

In the tourism, hospitality, and events sector, this happens exactly, as the tourist destination witnesses an active tourism movement, and then this movement begins to decline and shrink. That is, the tourist destinations, in general, go through an ebb and flow time. In a recession period, establishments, tourist destinations, and service facilities can take advantage of this period for strategic planning, training, reconstruction, renewal, and general development in preparation for the period of the return of tourism.

As for the flow time, tourism establishments, service facilities, and tourist destinations must focus on Total Quality Management (TQM) in order to maintain competitiveness, market share, and pay attention to customer satisfaction. The success of tourism destinations and service facilities depends on the ability to strategic planning, which is considered a comprehensive process through which future actions and goals are defined and what steps are necessary to achieve these developmental and competitive goals.

Strategic planning needs to address a number of things during the ebb time for the development of the tourist destination, such as the environment and the impact of tourism on it during the flow time, improving the traffic-related infrastructure, especially in major city centers, and addressing the causes of pressure in some tourist

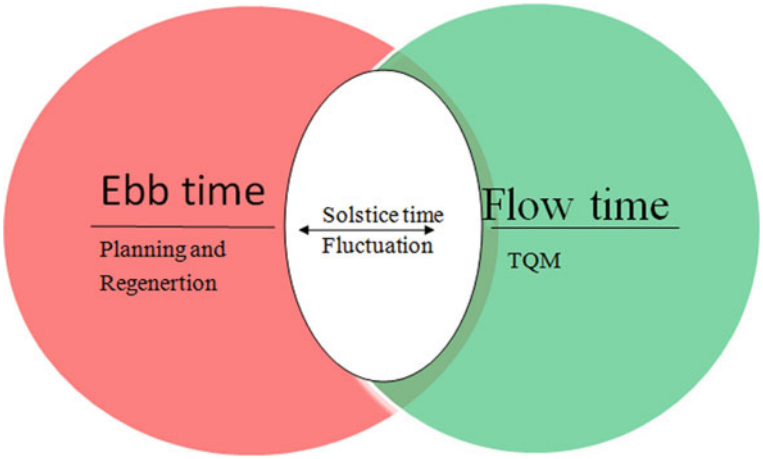

Fig. 1 Ebb and flow theory and its implementation (*Source* Prepared by the researchers)

areas. It makes strategic planning for the flow of tourists easier and does not affect the living conditions of the local population. Strategic planning also helps in maintaining the various service facilities and exploiting them in a healthy way, which can be the main driving force behind the revitalization of tourist destinations and their economic growth, especially during the transition process that destinations go through in the process of transition from ebb time to flow time (Jurdana, 2018) (Fig. 1).

On the other hand, tourism destinations and service establishments such as hotels and restaurants are responsible for total quality management during flow time, which means paying attention to all details and the involvement of all employees in achieving quality required to maintain the level of excellence in providing an ideal competitive service (Mok et al., 2013).

This is achieved by evaluating the policy and procedures followed to develop and implement comprehensive quality requirements and guarantee them that help the company in attracting a large number of tourists regardless of the reasons for travel, whether for business or leisure purposes. The expectations of tourists are high and they demand a certain level of quality; customers are generally willing to pay more for quality.

4 Tourism Industry in Jordan as a Case Study

Jordan is located in the west of the Asian continent, in the heart of the Middle East, and is bordered to the north by Syria, to the east by Iraq and Saudi Arabia, to the south by Saudi Arabia, and to the west by Occupied Palestine, and it has one seaport, which is the Gulf of Aqaba on the Red Sea. Jordan has an area of 89,342 km^2, and its most important natural resources are phosphates, potash, and shale oil. It is

Licensed to (putm@utm.my)

characterized by a moderate Mediterranean climate in summer and cold in winter (Alananzeh et al., 2018a, 2018b; Al-Dhoun, 2019; Alsarayreh et al., 2010).

Tourism is one of the main industries in Jordan, as the contribution of this industry reached an average of 8.10% in the Jordanian GDP during the period (1980–2014). Jordan relies on it mainly in adjusting its balance of payments (Abuamoud et al., 2019; Al-Dhoun, 2019; Bader et al., 2016). The tourism industry in Jordan has been affected by many political and security crises at the global, regional, or local levels, such as the second Gulf War in 1990, the second Palestinian uprising in 2000, the events of September 11th related to the bombing of the World Trade Center in 2001, the third Gulf War in 2003, the SARS epidemic IN 2003, Amman hotel bombings in 2005, the global economic and financial crisis in 2009, and the events of the Arab Spring for the period (2011–2014), the pandemic of Covid-19 (Al-Dhoun, 2019; Al-Shorman et al., 2016; Kreishan, 2014).

Table 1 clearly shows the great variation in the numbers of arrivals to Jordan, as the number increases (flow) in cases of peace and decreases (ebb) significantly in cases of crisis whether local, regional, or global. We also note through the statistics that the events that take place in Egypt affect quickly the tourism movement in Jordan for several reasons, including the proximity of Jordan to Egypt and the joint cooperation between the tourism offices in the two countries, as well as the common cultural, religious and civilization factors between Jordan and Egypt.

Figure 2 shows the impact of events and crises on the tourist movement (ebb and flow) coming to Jordan. We notice that there are ebb movements that have negatively affected the tourism movement in Jordan, for example the events of the end of the year 2000, The Second Palestinian Intifada (9-28-2000), which affected tourist areas in the West, but their impact was positive on Jordan. However, some crises and events in the other part of the ball affect positively the tourist, as the flow of tourists begins to the opposite part of the globe (flow movement). The best example of this is the events of September 11, which affected tourist areas in the West, but their impact was positive on Jordan, where the number of arrivals to Jordan increased due to this, and this was confirmed by the study of Al-Shorman et al. (2016), who indicated that Jordan has become a safe haven for tourists in these global crises. This increase was also accompanied by the visit of Pope Paul II to the baptism site, which reflected positively on the movement of tourists to the region (flow).

However, the occurrence of local and regional crises has a negative impact on the flow of tourism to Jordan (the movement of islands), such as the events of the Arab Spring. It leads to the influx of tourists to the other side of the globe (tidal movement).

5 Conclusion

Since the dawn of time, tourist destinations have been affected by the movement of ebb and flow in the movement of tourists. As the movement of flow meant prosperity, development, and economic and social returns for the tourist destination. And the

Table 1 Major events that impacted tourism industry in Jordan

Year	Number of arrivals	The major event	Its impact
1990	0,577.446	Peace and stability	
1991	0,439.481	The second Gulf war (1990-191)	Decrease
1992	0,699.262	Peace and stability	Increase
1993	0,774.871	Peace and stability	Increase
1994	0,857.61	Peace and stability	Increase
1995	1.074.548	Jordan-Israel peace treaty (26-10-1994)	Increase
1996	3, 164,000	Peace and stability	Increase
1997	3,068,000	Local protests linked to soaring bread prices (18-8-1996)	Decrease
1998	3,484,000	The establishment of the Jordan Tourism Board	Increase
1999	3,231,000	Peace and stability	Decrease
2000	2,700,000	The Second Palestinian Intifada (28-9-2000)	Decrease
2001	3,034,000	September 11th (11-9-2001) The visit of Pope Paul II to the Baptism Site	Increase
2002	4,677,000	Peace and stability	Increase
2003	4,600,000	The third Gulf war	Increase
2004	5,587,000	Peace and stability	Increase
2005	5,817,000	Amman Hotel bombing	Increase
2006	6,573,000	War on Hezbollah	Increase
2007	6,529,000	Peace and stability	Decrease
2008	7,100,000	Petra became one of the Seven Wonders of the World in 2007	Increase
2009	7,058,000	The war on Gaza, 27-12-2008	Decrease
2010	8,078,000	The visit of Pope Pope Benedict II to the Baptism Site in 2009	Increase
2011	6,813,000	Civil war in Syria Arab Spring 2010-2011	Decrease
2012	6,314,000	Impact of Arab Spring	Decrease
2013	5,389,000	Egypt-The dismissal of Egyptian President Mohamed Morsi The organization of the Islamic state- Daesh (ISIS)	Decrease
2014	5,327,000	The war on Gaza (2014)	Decrease
2015	4,809,000	The war on Daesh (ISIS)	Decrease
2016	4,236,000	Brussels attacks	Decrease
2017	4,565,000	Peace and stability	Increase
2018	4,922,000	Peace and stability	Increase
2019	5,361,000	Peace and stability	Increase
2020	1, 800,000	Covid-19	Decrease

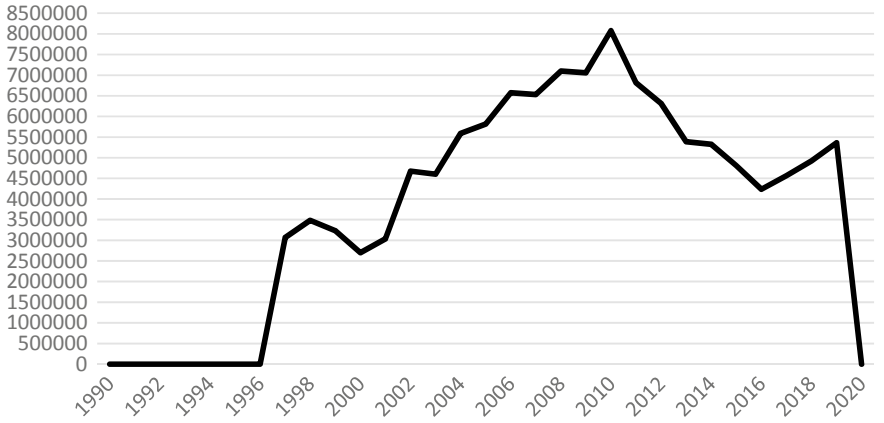

Fig. 2 International inbound tourists (overnight visitors)

flow of traffic may sometimes be above the capacity of the tourist destination, causing the loss of opportunities and negative impacts on the tourist destination and the host community. This is what strongly imposes on those tourist destinations that witness a tremendous turnout of tourists to plan to make the most of this flow movement and reduce the allowance for loss and negative impact.

On the other hand, some tourism destinations are facing at the same time a movement of decline and retreat in the tourism movement (ebb), and this is reflected negatively on the operational process of the facilities and the tourism projects in that tourist destination. Here, too, those countries must follow strategies and contingency plans to manage these crises in order to save the tourist season during the recession.

In the end, ebb and flow times have both benefits and downsides. However, tourist destinations, including tourism facilities and projects, must plan to take advantages of the flow time through the optimal absorption of the increase in the number of tourists, the optimal use of existing resources and resources, and the preservation of the permanence of those resources, focusing on reputation and service quality, and also following the method used in the shores of Brittany, in northern France, in storing water in the flow time to operate the mills in the ebbing time. Alternatively, those tourist destinations that suffer from stagnation in the tourism movement due to seasonality or local, regional, or global events and crises must reduce the risks and save the tourist season by following a developmental strategy and taking advantage of the stock of the peak period (flow time), as well as following the policy of beach cities, which adopts a policy cleaning, arranging, rebuilding and improving the beaches during the ebbing time, because that helps well. Those tourist destinations can follow this policy and strategy in re-developing, cleaning, and expanding the tourist sites in preparation for the flow time.

The Impact of Marketing, Technology and Security Orientations on Customer Orientation: A Case Study in Jordan

Omar Jawabreh and Ra'ed Masa'deh

Abstract The aims of this study are multifold: to explore the functionality of hotel websites by performing a content review and to evaluate customer opinions on the value of the design of hotel websites. To perform the study, hotel websites were used to include numerical and visual information. Information providers are assessed by an evaluation of their particular and comprehensive expertise measurements. The research is based on two significant aspects: a report on all 37 five-star hotels in Jordan that examines their website layout in terms of population, and a survey of 100 hotel clients to determine how clients interpret hotel websites. This planned study is the first of its sort, seeking to determine an appraisal method for all hotel measurements provided by hotel websites. The findings are as follows: When value T = 7.519 reflects the results of the independent variable (marketing orientation), the coefficient of simple linear regression has statistical significance (Customer Orientation). The fact that "Aqaba Zone Advertising and Customer Orientation Classified Hotels have a statistically significant influence on their categorization" is acknowledged, as "Aqaba Zone Advertising and Customer Orientation Classified Hotels have a substantial impact on the coefficient of simple linear regression equation (0.605)". As a result, hotel management may utilize a particular predictive evaluation model to analyze the websites of their hotels from a two-sided perspective: the management team and the consumers. This analysis brings together claims from both perspectives for the first time (hotel managers and clients).

Keywords Marketing orientation · Technology orientation · Security orientation · Customer orientation · Jordan

1 Introduction

The increasing usage of digital technology is providing a solid path for the expansion of the market for services in sectors such as tourism and hospitality, among others (Ahmad et al., 2021; Lee et al., 2022a, 2022b; Tariq et al., 2022b). Use of Information and Communication Technology (ICT) refers to the use of computers, the internet, mobile phones, and other digital devices in the course of corporate activities have drawn attention to the fact that technological advancements have really done their best to define the preferences and prospects of current and future visitors and travelers. Technology, in the form of computers and connected technologies, has made it easier for companies to gather, process, distribute, and store data at a quicker, more accurate, and error-free pace than ever before (Alshurideh, 2022; Alzoubi et al., 2022; Ansah et al., 2012). By modernizing their various company operations, the Indian tourist and hospitality sector has quickly adopted the use of this technology to provide better and more sophisticated services, as well as to explore new commercial possibilities by expanding their existing operations.

Due to the ever-changing marketplace and the rapid growth of information technology, a variety of customers are booking their travel facilities electronically, such as travel, hotel and car rental (Abu Zayyad et al., 2020; Bhuiyan et al., 2020; Chia et al., 2021; Shannak et al., 2010; Tariq et al., 2022a; Yang et al., 2014). In addition, according to a survey of 249 casual travelers (Toh et al., 2011), 80% of travelers searched for hotel information via blogs, with more than half making their bookings via hotel websites or third-party websites. As a result, the Internet plays a crucial function in customer behavior, with more than 50% of the sales of global hotel chains credited to online marketing networks in 2010 (Pan et al., 2013).

This study continues to extend the body of expertise and experience in the online review management assessment of the contents of the hotel website. There have been several academic reports focused on the travel and hospitality industry, which can be classified as either observational or theoretical analysis (Abujamous et al., 2018; Alaali et al., 2021; Daniel et al., 2016; Mahmoud et al., 2021). In the minds of customers, the Internet provides the right to access a hotel directly, without regional or time constraints, to request information and to make transactions. Managers in control of promotions and sales for hotels see lower delivery prices, increased profits, and a greater market share as being great outcomes from hotel websites (Abuhashesh et al., 2021; Al Kurdi & Alshurideh, 2021; Alshurideh et al., 2017; Masa'deh et al., 2018; O'Connor, 2003; Panagopoulos et al., 2014).

An important and well-known marketing resource for hotels is the hotel website (Kim et al., 2017). The job of designing and maintaining websites of the highest standard have been a crucial element in holding the company running. Unfavorable internet experience will limit online purchases, remove future buyers and have a detrimental impact on corporate credit. The analysis described the climate and process efficiency as the two key factors for determining the quality of the electronic services offered by hotel websites. The hotel website acts as a direct connection between the hotel and its guests to meet the needs of the customer (Hahn et al., 2017;

Meng et al., 2020). These days, passengers will use online booking applications to easily pick their lodging. The hotel website presented visitors with high-quality, but cost-effective, details while lowering costs and saving time.

For the evaluation of websites based on studying targets, a number of researchers have identified many variables. For the usage of the fuzzy Delphi screening method, the new study utilizes the present Delphi system, which is composed of many separate variables (Law & Wong, 2010). They explored the effect of blogging on tourism management as a result of their usage of analysis strategies used in other studies. The research discusses a variety of frameworks for website decision-making, including multi-criteria decision-making (MCDM). Promethee is considered to be the most effective promethee model owing to its capacity to accommodate a broad variety of quantitative and qualitative factors, as well as to rank various choices.

There has been a substantial growth in the amount of ways for large hotel chains to capture new market share through their use of the internet in the hospitality industry. As the Internet is still a required networking tool, hotels can make use of it to aid with their marketing (Abuhashesh et al., 2019; Alananzeh et al., 2018; Escobar-Rodrigueza & Carvajal-Trujillo, 2013; Lee & Kozar, 2006; Leung et al., 2016), note that the hotel industry has adapted to this technology and is working hard to create portals from which visitors can book rooms online.

However, only a tiny fraction of the tourism and hospitality literature discusses the relative value of numerous website functionality (Ahmad et al., 2020; Jawabreh, 2020; Yılmaz, 2020). A lot of hypotheses are being made as to what effect the internet has on supporting independent hotels in Jordan. Previous analysis has not researched the independent Jordanian hotel in great depth. Reaction to the dissemination of the Internet is essential for hotel firms in particular, as there is a lack of sufficient data on their opinions on the Internet's importance in their sectors and on how they react to the Internet's impact (Essawy, 2011). As there is a rise in the demand for hospitality, there is a new urgency to introduce innovative ways to advance its place in the industry. Selling and distributing goods and knowledge services on hotel channels to local and global audiences is critical, and the most reliable methods of doing so are in terms of online advertisement and delivery. The Internet is a critical marketing platform for customers.

When consumers are able to do more of their product search and book their travel and accommodation, all at once they are constantly requesting conveniences, specialized, accessible, interactive products, and personal interaction with different hotel providers. This hence puts value on the usage of the Internet for tourism, while also supporting the official websites for the sector (Happ & Horváth, 2020; Jawabreh et al., 2020; Mlambo & Ezeuduji, 2020; Orjuela et al., 2020; Ushakov et al., 2021). Hotel websites can be tested for accuracy as a website marketing platform is built for the current website and consumer perspectives. The aim of this research is therefore to suggest an existing assessment system for assessing the current quality of hotel websites and, by doing so, to help increase the quality of hotel websites for hotel chains (Dai & Lee, 2018).

In order to better understand and measure how various dimensions of hotel websites contribute to different elements of customers' preferences, the aim of the

study is to quantitatively analyze the highest current dimension of hotel website evaluations, as well as to recognize distinctions between different hotel website elements and their importance from customers' perspectives.

2 Background of the Study

Many studies have been undertaken to determine the influence of information and communications technology-based marketing tools on company performance and profitability in the tourist and hospitality industry (Jahmani et al., 2020; Law et al., 2014). The tourism and hospitality literature demonstrates an increasing interest in the adoption and use of social media for management and other business operations, notably marketing. Previous studies in the tourism marketing literature have explored and explained various aspects of social media use in this field, including effects of social media on tourist behavior, social media use by tourism organizations by Destination Marketing Organizations (DMOs) and by travel agencies, social media use for co-creation of value and social media use for tourism service personalization and brand management (Kim et al., 2022; Lin et al., 2020). These researches have enhanced knowledge of social media usage in tourist marketing. Tourism marketing is a performance-oriented commercial activity. That is, success or failure of marketing activities is decided by performance results. A performance-oriented activity is described as an activity undertaken by a person or organization that effectively and efficiently induces the behavior and resource allocation required to fulfill a task and to achieve sustained superior performance of the task (Che-Ha et al., 2014). Studies on adoption of service technology systems by enterprises in the hotel sector reveal that the success or failure (Sigala, 2015). Studies of social media usage in tourism-related marketing are quickly developing and several academic works have examined social media use for tourist marketing activities. However, the research reported thus far have utilized a fairly wide viewpoint (Singh & Dhankhar, 2020).

Much of the first research in this area has been undertaken to analyze the quality and functionality of hotel websites (Kang et al., 2021; Law & Wong, 2010; Qandah et al., 2020; Romanazzi et al., 2011; Wan, 2002). A variety of tests have been performed to assess the scope and detail of the knowledge that can be presented to consumers. In light of the findings obtained, these writers recommend that hotel managers provide a "more engaging appearance" on their websites by utilizing the interactive resources accessible on the Internet. The study concludes that cyber-hotels must investigate how these features impact or enhance the purpose, mission, and mechanics of their websites. five-star hotel websites have their own mobile app, which might allow travelers to know explicitly that there are any mobile apps accessible to them, the authors add. The study concluded that hotels use their websites to provide details and purchases, but not to communicate with clients. The author concludes that this implies that they ought to make their platforms more immersive.

Licensed to (putm@utm.my)

Hotel portals have been an important aspect of the travel and hospitality sector. Reservation knowledge is considered to be the most important dimension, with nearly all of its features considered to be essential. E-commerce activities are marginal among Jordanian hotels. In reality, none of the hotels offer online reservations.

The construction of websites that offer details in other languages, such as English and Arabic, will support visitors who are interested. Hotel portals have been an imperative aspect of the hospitality business, which is why several independent scholars have researched the actions of online travelers in order to consider their preferences and wishes (Lee & Lee, 2021; Widagdo & Roz, 2021). The measurements and characteristics of the upscale hotel on the websites were more significant than on the websites of the economy hotel. A research that explored the relative value of measurements and quality on hotel websites from the point of view of visitors. Jawabreh et al. (2021), proposed a computational model to improve the customer's intention to revisit hotel websites to book hotel rooms. The chain hotels appear to pay greater attention to the facilities offered by the website. Hotels and advertisers need to discuss their image of hospitality, consumer understanding, aspirations and loyalty (Masa'deh et al., 2019). The name of the hotel website is trustworthy and creates familiar amenities and services. Through putting up a website, hotels will improve their purchasing potential, enhance the reputation of the hotel brand and enhance the maximum impact of their marketing campaigns. The assessment of websites is of vital significance, since it can be checked by the degree to which websites satisfy consumer requirements. It involves studies on the effect of the content of the hotel website on sales and the impact of consumers' expectations of the standard of knowledge and the impact of online marketing campaigns on sales.

Most of the work in this field has been conducted to look at the degree of consumer loyalty and the features of websites. A variety of tests have been performed to assess the scope and detail of the knowledge that can be presented to consumers. Richness exists when the flow of knowledge is broader, wider and quicker than it is in the conventional sector. Bad site design would result in a 50% reduction in future revenue due to consumers being unable to locate what they want, according to one report (Li et al., 2015). The authors suggest that hotel managers are willing to have a "more engaging presence" on their websites using the interactive tools available on the Internet. The findings suggest that hotels use their websites to provide details and purchases, just not to communicate with clients, they claim. Take a look at some of the more popular blogs and other web tools on the topic (Jakovic & Galetic, 2014). Hotel websites that offer details in other languages, such as English and Arabic, may allow visitors who are unfamiliar with Iran to find the information they need. It is proposed that a range of transactional and relationship-building practices in the hotel industry in Jordan and around the world will rise in the immediate future. The study found that web design features are essential for online partnership marketing and web design is a core part of web marketing strategy in the travel industry.

Hotel portals are also at the forefront of the promotion and service of hotels. A well-designed website is the most significant marketing tool for the hotel in today's

fast-growing information period. Increasing numbers of researchers are paying attention to website design (Caglione et al., 2009) found that website adoption was positively connected to the success indicator Revenue per Accessible Space. They also noticed that sales growth rates were higher for hotels with their own websites than for hotels with an online presence only via regional portals (Hu, 2009). The "first image" of a hotel has now been moved from the front desk to its website.

The research aims to address the question: What is the strongest dimension in the assessment of the hotel's website? What are the contents? From the customer's point of view, what is the most important feature of the website for the hotel? Are there any gaps in the consistency of new hotel websites and the importance of these contents from the point of view of the customer (Zeki & Alrawadieh, 2017)? Provided a tool for analyzing the websites of international tourist hotels (O'Connor, 2007). Indicated that the assessment of the standard of electronic facilities on the travel platform should be viewed as a multi-criteria decision-making procedure. Hu's requirements are performance, enforcement, device availability, security/privacy, accessibility, reimbursement, communication, and gain. Law and Bai (2007) announced that the effective website of the hotel should be both accessible and functional (Wong & Law, 2005). The following research described the accuracy of details as the most critical aspect of a good hotel website.

Chung and Law (2003) created an information quality measurement model to calculate the efficiency of the hotel website. Law and Cheung (2005) considered the reservation information and website administration to be the measurements with the largest and smallest weights, respectively, the weight meaning representing the perceived significance of the dimension. In comparison to previous reports, the study discussed here focuses solely on a single feature, i.e., the cultural factors of the destination knowledge dimension.

3 Methodology

In this research, the Computational Package for Social Sciences (SPSS) was first used for data entry, and later for data interpretation. Data processing was the initial phase aimed at transforming raw data to a more standardized format that is more suitable for study. Tasks at this point involved data editing, data coding and data entry. Descriptive figures were used to outline the attributes of the respondent, including demographic details such as age, gender; questions about the identity of the participating organization, such as consumer numbers, were also included. Inferential statistics were often used to evaluate theories to assess the association between variables. In specific, the Pearson Correlation was used to check the relationship of the interval amount with the construct, while the Chi-square was used to confirm the association between the nominal variables and the construct. In addition, the Cronbach coefficient alpha was used for the measure of durability. Finally, the Variable Analysis Technique, Variance Analysis (ANOVA) was used to analyze the contents of the official tourist website of the Jordan case study: existence-importance summary (Fig. 1).

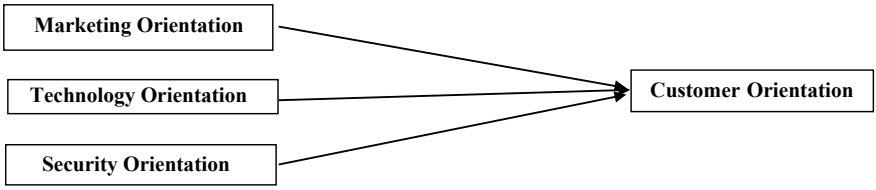

Fig. 1 The model of the study

3.1 Research Hypothesis

H1: There is a statistically relevant effect of Marketing orientation and Customer Orientation of classified hotels in Jordan.

H2: There is a statistically relevant effect of Technology Orientation and Customer Orientation of classified hotels in Jordan.

H3: There is a statistically relevant effect of Security Orientation and Customer Orientation of classified hotels in Jordan.

3.2 Sample Research

The study sample consisted of (100) workers employed in graded Jordanian hotels who were randomly chosen from the study population (Table 1).

3.3 Reliability

To ensure the reliability of the analysis used by Cronbach's Alpha equation to sample the initial analysis, in order to know the stability of the internal consistency for each area of research, Table 2 explains.

Table 2 displays the reliability coefficient for products with high loading where the range of values (0.797–0.950) is adequate.

4 Results

This section comprises the findings of the report, which seeks to analyze the contents of the five-star hotel website for a case study. Jordan: life—significance review; the following is a presentation of the findings, focused on the conclusions of the study:

H1: The marketing orientation and consumer orientation of categorized hotels in the city of Jordan has a statistically relevant effect.

Table 1 Indicates the informative personality trait statistics

Percentage	Frequency	Group	Variable
60.0	60	Male	Gender
40.0	40	Female	
0.00	0	Less than 20 years	Age
20.0	20	21–30 year	
20.0	20	31–40 year	
40.0	40	41–50 year	
20.0	20	51–60 year	
0.00	0	61 years and more	
20.0	20	Less than 1000$	Monthly income
10.0	10	1001$–1500$	
10.0	10	1501–2000	
60.0	60	More than 2001$	
50.0	50	Private sector	Occupation
50.0	50	Public sector	
0.00	0	High school	Education
70.0	70	Bachelor's degree	
20.0	20	Master's degree	
10.0	10	Post graduate	
30.0	30	European	Nationality
30.0	30	Asia	
30.0	30	USA	
10.0	10	Australian	
0.00	0	Canada	
0.00	0	Others	
100.0	100	Total	

Table 2 The values of reliability coefficient by Cronbach's alpha

Factors	Cronbach's alpha
Customer orientation	0.797
Marketing orientation	0.848
Technology orientation	0.805
Security orientation	0.950
Tool overall	0.928

To be confident, we used the Basic Linear Regression Analysis as seen below.

The following is seen in the Table 3. The meaning ($F = 56.534$) and the statistically meaningful value (0.00) are smaller than the statistically significant amount ($\alpha \leq 0.05$). The simple linear regression model is therefore suitable for the estimation of

the causal relationship between the independent variable (marketing orientation) and the dependent variable (customer orientation).

The value of the correlation coefficient between the independent variable (marketing orientation) and the dependent variable (customer orientation) was (0.605), the value of the coefficient of determination (R^2) (0.366) and the value of the changed coefficient of determination (Adjusted R^2) (0.359) which indicates that the independent variable (marketing orientation) should be explained (35.9).

There is a statistical significance of the coefficient of simple linear regression equation associated with the independent variable (marketing orientation) where the value ($T = 7.519$) shows the impact of the effect (marketing orientation) on the independent variable (marketing orientation) (Customer Orientation). There is therefore a substantial significance for the coefficient of simple linear regression equation (0.605), which was a positive result, and we therefore accept the statement that 'There is a statistically significant impact on the marketing and customer orientation of classified hotels in the Jordan.

H2: The influence of Technology Orientation and Consumer Orientation of Categorized Hotels in Jordan is statistically important.

To be confident, we used the Basic Linear Regression Analysis as seen below.

The following is seen in the Table 4. The meaning ($F = 148.09$) and the statistically meaningful value (0.00) are smaller than the statistically significant amount ($\alpha \leq 0.05$). As a consequence, a simple linear regression model is suitable for evaluating the causal relationship between the independent variable (technology orientation) and the dependent variable (technology adoption) (customer orientation).

The coefficient of correlation between the independent variable (technology orientation) and the dependent variable (customer orientation) was (0.776), the coefficient of determination (R^2) was (0.602), and the updated coefficient of determination (Adjusted R^2) was (0.598), both of which mean that the independent variable (technology orientation) should be explained (59).

Table 3 The results for simple linear regression

R	R^2	Adjusted R^2	F	Sig*	Regression coefficients				
					Domain	β	Std error	T	Sig*
0.605	0.366	0.359	56.5	0.00*	Marketing orientation	0.605	0.045	7.519	0.00*

* Statistically significant at the level of statistical significance ($\alpha \leq 0.05$)

Table 4 Effects of basic linear regression

R	R^2	Adjusted R^2	F	Sig*	Regression coefficients				
					Domain	β	Std error	T	Sig*
0.776	0.602	0.598	148.0	0.00*	Technology orientation	0.776	0.041	12.169	0.00*

* Statistically significant at the degree of statistical importance ($\alpha \leq 0.05$)

Table 5 The outcomes of a basic linear regression study

R	R^2	Adjusted R^2	F	Sig*	Regression coefficients				
					Domain	β	Std error	T	Sig*
0.480	0.231	0.223	29.359	0.00*	Security orientation	0.480	0.038	5.418	0.00*

* Statistically significant at the degree of statistical importance ($\alpha \leq 0.05$)

The coefficient of a basic linear regression equation in relation to the independent variable (technology orientation) has statistical significance, with the value ($T = 12.169$) suggesting the influence (technology orientation) on the independent variable (technology orientation) (Customer Orientation). As a consequence, the coefficient of the simple linear regression equation (0.776), which was a positive influence, has a significant impact, and we accept the statement that "Technology Orientation and Customer Orientation of Classified Hotels in the Aqaba Area have a statistically significant impact."

H3: There is a statistically important effect of the Security Orientation and Consumer Orientation of confidential hotels in Jordan.

To be confident, we used the Basic Linear Regression Analysis as seen below.

The following is shown in the Table 5. The meaning ($F = 29.359$) and the statistically meaningful value (0.00) are smaller than the statistically significant amount ($\alpha \leq 0.05$). The association between the independent variable (security orientation) and the corresponding relationship between the dependent variable (correlation) (customer orientation. The correlation coefficient between the independent variable (security orientation) and the dependent variable (customer orientation) was (0.480), with an R^2 of (0.231) and an Updated R^2 of (0.223) indicating that the independent variable (security orientation) could be explained (22.3%).

The coefficient of basic linear regression equation, which is associated with the independent variable (security orientation), has statistical significance (there is a meaningful association between the coefficient and the independent variable) (Customer Orientation). Thus, this implies that the coefficient of the basic linear regression equation (0.480), which was a positive effect, follows the statement that.

5 Conclusion

The statistical relevant number ($\alpha \leq 0.05$) is less than the significance ($F = 56.534$) but not smaller than the statistically meaningful value (0.00). Since the independent variable (marketing orientation) is the source of the causal interaction between the dependent variable (customer orientation) and the company, it is better to use a simple linear regression model. Correlation coefficient between independent and dependent variables (marketing orientation and consumer orientation) was (0.605), R^2 (0.366)

and Updated R^2 (0.359) both indicate that the independent variable (marketing orientation) may be rendered clearer. Pragmatism comes from a belief in our own abilities to work it out as we move along.

Coefficient of basic linear regression has statistical significance where value (T = 7.519) denotes the effects on the independent variable (marketing orientation) (Customer Orientation). Accordingly, there is a considerable impact on the coefficient of simple linear regression equation (0.605), which is a good impact, and we accept the argument that "Jordan Advertisement and Customer Orientation Classified Hotels have a statistically important effect on their categorization." When it comes to the advertising and consumer care aspect of hotels, hotel portals are masters. In today's dynamic environment, the website is the most important marketing asset. The rise in the number of scholars who study website design suggests that increased emphasis on website design is warranted. Website adoption was positively related to revenue per accessible area, according to O'Connor (2007). They observed that revenue growth rates were often higher for hotels with a website to which consumers could only resort from regional portals rather than for hotels with a presence on both the global and regional internet. "First pic" for a hotel is now on the website rather than on the front desk. According to Law and Wong, hotels should make their websites more interesting. According to them, just 20.00% of Croatia's five-star hotel websites have their own mobile app. According to the findings, cyber-hotels should look at how these elements affect or improve the purpose, goal, and mechanics of their websites.

Visitors unfamiliar with Jordan may be able to discover information on hotel websites that provide data in other languages, such as English and Arabic. In today's fast-paced information age, a well-designed website is the most important marketing tool for the hotel. The goal of the study is to find out what the most important factor is when evaluating a hotel's website. What are the contents of the package? What is the most significant element of the hotel's website from the customer's perspective?

Are there any inconsistencies in the consistency of new hotel websites, as well as the significance of these items from the customer's perspective? The research focuses exclusively on a particular characteristic, namely, the cultural variables that influence destination knowledge.

Although the explanation is described as 12.169, it represents the impact of the influence (technology orientation) on the independent variable (technology orientation) (Customer Orientation). To this end, it is necessary to reflect on the coefficient of the simple linear regression equation (0.776), which was a positive influence, and thus lend legitimacy to the finding that "The Technology and Customer Inclination of Classified Hotels in Aqaba Area has a statistically significant impact." The coefficient of basic linear regression associated with the independent variable (security orientation) has statistical significance (meaning: T = 5.418). (Customer Orientation). Also, because of this, we may infer that "The Protection Orientation and Customer Orientation of Classified Hotels in Aqaba Area has a statistically relevant effect".

The Awareness and Confidence About COVID-19 Vaccines Among Selected Students in Faculty of Health Sciences: Comparison Study Among Malaysia, Pakistan and UAE

Qays Al-Horani, Saher Alsabbah, Saddam Darawsheh, Anwar Al-Shaar, Muhammad Alshurideh, Nursyafiq Bin Ali Shibramulisi, Zainorain Natasha Binti Zainal Arifen, Amina Asif Siddiqui, Anizah Mahmod, Revathi Kathir, and Siti Shahara Zulfakar

Abstract The COVID-19 pandemic has impacted the world in an unpredictable way, affecting economic, socio-cultural, political, environmental statuses and billions regardless of privilege and wealth. Vaccines were developed quickly, for protection against the Coronavirus, as well as to curb the pandemic. This study aimed to (1) compare awareness about risks and benefits of getting vaccinated against COVID-19,

(2) compare the confidence in usage of vaccines for protection against the COVID-19 (3) determine the association between awareness about risks and benefits of the COVID-19 vaccine and confidence in getting it among selected undergraduate students in the Faculty of Health Sciences in Malaysia, Pakistan and UAE. A quantitative cross-sectional study was carried out using an online validated questionnaire with a 3-point Likert scale, which consisted of three domains, namely sociodemographic, awareness on risks and benefits of the vaccine, and confidence in getting the vaccine. Subjects were Faculty of Health Sciences' undergraduate students from three institutions; one each in Malaysia, Pakistan and UAE, that were recruited through non-probability sampling techniques; convenience and snowball sampling. The subjects' obtained scores on awareness and confidence from each country were averaged, and then compared between the countries using One-Way-ANOVA. Pearson's correlation was used to determine the association between awareness and confidence of the students. All data were analyzed using SPSS version 27.0. A number of 405 students from the three countries; Malaysia (142), Pakistan (124) and UAE (139) participated in this study. One-Way-ANOVA showed that students in Pakistan scored the highest mean awareness with a 1.55 ± 0.23 score, followed by UAE (1.53 ± 0.29) and Malaysia (1.49 ± 0.19). For confidence, students in Malaysia scored the highest mean confidence with a 1.25 ± 0.25 score, followed by Pakistan (1.24 ± 0.31) and UAE (1.20 ± 0.23). Pearson's correlation showed that there was a statistically significant association ($p < 0.001$, $r = 0.442$) between the students' awareness (1.52 ± 0.24) and confidence (1.23 ± 0.26) of getting COVID-19 vaccines. The study found that students in Pakistan had the highest awareness, followed by UAE and Malaysia. Whereas students in Malaysia had the highest confidence followed by Pakistan and UAE. There was a significant association found between the students' awareness regarding the benefits and risks of COVID-19 vaccines and their confidence in getting it.

1 Introduction

Coronavirus Disease (CO = Corona; VI = Virus; D = Disease) a.k.a. COVID-19 is defined by the World Health Organization (WHO) as a newly determined virus that spreads through direct contact with respiratory droplets (aerosol) of the infected person in the form of a cough and/or a sneeze. This new virus and disease was unknown before the outbreak began in Wuhan, China, in December 2019 (Al-Sabbah et al., 2021; Lau, 2020; Looi, 2021; Lorini et al., 2018; Lucia et al., 2021; Muqattash et al., 2020; Polit & Beck, 2006; Polit et al., 2007; Regmi et al., 2016; Saied et al., 2021; Sanche et al., 2020; Shafi et al., 2020; Sharma et al., 2021; Sonawane et al., 2021; Syed Alwi et al., 2021; Wadood, et al., 2020; Xu, 2020). The COVID-19 pandemic is being viewed as the most significant worldwide health crisis of the century and one of the biggest challenges since World War II (Aljumah et al., 2021; Alshurideh et al., 2021; Chakraborty & Maity, 2020). It has been named the sixth public health emergency of the last ten years, internationally, by the WHO (Gallegos, 2020). This pandemic has not only led to a large number of fatalities, and health crises but also severe economic difficulties all over the world (Al-Dmour et al., 2021a; Al-Hamad et al., 2021; Chakraborty & Maity, 2020; Leo et al., 2021). The COVID-19 affected people across the world, unsettling and disrupting 'routine' in the lives of many. In almost all countries affected by COVID-19, entire educational, commercial institutions were closed and non-emergency health services were also suspended (Ali & Gatiti, 2020; Al-Maroof et al., 2021; Creese et al., 2021; Shah et al., 2021).

Being very highly contagious, the novel coronavirus virus spread to more than 200 countries. The virus is known to spread through aerosol or droplets emitted from the nose and mouth; hence threatening its transmission among humans through close contact (Alameeri et al., 2021; Al-Dmour et al., 2021b; Nuseir et al., 2021; Sanche et al., 2020). This led to a large majority of countries imposing complete or partial lockdowns since January and February 2020 (Ahmad et al., 2021; Al Khasawneh et al., 2021; Harahsheh et al., 2021; Lau, 2020). Although the symptoms varied from mild to moderate in severity, approximately 1 out of every 6 patients diagnosed with COVID-19 was likely to become seriously ill and develop difficulty breathing, with progression of disease. Older people, and those with underlying medical problems like high blood pressure, heart problems, diabetes and/or individuals with weak immunity systems, are more likely to develop serious illnesses (Sanche et al., 2020).

The second wave of COVID-19 has hit Asia badly (Looi, 2021), and has caused countries to declare a state of emergency in the respective countries. In Malaysia, the government has employed several measures like putting in order the Movement Control Order, stringent screening process at all airports and economic help to the needy citizens, as well as providing COVID-19 vaccines for free. Similar efforts have been observed by countries in Asia such as the United Arab Emirates and Pakistan, where a lockdown was imposed, work from home was enforced and educational institutions initiated online academic instruction (Al-Sabbah et al., 2021).

The COVID-19 vaccine which was well developed on a war footing in the developed countries (Kakar et al., 2021). At least 198 countries have begun the process

of inoculating their populations against COVID-19, mobilizing more than a dozen vaccines for emergency use: from the American-manufactured Pfizer-BioNTech and Moderna jabs, to the Chinese Sinopharm and SinoVac. As of the Summer of 2021, more than three billion doses have been administered worldwide. But while several countries—such as the United Arab Emirates (UAE)—have been able to make significant headway towards vaccinating their citizens, others such as Malaysia and Pakistan are gradually stepping up the number of vaccines being administered per day.

Generally, the acceptance and demand of vaccines are complex in nature and are perceived differently by the behavioral nature in the communities (Biasio et al., 2021; Creese et al., 2021; Dutta, 2020). It is more complex when it is needed to be accepted in a pandemic as the nature of vaccines produced are not much known, hence hesitancy from people is very much to be predicted. Hesitancy in receiving the vaccines can be due to various factors like and also due to the already existing anti-vaccine movement which has been misleading and confusing the public, by propoganding mistrust in the system that is delivering the vaccination program (Saied et al., 2021). Therefore, this study will specifically look into examining the awareness and confidence about COVID-19 vaccines among selected students in the Faculty of Health Sciences: comparison study among Malaysia, Pakistan and UAE. In this study, the participants will be only from the Health Sciences Department for two reasons: (a) as healthcare providers, it will be mandatory to receive the vaccine and (b) hesitancy among the healthcare providers will affect the public negatively (Karim et al., 2020; Sharma et al., 2021).

The main objective of this study is to determine the awareness about the risks and benefits of the COVID-19 vaccine among selected undergraduate students in the Faculty of Health Sciences in Malaysia, Pakistan and UAE and their confidence in getting the vaccine. This study aimed to determine the awareness regarding the risks and benefits of the COVID-19 vaccines among selected undergraduate students in the Faculty of Health Sciences in Malaysia, Pakistan and UAE, and their confidence in getting the vaccine.

The on-going global discussion on the safety of the COVID-19 vaccines are potentially leaving communities undecided on whether to trust or not to trust. The concept of 'vaccine hesitancy' can be described as either to prolong or refuse in accepting vaccines that are made available (Gallegos, 2020; Sharma et al., 2021). Generally, vaccine hesitancy which starts with an individual will consequently affect the whole community with the similar hesitancy. And, in order to achieve the herd community, a high coverage rate of the vaccinated population is needed in the efforts to flatten the epidemic curve (Syed Alwi et al., 2021; Wadood, et al., 2020). Vaccine hesitancies are said to be specific to the environment and to be fluctuating in accordance to time and setting. In addition, it is prompted by factors like confidence and awareness (Saied et al., 2021; Sharma et al., 2021). Hence by examining the factors of awareness and confidence in getting COVID-19 vaccines, basic perception of the vaccine can be established.

2 Literature Review

2.1 Awareness Regarding the Risks and Benefits of COVID-19 Vaccines

Awareness denotes trust in vaccination safety, and the knowledge about the vaccines. In this pandemic, people are getting much information and resources of COVID-19 vaccines through various sources including television, radio, newspaper, social media, friends, healthcare providers, governments and NGOs. This information obtained, will shape their awareness level towards the COVID-19 vaccines (Domek et al., 2018), hence it is crucial to disseminate transparent and accurate information about the vaccine safety and efficacy to create a well-informed population (Alkalha et al. 2012; Domek et al., 2018). As advocated by Krejcie and Morgan (1970) people generally trust scientists the most followed by healthcare providers and agencies. Thus, if a country is trying to raise the awareness level of their citizens in this vaccine, all these agencies should team up to create awareness. Without proper awareness, the scene with vaccine hesitancy will continue to grow (Polit et al., 2007).

In a survey of 1068 medical students in India reported that they agree vaccines should be mandatory however they wanted an increase in vaccine advocacy to encourage those who were hesitant in getting it (Hui et al., 2020). This clearly describes low awareness, as they know it is important to receive the vaccine, however they aren't aware of the benefits, safety and efficacy of the vaccines. Similarly, in another study conducted by AlQutob et al. (2020) reported that poor acceptance of COVID-19 vaccines in Jordan is due to the lack of transparency and information dissemination from the national and public health authorities. A survey conducted among the Malaysians, reveals that Malaysians have a high rate of acceptance, but it still remains important to increase their awareness level in vaccine safety and effectiveness (Syed Alwi et al., 2021). Similarly, Pakistan reports have ample understanding on the vaccines and efforts for awareness should be uplifted (Yusoff, 2019a, 2019b).

2.2 Confidence in Getting COVID-19 Vaccines

Confidence denotes trust in vaccination safety, effectiveness and competence of the healthcare system. There is an overlap here with awareness and confidence as we can see with awareness, only then confidence can be built. The overlap factor is vaccination safety, so if the population is aware of the safety, then the confidence in effectiveness and the trust in the healthcare system can be established. Confidence is one of the major factors in vaccine hesitancy as the concerns of the safety, efficacy and the rush in vaccine development and production due to pandemic are lingering in the mind of the population. In addition, many rumors are also being spread which

does not help this situation (Lorini et al., 2018; Lucia et al., 2021; Sonawane et al., 2021; Xu, 2020).

As illustrated in the result of a survey of 186 medical university students in Jeddah, the majority of the students were aware of the risks of COVID-19, but 44% of them were hesitant in getting the vaccine. Of these 68.3% were concerned about vaccine side effects. The study recommended vaccine advocacy through educational programs (Chakraborty & Maity, 2020). This shows that there is some kind of awareness level among the participants, however the trust or confidence is not achieved. And to establish confidence, government health departments must ensure that 'good' information is released for public consumption, to ensure their trust towards COVID-19 vaccine (Chakraborty & Maity, 2020; Kakar et al., 2021).

3 Method

The focus in this study is to determine the awareness and confidence level among selected students from the Faculty of Health Sciences on the COVID-19 vaccine. Since COVID-19 is posing to be one of the major threat to the entire population and Asian countries (Lau, 2020), this study would be one of the pioneers in assessing the awareness and confidence level about COVID-19 among undergraduate students in Faculty of Health Sciences in these three countries (Malaysia, Pakistan & UAE), providing a more scientific backup for relevant parties to gear up their efforts in advocating about COVID-19 vaccines in the effort to flatten the pandemic curve.

3.1 Study Design

A quantitative cross-sectional study was conducted for a period of around one week from 29th May to 5th June, 2021.

3.2 Population and Sample

Subjects selected were among undergraduate students in the Faculty of Health Sciences from three universities: Universiti Kebangsaan Malaysia (UKM) in Malaysia, Ziauddin University (ZU) in Pakistan and Fatima College of Health Sciences (FCHS) in UAE. Non-probability sampling strategies through a convenience and snowball sampling technique were used to target all students that consented to fill in an online questionnaire.

The sample size was determined based on Krejcie and Morgan (1970) formula,

$$s = X^2NP(1 - P) / \left[d^2(N - 1) + X^2P(1 - P)\right]$$

According to the formula, s is the required sample size; X^2 is the table value of chi-square for 1 degree of freedom (3.841) at the desired confidence level of 0.05; N is the population size of 4000, P is the population proportion (assumed to be 0.50 since this would provide the maximum sample size) and d is the degree of accuracy expressed as proportion of 0.05. Based on the formula, the calculated sample size was 351. It was assumed that there would be a 10% drop rate in response. Hence, the required sample size was,

$$s = 351 + (10\% \times 351) = 351 + 35 = 386$$

3.3 Questionnaire's Validity and Reliability

The instrument used was a questionnaire adapted from studies by Al-Sabbah et al. (2021), Muqattash et al. (2020), Biasio et al. (2021). The adapted questionnaire that was named as Student COVID-19 Vaccine (STU-COV) Questionnaire, had three main domains in which were sociodemographic data, awareness on risks and benefits of the vaccine and confidence in getting the vaccine. In this questionnaire, the awareness and confidence domain used a 3-point Likert scale.

Collecting data for a questionnaire based study through traditional techniques (face to face) could be expensive, uncomfortable, unsafe (during the COVID-19 pandemic) and time consuming. The emerging data collection technique based upon internet/e-based modern technologies like online platforms (e.g. SurveyMonkey) was relatively a cost effective approach. These unique data collection techniques could collect a huge number of responses from participants in a short time frame as well as it would be a solution for a situation like COVID-19 pandemic, where no face-to-face contact was recommended (Khan et al., 2020).

Moreover, there was significant evidence that several large cross-country researches had actually been completed making use of online sets of questions to collect different types of data through popular dedicated platforms (e.g. https://www.surveymonkey.co.uk) (Regmi et al., 2016). That's why an anonymous online structured questionnaire was designed using Survey monkey to save time and make it more comfortable for the participants from the three different countries. The link for the questionnaire was exclusively shared by email with the undergraduate students—both individually and through their social media groups. Non-probability sampling strategy through a convenience and snowball sampling technique was used to target all students in the Faculty of Health Sciences consenting and willing to fill the survey. Upon completion of the survey, data was downloaded as a form of SPSS from Survey monkey platform, format and data analysis was conducted using SPSS software version 27.0.

The questionnaire had been tested for validity and reliability, in which two validation protocols i.e. face validation and content validation were conducted for all

domains in order to validate the newly developed questionnaire. Whereas, Cronbach's Alpha was used to test for reliability for the awareness and confidence domain. In the pretest of the questionnaire, six experts were involved in the content validation, nine students from the Faculty of Health Sciences were involved in the face validation, and 30 students (10 students from each country) from the Faculty of Health Sciences were recruited to check on the reliability of the STU-COV Questionnaire. The acceptable Face Validity Index (FVI) and Content Validity Index (CVI) values for face validation and content validation are both more 0.83 (Hui et al., 2020).

Meanwhile, the acceptable values for Cronbach's Alpha are 0.70 for 10 items and more (awareness domain), and 0.50 for less than 10 items (confidence domain) (Hui et al., 2020; Looi, 2021). Based on the validity and reliability test conducted, the STU-COV Questionnaire achieved a FVI and CVI values of more than 0.83 for all three domains. Whereas the awareness and confidence domain showed acceptable Cronbach's Alpha value of 0.78 and 0.56.

4 Data Analysis and Findings

A p-value of less than or equal to 0.05 was taken as significant. Data analysis was done using SPSS version 27.0.1.0 and Microsoft Excel. One-Way ANOVA was performed to compare the awareness about the risks and benefits of getting vaccinated against the COVID-19 among selected students in Malaysia, Pakistan and UAE, and also to compare the confidence in the usage of vaccines for protection against the COVID-19 among selected students in the three countries. For determining the association between the awareness about the risks and benefits of the COVID-19 vaccine among selected students and their confidence in getting the vaccine, a Pearson's Correlation test was conducted.

Table 1 showed the sociodemographic characteristics of the subjects. N = 405 students had participated in the study.

4.1 Awareness About the Risks and Benefits of COVID-19 Vaccines

As seen in Table 2 students from Pakistan had the highest awareness (1.55 ± 0.23) compared to UAE (1.53 ± 0.29) and Malaysia (1.49 ± 0.19). One-Way ANOVA was used to compare the awareness about the risks and benefits of getting vaccinated against the COVID-19 among the selected students between the three countries. The test showed that there was no statistically significant difference ($p > 0.05$) on the awareness regarding risk and benefit of COVID-19 vaccines among the students in the three countries.

Table 1 Sociodemographic characteristics

Variable	n (%)	Mean (SD)

The percentage of respondents who relied on the updates of information from authorized organizations were 95.1% for Malaysia, 87.8% for UAE and 88.7% for

Licensed to (putm@utm.my)

Table 2 The comparison on level awareness of risks and benefits of COVID-19 vaccines among selected students in Malaysia, Pakistan and UAE

Country	Score of awareness (Mean ± SD)	F statistic	*p-value
Pakistan (n = 124)	1.55 ± 0.23	1.890	0.152
UAE (n = 139)	1.53 ± 0.29		
Malaysia (n = 142)	1.49 ± 0.19		

* There is a significant association according to the One-Way ANOVA test ($p < 0.05$)

Pakistan. It was reported in Fridman et al. (2020) that more than half of the respondents who aged less than 25 years old in USA got their information from Communicable Disease Centre (CDC) (64.7%), local health department (63.7%) and WHO (59.2%), which is lower from the findings from this study.

4.2 Confidence in Getting COVID-19 Vaccines

According to Table 3, students from Malaysia had the highest confidence (1.25 ± 0.25) compared to Pakistan (1.24 ± 0.31) and UAE (1.20 ± 0.23). One-Way ANOVA was used to compare the confidence of getting COVID-19 vaccines among selected students in Malaysia, Pakistan and UAE. The test showed that there was no significant difference ($p > 0.05$) on the confidence of getting COVID-19 vaccines among students in the Faculty of Health Sciences in between the three countries.

This study found that 95.1% respondents from Malaysia, 92.1% respondents from UAE and 83.1% of the respondents from Pakistan trusted the healthcare sector in providing accurate and reliable information. In comparison with the results of this study, Imperial College London (2021) reported that confidence in the healthcare sector varies markedly between countries across the globe, ranging from the highest level of confidence on their healthcare sector (70%) in United Kingdom (n = 5005), and the lowest level of confidence (42%) in South Korea (n = 2460). This discrepancy was probably because the targeted population in this study were well-informed undergraduate students from healthcare sectors. Thus, the result could not be generalized into the general population (Saied et al., 2021; Sonawane et al., 2021).

Table 3 The comparison on awareness of getting COVID-19 vaccines among selected students in Malaysia, Pakistan and UAE

Country	Score of confidence (Mean ± SD)	F statistic	*p-value
Malaysia (n = 142)	1.25 ± 0.25	1.493	0.226
Pakistan (n = 124)	1.24 ± 0.31		
UAE (n = 139)	1.20 ± 0.23		

* There is a significant association according to the One-Way ANOVA test ($p < 0.05$)

Table 4 The correlation between awareness about the risks and benefits of the COVID-19 vaccine among selected students and their confidence in getting the vaccine

Item	Mean ± SD	Pearson's correlation (r)	p-value
Awareness	1.52 ± 0.24	0.442	0.001*
Confidence	1.23 ± 0.26		

* There is a significant association according to the One-Way ANOVA test ($p < 0.05$)

4.3 Association Between the Awareness of Benefit and Risk of the COVID-19 Vaccines

Pearson's Correlation was used to determine the correlation between the awareness of benefit and risk of the COVID-19 vaccines among selected students and their confidence in getting the vaccines. Table 4 showed that there was a statistically significant correlation between the awareness of benefit and risk of COVID-19 vaccines among selected students and their confidence in getting the vaccines ($p< 0.001$). Even though the correlation was found to be weak, it was a positive correlation ($r = 0.442$). In their systematic review, Biasio et al. (2021) also found that there was an association between health literacy and vaccination status.

5 Discussion and Conclusion

In conclusion, this study found that there were no significant differences between awareness and confidence level among undergraduates in the Faculty of Health Sciences in Malaysia, Pakistan and UAE. In these three developing countries, the majority of the participating students have awareness on risks and benefits of COVID-19 vaccines. Moreover, most of the students obtained the information from the internet and social media. Hence, government and authorities could use these platforms to educate and create awareness continuously to encourage vaccine uptake among university students, as well as to strengthen overall immunization for COVID-19. It was also found that the confidence level was related to their awareness, thus increasing the awareness of risks and benefits of vaccination would also increase their confidence level in getting it.

6 Recommendations

Questionnaires such as ours could be considered as an important tool that can be applied into a larger population to measure the level of awareness and confidence in getting the vaccine. To ensure increased awareness and confidence among the general population, the elements that define and create awareness should be understood and

thus, interventions can be crafted accordingly. A randomized sampling method also can be used to represent the real population. A thematic analysis can be done using a qualitative approach for this study in the future. More participants can be recruited for future study.

7 Limitations

This study recruited university students from the Faculty of Health Sciences only, who can be considered to have more awareness about the vaccine in comparison with the general population of any of the three countries at large. Moreover, this study could not determine the cause-and-effect relationship between the awareness and confidence in getting the COVID-19 vaccine. This study only measured the samples' awareness and confidence at one period of time.

Acknowledgements The authors would like to express their gratitude to everyone who participated in the pilot study and helped validate the STU-COV. The authors also acknowledge all students who have participated in this study. We would also like to acknowledge the Faculty of Health Sciences UKM, ZU and FCHS.

Predicting Bitcoin Prices Using ANFIS and Haar Model

Jamil J. Jaber, Rami S. Alkhawaldeh, Samar M. Alkhawaldeh, Ra'ed Masa'deh, and Muhammad Turki Alshurideh

Abstract This study aims to model and enhance the forecasting accuracy of cryptocurrency market data patterns using the daily bitcoin (BTC) close price data with 1535 observations from December 2017 to January 2022. The model employs a nonlinear spectral model of maximum overlapping discrete wavelet transform (MODWT) with Haar mathematical functions in conjunction with an adaptive network-based fuzzy inference system (ANFIS). We have selected the logarithm volume of bitcoin (LV) and logarithm trade count (LCT) as input values according to correlation and multiple regressions. The input and output variables have been collected from the cryptocurrency market. The performance of the proposed model (MODWT-Haar-ANFIS) is compared with traditional models that are the autoregressive integrated moving average (ARIMA) model and the ANFIS model. The obtained results show that the performance of MODWT-Haar-ANFIS is better than that of the traditional models. Therefore, the proposed forecasting model is a promising approach that capable of deploying in the cryptocurrency markets.

1 Introduction

Financial markets refer to any location or system that allows buyers and sellers to exchange financial instruments such as bonds, shares, foreign traditional currencies, cryptocurrency, and derivatives (Madura, 2020). Financial markets enhance the transfer of surplus cash from savers (surplus cash(to institutions (deficit cash), who subsequently invest them in productive activities. Financial markets encourage players to raise cash and transfer risk through derivatives contracts (forward, future, option) (Madura, 2020). Capital markets are used for long-term financing, whereas money markets are used for short-term finance. The financial market mainly is divided into two parts: primary markets and secondary markets. The primary market deals with the exchange of initial public offering (IPO) of new financial products, whereas the secondary market deals with the exchange of previously issued financial products. There are many types of financial markets such as capital markets, money markets, cryptocurrency markets, derivatives markets, and commodity markets. The capital markets provide long term investment such as stock and Bond. The money markets provide short term debt financing, while the cryptocurrency markets trade digital assets and financial technologies. The derivatives markets give mechanisms for managing financial risk, while commodity markets trade product such as gold, oil, livestock, and wheat (Hull, 2014).

Cryptocurrency is a digital currency that operates without the assistance of a central bank and uses encryption techniques to regulate unit generation and verify payment transfers. It's more accessible, more widely available, and has grown in popularity over time to become one of the most extensively used forms of currency worldwide. Cryptocurrency has been around since 2009, but it wasn't until 2017 that it became popular as a means of investing. The use of encryption to authenticate transactions is referred to as cryptocurrency. This means that cutting-edge code is being utilized to store and transfer cryptocurrency data between wallets and public ledgers. The purpose of encryption is to assure security and safety. Cryptocurrencies are built on blockchain, a decentralized public database that records all transactions that are updated and maintained by currency holders (Fang, 2022). Cryptocurrency units are created through a process known as mining, which entails using computer processing power to solve complicated mathematical problems in order to generate coins. Users can also buy the currencies via brokers, keep them in digital wallets, and spend them.

Advantages of trading cryptocurrency. First, drastic changes refer to the volatility of cryptocurrencies, which is typically likely to attract the curiosity of speculators and investors. The quick volatility of daily prices can give traders with excellent money-making chances, but they also carry a higher level of risk. Second, the cryptocurrency market is open 24 h a day, seven days a week because it is a decentralized market. Third, it offers certain advantages in terms of privacy to investors. Four, peer-to-peer transactions are one of the most significant advantages of cryptocurrencies is that they do not require the involvement of financial institution middlemen. This

can minimize transaction costs. Furthermore, this functionality may attract to individuals who are distrust of traditional systems. Some cryptocurrencies can provide holders with additional benefits, such as limited ownership and voting rights (Fang, 2022). Disadvantages of trading cryptocurrency; First, the limitations of technical infrastructure, transaction volume, and transaction speed make it unable to compete with traditional currency trading. Second, cybersecurity issues due to attack from hackers. Finally, regulations issue because it is not organized from some countries (Fang, 2022).

Bitcoin, which was founded in 2009, was the first cryptocurrency and is now the most widely traded (Fang, 2022). Satoshi Nakamoto created the currency, which is commonly assumed to be a codename for an individual or group of individuals whose specific identity is unknown. To improve the privacy of Bitcoin transactions, the currency employs a technique known as "Elliptic Curve Cryptography" (Wang et al., 2020). However, Bitcoin is a decentralized digital currency offering lower fees in transactions using secured decentralized authority in Blockchain architecture.

Artificial neural network (ANN) is a supervised machine-learning model utilized in a variety of business and scientific applications (Khuntia & Hiremath, 2019; Li et al., 2020; Smyth & Narayan, 2018; Xiao et al., 2018). The employment of ANNs has emerged in predicting the stock market. The authors in Lv et al. (2020) used the Haar wavelet and Takagi–Sugeno–Kang (TSK) fuzzy rule-based system to forecast stock prices depending on different technical indicators. The model is trained using the Taiwan Stock Exchange market dataset, which has a performance accuracy of up to 99.1%. The authors in Çatık et al. (2020) proposed a fusion-forecasting model of wavelet as a data preparation technique, fuzzy logic, and ANN. The model was built from a stock market dataset gathered during the period from 2005 to 2010. The hybrid behavior of the model indicates reasonable accuracy instead of employing the models independently. The authors in Munandar (2015) also proposed a fuzzy wavelet neural network (FWNN) model for predicting stock prices. The model is evaluated on a daily stock price dataset of 1000 samples that is 90% for training and 10% for testing. The model achieves remarkable results in comparison with other approaches.

The adaptive network-based fuzzy inference system (ANFIS) is a combination of fuzzy and ANN learning algorithms of five layers (Çatık et al., 2020; Geng & Wang, 2010; Khuntia & Hiremath, 2019; Li et al., 2020; Lv et al., 2020; Smyth & Narayan, 2018; Wang et al., 2020; Xiao et al., 2018) and (Fan et al., 2012) that is used in a variety of applications (Nadimi et al., 2010; Wang et al., 2020). The ANFIS model has achieved superior accuracy results in many applications as a forecasting model in comparison to the ANN model independently (Abiyev & Abiyev, 2012; Chang & Fan, 2008; Homayouni & Amiri, 2011; Honghui & Yongqiang, 2012; Munandar, 2015; Sehgal et al., 2014; Septiarini et al., 2016). Therefore, this paper exploits using the ANFIS model in forecasting the fluctuations in the cryptocurrency stock market. We evaluate the Bitcoin as a recent type of cryptocurrency stock market application. *Thus, our contributions is summarized as follows. First, Gathering a cryptocurrency dataset such as Bitcoin that maintains some features and stock price*

as a dependent variable. Second, Evaluating the proposed model using evaluation metrics to reveal the effectiveness of the proposed model.

This study is organized as follows. Materials and methods are explained in Sect. 2. The research design and methodology are discussed in Sect. 3. The empirical results are analyzed in Sect. 4. The conclusions are drawn in Sect. 5.

2 Materials and Methods

This section gives a background of the main concepts used in our study.

2.1 Wavelet Transform Formula

The Wavelet Transform (WT) is a mathematical function that transforms time series data into a time-scale domain. Due to its inherent nature, WT is an appealing solution for non-stationary data, particularly stock market data. Discrete Wavelet Transforms (DWT), Continuous Wavelet Transforms (CWT), and Maximum Overlapping Wavelet Transforms (MOWT) are the three types of WT. In general, these transformations behave the same way. The key difference between DWT and MODWT is that DWT can only be utilized with a certain number of observations (the number of observations should be 2 raised to the power J), but MODWT can handle any size of data. As a result, we'll concentrate on MODWT in this study because of its adaptability (Zhang & Wang, 2012).

WT is essentially an extension of the Fourier Transform (FT) (Adil, 2015), which uses sine and cosine functions. WT satisfies the admission criteria:

$$C_{\varphi} = \int_{0}^{\infty} \varphi(f) \vee \frac{\varphi(t)}{f} df < \infty \tag{1}$$

where $\varphi(f)$ is the FT and a function of frequency f, $\varphi(t)$. The WT is used in many applications such as image analysis and signal processing. It was introduced to overcome the problem of FT, especially when dealing with time, space, or frequency.

There are two types of WT namely the Father wavelet that describes the low-frequency components (smooth data) and the mother wavelet that describes the high-frequency (detailed data) components as shown in Eqs. (2) and (3), with j = 1, 2, 3, …, J in the J-level wavelet decomposition:

$$\phi j, k = 2^{\left(\frac{-j}{2}\right)} \phi\left(t - \frac{2^j k}{2^j}\right) \tag{2}$$

$$\varphi j, k = 2^{\left(\frac{-j}{2}\right)} \varphi\left(t - \frac{2^j k}{2^j}\right) \tag{3}$$

where J denotes the maximum scale sustainable by the number of data points and the two types of wavelets stated above, namely father wavelets and mother wavelets and satisfies:

$$\int \phi(t)dt = 1 \, and \, \int \varphi(t)dt = 0 \tag{4}$$

The general mathematical model is presented in Eq. (5)

$$S_{j,k} = \int \phi_{j,k} f(t)dt, d_{j,k} = \int \varphi_{j,k} f(t)dt, \tag{5}$$

In more details,

$$F(t) = \sum S_{j,k}\phi_{j,k}(t) + \sum d_{j,k}\varphi_{j,k}(t) + \sum d_{j-1,k}\varphi_{j-1,k}(t) + \cdots + \sum d_{1,k}\varphi_{1,k}(t) \tag{6}$$

$$S_j(t) = \sum S_{j,k}\phi_{j,k}(t) \text{ and } D_j(t) = \sum d_{j,k}\phi_{j,k}(t) \tag{7}$$

The WT is used to calculate the approximation coefficient in Eq. (7) where $S_j(t)$ and $D_j(t)$ are introducing the smooth and detailed coefficients, respectively. The detailed coefficients are used to discover the main variations of the original data, whilst the smooth coefficients contain the most relevant aspects of the original data.

WT has a number of well-known transform functions, including Haar, Daubechies (d4), coiflet (c6), Least Asymmetric (LA8), and the best-localized (bl14). The following are the primary characteristics of these functions: (1) Except for the Haar model, the WT functions are arbitrary regular. (2) Except for the Haar model, WT functions do not have explicit expressions. (3) Real numbers are used in WT functions. (4) The scale function, orthogonal analysis, bio-orthogonal analysis, continuous/discrete transformation, accurate reconstruction, and quick algorithm are all WT functions that are orthogonal, compact, and support an arbitrary number of zero moments. (5) The Haar, LA8, and d4 modes are symmetric, although C6 and Bl14 have near symmetry.

2.2 *Autoregressive Integrated Moving-Average Model (ARIMA)*

In time series analysis, the auto-regressive moving average (ARMA) models are used to represent stationary time-series data. A moving average (MA) and an auto-regressive (AR) model are combined in the ARMA model. A time series $\{e_t\}$ is called a white noise (WN) process and $\{Y_t\}$ is called Gaussian process iff for all t, e_t is iid $N\left(0, \sigma^2\right)$. A time series $\{Y_t\}$ is said to follow the ARMA (p, q) model if:

Licensed to (putm@utm.my)

$$Y_t = \mu + \phi_1 Y_{t-1} + \phi_2 Y_{t-2} \cdots + \phi_p Y_{t-p} + e_t - \theta_1 e_{t-1} - \theta_2 e_{t-2} \cdots - \theta_q e_{t-q} \quad (8)$$

where q and p are non-negative integers, p represents order of AR, q is defined as order of the first MA part, and $\{e_t\}$ is the WN process. An extension of the ordinary ARMA model is the auto-regressive integrated moving-average model (ARIMA (p, d, q)) given by:

$$\phi_p(B)(1 - B)^d Y_t = \theta_0 + \theta_q(B)e_t \quad (9)$$

where p, d and q denote orders of auto-regression, integration (differencing) and moving average, respectively. When $d = 0$, the ARIMA model reduces to the ordinary ARMA model.

2.3 ANFIS Model

The ANFIS model combines the fuzzy logic and artificial neural network into a single model. Its operations consist of forwarding and backward learning algorithms. The forward step consists of five layers. The fuzzy inference system under consideration is supposed to have two inputs (x, y) and one output (z) to simplify the explanations. A standard rule base of fuzzy if–then rules for a first order of Sugeno fuzzy model can be expressed as: If x is A_1 and y is B_1 then $f_1 = p_1 x + q_1 y + r_1$, where p, r, and q are linear output parameters. The ANFIS architecture with two inputs and one output is as shown in Fig. 1.

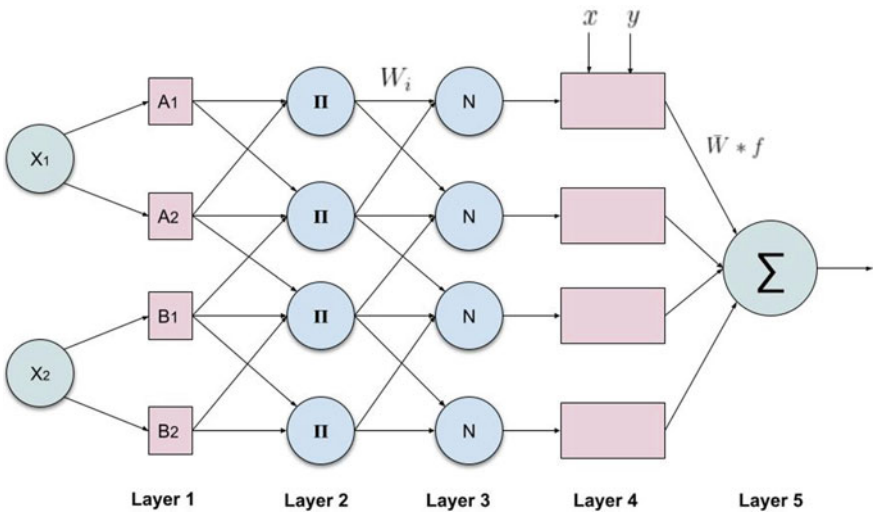

Fig. 1 ANFIS architecture of two inputs and one output with four rules

Layer-1: Every node i in this layer is a square node with a node function.

$$O_{1,i} = \mu_{Ai}(x), \text{for } i = 1, 2, 3 \text{ and } O_{1,i} = \mu_{Bi-3}(y), \text{for } i = 4, 5, 6 \quad (10)$$

where x and y are inputs to node i, and A_i and B_i are linguistic labels for inputs. The $O_{1,i}$ is the membership function of A_i and B_i. Typically, $\mu_{Ai}(x)$ and $\mu_{Bi}(y)$ are selected to be bell-shaped with maximum value of 1 and minimum value of 0, such as $\mu_{Ai}(x)$, $\mu_{Bi-3}(y) = \exp\left(\left(\frac{-(x_i - c_i)}{a_i}\right)^2\right)$, of the set of parameteris a_i, c_i. In this layer, these parameters are referred to as premise parameters. The fuzzification method turns crisp values into linguistic values by utilizing the Gaussian function as the shape of the membership function.

Layer-2: Each node in this layer is a circle node labeled Π that multiplies the incoming signals and sends out the product. For example,

$$O_{2,i} = w_i = \mu_{Ai}(x).\mu_{Bi-3}(y), i = 1, 2, 3, \ldots, 9 \quad (11)$$

The firing strength of a rule is described by each node output. The inference step uses the t-norm operator (AND operator) in this layer.

Layer-3: Each node in this layer is a circle node called N. The i th node measures the ratio of the i th rule firing strength to the sum of all rules firing strengths:

$$O_{3,i} = \overline{w}_i = \frac{w_i}{(w_1 + w_2 + \cdots + w_9)}, i = 1, 2, 3, \ldots, 9 \quad (12)$$

In short, the ratio of the strengths of the rules is calculated in this layer.

Layer-4: Each node i in this layer is a square node with a node function:

$$O_{4,i} = \overline{w}_i.f_i = w_i.(p_i x + q_i y + r_i), i = 1, 2, 3, \ldots, 9 \quad (13)$$

where w_i is the output of layer 3 and $\{p_i, q_i, r_i\}$ is the parameter set. Parameters in this layer are referred to as consequent parameters. In short, the parameters for the consequent parts are measured in this layer.

Layer-5: A circle node called $\sum$ is the single node in this layer that calculates the overall output as the summation of all incoming signals.

$$O_{5,i} = overall\ output = \sum_i \overline{w}_i.f_i = \frac{\sum_i w_i.f_i}{\sum_i w_i} \quad (14)$$

The backward step is an estimation approach that starts with the membership function parameters and ends with the linear equation coefficients. Because the Gaussian function is employed as the membership function in this method, two parameters of this function are optimized: mean and variance. In this step, the parameter learning is done using the least-squares method.

2.4 Accuracy Criteria

We use several types of accuracy criteria: the Mean absolute percentage error (MAPE), the Mean absolute error (MAE), and the Root means squared error (RMSE).

The MAPE criterion is also known as mean absolute percentage deviation (MAPD) that is a measure of prediction accuracy of a forecasting method in statistics. It usually expresses accuracy as a percentage, and is defined as $MAPE = \frac{1}{n}\sum_{t=1}^{n}\left|\frac{X_t - F_t}{X_t}\right|$, where X_t is the actual value and F_t is the forecasted value. The absolute value in this calculation is summed for every forecasted point in time and divided by the number of fitted points. The MAE is recommended for determining an arithmetic average of the absolute errors to measure comparative accuracy of forecasts. It is estimated by $MAE = \frac{1}{n}\sum_{t=1}^{n}|X_t - F_t|$, where the actual value (X_t) minus the forecasted value (F_t).

The RMSE is also known as root-mean-squared deviation (RMSD) that is a frequently used measure of the estimators differences. It measures the average error produced by the model in predicting the outcome for an observation. It is defined as:

$$RMSE = \sqrt{MSE} = \sqrt{\frac{\sum_{i=1}^{n}(actual\ value - predicted\ value)^2}{n}}$$

where n represents the number of observations.

3 Research Design and Methodology

The objective of this research is to first model the closed price data, and then discuss the fluctuations during the historical data issued from BTC that covers the duration from December 2017 to January 2022. In this regards, we have used ANFIS and MODWT models and considered the Haar WT function. The performance is assessed using the accuracy measure.

We have proposed several models to forecast the closed price BTC data. We used MODWT to convert the original data into a time-scale domain. Then we combined the MODWT with the ANFIS model to improve the forecasting accuracy. We studied Haar WT function of MODWT to evaluate our models. Figure 2 illustrates the steps of the MODWT forecasting process.

When the data pattern is very fluctuated, the wavelet process is repeatedly applied. The aim of pre-processing is to minimize the statistical criteria such as Root Mean Squared Error (RMSE) between the signal before and after transformation. The noise in the original data can thus be removed in this way. Significantly, the adaptive noise in the training pattern may reduce the risk of overfitting in the training phase. Thus, we adopt MODWT twice for the pre-processing of the training data in this study.

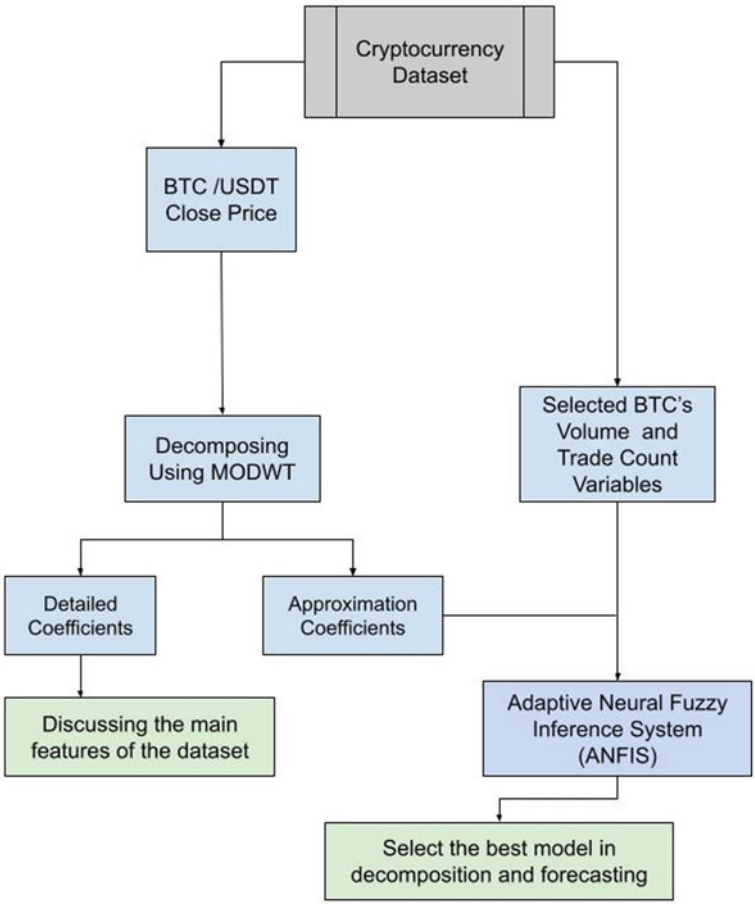

Fig. 2 The flowchart of the MODWT with ANFIS

Further, MODWT converts the data into two sets namely, detail series and approximation series. Since the financial data fluctuates significantly, we have employed these two series because they show good behavior on such data. This makes it easier to anticipate the transformed data with greater accuracy. The MODWT's filtering effect is responsible for these two series' exceptional behavior.

To model the data, we devised the following methodology, which is also shown in Fig. 2. First, the MODWT is used to simulate closed pricing data. The Haar function is then used to dissect the historical return data. Then, using detail series, the variations are recognized and the historical volatility data is examined. The independent variables are chosen in a preprocessing stage based on correlation, causation, and multiple regression. The ANFIS model is then calculated using dependent variables. The ANFIS model is then fitted to the approximation series for forecasting. Finally, using the required criteria, the new technique is compared to the ANFIS model.

Table 1 Descriptive statistic of BTC in cryptocurrency market

	Mean	Std. deviation	Minimum	Maximum	Skewness	Kurtosis
Close price	19200.07	17880.17	3211.72	67525.83	1.16	−0.21
Volume BTC	53858.83	34644.52	1368.15	402201.67	2.66	14.17
Trade-count	828846.24	748577.13	12417.00	6331062.00	1.58	3.41

To ensure a fair comparison and evaluation, we applied 80% of the original data and transformed data to the proposed model first, then select the best performing model, which is then combined with other suggested models for the remaining 20% of the data. This confirms the outstanding performance of our proposed model.

4 Empirical Results

In this section, we present the data used in our study. Then, we highlight the empirical results.

4.1 Data Description

The sample data of closing prices are collected from cryptocurrency market. The day-to-day closing prices of BTC/USDT (where, Tether (often called by its symbol USDT)) were collected from December 2017 until January 2022. The size of observations is 1535. Table 1 shows the descriptive statistic of dataset.

The mean and standard deviation of BTC's close price are 19200.07 and 17880.17, respectively. The minimum and maximum values of BTC's close price are 3211.72 and 67525.83, respectively. The skewness and kurtosis are 1.16 and −0.21. The BTC's volume, mean and standard deviation are 53858.83 and 34644.52 whereas the minimum and maximum values are 1368.15 and 402201.67, respectively. The skewness and kurtosis are 2.66 and 14.17. It should be noted that the mean and standard deviation of trade-count 828846.24 and 748577.13, correspondingly. The minimum and maximum values of trade-count are 12,417 and 6,331,062 whereas the skewness and kurtosis values are 1.58 and 3.41, respectively.

4.2 Endogeneity Issues

In this subsection, we discuss selecting suitable variables by removing multi-collinearity and multiple regression analysis.

Table 2 The correlations between the input variable and the output variables

	LCP	LTC	LV
LCP	1	0.795	−0.852
LTC		1	−0.491
LV			1

4.2.1 Correlation

We deliberately selected independent variables from various other variables, which are eliminated based on certain tests. First, we removed variables as a result of multi-collinearity among independent variables as shown in Table 2. The absence of perfect multi-collinearity, an exact (non-stochastic) linear relationship between two or more independent variables, is generally referred to as no multi-collinearity. We extracted some variables from independent variables according to the strong relation with other independent variables. The correlations between the independent and dependent variables are shown in Table 2. There is a strong correlation between the logarithm of BTC/USDT close price (LCP) with logarithm trade count (LTC) and logarithm volume for BTC (LV) because the percentage of correlation is more than 50%. However, because the correlation between the input variables LV and LTC is less than 50%, there is a weak association.

4.2.2 The Results of Multiple Regressions

Multiple regression is an extension of simple linear regression that is used when the value of a variable must be predicted based on the values of two or more other variables. The dependent variable (output variable (LCP)) is the one that has to be predicted, whereas LTC and LV are the independent variables (input variables) that are utilized to predict LCP. Table 3 shows the results of the multiple regression analysis. The LTC and LV are considerable at 1%. Furthermore, R-square and modified R-square are both around 90%, implying that the independent factors can explain roughly 90% of the dependent variable. The linear regression model is better suited to the results when the F-statistic is 1% significant.

Table 3 The multiple regression

	Estimate	Std. error	t value	Pr(>|t|)
Intercept	−0.028	0.097	−0.289	0.773
LTC	0.457	0.008	54.395	0.000***
LV	−0.709	0.011	−67.06	0.000***
R-square	*0.906*	*F-statistic*	*7417.445*	
Adjusted R-square	*0.906*	*p-value*	*0.000*	

Note "***" 0.001, "**" 0.01, and "*" 0.05

There is a negative relationship between LV and LCP. This indicates that the increase in LV will reduce the LCP in the cryptocurrency market by about 71%. On the other hand, the LTC has a positive relationship with LCP. This implies that the increase in LV will increase the LCP by about 46%. The R-square and adjusted R-square are approximately 90%. Furthermore, F-statistics is significant at a level less than 0.001.

4.3 Results and Discussion

This study examines the LCP of cryptocurrency. It is chosen for different reasons. Cryptocurrency is a digital payment mechanism that does not rely on banks for transaction verification. It's a peer-to-peer payment system that allows anybody, anywhere to send and receive money. Cryptocurrency payments exist purely as digital entries to an online database that identify individual transactions, rather than as physical money that can be carried about and exchanged in the real world. Cryptocurrency is stored in digital wallets. Cryptocurrencies are based on blockchain, a distributed public ledger that keeps track of all transactions that are updated and maintained by currency holders. Furthermore, BTC is an effective indicator of the crypto market in general since it is the largest cryptocurrency by market cap and the rest of the market tends to follow its movements. Therefore, the close price of BTC data is decomposed using MODWT with is Haar function as shown in Fig. 3.

The MODWT based decomposition is an effective approach for revealing variations, magnitudes, and phases of the data. The levels of decomposition can be carried out by the WT using the formula, according to the WT mechanism: $X = TV1 + TW1$ where the original signal is referred to as X. The next component consists of one level of approximation ($TV1$) that shows the plot of the transformed data approximation coefficients. The following parts of $TW1$ reflect the level of detail, whereby $TW1$ is the plot of the first level of the coefficients of detail, so the fluctuation can be explained by this level.

When Bitcoin was first introduced in 2009, it had no value. Its value raised to $0.09 on July 17, 2010. On April 13, 2011, the price of bitcoin climbed again, rising from $1 to a peak of $29.60 on June 7, 2011, a 2.960% rise in three months. Bitcoin's price had fallen below $2.05 by mid-November, following a sharp drop in cryptocurrency markets. By August 15, the next year, the price had risen from $4.85 on May 9 to $13.50. Throughout 2017, Bitcoin's price remained around $1,000 until it crossed $2,000 in mid-May, when it soared to $19,345.49 on December 15. Other institutions began designing cryptocurrencies to compete with Bitcoin as investors, politicians, economists, and scientists took notice. Bitcoin's price meandered laterally during the next two years, with brief bursts of activity. For example, in June 2019, there was a resurgence in price and transaction volume, with prices exceeding $10,000. By mid-December, though, it had decreased to $6,635.84. The economy came to a halt in 2020 owing to the COIVD-19 epidemic, and Bitcoin prices skyrocketed once more. The coin was worth $6,965.72 at the start of the year. Investors' anxieties

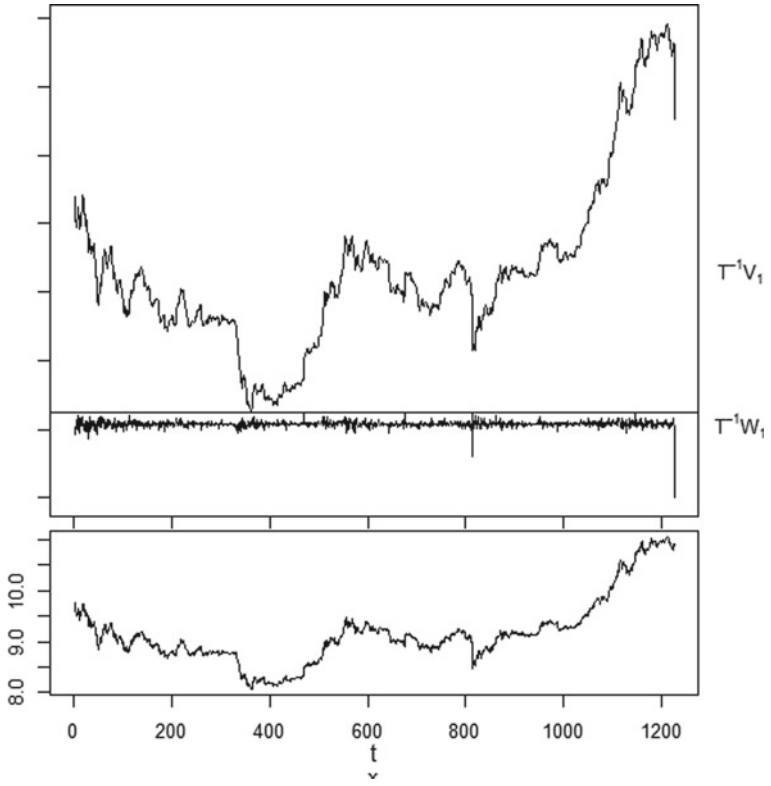

Fig. 3 Decomposing the data using MODWT based on Haar function

about the global economy were increased by the pandemic closure and subsequent government response, hastening Bitcoin's ascent. On November 23, Bitcoin was worth $19,157.16 at the end of the day. Bitcoin's price hit well around $29,000 in December 2020, having risen 416 percent since the beginning of the year.

In 2021, Bitcoin set a new price record in less than a month, reaching $40,000 on January 7, 2021. Bitcoin values achieved new all-time highs of over $60,000 for the first time as Coinbase, a cryptocurrency exchange, went public in mid-April. Bitcoin's price rose even higher as a result of institutional interest, reaching a peak of more than $63,000 on April 12, 2021. Nearly the summer of 2021, prices had plummeted by half, with the lowest being $29,795.55 on July 19. Autumn experienced another bull run in September, with prices reaching $52,693.32 before plunging to around $40,709.59 at the start of 2022.

Table 4 The statistical models for 80% and 20% of dataset

Size	Models	ARIMA	RMSE	MAE	MAPE
80%	Haar	ARIMA (1, 2, 0)	0.0323	0.0203	0.2211
	ARIMA-direct	ARIMA (1, 2, 0)	0.0506	0.0351	0.3823
20%	ANFIS		2.6360	2.6232	32.4777
	ANFIS + WT (Haar)		2.6295	2.6105	32.3071
	ANFIS + ARIMA direct		2.6466	2.6393	32.6862

4.3.1 The Result of ANFIS and Haar Function

The results of the suggested models using the first 80% of the dataset are shown in Table 4. The Haar model provides the original LCP data. Based on a comparison of Haar and ARIMA, the MODWT (Haar) is determined to be the best model, with minimal values of 0.0323, 0.0203, and 0.2211 for RMSE, MAE, and MAPE, respectively.

Forecasting is done utilizing the remaining 20% of the modified and original data for the same suggested models to confirm our findings. We discovered that ARIMA-MODWT (Haar) with ANFIS is the best model because it has the lowest RMSE, MAE, and MAPE-fit values. LCP is employed as an output variable in the training phase, whereas LCT and LV are used as input variables by MODWT (Haar) to build ANFIS and ANFIS + MODWT models.

5 Conclusion

We have proposed a new model called MODWT-Haar-ANFIS. The model is used to forecast the closing price in the cryptocurrency market. We have selected LTC and LV as input values based on correlation and multiple regressions. We found that there is a weak correlation between the input variables ($r = 0.49$). On the other hand, the correlation between LTC and output variable (BTC) is strong ($r = 0.795$). Moreover, the correlation between LV and output variable (BTC) is strong ($r = -0.852$). Furthermore, the multiple regression test is used. Therefore, the input variables are significant at level 0.1%. The output and input variables are collected from cryptocurrency market from December 2017 to January 2022 with 1535 observations. The MODWT-Haar mechanism splits output variable into details coefficient and approximation coefficient. On the other hand, the output variable is split into details coefficient (high fluctuated data) and approximation coefficient (which consists of the main features of data). The approximation coefficient data (MODWT-Haar) are used with input variables to build our model MODWT-Haar-ANFIS. Three statistical tests were used to analyze the MODWT-Haar-ANFIS: root mean squared error (RMSE), mean absolute error (MAE), and mean absolute percentage error (MAPE) (MAPE). Traditional models were compared to the MODWT-Haar-ANFIS model (ARIMA

and ANFIS models). Traditional models are less accurate than the MODWT-Haar-ANFIS. As a result, the new proposed forecasting methodology can be used to other cryptocurrencies as well. Furthermore, this model is powerful enough to optimize corporate operations for a country's economic progress.

Development of Data Mining Expert System Using Naïve Bayes

Mohammed Salahat, Nidal A. Al-Dmour, Raed A. Said, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract The consumer spectrum consists of a wide range, including the affluent, middle-income, and low-income. This consumer shows different behaviors or motivations towards choosing clothes. We want to develop a framework for a Sale Recommendation System. These expert System can be helpful for sale persons, fashion designer, promoter, brand manager as well as sponsor of Recommendation System. The study implemented the Data Science approach and techniques to see how reliable Recommendation Systems are and in our selected dataset we have applied different modelling techniques such as KNN, SVM, Bayes Naïve and Decision Tree and fond the NB as the most suitable and practical method of modelling in regard to the accuracy, recall and runtime.

1 Introduction

In recent years, fashion and dressing sale have found an abstract meaning in the form of start-ups, branding, design of production and representation. Famous brands have earned large sums of money for their business every year by gaining fame by associating and engaging their customers, and in this case, recommendation system from sale person has not been addressed or paid very little attention (Akhtar et al., 2021; Al Ali, 2021; AlHamad et al., 2021, 2022; Ali et al., 2021). The fashion and clothing industry constitutes high share value of active enterprises worldwide and its amount is increasing every day. New marketing ideas such as fast fashion and entrepreneurship campaigns are emerging (Ali et al., 2022; Alnazer et al., 2017; Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2022). In the present work, we want to make a decision support system from the data gained on the sales recommendation of several companies in the fashion and clothing industry, with the help of Data Scientific approaches and compare the reliability of our results in the business world. Are these methodologies suitable in the real world? Based on the findings, is it possible to make suggestions to other activists in the fashion and clothing industry who either do not have a recommendation system or have not made a profit from it, so that they can achieve high profitability and effectiveness? Manufacturers and intermediaries of this category of products generally compete in a win–win or offensive strategy (ex. luxury brands) (Alshurideh et al., 2020; Alwan & Alshurideh, 2022; Alzoubi, 2021a, 2021b; Alzoubi et al., 2020a, 2020b, 2022; Sweiss et al., 2021; Tariq et al., 2022). Clothing goods with customs exemptions are consumer goods and with a small investment can be distributed through the different channel and of course, except for brands that only sell their goods through reputable agencies, specialty stores and branches in hypermarkets and stores (Hanaysha et al., 2021a, 2021b; Joghee et al., 2020; Kashif et al., 2021; Khan, 2021; Lee & Ahmed, 2021). The seller brings his goods mainly to big cities through free trade zones and enters the market and delivers them to the location of his store at different prices at different prices to the consumer. Here, consumer behavior and the tastes of the upper middle class will be considered (Al Kurdi & Alshurideh, 2021; Al Kurdi et al., 2020; Alshurideh, 2019; Alshurideh et al., 2019). Taste or the same behavior of buying fashion and clothing in the traditional middle class mostly follows a single logic in the type of purchase and in the affluent class who have emotional behavior is at very high prices and is sold at the maximum prices in the market (Lee et al., 2022a, 2022b; Mehmood, 2021; Mehmood et al., 2019; Miller, 2021; Mondol, 2021; Obaid, 2021; Radwan & Farouk, 2021; Shamout et al., 2022).

2 Dataset Description

2.1 Preprocessing

First, before examining the size of the our data, we must have a description that refer to UCI repository (Afifi et al., 2020; Al Batayneh et al., 2021; Ali et al., 2021; Alzoubi et al., 2021a, 2021b; Ghazal, 2021; Ghazal et al., 2021a, 2021b, 2021c, 2021d), and because in this study recommendation system is considered independently, we must determine the number of counts and their description to each attribute. From the definition and understanding of this research we have used two filters for data cleansing namely RemovePercentage and AddNoise. Out of the number of samples in the dataset, which was 500, only 200 questionnaires were completely recommended. Therefore, considering dataset as a whole, it can be estimated to generate a 1/1 out of 2/3 ratio among recommendation to constitute 238 versus 238 rebalancing (Fig. 1).

Of the population selected for analysis, rating was with the most skewness in grade between 4 or 5. And price was major in Low and Average (middle class) (Fig. 2).

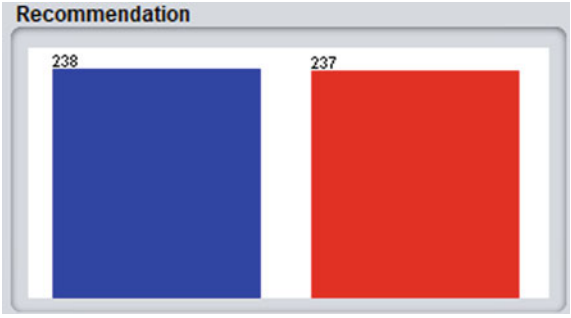

Fig. 1 Recommendation class

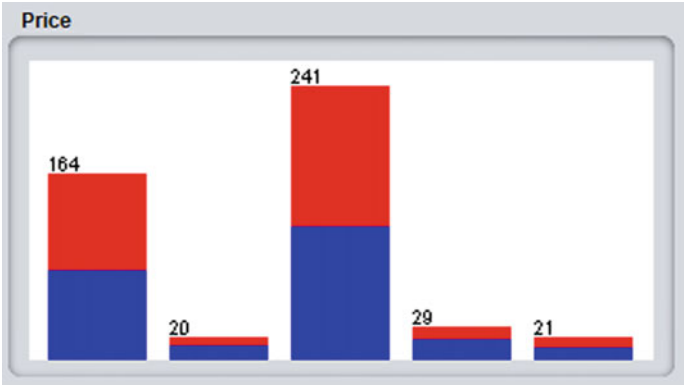

Fig. 2 Price marketing criteria

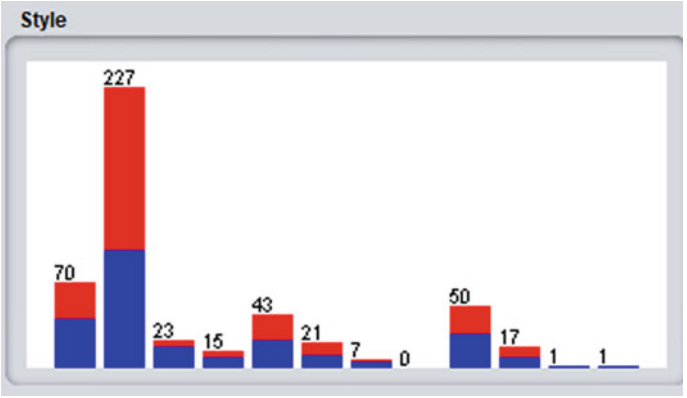

Fig. 3 Style distribution

According to the information on style and size one can guess that population were young aged and female which wear Casual, sexy and party style costume. The following figure diagram shows this information graphically (Fig. 3).

2.2 Attribute Selection

Subset evaluation is a vital step in the Data Science techniques. In our case Weka selected 39 subset and searched for the best set with 74.3% Merit of best subset found (Ghazal et al., 2013, 2021a, 2021b, 2021c, 2021d; Kalra et al., 2020; Khan et al., 2021a, 2021b). This resulted in the selection of seven attributes as shown in the following:

- Style
- Price
- Rating
- Size
- Season
- NeckLine
- Material.

3 Methodology

Java-based Weka version 3.9 was suited for our application in this report (Weka Application manual). We have used python 3.7 panda library to see those infographics. The details of results of coding within the description of all attributes are attached in the Appendix.

```
import pandas as pd
data = pd.read_csv("DressData.csv")
print(data.head(4))
data.info()
data.describe()
data
```

4 Modelling

After the importing the dataset into the Weka, modelling techniques utilised and was calibrated with the usage of hyper-parameter tuning were k-nearest neighbors (kNN), (the number of neighbors is equal to 4) Neural Network (NN), (the batch size is equal to 100) and Naïve Bayes (NB) (Alzoubi & Ahmed, 2019; Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2020b, 2021a, 2021b).

5 Results

Table 1 shows the result of accuracy (Recall for the danger of overfitting), F-Measure and Kappa statistics.

Table 1 Data scientific result performed in Weka

Attribute Selection	Classifier	F-measure	Kappa	Recall (%)	Accuracy (%)
12	Bayes Naïve (NB)	60.9%	0.1931	61.0	61.8
	k-Nearest Neighbors (IBk)	50.12%	−0.002	50.8	50.6
	Multilayer Perceptron (NNs)	53.9%	0.0305	53.2	53.2
9	Bayes Naïve (NB)	52.2%	0.0441	52.2	52.21
	k-Nearest Neighbors (IBk)	49.7%	0.0324	51.6	51.57
	Multilayer Perceptron (NNs)	47.7%	−0.044	47.8	47.7
6	Bayes Naïve (NB)	63.6%	0.2486	64.4	64.4
	k-Nearest Neighbors (IBk)	57.2	0.1215	57.2	57.2
	Multilayer Perceptron (NNs)	53.2%	0.0691	58.4	58.4

The Bayes Naïve model estimation is based on the Bayes Probability theory and outperformed other two techniques on all model efficiency and also runtime (Lee et al., 2021; Matloob et al., 2021; Naqvi et al., 2021; Rehman et al., 2021; Suleman et al., 2021). The effect of attribute reduction performed on preprocessing stage can be seen that 3 to 4 attributes are indifferent for our prediction models. Anyway, the precision was not intended to be either/or but rather the practically developed model with more than 60% accuracy. In the following table the confusion matrix is also indicated. The number of correct classified instances for "Yes" 100 and "No" was equal to 222.

```
=== Confusion Matrix ===
  a   b   <-- classified as
100 110 |   a = Yes
 68 222 |   b = No
```

6 Discussion

Generally, for retailers or clothing stores, this result has less external consequences, but the point of view is very important due to the importance of feasibility of designing of such smart system that can capture the customer sense and interaction with the customer. It is important for any brand as a beneficiary of a recommendation system to take advantage of opportunities and generally use chances and prevent failures in the competitive market, which will be created by differentiating in the mind of the customer (Aziz & Aftab, 2021; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021a, 2021b, 2021c, 2021d; Guergov & Radwan, 2021; Hamadneh et al., 2021).

7 Conclusion

We have developed a framework that can model the sale recommendation for better communication between clients. We have firstly extracted the dataset from the UCI and then imported the data for the preprocessing into weka and python. The data was cleansed at the forst step by the filtering tools embedded and was balanced for the danger of overfitting. Then five different machine learning tools was implemented in the dataset to tune the hyper-parameter which resulted into more than 10% improvement in the results. With the information learned from the modeling we understood that with the possibility of neat 65% we can use such system.

Appendix [Python Code with Outputs]

Does Strategic Change Mediate the Relationship Between Total Quality Management and Organizational Culture

Enass Khalil Alquqa, Bader Obeidat, and Muhammad Turki Alshurideh

Abstract The study conducts an empirical analysis of the relationship between total quality management (TQM) practices, with the organizational culture (OC) Cameron and Quinn (Diagnosing and changing organizational culture: Based on the competing values framework, John Wiley & Sons, 2011) model which was divided into four dimensions: leadership supportive, customer focus, strategic planning, and workforce focus. In addition, the study evaluates the mediating role of strategic change (SCH), between organizational culture (OC) and total quality management (TQM). The study uses data obtained from a survey of 341 respondents by using google form online from the employees of the Emirates Post Group (EPG), which is considered as one of the government-owned agencies that controls the logistics business in the UAE, Dubai. The result of the study revealed that strategic change has a direct impact on the TQM practices. In addition to that, the strategic change can be explained as a partial mediator in the relationship between organizational culture variables and TQM practices. It also found that there is a positive and significant effect of organizational culture on strategic change. This study makes a novel contribution by offering a detailed and deeper understanding of the relationship between Organizational culture, strategic change, and total quality management. According to the results, the study recommended that future studies might investigate if other possible mediating variables may also mediate whatever totally or partially the effect of the relationship between TQM and organizational culture.

Keywords Total Quality Management · Organizational culture · Organizational change

1 Introduction

In recent years, the TQM has directly contributed to the increased competition potential of most institutions and remains at the forefront of expanding changes in the economic, political, and administrative systems (Almaraz, 1994; Cao et al., 2000; Duck, 1993). The current global pandemic of the COVID-19 problem is the most visible illustration of the catastrophe which has unexpectedly struck the world and produced catastrophic change at the economic, political, and social level (Baldwin & Mauro, 2020). Numerous changes also occur at the local and global level to systems and legislation. Such changes demand a flexible, quick response to all the factors, including those at the strategic level, which encompass all the administrative procedures of the organization, that have altered on many levels (Balogun & Johnson, 2005). To encourage change, the organization's culture must be considered, based on the strong conviction of the employees at this institution that change is important and that they feel they are part of the organization, given its role in achieving directional changes requiring speed, preciseness, and quality of employment (Cameron & Quinn, 2011; Denison, 1990). Global rivalry encouraged companies to concentrate more on their clients (Lindquist, 2006). Consumers want items of the highest quality. The focus of the firm is on continual improvement and quality of production and product shipment for customers, with most companies modifying the whole quality management system for the organization and production structure. Total management of quality is crucial to the corporate culture and impacts all areas of employee performance. Every part of the performance of its employees must be carried out to achieve the objective of staff who are able to satisfy excellent customer demands (Prajogo & Sohal, 2006). Through distinguishing its goods and developing a competitive market position, companies have adopted TQM to enhance their company's success. by developing an adequate climate, corporate culture may truly influence company and business success (Cadden et al., 2013). Therefore, the study examined the relationship between the three elements—OC, TQM, and SCH, which are crucial to gain competitive advantage in any company. Additionally, the study has been investigated the relationship between the dimensions of (OC) in the Emirates Post Group and the extent to which (TQM) practices are used, as well as the role of strategic change (SCH) in mediating the relationship between (OC) and (TQM).

2 Importance of the Research

The study investigated the relationship between strategic change (cultural, hierarchical, and human resources); organizational culture (in terms of clan and hierarchy;

external environment: adhocracy and the market) (Cameron & Quinn, 2011). In addition, TQM (customer focus, strategic planning, and workforce focus on terms of leadership support). The point of consideration is that the relationships between these three groups of variables must be investigated, since there are discrepancies in recognizing such relations, as the literature has shown the connection between TQM with the culture and performance of organizations (Baird et al., 2011; Cheng & Liu, 2007; Valmohammadi & Roshanzamir, 2015). Furthermore, few studies have addressed TQM's relationship to strategic change (Huq, 2005; Leonard & McAdam, 2001). Thus, it is crucial to examine the impact of TQM practices on the relationship between strategic change and organizational culture.

3 Problem Statement

The role of management in institutions emerges increasing the extent of awareness of employees to change (Shin et al., 2012). Given the paucity of studies in the Middle East that are concerned with the organizational culture of the institution and the indicators of comprehensive quality and aspects of strategic change. The researchers first discussed the theoretical framework for those aspects that relied on previous studies in this field, then targeted a field framework to analyze the impact and relationship between the three variables: organizational culture, strategy change, and Total quality management (Cameron & Quinn, 2011; Haffar et al., 2013). Therefore, the study investigates the nature of the relationship between the three variables: total quality management, organizational culture, and strategic change management, using which some of the assumptions have been statistically tested in the Emirates Post Group (EPG), which is considered as one of the government-owned agencies that controls the logistics business and has been profitable for over 45 years. They lived through a period of tranquility during which the Emirate's post was safe. When compared to the previous year, in 2019, they lost 41% of their profits. As a result, if they are to recover and keep their market position, they must halt and make the required modifications. There are numerous barriers to overcome, a lot of misused resources, and a heavy burden on the organization. Rejoining the market will not be easy, as there are many logistic competitors where only the strong survive. In this case, we will discuss empirically the impact of the organizational culture of the organization and TQM on the mediation of strategic change.

The study focused on the independent variable total quality management with its indicators and its impact on the change strategy, as well as quality management as an independent variable and its impact on change strategies. It also focused on quality management indicators as an intermediate variable between organizational culture and strategic change.

4 Goals and Objectives

Accordingly, the importance of the study is in determining the relationship between organizational culture, strategic change, and total quality management when it comes to defining the research problem. Moreover, determine whether strategy change plays as a mediator between organizational culture and total quality management. To achieve the following goals:

1. To specify the level of TQM indicators, Strategic Change, and Organizational Change.
2. To investigate the relationship between Organization Culture (OC), Strategic Change (SCH and total quality management (TQM).
3. To examine strategic change as a mediator between (OC) and (TQM).

5 Purpose of This Research

Using empirical data collected from the emirates post group, this study attempts to achieve two primary goals. First, it aims to discuss the association between OC, strategic change, and total quality management. Secondly, to analyze the appropriateness of strategic change a mediation of the relationship between TQM and OC.

The study consists of four parts. The first focused on the general framework and the theoretical side and previous studies that dealt with all research variables and through which the research hypotheses were defined, which some considered on a relationship between organizational culture and strategic change (Abuhashesh et al., 2021; Al-bawaia et al., 2022; Alshurideh et al., 2021a; Choi & Ruona, 2011; Hamadneh et al., 2021; Heracleous & Langham, 1996; Johnson, 1992; Odeh et al., 2021). While the other considerations on the relationship between SCH, TQM and OC (Fares, 2017). The second part focused on the method of data collection and the mechanism of data analysis and determining the study population, while the fourth part dealt with several aspects. Moreover, the study laid the groundwork for future research to explore and extend the connection between Total quality management, organizational culture, and strategic change.

6 Research Questions

There are valuable explanations to investigate the relationship between (TQM), organizational culture (OC), and strategic change of the organization. The study aims to answer the following questions considering defining the relationship between organizational culture, strategic change, and total quality management:

1. What is the impact of Organizational Cultures (OC) on Strategic Change (SCH) for the employees at the emirates post group?
2. What is the impact of strategic change on total quality management for the employees at the emirates post group?
3. What is the impact of Organizational Culture (OC) on total quality management for the employees at the emirates post group?
4. Does the strategic change (SCH) mediate the relationship between the (OC) and (TQM) for the employees at the emirates post group?

7 Literature Review and Hypotheses Development

Total Quality Management Concepts

Different definitions have led to various interpretations of TQM, Persico (Persico, 1989) argue that TQM is an organizational culture approach which includes employees in numerous business areas as well as the continuous improvement in output through cooperation to achieve the organization's goals. The credit for TQM since 1950 is given to scientists in the United States, such as Edward Goran and Philip Crosby. Juran and Deming prefer to employ TQM measurement by using statistical techniques. While Crosby and Free (1979) did not accept statistical quality,14 actions have been taken to increase quality (Deming & Edwards, 1982). TQM has also been the main reason for the achievement of profitability and sustainability for small and big businesses in recent years. Ciampa (1992) described TQM as an organizational effort to build a sustainable environment where employees continuously enhance their customer satisfaction delivery capacity. In addition, an orderly manner to ensure the fluidity of planned operations is an efficient way to prevent problems, improve good conduct and apply management strategies effectively. Furthermore, Ciampa noted that an organization maintaining the flow of an organization's planned operations is an efficient approach to averting problems, improving good conduct, and making optimal use of management strategies. TQM also offers an organizational approach to building and developing a productive atmosphere in which employees consistently increase their ability to supply value-added products and services on demand. It is a commitment to meet client expectations at the best price, through improved performance.

Organizational Culture (OC): Organizational culture is defined as the general way that people share behaviour, standards, and attitudes and influences the organization's actions, practices, and other values that can readily be absorbed. Therefore, culture is distinguished factors between one organization and another (Schein, 1985). Organizational culture is also a process that aims to improve ways and techniques for reducing workplace conflict and barriers (Moorhead & Griffin, 1989). Furthermore, it is seen as a set of shared fundamental assumptions discovered and formed by a group of individuals in the same context.

Strategic Change (SCH): The study investigates some of the theoretical groundwork for change and, as a result, analyzes how academics are approaching the topic

of organizational culture and total quality management in their studies. In the public and private sectors, the pace of change has recently increased considerably. And it is expected to become much more extreme in a highly competitive world where all businesses will be forced to compete for survival in a new era of "intense competition" (Aupperle & Karimalis, 2001). Researchers propose many elements of strategic change concepts and apply them in various ways, therefore there is no precise or single notion for each one. In terms of dealing with change, the current societal situation is unparalleled. Organizations have accepted the theory that if they want to survive, they must adapt for many years since the industrial revolution (Beer & Nohria, 2000). In general, if people have different interests and values, the change will not be properly implemented (Jackson, 1995). To attain the aim of greater effectiveness based on intellectual ability rather than physical assets, organizations must modify the way they engage with their people (Jarrar & Aspinwall, 1999). Furthermore, the strategy lays out defined objectives, outlines activities to attain them, and allocates resources to carry them out. In addition, when the firm adapts or competes in its environment, a strategy is created as an operational pattern (Alkhafaji & Nelson, 2013). Whereas the operations of the strategy include strategic thinking and strategic planning (Pfeffer & Salancik, 2003). Also, from the perspective of Max Mckeown (2011) the strategy is to draw the future of the organizations and ensure success for the long term (Hill et al., 2014). Strategic change is considered essential for maintaining competitive advantage and long-term organizational sustainability. However, over the last 5 years, Google Scholar has published approximately (791,000) papers on "strategic change" address.

Organizational culture (OC) on strategic change (SCH) context

Cameron and Quinn (2011), Johnson (1992), Heracleous and Langham (1996), Choi and Ruona (2011), Henry (2008), Ashal et al. (2021) studies consider that there is a relationship between organizational culture and strategic change Table 1 summarizes the view of researcher on organizational culture effects on strategic change based on the previous discussion. The study Hypothesize that ***H1*** organizational culture positively impacts strategic change.

Strategic change (SCH) impacts on total quality management (TQM)

Total quality management seeks methods to enhance quality on a continuous basis. There are three criteria or questions that a company should examine when determining whether a change is required: Will the change improve overall consumer satisfaction? Is the change allowing the business and the client to get outcomes more quickly? Also, does the concept help the firm make better use of its resources? If you responded yes to any of these questions, you should adopt the concept to enhance overall organizational and product quality. Several studies, such as (Dutton & Duncan, 1987; Zeffane, 1996), have underlined the importance of culture within the framework of strategic change.

Thus, the second hypotheses are focused on investigating the relationship between strategic change and total quality management TQM.

H2. Strategic change positively impacts total quality management.

Table 1 Organizational culture effect on strategic change

Research	Effects
Henry (2008)	Culture is more powerful than anything else in business, thus every suggestion for change, whatever its nature, must always fit into the unique kind of culture that exists in the company if it is to succeed
Jones et al. (2005)	The employees of organizations that deal with the group's values and norms feel that by participating in a successful change process, they will gain advantages such as awards or promotions. Therefore, it will improve change awareness
Zammuto et al. (2000)	Organizations that follow a centralized structure with a bureaucracy culture and hierarchy, on the other hand, do not foster creativity and innovation; instead, they oppose change. As a result, the participants develop a negative attitude towards the change process
Cameron and Quinn (2011)	Leaders of companies are more likely to be positive about recommended improvements since they expect their firm to not begin or enforce any changes that may negatively impact their employees. This is due to the company's focus on internal employees, which emphasizes the long-term benefits of human capital and places a high value on boosting morale

The relationship between TQM, OC, and SCH

Various studies have been conducted on the relationship between Total Quality Management and organizational culture, with the conclusion that some businesses have failed to adopt because the application process is culturally neglected (Dale & Cooper, 1992). Furthermore, numerous research has claimed the connection or effect of organizational culture (OC) and total quality management (TQM), (Heracleous & Langham, 1996; Rad, 2006). While few have looked at TQM's empirical mediation role in the relationship between change methods and organizational culture. Table 2 highlighted the literature on the factors' mediating function in total quality management, as well as their relationships with other variables.

Therefore, according to the previous discussion, the hypotheses below has been formulated:

- *H3*. organizational culture positively impacts TQM.
- *H4*. Strategic change (SCH) partially mediates the relationship between OC and TQM.

8 Research Methodology

When this study aims to analyze the relationship between three variables, total quality management (TQM), organizational culture (OC), and strategic change (SCH), the analysis is descriptive, organization culture in the empirical analytics model is

Licensed to (putm@utm.my)

Table 2 The factors' mediating function in total quality management

Research	Effects
Cao et al. (2000)	refers to the assessment of multiple functional areas of TQM as well as strategic change in response to changes in organizational procedures, changes in hierarchical structure and frameworks, and changes in beliefs, norms, and actions related to the distribution of authority and personal rules and procedures
Cameron and Quinn (2011)	Leaders of companies are more likely to be positive about recommended improvements since they expect their firm to not begin or enforce any changes that may negatively impact their employees. This is due to the company's focus on internal employees, which emphasizes the long-term benefits of human capital and places a high value on boosting morale
Haffar et al. (2013)	Investigated the mediation role of total quality management as a possible mechanism through which organizational culture influences change tactics empirically. The findings of this study supported the idea that IRFC plays a mediating role in the relationship between OC and TQM. This contributes to elucidating the connections between OC and TQM implementation
Heracleous and Langham (1996)	Developed a set of three factors to identify the strategic change mediation concept between knowledge and TQM, the study discovered that strategic change mediates the relationship between knowledge management procedures and total quality management indicators
Dutton and Duncan (1987)	Created a framework for how leaders understand strategic concerns for the creation of effective change that helps managers to forecast how members will respond to a changing environment by emphasizing the systematic influence of two variables: the organizational structure and its resources
Demirbag et al. (2006)	Found a positive link between TQM and non-financial SMEs' performance, and a weak relationship between TQM and SMEs' financial performance. Furthermore, there is a mediating effect of SME non-financial performance on TQM practices
Mahmud and Hilmi (2014)	Found that TQM supported both SMEs' performance and organizational learning. Furthermore, culture has an indirect positive impact on total quality management. While (Cao et al., 2000) refers to the assessment of multiple functional areas of TQM as well as strategic change in response to changes in organizational procedures, changes in hierarchical structure and frameworks, and changes in beliefs, norms, and actions related to the distribution of authority and personal rules and procedures

known as the independent variable, while the strategic change as mediate and second independent variable, whereas TQM considered as the dependent variable.

In this study, a questionnaire-based tool was used to collect data, by using online google Microsoft form. 18 questions for evaluating TQM, 18 questions for organizational culture, and 16 questions for strategic change were considered on a Likert scale of 5 points. From which the criteria for evaluating TQM and organizational culture are provided by Cameron and Quinn (2011), Valmohammadi and Roshanzamir (2015) which OC based on the internal and external environment including clan culture, hierarchy, adhocracy, and consumer culture. TQM was also identified based on Cameron and Quinn (2011), contingent on his model, which was divided into four dimensions: leadership supportive, customer focus, strategic planning, and workforce focus. For the evaluation of strategic change (SCH), based on the questionnaire in Fares' research thesis, (Fares, 2017) which included three dimensions: organizational culture, hierarchy, and human resource.

The scope of the research

Emirates post group—Dubai plans for long-term preparation for its two divisions of E documents services and its branches, and Wall Street exchange centers. Currently, they provide high-quality services in the postal division starting from domestic mailing to global shipping, with routes of express mailing. They are continuously developing their services and seeking new solutions for their deliveries being motivated by the growing number of customers and public expectations from the corporation. One of the ideas they came up with is the one-stop-shop for post offices. Additionally, the corporation facilitates financial solutions for both government and private sectors for services like payment of bills, banking, and travelling.

Measurement and Tools

Validity and Reliability

The study used three reliable and valid tools from previous research to develop the questionnaire and methods to achieve the main goals and objectives of this article. The valid and reliable tools developed by Cameron and Quinn (2011) were constructed to determine the level of TQM and organizational culture in the Emirates Group Post (EPG). While measuring the valid and reliable of strategic change in the EPG via the tools developed by the study of Fares (2017). The study has used Cronbach alpha to measure and estimate the degree of the internal consistency of each construct. Table 3 shows that all scales have high reliability and values of Cronbach's alpha derived for the constructs ranging from 64.0 to 92.4. We assessed the construct validity of each construct by using SPSS factor analyses (Samson & Terziovski, 1999). The study result shows in Table 3 that the Cronbach alpha for 16 items of strategic change (SCH) ($\alpha = 91.6$) highly reliable, while the Cronbach alpha for 18 Total Quality Management (TQM) ($\alpha = 92.3$) highly reliable, and the Organizational Culture for 18 Items (OC) ($\alpha = 88.3$) are also highly reliable. Moreover, the study used Pearson correlation, see Table 4. In addition to that, the experts assessed the construct validity. The population includes all the staff in the Emirates post in

Table 3 The variables of the study and Test of reliability-results of factor and reliability analysis

Variables	Items	No. item	Cronbach's alpha
Strategic change	Organizational culture	5	80.2
	Organizational hierarchy	4	79.4
	Human resource	7	91.2
	Total	16	91.6
Total quality management	Leadership supportive	5	86.5
	Customer focus	4	68.1
	Strategic planning	4	92.4
	Workforce focus	5	83.9
	Total	18	92.3
Organizational culture	Clan	5	80.8
	Hierarchy culture	4	64.0
	Adhocracy culture	5	76.4
	Market culture	4	76.8
	Total	18	88.3

Dubai-2020, the total number of employees in person is 2000. The questionnaire was circulated online by using 1000 people in stratified random sampling. 341(198 male, 143 female) Questionnaires were returned. Were chosen and statistically analyzed. Different statistical methods were used for testing the conceptual model such as the Pearson correlation for testing the relations between variables and structural equation modelling for testing the fitness of the model (Table 4).

Testing the study Hypotheses

A series of regression analyses were performed to investigate the proposed relationships among TQM practices, OC, and strategic change (SCH).

From the correlation between the four factor's scores, there is evidence to support convergent validity.

Convergent validity was demonstrated by the positive significant correlation between the four factors (p-value = 0.01). In addition, inspection of the Table 4 reveals the significant correlation between the three factors which r ranging between (940**–732**) hence no item was deleted. As well as the Table 4 reveals the significant correlation between four factors which r ranging between (0.868**–0.456**).

In addition to that, the validity indicators of the tools were extracted by checking the correlation of each item with the dimension, to which it belongs, as well as the

Table 4 Internal context validity by using person correlation

	SCH3	SCH1	SCH2	SCH	
SCH3	1				
SCH1	0.816**	1			
SCH2	0.732**	0.795**	1		
SCH	0.940**	0.937**	0.891**	1	
	TQM1	TQM2	TQM3	TQM4	TQM
TQM1	1				
TQM2	0.863**	1			
TQM3	0.868**	0.865**	1		
TQM4	0.484**	0.456**	0.479**	1	
TQM	0.855**	0.834**	0.852**	0.840**	1
	OC1	OC2	OC3	OC4	OC
OC1	1				
OC2	0.543**	1			
OC3	0.613**	0.506**	1		
OC4	722**	450**	0.720**	1	
OC	886**	752**	0.839**	0.851**	1

correlation of each dimension with the total degree of the scale and the correlation of dimensions with each other.

Descriptive Statistics

Table 5 shows the mean score of organizational culture (OC), TQM, and strategic change. According to the value of mean and standard deviation SD, it is clear in a natural value.

Direct effect

Multiple regression analysis was used to test the direct effect of organizational culture (OC) on Strategic change (SCH) practices as Table 6 (Model1) shows, Clan ($\beta = 0.823$, $P < 0.001$), adhocracy culture ($\beta = 0\ .849$, $P < 0.001$), Hierarchy culture ($\beta = 0.573$, $P < 0.001$), Market culture ($\beta = 0.748$, $P < 0.001$) have positive and significant effects on SCH. in addition to that Table 6 shows that organizational culture (OC) ($\beta = 0.902$, $P < 0.001$) have positive and significant effects on strategic change (SCH). The result strongly supports the study hypotheses *H1*.

Multiple regression analysis was conducted to evaluate the influence of strategic change on TQM. The result in Table 6 (Model2) show that strategic change ($\beta = 0.784$, $P < 0.001$, $R^2 = 0\ .614$), organizational culture ($\beta = 0.663$, $P < 0.001$, $R^2 = 0.465$), and human resource ($\beta = 0.822$, $P < 0.001$, $R^2 = 0\ .676$) have a positive and significant effect on total quality management TQM, whereas the effect of hierarchy ($\beta = 0.525$, $P < 0.001$, $R^2 = 0.276$) affect less than other factors on TQM. In general, the result in Model2 supports *H2*.

Table 5 Mean score of SCH, TQM, and OC

Variables		No. item	MEAN	SD
Strategic change	Organizational culture	5	19.53	3.14
	Organizational hierarchy	4	15.72	2.46
	Human resource	7	26.83	4.69
	Total	16	62.09	9.31
Total quality management	Leadership supportive	5	18.92	4.27
	Customer focus	4	15.17	3.58
	Strategic planning	4	15.02	4.37
	Workforce focus	5	18.91	5.18
	Total	18	68.05	15.96
Organizational culture	Clan	5	19.37	3.84
	Hierarchy culture	4	14.79	2.98
	Adhocracy culture	5	19.49	2.89
	Market culture	4	15.52	2.42
	Total	18	69.18	10.13

The result in model 4 shows that there is a strong impact of OC on TQM that supports *H3*. On the other hand, the Table 6 shows that the culture ($\beta = 0.809$, $P < 0.001$, $R^2 = 0.654$). while the adhocracy culture ($\beta = 0$ .612, $P < 0.001$, $R^2 = 0$ .375), market culture ($\beta = 0.694$, $P < 0.001$, $R^2 = 0.480$) and hierarchy culture ($\beta = 0.461$, $P < 0.001$).

Mediating Effect: The main idea of the mediator between three variable impacts is to examine when Z leading the relationship between X and Y. in another word Z change the relationship between X and Y, it may increase or decrease (Sampedro-Matarín et al., 2006). Although to evaluate the mediating role of SCH strategic change between organizational culture (OC) and total quality management (TQM), the study follows Woodworth's model 1928 and (Baron & Kenny, 1986). The first step to test the direct relationship between the organizational culture-independent variable and SCH. the dependent variable to establish that there is an impact that may be mediated. The previous analysis in Table 5 Model1. Shows that the variables of OC significantly indirect impact on SCH see also (Fig. 1 and Table 7). Which the criteria for the first one was fit (MacKinnon, 2008). The second step is to ensure that the mediator variable affects the dependent variable. When we look back to Table 5. Which shows there is a positive impact on TQM. That is mean the criteria of the second step were met. The third step is to examine if the mediator factors affect the dependent variables. Table 5 and Fig. 1 show a positive and significant impact on TQM. Therefore, criteria three were met. In the fourth step, the study conducted a regression analysis to evaluate the mediating role of SCH strategic change in the relationship between OC variables and TQM practices. which the result of Table 6 Model 3 & 4, Figs. 1 and 2, and Table 7, indicates that the strategic change (SCH) lead to a decrease in the effect size such as (the strength of clan variable of organizational

Table 6 summary of the result of the multiple linear regression models

		Unstandardized coefficients		Standardized coefficients	T		Sig
	Model	B	Std. error	Beta		R^2

	Adhocracy culture	3.380	0.237	0.612	14.249	0.375	0.010
	Market culture	4.568	0.258	0.694	17.737	0.480	0.000
Model4							
Dependent Variable: TQM WITH SCH Mediator	Clan	2.994	0.186	0.721	16.078	0.781	0.000
	Hierarchy culture	1.235	0.221	0.018	0.446	0.614	0.000
	Adhocracy culture	-1.053	0.348	-0.191	-3.022	0.624	0.003
	Market culture	1.611	0.324	0.245	4.797	0.640	0.000

culture change with mediator SCH from ($\beta = 0.877$ to $\beta = 0.772$), market culture change from ($\beta = 0.694$ to $\beta = 0.245$). while the significant remains the same. The result of the study agrees with other studies such as (Haffar et al., 2013). Thus the study SCH strategic change can be explained as a partial mediator in the relationship between organizational culture variables and TQM practices. Therefore, the result indicates that OC indirectly affects TQM practices via the impact on strategic change SCH. That result support *H4* (Figs. 3, 4, 5 and Tables 8 and 9).

9 Results and Discussion

The aim of the study was to clarify of the mediating role of strategic change on the relationship between total quality management, organizational culture the result of the study has shown that the level of strategic change has a direct impact on the process of TQM practice. These findings support by other studies such as Haffar et al. (2013). Additionally, the strategic change can be explained as a partial mediator in the relationship between organizational culture variables and TQM practices. As well as the study emphasized the role of organizational culture to effectively transition across the various layers of organizational structure. On the other hand, the finding of this study indicates that organizational culture is highly affected by the strategic change. As a result, the organization believes how important a culture of belief and change is to be created. The organization often involves its members to make a change, and the organizational structure is distinguished by a high degree of cooperation between the various units to achieve strategic change. Therefore, the findings of the study indicate that the organizational culture (OC) is an impact on strategic change. In addition, some scholars, such as jones (2005) have found that clan/adhocracy and culture forms are correlated with higher levels of change. While (Iljins et al., 2015) have found that the organizational factors influencing organizational climate. In the current research, similar results were found where the degree of change is positively affected by the clan (that people get things in common. deep links of commitment, custom, and shared experience typically form) and styles of the culture of adhocracy. Furthermore, it is obvious from the findings of this analysis that a high degree of change is correlated with consumer culture. Therefore, the findings of this study suggest that organizations governed by forms of clan/adhocracy and consumer culture promote enhanced applicability of change. Hence, if they consider their work environment to have the factors associated with either a clan or adhocracy culture forms, members of an organization are more likely to have higher levels of change. In addition to that, the leadership of such organizations also used to appreciate employee engagement and empower their workers by setting up a fair system of benefits and rewarding the members who share in the progress of the implementation process. This contributes to improving the emotions and confidence of the participants in honesty and personal benefits that will be achieved because of involvement in the introduction

of new intrusive change initiatives. This confirms the results of several scholars, such as (Latta, 2009). who found that if members of organizational fairness in processes of change, they would have more personally prepared to adopt readiness of change? Moreover, the findings of this research show that the most positive culture groups for TQM are compared to cultural forms, community, and consumer culture. While the Cultural forms of hierarchy and adhocracy are the least encouraging to TQM. This is consistent with the results of various research studies, such as (Gimenez-Espin et al., 2013).

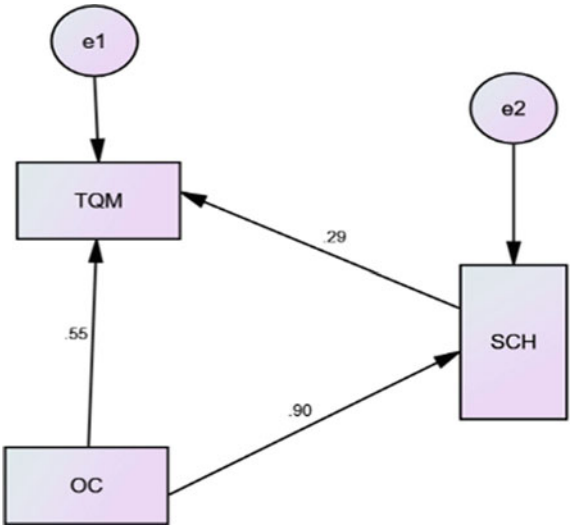

Fig. 3 Variables relationship with a mediator

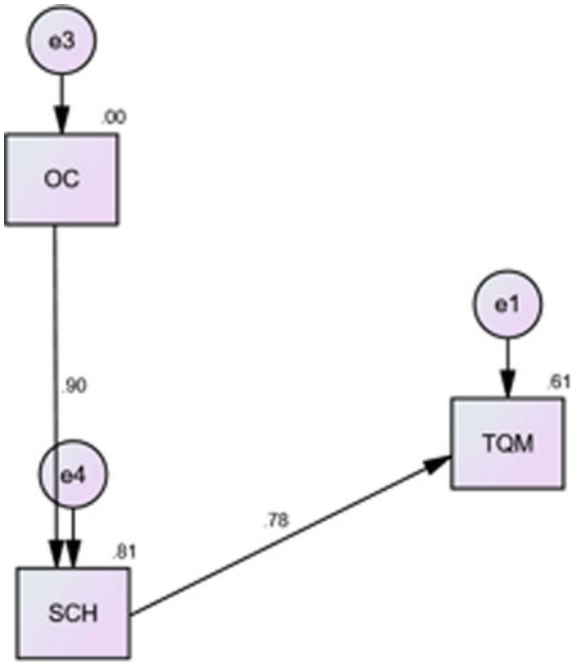

Fig. 4 Variables relationship with a mediator and without the correlation between OC and TQM

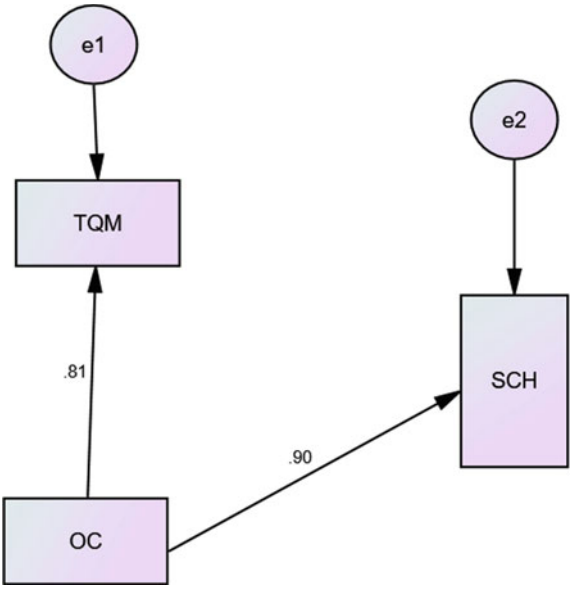

Fig. 5 Variables correlation without the correlation between TQM–SCH

According to the effective implementation of the TQM includes long-term strategic planning. Authors stress strongly on the value of strategic planning (Hitchcock & Willard, 2002; Sinclair & Zairi, 2001). Involvement and dedication of managers at various levels is important for the implementation of Juran and Godfrey (1999), Crosby (1989). Between OC and supportive leadership in TQM is consistent with the results of previous studies such as (Mustafa & Bon, 2012; Waldman, 1993; Zhang et al., 1999). Furthermore, the findings of this research demonstrate the lack of relevance for total quality management (TQM) of the hierarchical society. In addition, the finding of this study shows that the culture of adhocracy has less of a noticeable effect on TQM. Help for this performance with the study of Yong and Pheng (2008).

10 Conclusion

The result of the study revealed that strategic change has a direct impact on the TQM practices. In addition to that, the strategic change can be explained as a partial mediator in the relationship between organizational culture variables and TQM practices. The result of the study also found that there is a positive and significant effect of organizational culture on strategic change. On the other hand, the results analysis for TQM and strategic change revealed that the strategic change positively effects on total quality management in various areas.

However, we agree that this study laid the groundwork for future research to explore and extend the connection between Total quality management, organizational culture, and strategic change.

Finally, we conclude that to achieve success change TQM and organizational culture are important factors for any organization for gaining competitive advantages, increasing productivity, satisfying customer needs, and survive.

11 Limitations and Future Research

There may some limitation in this study that led to avenues in future research. First, the current research has evaluated the mediating role of strategic change (SCH) that possible the organizational culture impact on total quality management (TQM), however, future study, may recognize and explore the effect of other potential mediators in the connections between OC and TQM, as they will support extend our conceptual explaining the mechanism whereby the organizational culture influences the implementation of TQM.

Second, the study suggests that future work may include samples from a greater geographic area in UAE or be expanded to a multi-country analysis. Thus, the current study findings contribute to the global picture form the basis for future, more integrated studies.

According to the results, the study recommended that future research might investigate if other possible mediating variables may also mediate whatever totally or partially the effect of the relationship between TQM and organizational culture. Second thing, future studies can expand the respondents more than this study. Additionally, future studies may use the (SEM) Structure Equation Modeling that enhances the result by building a more convenient model of the study. Moreover, the researcher may use the result of this study to examine more specifically the relationship between two variables such as organizational culture with strategic change, TQM and organizational culture, or organizational culture and strategic change.

Finally, in current research, as in most recent research, regression analysis tests for hypotheses have been used. Although structural equation modelling (SEM) can be a useful technique for the analysis of large data, such as Kline (2015; Mueller & Hancock, 2008). considering that SEM is a large sample technique that needs to be used but the study couldn't implement because of the number of participants in the research is less than 400. For future research, it is suggested to use SEM with greater sample size and a higher number of participants' expectations.

12 Implication and Recommendations

The current study conducted within the COVID-19 pandemic. As most organizations are making a change in different fields of their organization to face the crisis and

survive (Ahmad et al., 2021; Alameeri et al., 2021; Alshurideh et al., 2021b, 2021c). It is hoped that the findings of the analysis will be useful to managers, even after the present crisis has ended. Having taken the study techniques and organizational culture variables into consideration to apply total quality management.

In addition to that, creating a positive environment will also promote the willingness of employees for the change process and encourage their participation in the implementation of TQM. In turn, this increases the chance of a successful TQM implementation in organizations, especially in the current situation with the COVID 19 pandemic, which gives the managers new experience to come up with innovative ideas to keep up and maintain the TQM success.

What Emirate Post Group have to do to improve their business?

- Foster high performing organization culture by defining the organization ethically, enabling two-way communication, rewarding employee, and empowering the team.
- Redesign the performance evaluation process to ensure that the individual goals align with the department goals.
- Develop learning manuals for new joiners.
- Document job descriptions.
- Update the HR process.
- Establish a cultural periodical review and continuous improvement.

Educational Supply Chain Management: A View on Professional Development Success in Malaysia

K. L. Lee, G. Nawanir, J. K. Cheng, Haitham M. Alzoubi, and Muhammad Alshurideh

Abstract The industrial environment is unpredictably shifting. Technology advancements and pandemics force the corporate environment to evolve even faster in order to stay competitive and thrive. As a result, in today's fast-paced business environment, supply chain management has grown in popularity. The study's major goal is to apply the concept of industrial supply chain management to educational management. The empirical study will be conducted separately and do not cover in this paper. In dynamic and uncertain business operations, the educational model is more appropriate to switch from mass production delivery to industrial experiences in building individual talent excellence. This minimizes the educator's knowledge and experiences delivery gap to the learner in the educational supply chain. From the issues, This study identifies the education attributes and how it affects professional development success. This study further investigates the moderating effect of industrial experiences on the relationship between education attributes and professional development success. Besides, this study aims to propose an educational supply chain model (EduSCM) for 21st-century professional development success in

Malaysia higher education to gain competitive advantages. To achieve the objectives, mixed methods research design is proposed. The qualitative data collection will be collected after the completion of quantitative data analysis. The data collected from the interview use to explain, interpret, understand, and triangulate the results of quantitative analysis to produce a potent conclusion. Lastly, this study will provide a unique conceptual diagram expected to aid researchers and practitioners to create a more comprehensive understanding of the linkages between learning competencies, industrial experiences, and professional development.

Keywords Educational supply chain management · Professional development success · Industry experience · Malaysia

1 Introduction

The initial concept of logistics began in 1950 and the concept matured in 1970 (Habib & Jungthirapanich, 2008a, 2008b). The industry noticed that the logistics concept plays an essential role in the business environment and gets critical, and the logistics elements also get more comprehensive. Therefore, in 1980, the focus of the logistics concept is switched, and the supply chain management concept is initiated. Due to the power of the supply chain concept, researchers and academicians start researching the concept, and the publication was available in 1982. In 1985, the manufacturing industry realized the usefulness of the supply chain management concept in managing their operation. The manufacturer applies the supply chain management concepts as strategic and systematic coordination of business activities to reduce costs, improve customer service, enhance quality, and increase competitiveness (Tan et al., 2002). In 1990, more and more researchers started exploring the concept and the area that can be researched in the supply chain (Huan et al., 2004; Cooper, 2006).

The power of supply chain management concept and the result of research activities from academician influenced the service industry as one of the main sections in a country start to implement supply chain management concept in-service operation in 1995. After five years, in 2000, it gains incredible attention from academics and practitioners (Chan & Qi, 2003). The concept of educational supply chain management started to emerge in 2007 as it is one of the service industries and aims to produce the right talent that can meet the industry needs (Habib & Jungthirapanich, 2008a, 2008b). In 2010, the market no longer competed between the organizations but between the supply chain to gain competitiveness (Gunasekaran et al., 2008). Technology advancement is moving faster than ever in the current decades. Therefore, the digital supply chain starts to emerge in 2017, focusing on integrating the information system to increase the efficiency, reliability, and transparency of the overall supply chain (Büyüközkan & Göçer, 2018; Korpela et al., 2021). In short, the supply chain management concept becomes more and more important in the current

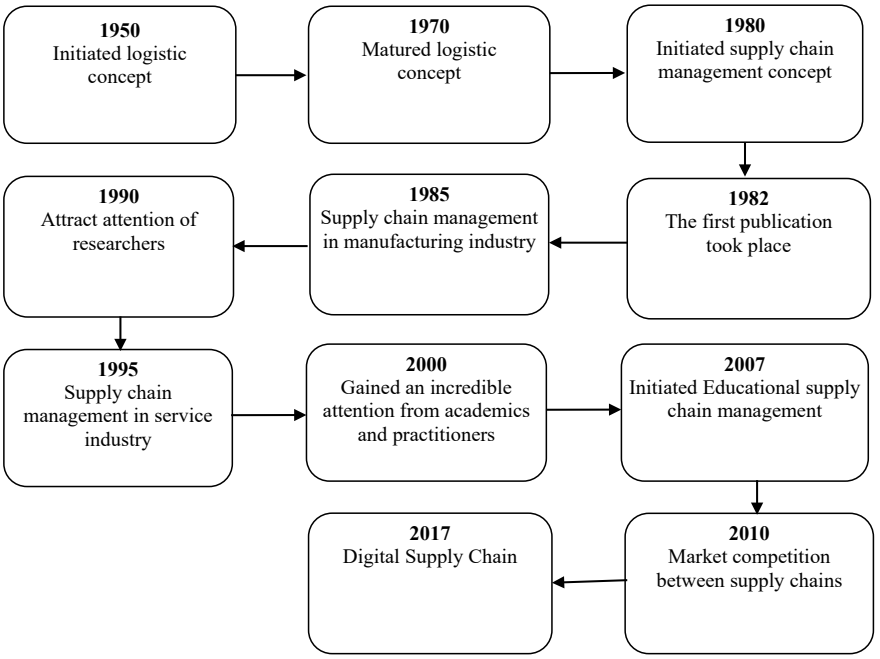

Fig. 1 The Evolution of Supply Chain Management. Source. Adapted from Lee et al. (2018)

industries, not only in the manufacturing but also in the service sectors, including the education sector. The evolution of supply chain management is illustrated in Fig. 1.

The graduates' statistics 2019 reported by DOSM (DOSM, 2018) shows that the number of graduates in Malaysia was increased from 4.94 million to 5.29 million in 2019. Based on the statistics, the number of graduates was increased. However, the employment rate was slightly decreased from 83.6 to 83.5%. The statistical number shows the employment rate and whether the graduates produce and are employed in the right field based on the program graduate is another issue. The mismatch in the supply and demand of graduates between higher institutions and industry needs remains a critical discussion topic until today. Employers claimed graduates lacked the necessary knowledge, skills, and attitudes. Computing skills, teamwork, English language proficiency (Markussen-Brown et al., 2017), previous training, and the graduate's personality are the five most important employability qualities, according to a recent research (Belwal et al., 2017). According to McKinsey report in education to employment, only 40% of graduates are completely prepared by the university to work in the real industry ield (Coffield, 2012). Obviously, Malaysian education needs to have a new professional development success model in handling contemporary issues.

Therefore, this paper investigates the relationship between education attributes and professional development success in Malaysia and how the moderating effect of industrial experiences in the relationship. Ultimately, this paper aims to propose an

Licensed to (putm@utm.my)

educational supply chain model (EduSCM) to improve the professional development success in Malaysia.

2 Literature Review

Resource-Based View (RBV) theory becomes an essential guide for this paper. The concept of RBV in this paper demonstrates the process of transformation of learners to be the professional development success which can be the employee or entrepreneur in the job market or industry (Barney, 2001; Grant, 1991; Halldorsson et al., 2007; Peteraf, 1993; Wernerfelt, 1984, 1995). The entrepreneur can be the job creator that offers the job opportunity to the job seeker. This paper believed that the parent participation and the learning environment are the primary resources for the learning process and the success of the professional development need to go through school education, tertiary or higher education, lifelong learning, and the most important is the industrial experience to gain a sustainable competitive advantage (Barney, 2001; Grant, 1991; Peteraf, 1993; Wernerfelt, 1984). The six measurements will measure the education attributes in which leadership skills, ethics and spirituality, national identity, thinking skills, language proficiency, and knowledge. The four measurements will be used to measure the professional development success in which holistic, entrepreneurial and balanced graduates, talent excellence, lifelong learner, and quality technical and vocational graduates. The application of RBV theory in educational supply chain management is shown in Fig. 2.

There are 672 higher learning institutions in Malaysia, consisting of 70 private universities, 20 public universities, 34 private university colleges, 410 private colleges, 33 polytechnics, 91 community colleges, and 14 higher institutions centres of excellence (HICoE), as shown in Table 1. In addition, there are 67,747 academic staff and 1,157,000 students in higher learning education in Malaysia, as shown in Table 2. The Ministry of Higher Education (2014) research noted that only 75% of

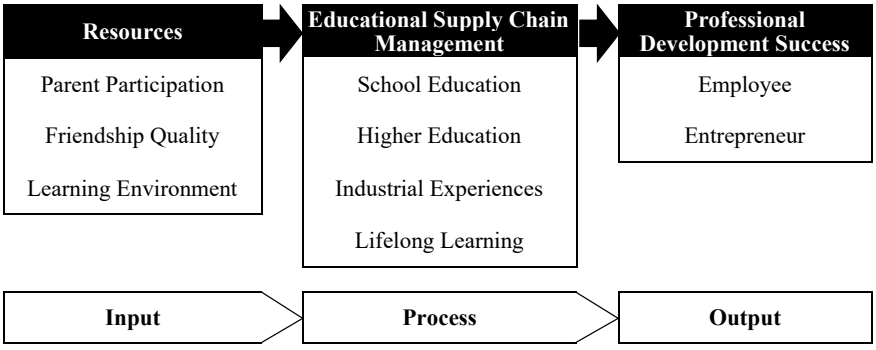

Fig. 2 Resource-based view theory in educational supply chain management. *Note* Adapted from Lee et al. (2018)

graduates are employed. Moreover, McKinsey (2012) noticed that only 40% of graduates are entirely prepared to work in the real industry. The International Standard Classification of Education (ISCED) level five encompasses Diploma, Advanced Diploma, Postgraduate Diploma, Professional Certificate, Bachelors, Master's, and Ph.D. programmes.

The phenomenal expansion of Malaysia's higher education industry over the previous two decades has aided in the country's internationalisation. The primary goals, according to the Ministry of Higher Education (MOHE), are to guarantee that all Malaysians have better access to excellent higher education by maximising the resources of current public and private higher education institutions. Malaysia's well-structured higher education system is critical to accomplishing professional development goals. Ethics and spirituality (Frich et al., 2015; Puchalski et al., 2014) leadership skills, national identity, language competence (Murray, 2011; Noom-Ura, 2013), thinking skills (Petersen, 2007) and knowledge are six main qualities for individual pupils presented in a recent study. Industrial experience is recommended to play a moderating role in enabling higher education to work closely with industry to guarantee that supply and demand are met demand. As a result, modern educational trends place a greater emphasis on delivery, accountability, openness, and outcomes rather than input.

Table 1 Higher learning institution in Malaysia

Higher learning institution in Malaysia	Number of institution

It's recommended that a graduate be considered outstanding academic performance is comprised of holistic, entrepreneurial, talent excellence, lifelong learner, and quality technical and vocational. Education entrepreneurs must improve professional development success (Ruskovaara et al., 2015) through curricula that earned the country international recognition. Lifelong learning can be achieved through the current trend of globalized online learning (Fine & Zygouris-Coe, 2011). This is supported by the fact that Malaysia presently has a 67% internet penetration rate, which is the seventh-highest penetration rate in Asia, indicating significant potential. Besides, In dynamic and uncertain business operations, the educational model is more appropriate to switch from mass production delivery to personalized learning experiences in building individual talent excellence (Alshurideh, 2012; Fraser-Seeto et al., 2014; Nijs et al., 2014). The conceptual framework of educational supply chain management is illustrated in Fig. 3.

By focusing on supply chain reliability, responsiveness, agility, and costs, today's supply chains are more likely to respond quickly, efficiently, and effectively to changes, volatility, and turbulence in the marketplace to achieve, succeed, and sustain competitive advantage in the new edge of business environment that is more global, customer-driven, and technologically oriented. In Malaysia, several supply chain management studies have been done. Supply chain management, according to the trends, has offered several benefits to the supply chain or company. Firms have used the supply chain to globalise their business, particularly in recent years, in order to

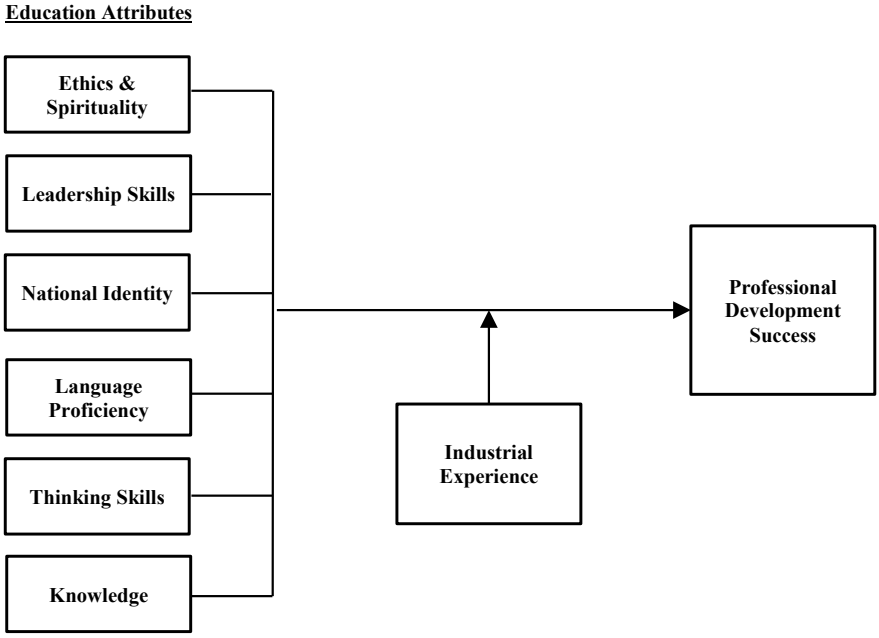

Fig. 3 Conceptual framework of professional development success

satisfy customers with high-quality products and cost-effective delivery (Al Dmour et al., 2014; Crinis, 2012; Lam & Postle, 2006). However, there are just a few studies that have used supply chain management theory to manage educational operations.

Educational supply chain management is based on the same principles as existing industrial supply chain management methods Kurdi et al. (2021). The supply chain also has upstream and downstream components. The upstream educational supply chain refers to the movement of students, information, and finances from early childhood education (kindergarten and pre-school) to primary, secondary, higher education, and higher education. However, parental involvement and the quality of children's friendships are crucial, and they can have a considerable influence on the quality of graduates produced. This stage may be viewed as laying the groundwork for producing high-quality graduates in the future. This is due to the fact that both elements are considered raw material providers. With low-quality raw materials and inefficient manufacturing methods, it is difficult to generate a high-quality product. The downstream educational supply chain, on the other hand, refers to the delivery of graduates to industry as employees or the business world as entrepreneurs. According to the newest Malaysia Education Blueprint 2015–2025, graduates are not need to be job seekers in order to be employed; instead, they may be job creators in order to be entrepreneurs who give work possibilities to job seekers.

Parents' involvement and the quality of their friendships are seen as requirements for generating high-quality graduates (Alshurideh, Salloum, Al Kurdi, & Al-Emran, 2019; Pittman & Richmond, 2008; Salloum et al., 2020). Since their children are born, parents may have a big influence on them. Before sending their children to school, they spend a long time together. Even at school, the school day is shorter than the time spent with parents. According to statistics, parent involvement in the educational supply chain is important (Alshurideh, 2022; Alzoubi et al., 2022; Joghee et al., 2021; Shamout et al., 2022). Furthermore, one of the most important factors in creating high-quality graduates is friendship quality (AlHamad et al., 2022; Amarneh et al., 2021; Lee et al., 2022a, 2022b). Although friendship quality did not have a direct impact on academic achievement, it was found to be strongly connected to the reduction of problem behaviour in individuals (Bettayeb et al., 2020; Lee et al., 2022a, 2022b). Problem behaviour is thought to be the cause of poor academic achievement (Al Kurdi et al., 2021; Alshurideh et al., 2022). To make the registration process go well, however, coordination between parents, friends, and the school is necessary.

Collaboration between higher education and schools is essential. The partnership can guarantee that the appropriate resources are developed and available for higher education. This not only enhances the student's competence and ability for further schooling, but it also raises the student's potential for future grooming. A high-quality input is thought to provide a high-quality output in supply chain management (Al Ali, 2021; Alshurideh et al., 2020a, 2020b; Kashif et al., 2021). Some of the issues that arise in higher education stem from students' academic performance. One of the most important factors in a student's ability to succeed in higher education is the school's academic success (Akour et al., 2021; Alzoubi, 2021a, 2021b; Lee & Ahmed, 2021). A shaky foundation creates a gap in the learning process for the pupil. This had an impact on pupils who had a weak foundation, as well as the entire

teaching and learning process. It might have an impact on how a lecturer teaches and how other students in the same class learn.

Furthermore, collaboration between higher education and industry cannot be ended at any point throughout the educational process. For the transition from student to employee or entrepreneur, both sides must communicate effectively (Cruz, 2021; Kurdi, Alshurideh, & Salloum, 2020a, 2020b, 2020c; Radwan & Farouk, 2021). This is because the industry's demands can only be met if the industry's higher education requirements are shared, as the industry's primary source of graduates (Alshurideh, Al Kurdi, et al., 2019a, 2019b, 2019c; Alzoubi, 2021b; Aziz & Aftab, 2021). All of the grads are not necessarily searching for full-time employment. Graduates, on the other hand, can become entrepreneurs who generate jobs and give them to others. This seeks to lower the unemployment rate among graduates, as stated in the Malaysia Education Blueprint 2015–2025 (Ali et al., 2022).

According to the explanation above, data, information, and knowledge exchange are essential throughout the educational supply chain process (Alzoubi and Yanamandra 2020; Mehmood et al., 2019; Mehrez et al., 2021). As illustrated in Fig. 2, the sharing must be evenly balanced between curriculum design and industry demands (Al-Maroof et al., 2021a, 2021b; Alshurideh et al., 2019a, 2019b, 2019c; Farouk, 2021; Obaid, 2021). This is to guarantee that the information shared from industry to higher education is successful in developing curriculum that produces high-quality graduates who meet real-world industry requirements (Akhtar et al., 2021; Eli, 2021). This method maintains higher education curriculum design current while also lowering the jobless rate. Industry is continuously on the lookout for people who have the necessary knowledge and abilities for the job (Al Kurdi et al., 2021; Alshurideh et al., 2020a, 2020b; Alzoubi et al., 2020a, 2020b; Kurdi et al., 2020a, 2020b, 2020c). This indicates that the recruited person is capable of doing the job without any basic training, therefore meeting the ultimate expectation from industry to higher education. Prior to that, all programmes need an industrial internship for students to learn about real-world industrial functions. Consistent measurement is used and discussed to achieve consistent performance at all levels, including school, higher education, and industry (Alshurideh, 2014; Alshurideh et al., 2015, 2021a, 2021b; Al-Maroof et al., 2021a, 2021b; Alnazer et al., 2017; Ghazal et al., 2021; Kurdi et al., 2020a, 2020b; Nazir et al., 2021).

In educational supply chain management, student performance should be evaluated in all elements of the learning process, including ethics and morals, as well as knowledge and abilities. (1) ethics and spirituality, (2) leadership skills, and (3) national identity make up ethics and morals, whereas (1) language proficiency, (2) thinking skills, and (3) knowledge make up knowledge and skills. However, as shown in Table 3, the measures may be divided into two stages: school level, higher education, and industrial level (Alshamsi et al., 2020; Alsharari, 2021; Alsharari & Alshurideh, 2021; Alshurideh et al., 2021a, 2021b; Leo et al., 2021; Mehmood, 2021; Sultan et al., 2021).

In responding to these needs, this study summarised the concept of educational supply chain management as shown in Fig. 4. is expected to be fundamental to provide a comprehensive, integrated view on all aspects and facets of learning competencies,

Table 3 Definition of measurements used in conceptual framework

Measurements	Definition	
	School level	Higher education and industry level
Ethics and spirituality	Possesses solid moral foundation and courage to make right decisions	Ethically and morally upright, spiritually grounded, compassionate and caring; appreciates sustainable development and a healthy lifestyle
Leadership skills	Has strong communication skills, is entrepreneurial, resilient, can lead and work in teams	An effective communicator, emotionally intelligent and able to work across cultures; is socially responsible, competitive, resilient, and confident
National identity	Proudly identifies as Malaysian and embraces diversity	Pride in Malaysia and an understanding of Malaysia in relation to the world
Language proficiency	Operationally proficient in at least "Bahasa Melayu" and English	Proficient in "Bahasa Melayu" and English, and encouraged to learn one additional global language
Thinking skills	Inquisitive and innovative can apply, create, and connect knowledge to provide solutions	Appreciates diverse views, can think critically and innovative, as a problem-solving initiative, and has an entrepreneurial mindset
Knowledge	Mastery of core subjects and general knowledge about the world	Has mastery of own disciplines, can harness, connect and apply knowledge learnt, and has an appreciation of culture, arts, and Science, Technology, Engineering and Mathematics (STEM)

Source Adapted from Puchalski et al. (2014)

personalized learning experience, and professional development success (Guergov & Radwan, 2021; Khan, 2021; Miller, 2021; Mondol, 2021).

3 Methodology

There are three primary research paradigms in social science research: quantitative, qualitative, and mixed-method research design (Hanaysha et al., 2021a, 2021b). Convergent parallel, explanatory sequential, exploratory sequential, embedding, transformational, and multiphase designs are the six types of mixed-method study designs (Alhamad et al., 2021). This study concentrates on professional development success through educational supply chain management in Malaysia higher education. Therefore, the population in this study is Malaysian higher education graduates

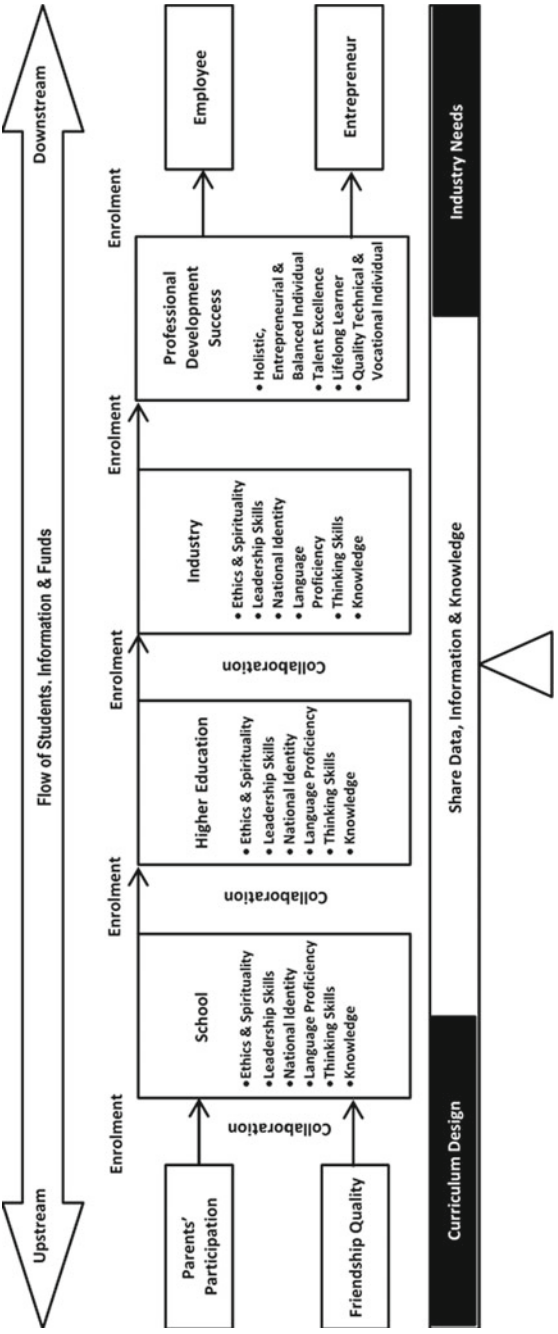

Fig. 4 Conceptual diagram of educational supply chain management

(Puchalski et al., 2014) to provide information for this research. Thus, the unit of measure of this study would be individual. The population of this study will be 504,000 individuals, and the sample size will be 384 individuals (Alzoubi & Aziz, 2021). A convenient sampling technique will be applied to determine the sample.

In a mixed method research design, survey questionnaires will be the instrument used to collect quantitative data, while the case study will be used to collect qualitative data. The respondents will be asked to answer the simple and convenient 5-point Likert scale questions (Hamadneh et al., 2021; Hanaysha et al., 2021a, 2021b). The survey questionnaire will distribute to 384 individuals, and three samples will be chosen from quantitative respondents for the case study. After the data collection, the collected data will be analyzed using the structural equation modeling (SEM) technique using SmartPLS 3.0 software. After completing quantitative data analysis, the next step is to prepare an interview protocol or semi-structured questionnaire for the case study, a face-to-face interview to collect qualitative data (Alzoubi et al., 2021). According to Ali et al. (2021) and Alzoubi et al. (2020a, 2020b), there is no rule of thumb to identify the sample in the qualitative study. The study is proposed to have three samples for the qualitative phase, and the sample will be selected from the quantitative respondents based on the result of quantitative data analysis. After the interview with the individuals, the software ATLAS.ti will analyze the data collected from the interview session. The combination of quantitative and qualitative data will produce a potent conclusion for this study (Alnuaimi et al., 2021; Alzoubi & Ahmed, 2019; Joghee et al., 2020).

3.1 Expected Implications

An appropriate combination of existing education attributes, industrial experience, and professional development success can help firms gain a more comprehensive picture of operational effect across their value chain. Institutions along the education supply chain would make more use of clear and consistent education attributes. In addition, by highlighting the effects of Malaysian educational attributes and industrial experience on the country's professional development success consequences of higher education institutions. Academicians of these institutions can benefit from the six education attributes that can be developed in addressing the issue. The model is expected to help the academicians to recognize and control the effects of education attributes.

It is strongly believed that the six education attributes and industrial experience initiated from the model developed will mitigate school, university, or company's social impact. This impact will shape not only the quality of graduates but also make professional development success and business operation more effective and efficient. In the long term, these will impact the economy of Malaysia, which is robust in advance professional development and ultimately contribute to the Gross Domestic

Product (GDP) of Malaysia. Finally, contribute to Malaysia's reputation and international standards by professional development through an educational supply chain model well-known globally.

Linear Discrimination Analysis Using Image Processing Optimization

Raed A. Said, Nidal A. Al-Dmour, Liaqat Ali, Haitham M. Alzoubi, Muhammad Alshurideh, and Mohammed Salahat

Abstract When we talk about Machinery Vision and Deep Learning, we often talk about algorithms. In fact, mathematical models with computer knowledge are the basis of how we deal with graphical data to process the Image and make decision. Machine learning can play an important role in determining agricultural plant type in order to optimize the harvesting steps in an automated way. How to process and introduce the products to the market often requires detailed information about the stages of planting and harvesting. In addition, by using this method, sophisticated research can be designed in plant genetics and effect of environmental variables on the end product. The ultimate goal of this work is to use Linear Discrimination Analysis for the Image Processing and classification of harvested wheat grain which are belonged to different types of grain namely Rosa, Kama and Canadian. The above discovery has proved with the statistics to have with more than 94% of accuracy.

1 Introduction

Wheat grain with the highest nutritional value is the main resource of starch, fibers, amino acids, phenolics and polycarbonates. The wheat grains can be used as the supplemental ingredient of foods with low amino acids, phytases and antioxidants. Lactic fermentation also significantly improved protein digestibility and a satisfactory reduction in glycemic index compared to bread made from wheat flour alone (Akhtar et al., 2021; Al Ali, 2021; AlHamad et al., 2022). Lactic acid bacteria have a great effect on improving the nutritional and functional properties of the product and the enzymatic activity of these bacteria is responsible for increasing phenolic compounds and soluble fibers in the final product and reducing the risk of cardiovascular disease, type 2 diabetes, some types Cancers and obesity (Alhamad et al., 2021; Ali et al., 2021, 2022; Alnazer et al., 2017).

The wheat grains are damaged in their harvesting or post harvesting stages due to mechanical and thermal shocks (Alnuaimi et al., 2021; Alsharari, 2021; Alshurideh et al., 2022). Wheat Kernel damage as the main driver for the detrimental effects affect their biological and physical properties. One of the most important factors causing damages in the wheat kernel is its moisture absorption, which can be measured from prepared seed sample with weighting after maintaining in several hours in distilled water at certain temperature (Alshurideh et al., 2020; Alzoubi, 2021a, 2021b). For the kernels with higher potency i.e., high tendency for damage, a significant difference can be measured by the electrical conductivity of the solution obtained from seeds with different potency. The electrical conductivity of seeds with higher potency can be significantly lower than that of seeds with lower potency. The laboratorial methods required for the measurement of physical properties need a controlled environment induce higher cost. Other methods such as Magnetic Resonance Imaging, laser or scanning electron microscopy is also very cost intensive (Alzoubi & Aziz, 2021; Alzoubi & Yanamandra, 2020; Alzoubi et al., 2020a, 2022).

As an optimal alternative, Soft X-ray Image processing measuring the geometrical and statistical parameters of kernels are well posed as the way of quality inspection and assessment most cereal internal structure where the naked eye cannot separate the wheat grain type. The main reason is that X-ray can be differently exposed in the damaged and undamaged regions of internal kernel (Alzoubi et al., 2021; Alzoubi et al., 2020b; Alzoubi & Ahmed, 2019; Aziz & Aftab, 2021). The main steps for the determination of the damage index of wheat kernels are.

Companies are now rapidly developing agricultural performance-enhancing algorithms that can show farmers what the best crop method is (Alhashmi et al., 2020; Cruz, 2021; Eli, 2021; Farouk, 2021; Ghazal et al., 2021a, 2021b). Despite some concerns about the difficulty of doing this kind of analysis in nature, farmers and

others can make great strides in maximizing yields simply by using intelligent algorithms and generators designed to help mimic computers. In simpler terms, the work of artificial intelligence has supported the idea that machines can provide deep insight into farmers and take many human arguments out (Al AlShamsi et al., 2021; Guergov & Radwan, 2021; Hamadneh et al., 2021; Hanaysha et al., 2021a; Shebli et al., 2021; Yousuf et al., 2021). Finally, it should be noted that population growth and climate change will be major challenges for the future of world agriculture, but the establishment and use of artificial intelligence can mitigate the impact of these challenges and other challenges and make smart agriculture in the face of problems. What farmers are facing is more resilient (Hanaysha et al., 2021b; Joghee et al., 2020; Kashif et al., 2021; Khan, 2021; Nuseir et al., 2021).

Linear Discrimination Analysis (LDA) is the method used in Machine learning for the recognition of two or more objects. In LDA, which is very similar to variance and regression analysis dependent variable is linearly relate to the other variables (Lee & Ahmed, 2021; Lee et al., 2022a, 2022a, 2022b; Mehmood, 2021). The difference between these methods is that in LDA, instead of distance relationship, dependent variable is solved by the ranking or ordinal outranking (Siddiqui et al., 2021; Zitar, 2021; Zitar et al., 2021). The LDA is also closely related to Principal Component Analysis (PCA) core component analysis. Because both methods look for a linear combination of variables that best describe the data. The LDA also attempts to model differences between different data classes. The LDA is used when the observation sizes are continuous values (Mehmood et al., 2019; Miller, 2021; Mondol, 2021).

In this paper, the essential data preprocessing stages are described in Chap. 2 then in Chap. 3 the configuration of the Weka Program for the LDA analysis are explained. Modelling methods is the subject of Chap. 4 and their tuning parameters are described in Chap. 5. The results are shown for the classification accuracy are discussed and the confusion matrix is represented. At last, the results are summarized and the usage of the Machine Deep Learning in wheat classification are discussed in the conclusion.

2 Dataset Description

A. Preprocessing stage

The dataset consisted of 210 instances corresponding to the three equal batches of grain for each class with 7 attributed. Wheat grain dataset can be extracted from the UCI repository dataset (Obaid, 2021; Radwan & Farouk, 2021; Shamout et al., 2022). The file was in the form of txt file and attributes a compaigned only with numerical values, then we used microsoft excel to name each column and export the result as a csv file. Since the ultimate goal of this work is to measure the misclassification of the randomly ordered classes with linear discrimination modelling, it is needed to use two filters for data preparation in this step (Al-Dmour, 2016; Al Hamadi et al., 2017; Al Neaimi et al., 2020). These are namely NumerictoNominal for object class

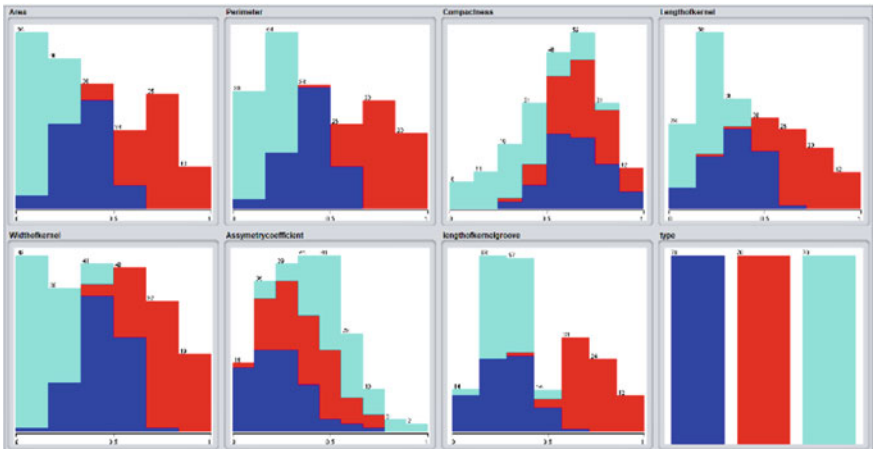

Fig. 1 Attribute distribution versus multi-nominal Class

and Normalize for all others. The normalization process transform all attributes to range [0,1] with mean 1 and variance 0. This can be used to control the bias error and reduce the risk of overfitting. As it is shown in Fig. 1, it is not possible to cover all the differentiae each of types with a single variable. That's evident from the fact that a coverage of the some of the area is existed where make the classification in that region impossible. For instance, Rosa Grain (red color) class can fairly be explained by the Area, Perimeter and length of kernel groove (Bibi et al., 2021; Ghazal, 2021; Maasmi et al., 2021).

Canadian and Kama Grain centroid are neat which is therefore difficult to separately classified by one single attribute (Al-Dmour & Teahan, 2005; Al-Hamadi et al., 2015, 2021). The advantage of the Linear Discrimination Analysis is where it is not possible to differentiate the class by a single attribute. LDA algorithm makes a linear relationship between the independent variable and classes to make this happen. The effect of each variable will be on the whole classification. The classification problem is to find a predictor for each class from the same distribution (not necessarily from the training set) given by the observation set x. LDA is assumed a conditional probability density function exist which are both have normal distributions with mean and covariance parameters.

B. Dimension Reduction

Linear Discrimination Analysis is a method similar to Principal Component Analysis and factor analysis; Both of these statistical methods are used to linearly combine variables in a way that best describes the data (Ali & Dmour, 2021; Al-Naymat et al., 2021; Aslam et al., 2021). A major application of both of these methods is to reduce the number of dimensions of the data. However, there are major differences between these methods: in Linear Discrimination Analysis, class differences are modeled, while in principal component analysis, class differences are ignored. The reduced

dataset was exported to reduced.arff in order to further analysis the reduced result by Linear Discrimination Analysis. In Fig. 2 the new variables are represented:

As it can be seen from the PCA analysis in Fig. 2, the first and second are posed well as a Principal Component Analysis. Figure 3 shows the graph of second versus first dimensions and the region inside the ovals are for each type of grain kernel.

3 Methodology

We have used python 3.6 to import the dataset into Jupyter Notebook. The details of results of coding within the description of every attributes are attached in the Appendix; For machine learning the Weka Program V 3.9 was applied.

```
import pandas as pd
data = pd.read_csv("wheat.csv")
data.info()
data.describe()
```

4 Modelling

After importing the dataset into the Weka program, modelling techniques utilized which was calibrated with the usage of hyper-parameter tuning where in k-nearest neighbors (kNN), the number of neighbors was chosen to be equal to 4 and in Neural Network (NN) and Naïve Bayes (NB), the batch size was with the volume of 100.

5 Results

Table 1 shows the result of accuracy (Recall for the danger of overfitting), F-Measure and Kappa statistics.

The Bayes Naïve model estimation is based on the Bayes Probability theory and outperformed the other two techniques on all model efficiency and also runtime. The effect of attribute reduction performed on preprocessing stage can be seen that 3–4 attributes are indifferent for our prediction models. On the other hand, the precision was not intended to be either/or with more than 99.9% correctness but rather the practically developed model with more than 60% accuracy. In the following table the confusion matrix is also indicated. The number of correct classified instances for "Yes" 100 and "No" was equal to 222.

```
=== Confusion Matrix ===
a   b   <-- classified as
100 110 |  a = Yes
68  222 |  b = No
```

Table 1 Data Scientific result performed in Weka

Attribute selection	Classifier	F-measure (%)	Kappa	Recall (%)	Accuracy (%)
12	Bayes Naïve (NB)	60.9	0.1931	61.0	61.8
	k-Nearest Neighbors (IBk)	50.12	−0.002	50.8	50.6
	Multilayer Perceptron (NNs)	53.9	0.0305	53.2	53.2
9	Bayes Naïve (NB)	52.2	0.0441	52.2	52.21
	k-Nearest Neighbors (IBk)	49.7	0.0324	51.6	51.57
	Multilayer Perceptron (NNs)	47.7	−0.044	47.8	47.7
6	Bayes Naïve (NB)	63.6	0.2486	64.4	64.4
	k-Nearest Neighbors (IBk)	57.2	0.1215	57.2	57.2
	Multilayer Perceptron (NNs)	53.2	0.0691	58.4	58.4

6 Discussion

Generally, for retailers or clothing stores, this result has fewer external consequences, though the point of view is very important due to the importance of feasibility of designing of such a smart system that can capture the customer sense and recommend a cloth for the customer. It is important for any brand as a beneficiary of a recommendation system to take advantage of opportunities and generally use chances and prevent failures in the competitive market, which will be created by differentiating in the mind of the customer. On the other word, this study could be the first evaluation of application of such framework in the stores which can be developed by the help of expert in fashion design and apparel entrepreneurship.

7 Conclusion

We have developed a framework that can model the sale recommendation for better communication between clients. We have firstly extracted the dataset from the UCI and then imported the data for the preprocessing into weka and python. The data was cleansed at the first step by the filtering tools embedded in Weka Application. Then the dataset was balanced to 50/50 distribution of target class for the danger of overfitting. Atlast, five different machine learning tools was implemented in the dataset to tune the hyper-parameter which resulted into more than 10% improvement

in the results. With the specific learning from the modeling, we understood that with the possibility of near 65% of success such a recommendation system can be applied.

Appendix [Python Code with Outputs]

Pricing Policies and Their Impact on Customer Satisfaction

Omar Jawabreh, Ra'ed Masa'deh, Yaqoub Bqaa'een, and Muhammad Alshurideh

Abstract This research aims to focus on pricing, policies and their impact on customer satisfaction in the five-star hotels in Aqaba. The technique that was used in the present research is described in this section. There are many components of this document: the research model, operational definitions of the study's independent and dependent variables, research hypotheses, as well as a data collection instrument, research population, and research sample. The components of this study are developed on the basis of prior literature, which may be either theoretical or empirical in nature. Indeed, the factors utilized in this research are often found in the literature on tourist development. The data analysis results have shown that services in restaurants in Aqaba hotels are applied at a very high level, which the mean score is 4.38. Also, customer satisfaction and pricing cognition (pricing) existed on a high base with mean of 3.86 and 3.74 respectively. Specifically, the research seeks to develop price policies for all categories and to work on the design of all pricing criteria to fit the quality of service and the degree of customer satisfaction, which shows that a high level of customer satisfaction may be achieved.

Keywords Services in restaurant · And pricing cognition (Pricing) · Customer satisfaction

1 Introduction

Being customer focused nowadays has to be accepted as a bare necessity to conduct business. Globalization and value-driven business imperatives will therefore mean that mistakes are not going to be tolerated; substandard products and services will ensure that the weakest are not going to continue competing; and fragile practices and poorly defined and managed processes will not be accepted (Jawabreh, 2020). Apart from anything else, true competitive advantage will only be established through excellence in customer value and the ensuing relentless care and attention provided. Customer satisfaction (CS) is a very often misused and abused expression. Many organizations use it casually in order to state that their customers are happy and satisfied with the levels of service rendered and the products and services purchased, but they actually have never tried to measure that satisfies. But if a company takes its customers seriously, it should not behave like this because the results of customer satisfaction measurements provide significant information for modern management processes and a warning signal about future business results. This enables an understanding of how customers perceive the organization, i.e., whether its performance meets their expectations, identifies priorities for improvement, benchmarks the performance of the organization against other organizations, and increase profits through improved customer loyalty. Through the process of creating a customer and supplier chain at all levels, a better focus can be achieved and, ultimately, all the work carried out will be of value. This customer–supplier communication will help to ensure quality and thus the customer's satisfaction (Al Khasawneh et al., 2021; Jawabreh, 2017; Jawabreh & Al Sarayreh, 2017; Lepkova & Žūkaitė-Jefimovienė, 2012).

For decades, the conception of trust has achieved appreciable implications in the field of marketing, not only for products as well as for services. When we have to make a choice between different products in the same category, trust is involved. It is an essential asset of a person, product, organization, institution, and skill. The buyer will go for the trustworthy asset mentioned above. Customer trust is an important variable that enhances customer commitment. He also stated that the quality of services enhances customer trust. Loyalty has, for years, been an important and fundamental ingredient of marketing. It has been a burning subject matter in marketing, not only for commerce academics, but also for industry managers (Qandah et al., 2020; Sarwar et al., 2012). For long-term success, organizations work very hard. The organizations' success is determined by numerous factors. Those organizations which earn lots of profit are not thought to be powerful organizations, because profit generation is one of the tasks of the organization. So, not just organizations now have to focus on shareholders, but also for customers, because now the customers are the king. In the existent world, maintaining the old ones and drawing the attention of new customers is considered to be a victory. Now the telecommunication sector is growing to be a vital sector of the world. Voice communication, graphics, data, and delivery of video at a very high speed are provided by the telecommunication sector. The world economy is being influenced by the telecommunication sector. Competition is going

to be more intense. For the purpose of achieving a maintained competitive edge, the telecommunication industries are compelled to pursue innovation and to execute the best thing for the satisfaction of their customers. So, the marketing relationship plays a vital part in the industry of telecommunication (Alrowwad et al., 2020; Mahmoud et al., 2021; Malik et al., 2012; Obeidat et al., 2019).

Much emphasis has been placed on revenue from the oil and gas industry, thereby leading to the neglect of other vital sectors of the economy, such as tourism, power, etc. It is based on this fact that the hospitality industry has really remained under-explored in Nigeria for too long as an alternative source of generating revenue. The operations of hotels and other tourist centers gave rise to the function of what we see today as the hospitality industry. The hospitality industry is an important variable in the affairs of a nation and, most recently, it has sprung up to be a viable fund-generating medium in Jordan. Tourist centers, to a great extent, tend to bring investors and tourists, both local and foreign, to these countries, which, in turn, helps to improve the productivity level of the nation. The hotels in an environment serve as residing and accommodating places for people. These tourists, investors, and leisure seekers stay in hotels for different reasons, ranging from business meetings, conferences, leisure, etc. The government, on the other hand, derives revenue from the taxes imposed on these hospitality centers, which they usefully utilize in other productive ventures (Abuhashesh et al., 2019; Akaegbu, 2013).

While customer relationship marketing may be a firm's important driver towards the satisfaction of its customers, switching barriers and price perceptions are also likely to influence retention. Recent research on switching barriers and pricing perceptions may have interaction effects on customer retention. If they are high, service firms may continue to retain customers even if they are not highly satisfied (Kyriazopoulos & Rounti, 2007). Customers' satisfaction with their purchase is a significant factor that leads business to success. In recent times, customer satisfaction has gained new attention within the context of the paradigm shift from transactional marketing to relationship marketing. Customers who are satisfied with a purchased product will buy the same product again, more often, and will also recommend it to others (Masadeh et al., 2019). Customer satisfaction is commonly related to two fundamental properties, including the customer's judgment of the quality of the product and his evaluation of the interaction experience he or she has had with the product provider. He sums this up when he states: "The key to customer retention is customer satisfaction." Even though it is agreed in the literature that price and quality have a high effect on customers' satisfaction, there is little empirical evidence exploring this relationship. Almost nothing is known about the human neural mechanisms through which they affect the decisions made by individuals (Dapkevicius & Melnikas, 2009).

Traders usually use various pricing tools and promotion policies to attract new customers and increase customer loyalty. It is surprising that pricing strategies have proved to be a fruitful research area for marketers. Marketing scientists have offered both theoretical and empirical estimates showing that for all types of consumers, different price policies are likely to attract. Although there are well-known reasons why a consumer selects a store, we know relatively little about how retailers choose

Licensed to (putm@utm.my)

pricing strategies because of the complexity of such a decision should take into account both consumer preferences and current and anticipated actions of rivals (Marinescu et al., 2010).

One important factor that has been considered in many exchange relationships is price, which is the financial value that is given out in exchange for a product. The literature on consumer studies regarding prices has argued that customers hold an internal reference price which serves as a standard against which newly encoded prices are compared. In consumer markets. Price and satisfaction, so far, only measured aspects of the financing. Although price satisfaction has a direct impact on consumer behavior and loyalty. Obviously, this increased loyalty can reduce the cost of switching customers to other brands and the use of marketing tools such as word of mouth. In today's competitive and turbulent environment, according to a new marketing philosophy, customer-oriented organizations focus on customers and look at things from the perspective of the customer. Thus, it is clear what the customer wants and then begins searching for their research (Hortamani et al., 2013). With increasing globalization, local retailers find themselves having to compete with large foreign players by targeting niche markets. To excel and flaunt as a market leader in an ultramodern era and a globalized world, organizations must strive to harvest from their marketing strategies, benchmarking and company quality policies. Ranking and selecting projects is a relatively common, yet often difficult, task. It is complicated because there is usually more than one dimension for measuring the impact of each criterion and more than one decision maker.

It's impossible for anyone to neglect the impact of the air transport business on the world economy. Sir Colin Marshal, the former CEO of British Airways, has described it as "the flywheel for the engines of the world's industry". According to the Air Transportation Action Group, the industry at the beginning of this decade produced more than €1.5 trillion worth of economic activities and employed directly and indirectly 57 million people. It is, furthermore, an essential element in the world transport network, as it is currently used by more than two and a half billion passengers per year, and ships around 35% of the world's manufactured products (by value). The industry has, therefore, turned from a sign of military and national power to a key element of business and investment. Technologically driven innovations have boosted the industry, but economic developments have had even more influence on the market (Jahmani et al., 2020; Jawabreh, 2021). Despite being faced with rising fuel prices, environmental concerns, and small margins, the airline business will still face an intensely competitive market (Al-Jabaly & Khraim, 2014).

The study aims to provide pricing policies for all categories and work on the design of all pricing requirements to suit the quality of service and customer satisfaction, which indicates reaching a high level of customer satisfaction.

2 Literature Review

Trust is the name of confidence and belief which a customer attaches to some organization and considers what he or she thinks should be delivered. Actually, trust is a relationship that attaches the customer to the company. Trust is also involved between the employees of an organization. The high level of trust between each other in multinational and multicultural organizations creates productive relationships, which, in the end, generates long-term benefits for the organizations (Alananzeh et al., 2019; Jawabreh et al., 2020). Basically, trust plays an important role in e-business. Because in the e-market, privacy and security are key elements to developing trust. Trust development is more suitable for trade when considering the business to consumer market. Even in store salesperson behavior influences building trustworthy relationships. Sales effectiveness ultimately increases the trust of customers. Salesperson behavior plays a vital role in trust building (Alshurideh et al., 2021; Masa'deh et al., 2018; Sarwar et al., 2012).

The restaurant service practitioner provides high-quality food and drink service to guests. A food service practitioner generally works in the commercial sector, offering a range of services to customers. There is a direct relationship between the nature and quality of the service required, and the payment made by the guest. Therefore, the practitioner has a continuing responsibility to work professionally and interactively with the guest in order to give satisfaction and thus maintain and grow the business. The Marketing Accountability Standards Board (MASB) endorses the definitions, purposes, and constructs of classes of measures that appear in Marketing Metrics as part of its ongoing Common Language in Marketing Project. In a survey of nearly 200 senior marketing managers, 71% responded that they found a customer satisfaction metric very useful in managing and monitoring their businesses. The pricing/marketing strategy is based on the theory that certain prices have a psychological impact. Retail prices are often expressed as "odd prices": a little less than a round number, e.g., $19.99 or £2.98. There's evidence that consumers tend to perceive "odd prices" as being significantly lower than they actually are, tending to round to the next lowest monetary unit (Jawabreh, 2020). Thus, prices such as $1.99 are associated with spending $1 rather than $2. The theory that drives this is that lower pricing such as this institutes greater demand than if consumers were perfectly rational. Psychological pricing is one cause of price points. In this context, customer retention is a burning issue. In this context, trustworthy customers facilitate the organization to achieve its core objective, even if the organization is a profit-making concern or a nonprofit organization. Retaining more customers and delighting them leads the customer to retention with the organization's products or services. Since mid-1990, customer retention has been a very beloved topic for researchers. Those companies who know about the value of customer retention invest in it even from their profit, because customer retention gives long-term benefits to the organization in return. That's why not only big organizations, but small firms care about retaining customers (Sarwar et al., 2012).

The building of brand image is also an important matter for service firms as it is a powerful determinant for product marketing. Brand image as "the brand relations retained in consumers' minds causes assumptions about a brand." According to Nel et al., (2018), the product brand image is negatively affected by brand expansion, but the negative effect is being reduced by the relationship between the original and expansion brands. The great fall in the brand image will occur due to the brand expansion if the supposed image and quality of the original brand is superior. There have been positive effects on the apparent quality of the brand, consumers' brand awareness, fit perceived by the consumer, and consumers' attitudes towards the expansion of the product brand image after the expansion. The behavioral study reveals that there is a positive effect of brand image on customer loyalty and dedication towards market offerings. The supposed quality of the expansion is being affected by the degree of the relationship between the corporate brand and the service extension, which, as a result, affects the corporate image, particularly for those corporate brands which have very high-rated images (Malik et al., 2012).

A marketing concept that encompasses a customer's impression, awareness, and/or consciousness about a company or its offerings. Perception is the process by which we select, organize, and interpret information inputs to create a meaningful picture of the world. Perception is very important because it affects customers' actual behavior. This is a concept that constantly arises when trying to evaluate customers' satisfaction. This is in view of checking how the customer perceives or rates the organization in terms of product, quality, pricing, and service delivery. It is a term frequently used to measure how well products/services supplied by a company meet or surpass customers' expectations. Evaluating customer perception regularly helps in managing and monitoring business progress. When a particular firm has loyal customers, it gains positive word-of-mouth marketing, which is both free and highly effective, but very disastrous if it is negative and disloyal. Customer perception is how your target market sees your product or service, and this can go a long way towards determining the success or failure of any business. For example, if a particular hotel has a reputation for having the best customer service as well as internet facilities, the general customer perception would be that you should go there if you need assured services. This sentiment could influence the hotel's ability to make a profit. When the customer makes his buying decision, he evaluates the benefits to be derived from a particular service/product and compares them with the cost (Akaegbu, 2013).

Companies win or lose based on what percentage of their customers they can keep. Success is largely about the retention of customers, which again depends on the CS level. It would be a great help to be able to comprehensively measure the quality of products and services by relating the measures of quality to real customer behavior. Some companies get feedback about CS through the percentage of complaints and some through non-systematic surveys, but some do not measure CS at all, because the system would not add anything useful and is very time-consuming. Due to the small size of the market, there is intense rivalry among different airlines companies in Jordan. This rivalry has taken the form of severe price competition, with airlines ruthlessly undercutting each other with fare promotions. The service the airlines sell (air transport) is pretty homogenous, and there is not much service differentiation.

Airlines strive to create customer loyalty by offering frequent flyer programs, but this competitive advantage is quickly eroded by almost all airlines offering such programs. At present, it is much easier for travelers to search around for the best price. In a small market like Jordan, intense competition can lead to excess seat capacity due to declining demand because of macro-economic factors, and the high fixed costs and low marginal costs make the airline industry very price competitive. This study will yield a better understanding of the factors that lead to customer satisfaction and the value they are looking for, and ultimately, perceived price fairness for the overall service obtained by them (Al-Jabaly & Khraim, 2014).

3 Research Methodology

This section provides the methodology applied in the current study. It consists of the research model, operational definitions of the study's independent and dependent variables, research hypotheses, besides data collection tool and research population and sample.

3.1 Research Model

The elements of this research are established based on preceding literature, either theoretically or empirically. Indeed, this study used variables that are common in tourism development literature. Figure 1 represents a model for the study that shows the independent variables, the dependent variable, and the proposed relationship between them.

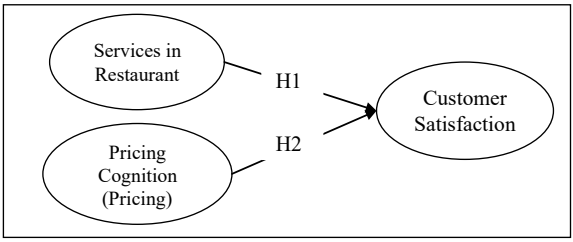

Fig. 1 Research model

3.2 Operational Definitions

Adapted from (Lepkova & Žūkaitė-Jefimovienė, 2012), the current research considers two independent variables (i.e., Services in Restaurant, and Pricing Cognition (Pricing)) which were measured in the research questionnaire through five items for each variable; one dependent variable (i.e., Customer Satisfaction) which is adapted from (Lepkova & Žūkaitė-Jefimovienė, 2012) and measured through five items.

3.3 Research Hypotheses

In order to test the research model, the study is hypothesized as follows:

H1: There is a significant relationship between Services in Restaurant and Customer Satisfaction.

H2: There is a significant relationship between Pricing Cognition (Pricing) and Customer Satisfaction.

3.4 Population and Sampling

The study population consisted of all spectrums of the community interested in tourism in Aqaba city includes all age levels (from 18 to 40 years and above). 1000 questionnaires were distributed and considered 600 of them for statistical analysis, thus the response rate was 60% which is high for the community of the city of Aqaba.

4 Data Analysis and Results

In order to examine the research hypotheses, in which these variables have been measured using 5-points Likert scale that varies between strongly disagree = 1 and strongly agree = 5. Also, reliability and validity analyses were conducted; descriptive analysis was used to describe the characteristic of sample and the respondent to the questionnaires besides the independent and dependent variables. Also, multiple regression analysis was employed to test the research hypotheses.

Table 1 The Cronbach's alpha coefficients of study variables

Variables	Number of items	Cronbach alpha
Services in restaurant	5	0.763
Pricing cognition (Pricing)	5	0.799
Customer satisfaction	5	0.812

4.1 Validity and Reliability

Validity and reliability are two important measures to determine the quality and usefulness of the primary data. Validity is about accuracy and whether the instrument measures what it is intended to measure while reliability is about precision; it is used to check the consistency and stability of the questionnaire. Indeed, the researchers depended on scales and items that were previously developed and used by other researchers with similar interest. Also, a draft of the questionnaire was formulated, and then it was reviewed by four academic lecturers—who have a sufficient knowledge and experience in this scope—to ensure that each item is measuring what is intended to be measured, and to avoid the ambiguity and complexity in the phrasing of questions. The reliability of the instrument was measured by the Cronbach's alpha coefficient. Further, some scholars (e.g., Bagozzi & Yi, 1988) suggested that the values of all indicators or dimensional scales should be above the recommended value of 0.60. Table 1 represents the results of Cranach's alpha for the independent and dependent variables. Cronbach's alpha coefficients of all the tested variables are above 0.60 which suggesting the composite measure is reliable.

4.2 Respondents Demographic Profile

As indicated in Table 2, the demographic profile of the respondents for this study showed that they are typically females, most of them between 20 and 30 years old, and the majorities' experiences between 3 and less than 10 years.

4.3 Descriptive Analysis

In order to describe the responses and thus the attitude of the respondents toward each question they were asked in the survey (Poh et al., 2012), the mean and the standard deviation were estimated. While the mean shows the central tendency of the data, the standard deviation measures the dispersion which offers an index of the spread or variability in the data (Sekaran & Bougie, 2013). In other words, a small standard deviation for a set of values reveals that these values are clustered closely about the mean or located close to it; a large standard deviation indicates the opposite. The level of each item was determined by the following formula: (highest point in

Table 2 Description of the respondents' demographic profiles

Category	Category	Frequency	Percentage (%)
Gender	Males	18	18.0
	Females	82	82.0
	Total	100	100
Age	20 years–less than 25	37	37.0
	25 years–less than 30	42	42.0
	30 years–less than 35	13	13.0
	More than 35 years old	8	8.0
	Total	100	100.0
Experience	1 years–less than 3 years	18	18.0
	3 years–less than 6 years	38	38.0
	6 years–less than 10 years	36	36.0
	Without experience	8	8.0
	Total	100	100

Likert scale − lowest point in Likert scale)/the number of the levels used = (5–1)/5 = 0.80, where 1–1.80 reflected by "very low", 1.81–2.60 reflected by "low", 2.61–3.40 reflected by "moderate", 3.41–4.20 reflected by "high", and 4.21–5 reflected by "very high". Then the items were being ordered based on their means. Tables 3 and 4 show the results.

As presented in Table 3, data analysis results have shown that services in restaurant in Aqaba hotels are applied to a very high level in which the mean score is 4.38. Also, customer satisfaction and pricing cognition (pricing) were existed in high bases with means of 3.86 and 3.74 respectively. Table 4 demonstrates the mean, standard

Table 3 Overall mean and standard deviation of the study's variables

Type of variable	Variables	Mean	Standard deviation	Level	Order
Independent variables	Services in restaurant	4.3860	0.58690	Very high	1
	Pricing cognition (Pricing)	3.7420	0.73816	High	2
Dependent variable	Customer satisfaction	3.8620	0.71220	High	

Table 4 Mean and standard deviation of the study's variables

Services in restaurant	Mean	SD	Level	Order
The food level is good in restaurants	4.59	0.698	Very high	1
Staff apply the rules of public safety in cooking	4.40	0.667	Very high	2
Use the latest cooking tools	4.34	0.819	Very high	3
Work as a team to reach a high level of service	4.33	0.817	Very high	4
Follow-up by officials on performance and productivity	4.27	1.043	Very high	5
Pricing cognition (Pricing)				
Pricing for marginal profit per unit or at the aggregate level	3.64	1.078	High	5
Pricing to achieve large volume sales with market spread	3.73	0.941	High	3
Pricing in order to stabilize the market and establish a stable mental image of the market for the products provided by the institution	3.68	0.952	High	4
Increase customer purchase rate for products on the market	3.78	0.960	High	2
Increase demand from non-users and win new customers	3.88	1.018	High	1
Customer satisfaction				
The food level fits the customer's satisfaction	4.00	0.953	High	1
The staff treat fits the customer's satisfaction	3.86	0.899	High	3
The prices are commensurate with the quality of service	3.82	0.936	High	4
Restaurants reach a high level of customer satisfaction	3.75	0.957	High	5
The meal speed is suitable for the customer	3.88	0.967	High	2

deviations, level, and order scores for services in restaurant and pricing cognition (pricing) toward customer satisfaction.

4.4 Hypotheses Testing Results

The current research is mainly seeking to investigate the impact of services in restaurant, and pricing cognition (pricing) toward customer satisfaction in Aqaba city in Jordan. Consequently, in order to test the hypotheses developed for this study, multiple regression technique was used. Further, the level of significance (α-level) was chosen to be 0.05 and the probability value (p-value) obtained from the statistical hypotheses test is considered to be the decision rule for rejecting the null hypotheses (Creswell, 2009). If the p-value is less than or equal to α-level, the null hypothesis will be rejected and the alternative hypothesis will be supported. However, if the p-value is greater than the α-level, the null hypothesis cannot be rejected and the alternative hypothesis will not be supported. In addition, normality of the independent variables and the absence of multi co-linearity problem (a case of multiple regression in which the independent variables are themselves highly correlated) were checked. According to (Pallant, 2005), most of the values should be inside the adequate ranges

Table 5 Skewness and VIF for the independent variables

Variables	Tolerance	VIF	Skewness
Services in restaurant	0.987	1.013	0.525
Pricing cognition (Pricing)	0.987	1.013	0.721

Table 6 Result for the study model[b]

Variable	r	R^2	F	Sig (f)	β	t	Sig (t)
Services in restaurant	0.536	0.287	19.561	0.000[a]	0.124	1.433	0.155
Pricing cognition (Pricing)					0.508	5.884	0.000

[a] Predictors: (Constant), Services in Restaurant, Pricing Cognition (Pricing)
[b] Dependent variable: Customer Satisfaction

for normality (i.e., −1.0 to +1.0). For this purpose, skewness and Variance Inflation Factor (VIF) were investigated; Table 5 includes the results.

As can be noticed from Table 5, the skewness values were within the normal values (−1.0 to +1.0) suggesting that the data of the independent variables is normal. The VIF values were less than the critical value (10) which is most common among the most studies, suggesting no multi co-linearity problem among the independent variables. However, the results of testing the two hypotheses on the impact of services in restaurant and pricing cognition (pricing) on customer satisfaction are demonstrated in Table 6.

Refer to Table 6 the multiple correlation coefficient $R = 0.536$ indicates that there is a positive correlation between the independent variables (services in the restaurant, and pricing cognition (pricing)) and customer satisfaction. The R2 indicated the generalizability of the model. It allows us to generalize the results taken from the respondents to the whole population. In this case it equals 0.287. The results showed that the F-ratio for these data is equal to 19.561, which is statistically significant at $p < 0.05$. Therefore, we conclude that there is a statistically significant impact of the independent variables on customer satisfaction.

The β indicates the individual contribution of each predictor (independent variable) to the model, if other predictors are held constant. Table 6 shows the standardized coefficients for each independent variable. The value of β for services in restaurant is 0.124 which has a small value. While for pricing cognition (pricing); the value of β is 0.508, which has a good value compared with another predictor. The level of effect of these variables depends on the β value, the higher β value, the higher effect on dependent variable. We can infer from the values of beta that the variable that has the highest contribution in the model is merely pricing cognition (pricing).

5 Discussion and Conclusions

In light of the results of the study answers questions and test hypotheses has been reached following results; the study results showed H1 was rejected whereas H2 was accepted by reference to the Table 6. In this study we aim to identify quality methods in restaurants, Focus on the core aspects of customer satisfaction and to develop cooking methods and staff development and give awareness sessions in all cooking styles and focus on all segments of society, because in general this leads to a high level of quality of pricing, service and development, which leads to increased customer satisfaction.

The findings of the data analysis revealed that services at restaurants in Aqaba hotels are provided at a very high level, with a mean score of 4.38 out of 5. Customer satisfaction and price cognition (pricing) were both found to be at high levels, with mean scores of 3.86 and 3.74, respectively, indicating high levels of both. Table 4 shows the mean, standard deviations, level, and order scores for services in a restaurant and price cognition (pricing) in relation to customer satisfaction in the restaurant industry. The multiple correlation coefficient $R = 0.536$ shows that there is a positive relationship between the independent variables (restaurant services and price cognition (pricing)) and customer satisfaction. The model's generalizability was shown by the R2 value. It enables us to extrapolate the findings obtained from the respondents to the whole population as a whole. In this particular instance, it equals 0.287. The findings revealed that the F-ratio for these data points is equal to 19.561, which is statistically significant at a 0.05 level of significance. As a result, we reach the conclusion that the independent factors have a statistically significant effect on customer satisfaction.

Customer retention is a hot topic globally, and trustworthy customers help organizations accomplish their goals, whether for profit or not. Retaining more consumers and making them happy contributes to customer retention. Since mid-1990, client retention has been a hot study subject. Because customer retention provides long-term advantages to the company, not just large organizations, but even small businesses worry about keeping consumers (Sarwar et al., 2012). Building a brand image is essential for service companies since it influences product marketing. This is because the brand image is "the brand relations maintained in customers' minds." According to (Nel et al., 2018), brand, expansion adversely impacts product brand image, although the impact is mitigated by the relationship between the original and expansion brands. Brand expansion will cause a significant loss in brand image if the original brand's image and quality are better. The product brand image has improved due to increased customer knowledge, perceived fit and consumer attitudes towards the expansion. The behavioral research shows that brand image has a beneficial impact on consumer loyalty and commitment to market offerings. The degree of connection between the corporate brand and service extension affects the perceived quality of the expansion and therefore the corporate image, especially for those corporate brands with high rated images (Abu Zayyad et al., 2021; Aljumah et al., 2021; Alshurideh, 2022; Alshurideh et al., 2015; Alwan & Alshurideh, 2022;

Licensed to (putm@utm.my)

ELSamen & Alshurideh, 2012; Hamadneh et al., 2021; Malik et al., 2012; Sweiss et al., 2021; Tariq et al., 2022).

Each predictor (independent variable specific) contribution to the model is represented by the symbol, assuming that all other predictors are kept constant. The standardized coefficients for each independent variable are shown in Table 6. Table 6 showed a little amount of money is spent on services at a restaurant, as shown by the figure of 0.124. Whereas, for pricing cognition (price), the value of the predictor is 0.508, which is an excellent value when compared to other predictors. The magnitude of the impact of these variables is determined by the value; the greater the value, the greater the effect on the dependent variable. Based on the values of beta, we may conclude that the variable that makes the most contribution to the model is simply pricing cognition (price discrimination) (pricing) (Alzoubi et al., 2020).

The Impact of Changes in Oil Prices on the Global and Saudi Arabia Economy

Mona Halim, Walaa Rezk, Saddam Darawsheh, Anwar Al-Shaar, and Muhammad Alshurideh

Abstract This study aimed to identify the impact of COVID-19 on oil sector which faced the significant challenges, globally and in Saudi Arabia. The study sheds light on the unprecedented crisis that occurred in the decline in demand for oil and the collapse of its prices, and its effects and consequences on world economies and Arab economies, and the extent to which the Saudi economy has been affected by them in light of what markets have witnessed global oil, and opportunities to benefit from this crisis and the study relied on the descriptive and analytical methodology. The study paper will use the NARDL to explain the asymmetric effect of changes in oil price on Government Budget for Saudi Arabia. The study reached that this situation provides a further opportunity for Saudi Arabia to diversify the economy away from a reliance on oil, Government policies seek to facing these challenges by diversifying the economic base and developing and diversifying revenues non-oil products to reduce financial volatility, in addition to enhancing the role of the private

sector focusing on supporting non-oil GDP growth rates to enhance the resilience of the economy.

Keywords Oil prices · Oil and gas sector crude oil futures · Global economy · Saudi Arabia

1 Introduction

The oil markets witnessed in April 2020 a historic event, where the prices of American light crude collapsed below zero, in an unprecedented event, and the world will remember them for a long time, which raises questions about how this happens and its meaning, those affected by it and the potential or expected effects after That and such prices. The Corona pandemic was not the main reason for the decline in oil demand and the collapse of its prices in the manner that occurred, but the last actions by oil producers was the reason for increasing pressure in a market that was previously suffering.

This decrease in oil prices (American crude) came in the context of the global downturn in the COVID -19 pandemic that struck the world's economies in a recession, causing the demand for points to drop by nearly a third, in addition to the disturbances that dominated the relations of OPEC members, After Russia withdrew from the Alliance of Oil Producers, which was aiming to balance the market, in early March 2020.

And where there are producing countries that produce oil, there are other countries that store only, and based on the agreement of the OPEC countries, the producing countries must maintain the equivalent of 90 days of oil reserves, to face any crisis, especially in times of war. However, it did not happen that the OPEC member countries kept this amount of reserves, until the COVID-19 pandemic came and caused the demand for oil to drop, and the rates of over storage increased dramatically—due to the oversupply increase to 35 million barrels per day. Exceeds the actual storage capacity in countries that do so.

In this context, this research paper attempts to shed light on this unprecedented crisis and its effects and consequences on the global economy, the extent to which the Saudi economy was affected by it and the opportunities to benefit from this crisis.

2 Literature Review

The oil and gas industry are experiencing its third price collapse in 12 years. After the first two shocks, the industry rebounded, and business as usual continued. This time is different. The current context combines a supply shock with an unprecedented demand drop and a global humanitarian crisis. Additionally, the sector's financial and structural health is worse than in previous crises. The advent of shale, excessive

supply, and generous financial markets that overlooked the limited capital discipline have all contributed to poor returns. Today, with prices touching 30-year lows, and accelerating societal pressure, executives' sense that change is inevitable. The COVID-19 crisis accelerates what was already shaping up to be one of the industry's most transformative moments.

The pandemic is first and foremost a humanitarian challenge, as well as an unprecedented economic one. The industry has responded with a Herculean effort to successfully and safely operate essential assets in this challenging time. The current crisis will have a profound impact on the industry, both short and long term. How radically the oil and gas ecosystem will reconfigure, and when, will depend on potential supply–demand outcomes and the actions of other stakeholders, such as governments, regulators, and investors. In any scenario, however, we argue that the unprecedented crisis will be a catalytic moment and accelerate permanent shifts in the industry's ecosystem, with new future opportunities.

Taking bold action during the crisis to secure resilience and accelerated repositioning Hard questions, indeed. In the meantime, winners will accept the crisis for what it is: a chance to form their own views of the future and to lead to capture new opportunities. Leaders will adopt tailored strategies that fit within their specific environment and markets in which they choose to compete, and the capabilities they bring (such as low-cost production, regional-gas or downstream-oil market leadership, value-chain integration, and specialized strengths in for example retail, trading, and distribution). In our view, all companies should act boldly on five themes, consistent with their chosen strategy: Reshape the portfolio, and radically reallocate capital to the highest-return opportunities, Take bold M&A moves, Unlock a step-change in performance and cost competitiveness through re-imagining the operating model, Ensure supply-chain resilience through redefining strategic partnership approaches, Create the Organization of the Future, in both talent and structure (Al-Jarrah et al., 2012; Assad & Alshurideh, 2020; Barbosa et al., 2020).

Aloui et al. (2020) indicated that on 12 March 2020, the sharp fell of U.S. crude oil price to 30 dollars was explained by the outspreads of coronavirus pandemic and the OPEC's inability to reach a production quota agreement. We employ the structural VAR model with time-varying coefficients and stochastic volatility (TVP-SVAR model) developed by (Primiceri, 2005) to assess the impact of COVID-19 shocks on the energy futures markets, particularly on crude oil and natural gas S&P GS Indexes. The findings confirm that energy commodities S&P GS Indexes respond to COVID-19 shock that varying over time due to fundamentals factors as well as behavioral and psychological factors.

Using a TVP-SVAR with a stochastic volatility model, they investigate the impact of COVID-19 on the commodity futures market. First, we show the importance of investors' expectations in future commodity price dynamics. Speculators in the futures markets anticipate price movements which caused high stochastic volatility during the period that precedes the huge increase in the number of deaths. Then, we show that commodity responses to COVID-19 shock varied from one period to another. The determinants likely to explain the dynamics of the SP GSCI Crude oil index and SP GSCI natural gas index face the COVID-19 include fundamental

factors as well as financial factors. In fact, the fall in oil futures prices is partly due to a structural imbalance between supply and demand, particularly a strong decreasing of energy demand following the COVID 19 in large emerging countries such as China and an oil shock caused by disagreements between the Organization of the Petroleum Exporting Countries (OPEC) and Russia, triggering the drop in oil spot prices. In addition, the spread of the virus in the USA negatively impacted the commodity futures market. On the other side, based on behavioral finance theorist, the commodity indices fluctuations are linked to the investors' expectations. In fact, during the crisis, speculators operating on a purely financial logic, turned to the commodity markets to increase their returns which lead to a slight increase in commodity futures index during stock market crash. The short-term outlook for the commodity futures market will depend on the efficiency of government policy to contain the COVID-19 outbreak, and to weaken the impact of the global health crisis has on economic activity.

Recently many studies investigated COVID-19's impact on global economic activity (Ahmad et al., 2021; Al-Dmour et al., 2021; Alameeri et al., 2021; Aljumah et al., 2021; Alshurideh et al., 2021; Harahsheh et al., 2021; Shah et al., 2021). Yilmazkuday (2022) by using daily data on the global coronavirus disease 2019 (COVID-19) deaths, shows that the effect of COVID-19 deaths is insignificant, and explained the plunge of oil price in March 2020 by the OPEC disagreement. In the same line of work, Musa et al. (2020) investigates the impact of coronavirus outbreak on the global energy demand by using daily data on China's population, currency Chinese exchange rate, and international crude oil prices, from 23rd January to 8th February 2020. The result revealed that the total population has a positive and significant impact on total coronavirus infected cases while the crude oil price is negative and significantly related to the coronavirus infected cases.

3 Oil Production (American Crude) and OPEC Countries and Oil Prices in the Period 2011–2020

Oil prices ranged 2012–2020 between $110 in 2011 and below the dollar per barrel in 2020, decreased in 2015 and ranged to $80 and below $30 per barrel until 2020. It is worth noting that there are two types of American crude Both are used as a benchmark for setting world oil prices:

- **The first type**: West Texas Intermediate (WTI) oil. It is extracted from oil fields in the United States, especially from Texas, Louisiana and North Dakota, and then transported via a pipeline to Cushing, Oklahoma, for delivery. WTI is used as the benchmark for determining the price of oil in North America.
- **The second type**: Brent Crude, extracted from oil fields in the North Sea, which is a mixture of four crude oils, but collectively referred to as "Brent Crude Oil (Wingfield et al., 2020).

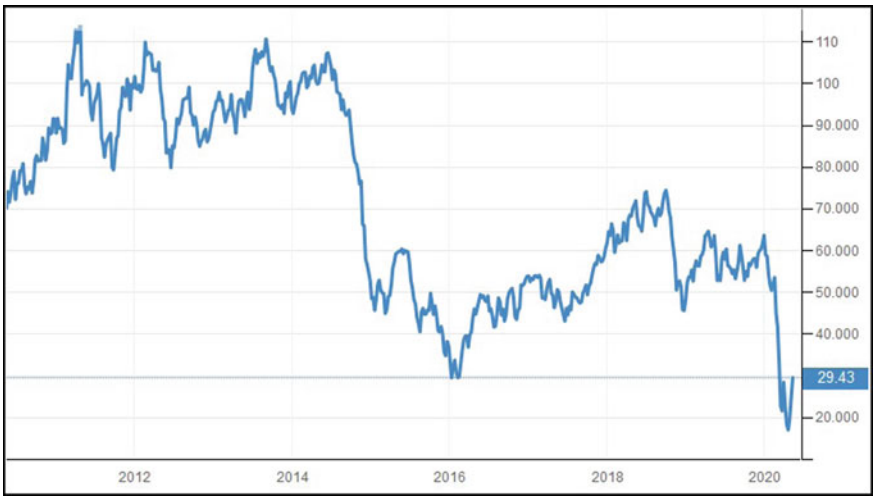

Fig. 1 Oil prices (Brent crude) in the period 2011–2020 (dollars per barrel). *Source* tradingeconomies.com (2020)

- Brent crude is the most traded globally and is used as a standard for global pricing and measurement. Brent crude and West Texas are classified as relatively light oils (Energy, 2020) (Fig. 1).

These prices mentioned in the previous figure refer to the prices of American crude (Brent), as it is considered the main reference for oil prices and purchases in the world Major Benchmark Price for purchases of oil worldwide. Brent prices have fallen to nearly $20, compared to previous years, when they reached the ceiling of $100 a barrel. As for the oil whose price has reached below zero (37-), it is WTI, as shown in the following figure (Amadeo, 2021) (Fig. 2).

West Texas Intermediate was trading at a higher price than Brent crude, and due to the revolution in shale oil production in the United States in early 2000, along with more imports to the United States from Canada, the price of WTI decreased, and it is now usually trading at a price Low on Brent. But in general, there are no major differences between the prices of Brent crude and West Texas crude, as shown in the following figure in the last five months. It also indicates the decrease of WTI prices to below zero last April and then returning to rise again, but below the levels recorded in the months Previous (Sharma, 2020) (Fig. 3).

The total oil production in the world is between 100 and 105 million barrels per day, of which 41–43 million barrels are produced by OPEC countries daily. OPEC controls approximately 75% of the total crude oil reserves in the world and produces 42% of the total crude oil production in the world.

Before the Corona pandemic, the supply of oil was greater than the demand for it (global demand = 90 million barrels per day), equivalent to 12–15 million barrels per day. Since the United States is the largest producer and consumer, as well as an importer of oil in the world, producing close to 12 million barrels per day, until

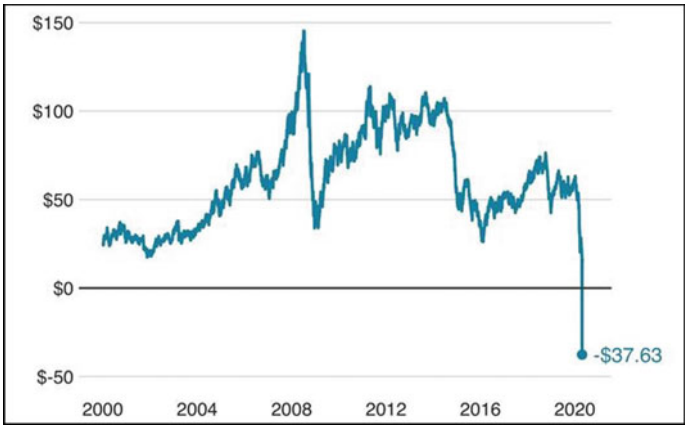

Fig. 2 US WTI crude price collapse below zero in April 2020. *Source* Bloomberg, 27 April 2020

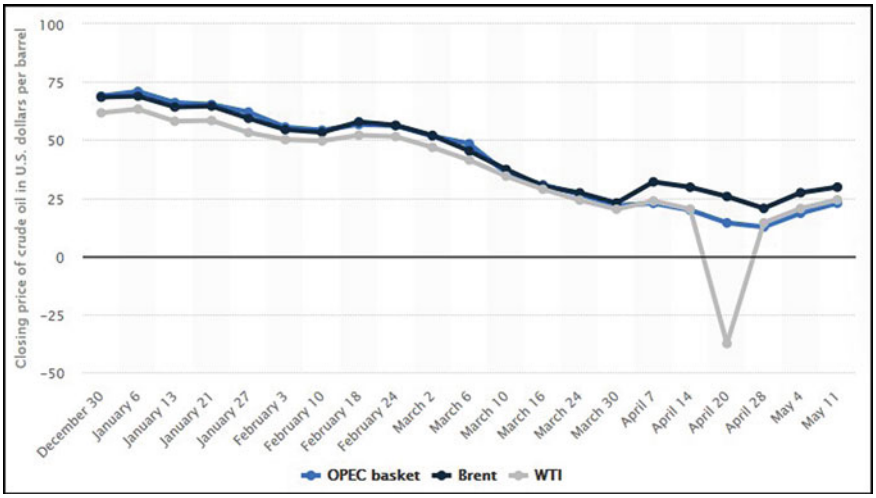

Fig. 3 Oil prices for: Brent, OPEC basket, and WTI from December 2019 to May 2020. *Source* www.statista.com

2012, it used to import about 5 million barrels per day from all over the world. but as of that year, the United States began to rely on "shale gas and shale oil", and paid attention to everything related to extractive industry to not fall under the pressure of the oil producing countries. Since that time, American oil production increased to reach 13 million barrels per day in early 2020, after it was only 8 million barrels in 2014, as shown in the following figure (Sönnichsen, 2020) (Fig. 4).

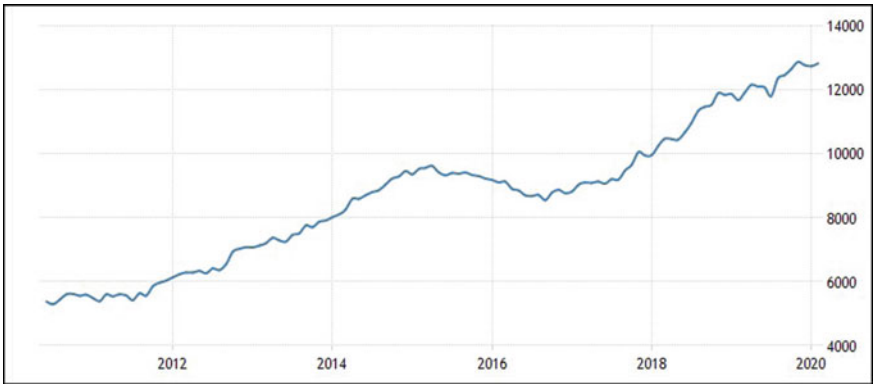

Fig. 4 The development of American crude production in the period 2011–2020 (thousand barrels). *Source* tradingeconomies.com 2020, U.S. Energy Information administration

4 Reasons for the Recent Sudden Collapse of Oil Prices in Late April 2020?

When the world invaded the newly emerging epidemic of 19-COVID, countries did not think that a comprehensive ban would be imposed in all sectors and at all levels in the manner we are witnessing today, but the United States did not expect the pandemic to extend to it in this way and cause economic life to stop in all Countries of the world, and as a result, the demand for oil decreased significantly.

If we look at Kuwait and the Kingdom of Saudi Arabia as two countries that depend on oil and its exports at 90% of their national product for each of them, and assuming that Saudi Arabia exports 3 million barrels per day, their value before 2016 was approximately $400 million, and today their value is only $120 million, meaning that A loss of $300 million per day and $9 billion per month that would harm the Saudi economy, likewise in Arab economies dependent on oil.

The value of futures contracts for US crude fell unprecedentedly, as the price of a barrel fell to minus $37, the lowest level since the beginning of the sale of futures contracts in 1983, which are obligated to sell a specific product at a specific date at specific prices, which has increased the economic pressures that it suffers from during Corona pandemic.

In a deeper view of the American crude market, the buying and selling in the oil market is not done on quantities on time. Rather, there is a circulation of buying and selling contracts between speculators who do not obtain oil in kind, but rather seek to achieve profits only through trading in contracts.

Because of the state of closure and stagnation that prevailed in the world due to the Corona pandemic, a crisis of surplus oil production was generated, while Saudi Arabia and Russia continued to pump large quantities to the market, and with the decrease in demand to stop the movement of air, land and sea navigation, contract

Licensed to (putm@utm.my)

holders were no longer able to Sell them, not even able to take the oil drums they had previously bought, because storage places have reached their maximum limits.

Regarding the contracts that are traded on the oil market, there are 3 types of contracts:

- Long-term contracts
- Medium-term contracts
- Spot contracts.

The long-term contracts are known to be the least expensive, then medium-term, where prices increase slightly, and the last spot contracts are the most expensive, as they represent the urgent need. Also, there are three oil exchanges in the world in which these contracts are traded:

- West Texas Stock Exchange
- Brent Stock Exchange
- Gulf Stock Exchange.

In the first type (West Texas) contracts were concluded in May 2020 until 20 April 2020. On the Brent Stock Exchange, June contracts were concluded at $25 a barrel, and May contracts closed at $23, with an outlook for July of $30 a barrel. the Gulf Stock Exchange, May, June and July contracts were concluded without any storage problems.

The problem of storage appeared in the United States only, and it became difficult to receive any additional quantities from oil producers, and the cost of storage until June became equivalent to $40 a barrel per month, while the cost of producing a barrel is only $25, Thus, the cost of storage in two months is $80 per barrel.

To get out of this deadlock, which is called the loss-lose situation, which is the worst situation the world has reached, the offer to sell for $0 would be better, in order to avoid the cost of storage for two months ($80 per barrel), which happened on Monday, 20 April 2020, but It was required that the sale be negative, meaning that each barrel added 37 dollars, which is better than the product costing 80 dollars storage per barrel/two months. Thus, this solution was to discard WTI stock.

Not all the Brent and Gulf stock exchanges were exposed to this problem, as Gulf oil is directly to the refining markets in India, Korea and Japan, and these markets was far from the oil market turmoil in North America.

Oil prices often change, and prices are affected by a wide range of factors, the most important of which are:

- Increase or decrease in supply by oil producers.
- Increase or decrease in demand by oil users and importers.
- Subsidies to oil companies or other energy companies.
- International policy (agreements concluded between countries).
- The internal policy of oil producers.
- Oil supply worldwide.
- Competition from other energy sources.
- Geopolitical disturbances, pressures, and insecurity (leads to an increase in prices).

the global oil price curve will rise in light of:

- The tendency to reduce production due to lower demand, and hence a decrease in the amount of surplus or stock.
- The return of economic and air to work in most countries of the world, as the weakness of the global economy has an adverse effect that would reduce the demand for oil.

The price of a barrel of oil will rise to $40–$60, which is the fair price of oil after adding variable costs to the production cost, which is estimated at $23 a barrel, while variable costs range between $15 and $25 a barrel and selling at any price below that constitutes Loss of the product. Also, the lower price than the fair price pushes small producers (whose production ranges between 7 and 10 million barrels per day) out of the market (Aloui et al., 2020).

5 The Impact of the 19-COVID Pandemic on the world's Economies

Before examining the economic effects of changes in the oil market and its prices on the global economies and the Saudi economy in particular, it is necessary to identify the most important effects of the Corona pandemic through exposure to the most important economic indicators summarized in the following table to know the impact of the pandemic on economic performance in those countries (Soïnichsen, 2021) (Table 1).

When looking at the indicators it is necessary to look at them somewhat conservatively, especially indicators of Saudi, because these indicators were calculated by the end of the fiscal year in June 2019, and not in December 2019 as in other countries. That is, the impact of the COVID-19 pandemic has not yet appeared in economic indicators, Noting that there is an estimate of some indicators for some countries that were calculated in the first quarter of 2020, which makes them appear somewhat deteriorated, as shown in the unemployment rate in the United States (14.7%), the growth rate in China (−6.8%), The growth rate in the euro area (−3.2%), in addition to the increase in the ratio of public debt to gross domestic product in countries that achieved negative growth at the end of the first quarter of this year (*Trading Economies*, n.d.).

If we look at, for example, the rate of unemployment in Saudi Arabia and its development in the period July 2017–January 2020, we find that it has made remarkable progress at the last estimate of 5.7%, as shown in the following figure (Fig. 5):

Table 1 Some economic indicators in some economies in 2018/2019

The indicator Country	The growth rate economic (%)	The interest rate (%)	The rate of inflation (%)	The unemployment rate (%)	Budget deficit (%)	Public debt/GDP (%)
United State	0.3	0.25	0.3	14.7	−4.60	106.90

6 The Expected Effects of Changes in the Oil Market and Its Prices on Arab and Saudi Economies During Corona Pandemic

It is noted in recent years that the world is on the way to reducing dependence on oil as an energy source, and therefore has a direct negative impact on oil prices. But at the same time, oil remains an irreplaceable source of energy in many areas with other sources of energy. The natural resources that exist in the world, such as minerals, timber, and textiles, will not be enough for the inhabitants of the earth at one time, so the alternative is "the petrochemical industry".

Therefore, we find the policy of Arab countries, including the Gulf states, especially Saudi Arabia, to establish a number of advanced refineries to encourage the manufacturing industry by relying on oil, and then export those products and move as far as possible from the export of oil as crude.

we can say that the Arab common market and the creation of an integrative market among the countries of the region is a real opportunity, and Arab economies should work in this direction, because it will achieve a great added value that is not comparable to that generated from the export of crude oil.

Demand for oil declined due to the emerging Corona Virus "Covid–19", which pushed the price of oil down, and consequently, the Kingdom's oil revenues decreased to increase the fiscal deficit with it.

Demand for oil has fallen historically due to the emerging Corona Virus "Covid-19", which caused the oil price crash to an unprecedented degree. Government oil revenues decreased in the first quarter of 2020 by 24.0% from the same quarter of the previous year, to record 129.0 billion Saudi riyals. This was accompanied by increased expenditures, bringing the budget deficit in the first quarter of 2020 to 34.1 billion Saudi. With the weak expectations of oil demand continuing until the end of 2020, due to the decline in economic activities, high financial spending and decreased financial revenues, we expect the Kingdom to record this year the largest historical deficit in its budget. Early estimates are that the Kingdom's budget deficit will range between 420 and 370 billion Saudi riyals. The longer the epidemic spreads, the greater the impact on the economy.

7 Model and Methodology

The study tries to investigate the short-run and long-run asymmetric effect of oil price changes on the aspects of the government budget in Saudi Arabia. The study uses the nonlinear ARDL approach.

The asymmetric integration interrelationship can be written in the following form:

$$y_t = \gamma^+ z_t^+ + \gamma^- z_t^- + \varepsilon_t \tag{1}$$

where y_t is the dependent series, z_t^+ and z_t^- are the partial summation of negative and positive developments in z_t, and ε_t is the error component. In addition, γ^+ and γ^- measure the long run asymmetric impact for positive and negative changes respectively.

$$z_t^- = \sum_{i=1}^{t} \Delta z_i^- = \sum_{i=1}^{t} \max(\Delta z_i, 0) \tag{2}$$

$$z_t^+ = \sum_{i=1}^{t} \Delta z_i^+ = \sum_{i=1}^{t} \max(\Delta z_i, 0)) \tag{3}$$

Therefore, the asymmetric effect of oil price changes on the different aspects of government budget can be expressed as follows:

$$y_t = \rho y_{t-1} + \sum_{k=0}^{p-1} \vartheta_k^+ OP_t^+ + \sum_{k=0}^{p-1} \vartheta_k^- OP_t^- + \sum_{k=1}^{p-1} \varphi_{yk} \Delta y_{t-k} + \sum_{k=1}^{q} \varphi_k^+ \Delta OP_t^+ + \sum_{k=1}^{q} \varphi_k^- \Delta OP_t^- + \varepsilon_t \tag{4}$$

where, 'y_t represents the different aspects of public budget, ε_t reflects the error component, $\gamma^+ = -\vartheta^+/\rho$ and $\gamma^+ = -\vartheta^+/\rho$ reflect the asymmetric long run coefficients.

In order to check for the existence of the cointegration relation in (4), we will follow (Shin et al., 2014) and (Sims et al., 1982) by utilizing the Pesaran (2001)'s cointegration bound (F_{pss}) test (Pesaran et al., 2001). Which depends on F test. F_{pss} based on the null hypothesis that there is no cointegration in the underlying relationship; it means the joint summation for the long run coefficients are equal to zero or $\rho = \vartheta^+ = \vartheta^- = 0$. Therefore, refusing the null hypothesis means that the existence of the long run cointegration in the underlying relationship. Moreover, usual Wald test can by utilized to test for the asymmetry in short and long run relationship.

Data

The paper explores the hypothesis that changes in the crude oil price would have a considerable impact on government budget, total government expenditure, current government expenditure, capital government expenditure, total government revenue, and the ratio of surplus or deficit to the GDP in Saudi Arabia. The data covers annual data for the years 1990 to 2020 for West Texas Intermediate crude oil price, total government expenditure, current government expenditure, capital government expenditure, total government revenue, and the ratio of surplus or deficit to the GDP. The dataset is captured from IFS and the General Authority for Statistics in Saudi Arabia (Ministry of Finance, 2020b).

Table 2 shows the descriptive statistics for the raw data of the utilized variables where Table 3 depicts unit root tests for the variables. The ARDL model has one condition is that employed series are integrated of order I(0) or I(1) and it is not allowed to be integrated of order I(2). We depend on Augmented Dickey Fuller test to check for the unit root. As it is shown in Table 3, all variables are stationary in the level of the first difference and there is no any series is stationary in the second difference; which means it is appropriate to apply ARDL model.

Table 4 depicts the results of the linear ARDL for the effect of oil price changes on a public budget. The first and the second column show that over the long run changes in total government revenue is significantly affected by its first lag, the level and the lag of oil price. Over the short run, a change in total government revenue is significantly affected by changes in its lag and changes in the level oil price changes. In addition, the cointegration term is negative and significant which means the relationship is stable.

Table 4 shows estimates for current government expenditure, capital government expenditure, and total government expenditure. Over the long run, current government expenditure is considerably affected by its lag and the level of oil price where over the long run it is significantly determined by changes in its lag and changes in

oil price. Further, Table 4 shows that capital government expenditure is significantly affected by its lag and the leg of oil price over the long run. However, over the short run, capital government expenditure is significantly determined by changes in its lag and changes in the level of oil price. Furthermore, Table 4 reveals that total government expenditure is significantly affected by its lag, level of oil price and the first lag of oil price. On another hand, over the short run, total government expenditure is significantly affected by changes in its lag and changes in the level of oil price.

Table 4 presents the results for the deficit or the surplus of government budget as a ratio of GDP. It can be observed that over the long run RGDP is significantly determined by its lag, the level of oil price and the lag of oil price. However, over the short run, RGDP is significantly determined by changes in oil price.

Table 5 depicts the estimates for the asymmetric effect of oil price changes on the government budget. The first two columns show factors that effect on total government revenues, we can observe that over the long run total revenues is significantly affected by its lag, positive and also negative shocks of oil price. However, the effect of positive socks is stronger than negative shocks. Over the short run, the total revenue is considerably only affected by changes in negative oil price shocks. Moreover, the cointegration term is negative and significant which reflects the stability of cointegration relationship.

Table 5 shows the current government expenditure is significantly affected by its lag and the negative oil price shocks. Further, current government expenditure is significantly affected by positive and negative oil price shocks. However, the effect of positive shocks is more obvious than negative shocks. On the other hand, capital government expenditure is significantly affected by its lag and positive oil price shocks over the long run. In addition, capital government expenditure is mainly determined by changes in its lag, changes in the level of positive oil price shocks and the changes in negative oil price shocks. Furthermore, the total government expenditure is mainly determined by its lag, the level of positive oil price shocks and the lag of positive oil price shocks. Contrary, the total government expenditure is significantly affected by changes in its lag, changes in the level and in the lag of positive oil price shocks.

Table 5 presents the results of the asymmetric effect of oil price changes on the ratio of surplus or deficit in the public budget to the GDP. It can be observed that this ratio is considerably affected by its lag, the level of negative and positive shocks of oil price and the lag of positive shocks. However, the ratio of the surplus or deficit to GDP is significantly affected by changes in positive shocks and changes in the lag of changes in negative shocks.

In sum, our results support the asymmetric effect of oil price shocks on different aspects of public budget in Saudi Arabia. This is confirmed by the results of Wald test which refer to rejecting the null hypothesis over the short run and long run for the majority of the underlying models.

8 How Did Saudi Arabia Face This Price Crisis in the Oil Market?

The Kingdom and the oil-exporting countries are experiencing many challenges, as restricting oil production and developments on the supply side are other negative effects added to the slowdown in the growth of the global economy, which affects price stability and thus affect the ability of financial planning for countries. Oil markets witnessed great fluctuations during the year 2019, as Brent crude prices achieved their lowest levels in January at 2.53 dollars a barrel, and its highest levels in April, to reach $9.74 a barrel.

The Kingdom, through its oil policy, seeks to stabilize the global market. Crude Oil, which balances the interests of producers and consumers together and provides the right environment for sustainable growth in the global economy through its active leadership role in commitment in quotas agreed in accordance with the OPEC agreement. Government policies also seek to facing these challenges through diversification of the economic base and developing and diversifying revenues from mon-oil resources to reduce the volatility of financial flows, in addition to strengthening the role of the private sector Emphasis is placed on supporting non-oil GDP growth rates to enhance the economy's resilience (Ministry of Finance, 2020a).

The following are important points that can be taken into account when such crises occur and minimize their negative effects on the Saudi market.

- Encouraging the manufacturing industry and stopping the export of oil or gas in its raw form.
- Relying on alternative sources of electric power generation, which is a global trend sought by different countries of the world, and has many positive consequences and effects, the most important of which is reducing pollution rates. Evidence for this is that the low dependence on petroleum products and the consequent stoppages of flights and land and the stopping of many factories worldwide have had the greatest impact in reducing pollution rates in the world by rates that reached 25%.
- Working to form a fully supply chain in the Arab region, and to use the crude oil produced in one country to produce finished goods in another country and then export them abroad(Barbosa et al., 2020).
- Forming a moderate axis by the oil-producing Arab countries, and not aligned with the Chinese or American poles, considering the global power imbalance. Power is not only a military force, but there is an economic force that will not be achieved in the Arab region except by integration between the countries of the region to form one economic force that produces what is needed and exports what others need (Fig. 6).

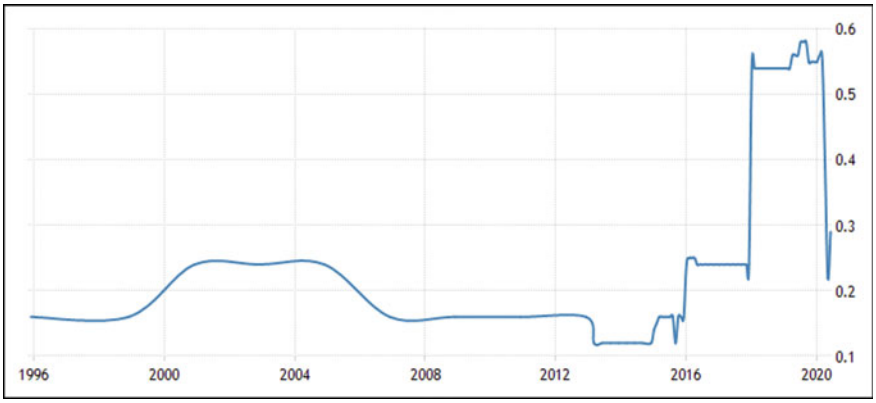

Fig. 6 Saudi Arabia Gasoline Prices. *Source* https://tradingeconomics.com/Saudi Arabia/gasoline-prices

9 Saudi Arabia Reforms of Energy Products Prices (Increasing the Efficiency of Government Support)

- The Kingdom has been providing energy products to local consumers at a subsidized price and much less. Of their prices when exporting. The difference between the price of a product domestically and its price when exporting represents the cost of an alternative opportunity per barrel of oil or the benefits that the domestic consumer acquires from the subsidized price.
- The value of government support for energy and water products in 2015 was approximately (300) billion Saudi riyals, based on the export price of energy products at that time. The value of subsidies can increase significantly over time due to the rapid growth of domestic consumption of energy and water products and changes in the export prices of energy products. Subsidized prices also contribute to stimulating rapid growth in the consumption of state resources.
- The Kingdom relies on oil and non-renewable natural resources as a main source of income, and therefore it is not possible in the long run to continue consuming these resources locally in this unfair form and at subsidized prices.

The Kingdom aims to adjust the prices of energy products as the cost of the alternative opportunity wastes on the Kingdom the opportunity to collect the optimum price for its natural resources, and therefore to use those lost revenue in investment in other sectors to achieve economic diversification and provide various benefits for the residential and non-residential sectors.

10 Conclusion

In this study we presented and shed light on unprecedented crisis for the oil industry which generated from the COVID-19 pandemic demand disruption, and a supply surplus. The oil sector is witnessed its third price collapse in 12 years. After the first two shocks, but this time is different. This one combines a supply shock with an unprecedented demand drop and a global humanitarian crisis. The depth and duration of this crisis are uncertain, this crisis will have a deep impact on the industry, both short and long term. We think, it will be difficult to return to the attractive industry performance without fundamental change. In the Short-term scenarios for supply, demand, and prices we expected oil prices could recover in 2021 or 2022 to pre-crisis levels of $50/bbl to $60/bbl. We think it will be two years before demand recovers, with the outlook for jet fuel particularly bleak. The immediate effects are already staggering companies must figure out how to deal with full storage, prices falling below cash costs for some operators. We think in the long run the macro-environment will become more challenging and we predict growth in demand for oil, to peak in the 2030s, and then begin a slow decline.

The challenge of the energy transition will continue. Saudi Arabia must begin a new age and change in its strategy, where the industry will be entering an era defined by intense competition, technology-led rapid supply response, flat to declining demand. The unprecedented crisis will be a catalytic moment and accelerate permanent shifts in the industry's ecosystem, with new future opportunities.

IoT Applications in Business and Marketing During the Coronavirus Pandemic

Muhammad Turki Alshurideh, Barween Al Kurdi, Salaheddin Saleh, Karim Massoud, and Abdullah Osama

Abstract The internet of things (IoT) is a widely used technology in day-to-day life and in many business fields. the applications of IoT are used in many businesses and in marketing as main part of business activities, but during the coronavirus pandemic, IoT was intensively used, as a practical solution to many challenges. In this paper, the use of IoT is discussed generally in business such as in supply chain and logistics, human resources management, and in organizational performance. The paper will also tackle the use of IoT in both marketing and business activities and finally discussing some of the limitations and challenges businesses face when implementing IoT.

1 Introduction

The coronavirus pandemic has necessitated changes in organizational management. Thus, the pandemic has revealed the aspects pertaining to the management of companies and its efficiency. Furthermore, its effect has echoed the need for greater engagement between businesses and their consumers. As a result of the pandemic, community changes have become the key factor necessitating provision of new organizational management models. One of the key areas that organizational management

M. Alshurideh et al. (eds.), *The Effect of Information Technology on Business and Marketing Intelligence Systems*, Studies in Computational Intelligence 1056,
https://doi.org/10.1007/978-3-031-12382-5_140

has had a chance to integrate is using the internet of things (IoT) (Friedow et al., 2018a).

The Internet of Things (IoT) devices and applications are utilized in several fields (Nasajpour et al., Dec. 2020) as it offers a great chance for businesses to have an influential model for tackling and managing several aspects of business such as monitoring customers' needs, measuring business performance, marketing, and business processes; thus, making IoT the key tool in, defining management roles and potential improvement reaching down to the level of monitoring physical engagement of employees. Notably, the coronavirus pandemic has provided an insight into using IoT applications in the management of organizations.

2 What is IoT or IoE (Internet of Thing or Internet of Everything)

The Internet of Things (IoT), also known as the Internet of Everything or the Industrial Internet, is basically the interconnection of machines and devices through a network or internet that enables their communication (Lee & Lee, 2015). The communication happens through sensors by sending and receiving information without the direct involvement of a human being (Ranger, 2020). This communication uses Radio Frequency Identification (RFID), in which information systems will be invisibly embedded in the environment around us (Gubbi et al., 2013). The history of this machine-to-machine communication started in 1843 when a sensor was put on the clouds transmitting data every half-hour to predict the weather patterns (J.-F. (JF) Fava-Verde and S. Forster 2017). Another example used nowadays is a smartwatch. As it monitors the movement of the person wearing it, it automatically collects information such as steps walked, calories burnt, and even sleeping patterns, without the direct input by the person.

3 The Applications of IoT in Business

IoT has a significant impact on several aspects of life and behavior of individuals and on businesses. From the business perspective, using IoT has greatly impacted automation, business processes and logistic (Atzori et al., Oct. 2010). IoT devices and applications include robots, drones, smartphone applications, and wearables. They were significantly utilized during the coronavirus pandemic (Nasajpour et al., Dec. 2020) as they were used for data collection and generation. The application of IoT in the form of sensors in different locations of a smart building for example, are used for collecting and managing data from different parts of the smart building. The data produced from each sensor would be collected and saved through a cloud server. Then, it will be managed through a remote device such as a mobile, functioning

through a mesh of network by IoT technology. The purpose of collecting these data in smart building, is to promote energy-friendly smart buildings which would also be called Green Smart Buildings (Plageras et al., May 2018). In addition, data collection was extensively used during the coronavirus pandemic. Drones were to collect data for crowd monitoring and smartphone applications were used to capture data of people of close contact such as the duration of contact (Nasajpour et al., Dec. 2020).

Notably, during the use of IoT technology, it was seen to reduce maintenance costs. For instance, a study was done in a hospital in the UAE that presented a Predictive Maintenance (PdM) approach in which it works to monitor the equipment, predict, and classify healthy vs faulty parts thus enhance their performance. Moreover, they have proved how IoT technology is important in the economic sector as their approach caused up to 25% repair cost savings and functioned as an investment payback period of a year. In addition, deploying IoT along with other technologies was found to have a chance in providing the e-health system at high availability, accessibility, performance, with low maintenance cost (Shamayleh et al., 2020).

3.1 IoT in Supply Chain

Businesses use IoT to help managing supply chain and saving on inventory management activities. The application of IoT in companies helps create relevance in dealing with the supply and demands. Hence, the use of IoT in companies pertains to the designed operations and functionality elements (Kumar et al., 2020). In this case, IoT helps companies to maintain costs through tracking the use of smart devices. The application of smart solutions for printers, is another example of operating cost reduction (Nasajpour et al., Dec. 2020). In addition, in its application in the supply chain, IoT supports smart inventory management by collecting data and helps companies use right steps in assigning suppliers, retailers, and even managing employee activities. Inventory management of companies using IoT is less tedious to use, as it assigns roles for every party and increases the chances of attaining higher efficiency level. Similarly, the inventory management role of the IoT simplifies conducting logistic modeling for the companies (Nasajpour et al., Dec. 2020). Moreover, the use of IoT marks a chance to align and integrate the community's functional segments to specific organizational objectives. Hence, IoT enables companies have better management of their supply chain framework, logistics, and job assignment platforms. Therefore, integration of these functional areas marks the chance to use the IoT in managing organizational functions and increasing effectiveness of company operations (Nasajpour et al., Dec. 2020). It also offers, for example, a chance for companies to use smart tagging solutions to create a relevant model of tracking location of their products. IoT, in this sense, brings in an easier alternative for business to respond to the needs of the consumers when delivering goods. Nonetheless, it also increases the company's chances for saving on costs and marking the channel to grow. These advantages increase the demand for IOT in companies, particularly, in the times of pandemic. Hence, IoT contributes to ensuring efficiency of management

and identification of proper avenues to target the organizational growth (Kumar et al., 2020).

3.2 Organizational Performance

IoT application will increase the chances and capacity to attain better performance for companies. The use of IoT in companies provides market analysis and information from consumers. Thus, IoT real-time data will help companies gain an increased role over the consumer demands. Therefore, the IoT will help business institutions to pinpoint the best activities and implement relevant changes to cater for their customers' needs. Similarly, IoT application will appease the required level of addressing the needs of the consumers and target all parties' demands. Likewise, the use of IoT in conducting logistic management and customer service will increase efficiency of company operations (Friedow et al., 2018b). Thus, IoT will ensure an increased capacity and ability of the company to target the consumers' demands as well as to structure the company operations to attend them. Managing the logistics will bring out a high level of engagement with the consumers. Moreover, the use of the customer service model will ensure the company has an adequate level of connection with the consumers as well as can focus on appreciating demands of the stakeholders within the community (Nasajpour et al., 2020).

Another application of IoT is truck telematics, where it was utilized to better understand, and improve driving behaviors. Remote control centers monitor live sensor data from the company's fleet of vehicles, capturing speed, location, braking, and engine data. The gathered data is used to enhance future training programs. A combination of truck telematics and geo-information are being used to enable proactive alerts to be sent to drivers regarding possible upcoming hazards. Camera-based technologies have been adopted to improve driver safety, and fatigue management, capturing evidence of important driving events, improve truck routing, recommend optimal fuel purchasing times/locations, and forecasting predictive and proactive maintenance schedules. Improvements in utilization and routing have the potential to reduce traffic congestion, which is responsible for losses in productivity, increases in fuel consumption, air pollution and noise, and can incite stress, aggression, anger, and unsafe behaviors in drivers. Predictive analytics, which generate refueling and maintenance schedules, have the potential to be adopted by all vehicle manufacturers, and could generate reductions in customer fuel costs, whilst improving the performance, efficiency, and life expectancy of future motor all vehicles (Hopkins & Hawking, 2018) (Jianli, 2012). Furthermore, automated tracking integrates the communication of IoT devices with blockchain, which play a role in monitoring products and automating the tracking and clearance processes (Augusto et al., 2019).

3.3 IoT and Customer Service Management

Similarly, IoT can be applied in companies when executing customer service. The use of customer service bots in companies reduces the need for hiring physical experts to handle the customers. Nonetheless, this application also relates to the chance and capacity to integrate 24–7-h service for customers. In its turn, the use of the IoT bots to instruct a better customer service model encourages identifying and highlighting the steps to handle through the IoT advancement within the company. In effect, the IoT customer service bots ensure efficiency of the customers' engagement and proper organizational connection with the market. Hence, the use of IoT in the customer service segment boosts company image (Friedow et al., 2018b).

3.4 IoT and Human Resources Management

IoT helps companies save on the employment costs by eliminating the need to hire more employees or performing the roles that were carried by individual employees. For example, bigger companies employ baristas in their canteens and cleaners. The application of IoT technology provides smart solutions to these roles. Thus, cleaning activities can be replaced with smart vacuums that would activate as pre-programmed. Consequently, IoT will reduce the costs of paying the employees to perform cleaning services and increase the efficiency of cleaning services (Friedow et al., 2018b). In their turn, smart coffee-machines will help increase work efficiency of the employees and save servicing time as they may offer pre-programmed solutions to every employee's drink preference. Smart coffee makers are, therefore, a beneficial solution to increase the level of productivity among employees. Thus, the use of IoT will ensure a better level of managing the company's activities (Friedow et al., 2018b).

3.5 Environmental and Energy Conservation

IoT helps companies to ensure environmental conservation through temperature control within the premises. The use of IoT smart technology helps to set the optimal temperatures for the office thermostats and can be used in creating office heat map. Therefore, IoT helps in reducing energy costs in companies through introduction of new effective ways of handling environmental and energy needs. Another example is the use of intelligence lighting as it contributes to energy conservation. As intelligent lighting is programmed to light only at specific hours, reduces the maintenance costs that the company must conduct on its energy sources (Hussain, 2017).

Licensed to (putm@utm.my)

3.6 Data Security Management

IoT maintains the data management function of companies in various models, such as data learning and data integration. It also provides smarter security options for configuring appropriate steps and channels to handle security breaches in companies. The use of IoT is instrumental in identifying the core levels of handling the security needs of databases and server rooms as well as detecting real-time threats and mitigating them before causing harm to anyone. Integration of the smart security system on a company platform ensures increased relevance and potential to engage the company's best segments in safety management (Kumar et al., 2020). Therefore, the IoT security management system is a key factor in ensuring safety in technological networks and platforms within the companies. To this end, the IoT helps in appealing to a company's core segments by providing security and handling information provided to all company members. Real-time data from IoT helps define the channels of threat, deploy solutions to mitigate the threat, achieve best outcomes and manage provision of instructions to the company employees.(Nasajpour et al., Dec. 2020).

3.7 Organizational Management and Decision Making

IoT assists in increasing the organizational capacity to make informed decisions. The IoT plays a key role in designation of values and provision of decisions to meet the company's demands. In using IoT, companies look into data and have new insights into carrying out their activities (Nasajpour et al., Dec. 2020). The role designates an increased chance to affiliate and works with the elements of valuing community changes. IoT is considered a major factor in informing the companies on better ways to carry out their activities, as it emphasizes the weak points of the companies and defines the ways they can achieve efficiency (Friedow et al., 2018b). To enumerate, IoT looks into industry trends and ways that the company's activities suit the trends (Kumar et al., 2020). In cases, where the application of IoT does not lead to better handling of the trends, the institutions can challenge their models and decide on better ways that would elevate their performance. Besides, the IoT helps select the best practices within companies and analyze at the statistics of dealing with the organizational needs to achieve the optimal outcome in every operation carried out (Hussain, 2017). Hence, IoT helps companies to attend to core demands and requirements through improved management model.

In addition, IoT helps managers to establish the best channel of working towards addressing pertinent issues in times of pandemic. By obtaining information from the market segments, the customer behavior models, and industry trends, managers would be directed towards data-driven decision -making. Notably, real-time information will also increase efficiency of the managers. For instance, the use of realistic levels of attending to employee demands in the pandemic and instructing remote

working capacities will increase the overall company performance (Friedow et al., 2018b). Thus, regarding the employees work from home, the company's management will be able to efficiently designate duties and ensure the employees can meet the set deadlines. Equally important, IoT can help company management to address the pertinent trends and issues that offer value to their activities. In this sense, a company will relate to industry trends and begin working, for example, on e-commerce platforms. Most companies applied e-commerce as an avenue to maintain contact with their customers during the pandemic. Restriction of movement and reduced working hours has rendered e-commerce platform more appealing to most customers. Thus, IoT application and the use of insights from the industry helped to ensure an effective and impactful integration of activities (Friedow et al., 2018b).

3.8 Workplace Sanitation

The coronavirus pandemic has indicated the increased need for cleanliness and sanitation within workplaces and public environments. The use of IoT was able to assist in the automation of these functions to ensure exclusion of the employees' services, thus ensure health security of the latter. Automation of the cleaning and hygiene functions increased the role of IoT and the structural engagement of companies to confer with the community's demands and the pandemic sanitation requirements (Kumar et al., 2020). To demonstrate, IoT automation can be used to operate workplace fumigation and sanitizer dispensers. These machines will fumigate the workplace to ensure the place is free from bacteria and viruses. Increased application of the automated service will ensure dispensation of liquid sanitizers to employers, when they get in and out of the workplace, as the machine will be measuring their temperature. Application of IoT will create a sufficient level of ease of use and relevance for the employees. Thus, the use of IoT in companies will ensure compliance with health and sanitation regulations and reduce the risk of employees becoming sick (Kumar et al., 2020).

4 IoT Applications in Marketing and Advertising

There are many applications of marking using IoT. Some examples of these applications are contextual advertising: With the wide spread of smartphones, targeted advertising using IoT applications could be easily done by sends pop-up ads to the customers and informing them with promotions or offers. Another application is in-store advertising which is done by using an electronic device called "beacon" to send ads and notifications to customers' smartphones when they are in or nearby the store. In addition, location-based advertisement by using GPS on smartphones, ads or activities within a certain range could be sent to customers. Another commonly used application is targeting customers by collecting data about a customer's preference or behavior then sending smart ads based on the collected data every time the

customer goes online. IoT is also used in interactive marketing with high potential of opportunities, such as using interactive smart mirrors that enable customers to try on clothes only by looking at the mirror and without wearing them. Another example is using QR codes to open a menu or use them for a discount (Hashem, 2021).

4.1 Customer Behavior Analysis

Another area of IoT application in businesses is ensuring proper level of attending to customer needs. The use of IoT attracts insights into customer behavior and changes within the customer segment (Hussain, 2017). In this sense, IoT facilitates identification and definition of optimal steps to handle customers' requirements. The application of IoT provides an opportunity to integrate company values and mitigate the challenges related to satisfying customer needs across all segments. Thus, the use of IoT ensures an increasing application of value in a company's operations. IoT management of consumer data is a key factor in depicting organizational actions and activities in the market segment. IoT establishes a sustainable channel of advancing the needs of the company by defining the best activities to conduct at any given moment.(Kumar et al., 2020).

4.2 IoT and Customer Relationship Management (CRM)

Data-driven marketing is a success factor in customer relationship management (CRM), thus utilizing all sorts of data collected from different sources including ones from IoT, help in predicting customers' needs and behavior, design marketing plans that fit predictions, personalizing marketing campaigns and advertisements, and increase the accuracy of decision-making process and data driven marketing strategies. The relationship between IoT and CRM could be summarized by: IoT provides decision making capabilities, data collection and exchange, marketing management, and by providing customers with rich experiences and high level of personalized interaction. These factors are connected directly to better CRM leading to better marketing management. (Hashem, 2021).

4.3 IoT Applications in Customer Service and Support

Manufacturing companies operate in an environment characterized as increasingly volatile, uncertain, complex, and ambiguous. At the same time, customers' orientation makes it increasingly important to ensure high delivery reliability. A concept to connect supply network and manufacturing more closely by integrating events from the supply network into manufacturing control's decisions. This approach enables an

effective and efficient response to events from the supply network through smarter manufacturing control, and thus more resilient manufacturing (Bauer & Bauernhansl, 2021).

4.4 IoT and Product/Service Support

IoT can be helpful in the products support when it comes to supply and demand management. In the supply management, operations at the manufacturing companies can be a bit of a mess if not handled properly. The more complex the operation, the more attention and monitoring it requires. IoT comes in hand in introducing concepts that would connect supply network with manufacturing decisions (Bauer et al., Mar. 2021).

5 Limitations and Challenges

The use of IoT has several limitations and challenges that needs to be taken into consideration: Privacy and secrecy concerns: Since IoT is all about gathering all sorts of data which could be accessed by hackers, thus could be causing security threats and breaches depending on the type of data and information collected. This requires the adoption of technology that is designed to prevent information leakage and the implementation of network guards and firewalls ((Hashem, 2021; Razzak, 2012)). Data interpretation: It is equally important to note that the companies should consider the bulk of data generated and to design proper processes to handle it terms of processing, storage, and interpreting it in a useful manner such as in the field of marketing (Hashem, 2021).Cyber threats: due to the interconnection of IoT devices, the network could be facing a security attack by malware or worm.

Unsolicited intrusions: Leaked data could take place while transferring it through IoT, thus security protocols should be adopted to protect private. Loss of jobs: Since IoT is considered an efficient and effective automation process, it could replace many jobs due to its capabilities and accuracy (Razzak, 2012).

6 Conclusion

To conclude, IoT technology has a powerful impact on day-to-day life and on businesses in many aspects (Ghazal et al., 2021a)-(Lee et al., 2022). As seen in this paper, the applications of IoT varies from minor daily tasks to major strategic decisions and from simple process automation to transformative innovations which were all evident during the coronavirus pandemic. Since the adoption of this technology along with other technologies is inevitable, businesses are required to benefit from

its applications in achieving goals and competitive advantage (Al Kurdi et al., 2020)-(Tariq et al., 2022). Therefore, setting the right implementation methodology is a must especially with consideration to challenges such as privacy and social impact.

Impact of Workplace Happiness on the Employee Creativity: A Systematic Review

Shamsa Alketbi and Muhammad Alshurideh

Abstract This study examines the antecedents of workplace happiness and how the later impact the employees' performances and their levels of creativity. Based on our literature review, researcher identified four main potential drivers of workplace happiness, namely, leadership style, work environment, compensation and opportunities for learning and personal development.

Keywords Workplace happiness · Work environment · Leadership · Compensation · Opportunities for learning and personal development · Employees' performance · Employees' creativity

1 Introduction

Systematic reviews are types of literature reviews that collect and critically analyze multiple research studies or papers, using methods that are selected before one or me research questions are formulated, and then finding and analyzing studies that relate to and answer those questions in a structured methodology.

2 Problem Statement

Happiness is very important nowadays, especially in United Arab Emirates, as we know UAE is a rapid and growth country, which contains a various number of nationalities. Who came from different cultures, so we need to keep in mind the importance of keeping those nationalities happy with us in order to give us a wide range of creative ideas as well as perform in best way? The competition in the business environment has been increasing over time. At present, organisations have a large number of rivals, in every market and industry (Chandrasekar, 2011). This rivalry and competition have made it impossible for organisations to afford to waste the potential of their human resources and workforce. Several factors come together to determine the workplace environment suitability for employees. For instance, organisations, in the modern era, are promoting new programs for employees which address issues such as health, fitness, work-life balance, lifestyle changes, and other benefits so that the employees perceive their work environment as favourable (Chandrasekar, 2011).

Even some organisations have introduced policies such as performance-based salaries, motivation programmers, and employment security agreements. The main reason behind such practices is that organisations, practitioners, and experts have realised that workplace happiness has an important role in determining the performance and success of the organisation. Workplace happiness can ensure motivation among employees, which can, in turn, further promote the necessary skills and ability to perform their jobs effectively.

Being happy holds significant importance to many people. More importantly, most of the societies around the world, value happiness to a great extent-it causes it to become the basis of the human emotional framework. Fisher (2010) reported that feeling happy is a fundamental experience for human beings and people must remain happy to be emotionally and psychologically well. Fisher (2010) defined happiness as a person's satisfaction with their relationships, work, leisure, and health. It also defined as the set of positive feelings which arise due to the positive experiences in life (Ashkanasy & Dorris, 2017). Based on this definition of happiness, the same feeling at the workplace can be viewed to have constructed of job satisfaction and motivation level of an employee (Fisher, 2010). According to Fisher (2010), there are a large number of happiness-related constructs which affect the creativity and performance of an organisation. These include job solicitation, a typical mood at work, dispositional effect, job involvement, and personal career development. Oswald et al. (2015) present evidence from their findings to support the hypothesis that happiness at workplace is positively related with the performance of an organization and employee performance (Oswald et al., 2015).

There are several factors which can affect the happiness, performance, and creativity of personnel in an organisation. Career development, workload, organisational culture, salary, monetary incentives, and infrastructure, are some of the most important indicators of workplace happiness (Mazuki et al., 2017).

Career development is one of the functions of HRM of any organisation. It focuses on issues such as upward mobility of employees and promotions in the hierarchy of an

organisation. According to Mazurka et al. (2017), the major concern of career development is to ensure that personnel performance increased over the period. In addition to this, career development also aims to promote the overall growth of employees and their skill acquisition. Organisations that promote career development opportunities for their employees have better workplace happiness than the organisations that do not have any programs for career development. The workload is also an important factor which affects the workplace happiness of organisations. Organisations, where people have an adequate workload, have better culture. More importantly, employees' satisfaction with their jobs needs to ensure before the personnel can perform at their maximum potential (Liu et al., 2016).

Better infrastructure has also been found to be associated with better workplace happiness. Several large organisations have worked to create new designs of office buildings, equipment, and facilities which lead to better creativity, happiness, and performance among employees (Mazuki et al., 2017). The ultimate goal of such efforts is to maximise the creativity and performance of employees by promoting workplace happiness (Chandrasekar, 2011).

The culture of an organisation is also important to consider when it comes down to workplace happiness. For instance, the work ecosystem or organisational culture refers to the relationships and values inside an organisation or workplace (Mazuki et al., 2017). Better interpersonal relationships at workplaces are associated with better happiness at work. It has been often found to lead to better performance and creativity among employees as open communication is promoted (Sageer et al., 2012).

Monetary incentives and raises in salaries are also an important factor which determines workplace happiness. A reasonable and high salary can ensure that employees feel more connected to their workplace (Mazuki et al., 2017). Further, it has been found that employees, receiving high salaries, are more productive and creative because they feel motivated. In addition to this, prizes and incentives can also promote workplace happiness and performance among employees.

Leadership style at the workplace is also important in determining the performance and creativity of employees. Yang (2014) reported that leadership style shapes the culture of an organisation, which further influences the workplace happiness. Ethical leadership found to associated with a better focus on the well-being of employees. Any culture which gives adequate attention to the well-being of employees is more likely to have a better index of workplace happiness since the employees feel a sense of connection with their workplace (Yang, 2014). An adequate leadership style in an organisation can ensure that proper team-building skills promoted among the employees. It has a positive influence on workplace happiness, which further positively affects the performance and creativity of employees. Overall, the performance of the organisation begins to rise (Ashkanasy & Dorris, 2017).

Since workplace happiness connected with the level of satisfaction that a person has about their work environment, leadership and organisational culture directly tied to their performance and creativity (Joo & Lee, 2017). Even more important is the fact that the creativity and performance of employees are factors which govern the

performance of an organisation. Happy employees are highly engaged in their work which heightens their performance as well as creativity (Chandrasekar, 2011).

Several research studies have found various methods which can be implemented at workplaces to maximise the potential of the workforce. For instance, goal-setting is a process which can be enforced at the workplace, so the meaning given to the work that an employee does. In this way, the employee is assigned a supervisor and becomes a part of the management processing maximises their job satisfaction since performance measures (Chandrasekar, 2011). Similar to the goal-setting, performance feedback can be enforced at workplaces so that the upper management and leadership know the problems and issues of the employees.

Additionally, the employees feel a sense of belonging to their organisation when the management takes relevant steps regarding their problems (Chandrasekar, 2011). Furthermore; the culture of an organisation can have a significant impact on how employees interact with each other and with the top management. Therefore, it can be said that that leadership style and management of an organisation could determine the workplace happiness of an organisation. This level of happiness, further, determines the performance and level of creativity among employees. In the long run, all of this process affects the performance of an organisation.

Large companies have been becoming more and more concerned about their employees' happiness and well-being. Proto (2016) has found that the workplace environment can be very unhealthy and unsafe for workers in several industries. Unsafe unhealthy, the workplace environment causes the workers to become unhappy regarding their jobs if the problems not dealt with, accordingly (Proto, 2016). It has also found that the majority of offices and workplaces have unsuitable furniture, excessive noise, poorly designed workstations, lack of proper ventilation, and lack of security agreements for employees.

In addition to this, there are many other factors which can affect the workplace happiness among employees, such as an increase in pays or wages, growth in career, and personal development opportunities (Chandrasekar, 2011). In several organisations, the problems mentioned above not adequately addressed which renders the employees unhappy. With the employees growing unhappy, the performance and motivation level drops considerably, as has been noted by Proto (2016). It becomes highly challenging for organisations to keep up their performance or to improve their performance. The overall effect of such problem results in lower performance and creativity among employees. The performance of any organisation is related to the performance and creativity of employees (Proto, 2016).

It has further noted that industry giants such as Google have better performance because their employees are happier than other organisations (Han, 2015). Therefore, the happiness of employees becomes a major problem to be dealt with. Only by promoting happiness at the workplace can an organisation provide the right environment for performance and creativity among employees. Proto (2016) had also found that psychological well-being was of primary concern when happiness at the workplace discussed. For instance, it has found that the motivation level of an employee is directly related to their psychological well-being at their workplace (Han, 2015).

Licensed to (putm@utm.my)

In any organisation, the performance of employees is reliant on workplace happiness. It is defined as the level of satisfaction that the workers have, regarding their work environment (Mazuki et al., 2017). In addition to this, a happy workforce has more motivation to get a job done as compared to the unhappy staff. Therefore, Mazurka et al. (2017) found that unhappy staffs are usually unable to execute their operations productively as compared to a happy workforce. To maintain sustainability performance offices and workplaces, organisations need to maintain long-term happiness for their employees, as well. Happiness is another factor, in terms of which, the performance of an organisation can be measured, apart from monetary units (Chandrasekar, 2011). Therefore, this study will attempt to investigate the antecedents and consequences/outcomes of workplace happiness.

3 Research Purpose

As has been mentioned before, workplace happiness is something that needs to be addressed in all organisations to ensure performance and success. The concept, at present, is relatively newer than other concepts of management and HRM (Mazuki et al., 2017). Therefore, the specialists of the subjects are adding knowledge to the literature, regarding happiness at work. This concept has to deal with the psychological aspects of human nature, the leadership style of the organisation, the culture of an organisation and the policies of an organisation. Therefore, workplace happiness is a vast topic to discuss (Oswald et al., 2015). The emotional dimension is one of the most important aspects of workplace happiness. By studying the workplace happiness, the various factors can be uncovered which are into play when the performance of an organisation is to be determined.

More importantly, the impact of workplace happiness on employee performance and employee creativity can also be found out. The major reason to study employee performance and creativity is that both of these are key determinants of organisations performances. Unless the performance and creativity among employees of an organisation maximised, it is not possible to achieve the desired results or aims of an organisation. It is also important to mention here that the research study will aid in revealing the role of leadership in promoting happiness at workplace Yang (2014), noted that ethical leadership at workplaces could help in maximising the performance of workers by promoting workplace happiness. Not only workplace happiness is beneficial for the organisations in achieving the organisational goals, but the employees exposed to career development and skills acquisition opportunities (Yang, 2014).

The overall effect of such culture is that the employees have a greater sense of motivation and feel happier about working in their workplace. Enables the employees to learn a wider range of skills and helps them in improving their career. As for the organisation, the benefit is simple and straight-forward, as mentioned before—growth in performance and performance (Chandrasekar, 2011). This importance of workplace

happiness makes it a very valuable concept to be studied and investigated. Furthermore, it becomes important to explore the various underlying factors which can either promote or demote happiness among employees, at the workplace. By understanding the reasons and factors affecting workplace happiness, the performance and creativity of employees can improve.

4 Research Questions

The objective of this study is to examine the main antecedents of work happiness and how the later may impact employees' performance and creativity in context.

RQ1: What are the main determinants of workplace happiness?
RQ2: What is the impact of workplace happiness on employees' performance?
RQ3: What is the effect of employees' performance on employees' creativity?
RQ4: What are the main research methods and research outcomes addressed in the collected studies?
RQ5: What is the main effect of payment criteria in employee happiness?
RQ6: What is the effect of leadership style in employee happiness and creativity?
RQ7: What are the results of employees' performance in creativity?
RQ8: what is the effect of opportunity of learning and personal development in happiness and creativity?

5 Research Hypotheses

Based on our literature review, we propose to test the following:

H1: Leadership style influences positively employees' workplace happiness.
H2: Work environment influences positively employees' workplace happiness.
H3: Flexible pay influences positively employees' workplace happiness.
H4: Opportunities for learning and personal development influences positively employees' workplace happiness.
H5: Employees' workplace happiness influences positively employees' performance.
H6: Employees' workplace happiness influences positively employees' level of creativity.

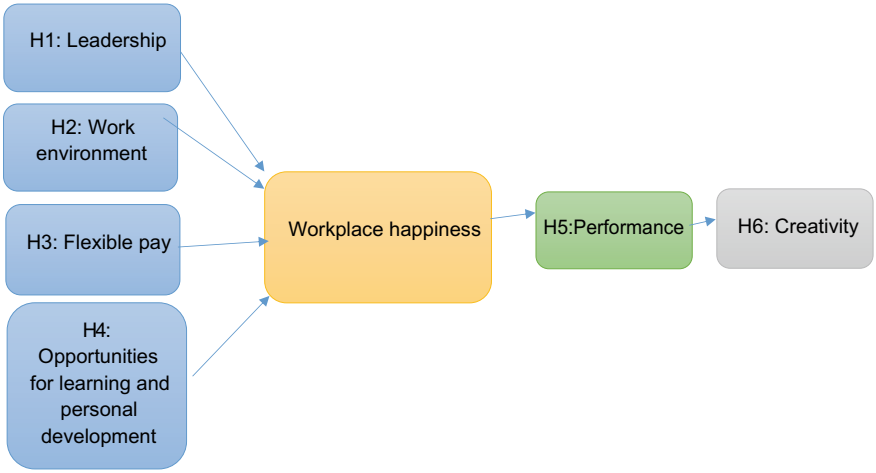

Fig. 1 The study model

6 The Study Proposed Model

See Fig. 1.

7 The Study Terms Definitions

In the following, we define the variables included in the conceptual model.

V1: Workplace Happiness

Workplace happiness is how satisfied and excited the employees feel about their workplace and job. It can make sure that motivation among employees promoted, which can, in turn, further increase the necessary skills and ability to perform their jobs effectively. It has also been found to be associated with the level of satisfaction that a person has about their work environment.

V2: Employee Performance

Employee performance refers to the efficiency and efficacy of a worker to carry out the job or task assigned to them (Bratnicka, 2015). This variable enables an organisation to assess their workers' output in terms of the task they did and the time duration they took to complete it.

V3: Employee Creativity

Employee creativity refers to the attempts of employees to try out something new (Cole, 2015). It helps the employees to think out of the box and enables the organisations to get a competitive advantage over their rivals and competitors.

V4: Leadership Style

Leadership styles can influence organisational culture and workplace happiness. There are several leadership styles, out of which, ethical leadership has been found by Yang (2014) to be associated with a better focus on the well-being of employees. This kind of behaviour in the workplace promotes workplace happiness. Any culture which gives adequate attention to the well-being of employees is more likely to have a better index of workplace happiness since the employees feel a sense of connection with their workplace (Yang, 2014). An adequate leadership style in an organisation can ensure that proper team-building skills promoted among the employees. It has a positive influence on workplace happiness, which further positively affects the performance and creativity of employees. Overall, the performance of the organisation begins to rise if the leadership resonates with the expectations of employees.

V5: Work Environment

Work environment refers to the surroundings of employees while at work. It has a direct influence on employees' performance and their involvement with work (Chancellor, 2015).

V6: Flexible Pay

Pay and financial benefits are important factors when it comes to employee performance and creativity. Employees who receive better pay and benefits are more motivated to work effectively (Davis, 2015).

V7: Opportunities for learning and personal development

Opportunities for learning and personal development refer to special training workshops and sessions that focus on improving the skills and performance of employees. Through such opportunities, an organization can help handle change and promote productivity (Bratnicka, 2015).

8 Literature Review

It is a general concept that happy employees tend to be productive employees. The happiness of the employees at their workplace exerts not only a positive influence on the professional but also the personal lives of the employees. The happiness of the employees at the workplace depends on several factors like the environment of the workplace, leadership at the workplace, availability of the career development

opportunities, characteristics and nature of the job and the compatibility of the person with the environment of the workplace (Joo, 2016).

8.1 Workplace Happiness

Boehm and Lyubomirsky (2008) preliminarily define a happy person as someone who frequently experiences positive emotions like joy, satisfaction, contentment, enthusiasm and interest. Fisher (2010) suggested that happiness can be explained in several ways. Happiness constitutes the pleasant feelings and sensations. Extensive research work has done on the antecedents of happiness at the workplace and the consequences of happiness at the workplace. The definition of happiness at the workplace extends far beyond the mere job- satisfaction. In the modern age of technology and business, there is high competition and rivalry in the business environment. Every industry is, at the moment, facing a large number of rivals. The current situation of competition has made it impossible for the organisations to afford to waste any useful potential of their human resources and workforce. Therefore, the need for maximising performance and creativity arises. Several factors come together to determine the workplace environment suitability for employees. All of these factors can have significant on the performance of any organisation.

Many organisations, nowadays, are promoting new policies for employees which address issues such as health, fitness, work-life balance, lifestyle changes, and other benefits so that the employees perceive their work environment as favourable. All of these efforts are to promote happiness among the workforce.

Based on the above discussion, this research study will attempt to map the patterns of happiness in various organisations across the world. Also, it will try to observe the case of the UAE, so that it can determine the behaviour of employees and their happiness, at their workplaces. More importantly, the study will observe the impact of happiness on employee performance and employee creativity. Research on employee happiness, at present, is quite limited. Therefore, the paper will attempt to bring together knowledge, based on primary sources, to give a valuable contribution to this area.

In most of the societies, the happiness is thought to be the most valued goal of the individuals, groups and organisations. It is the basic human emotion expressed in the form of joy. For the human experience, happiness is the fundamental need, and most of the people are mildly happy at most of the times in their lives (Cole, 2015).

Happiness in the workplace has attracted the attention of several researchers. Over the last past years, several constructs are overlapping the concept of happiness. An important construct of workplace happiness is job satisfaction. The happiness at the workplace related constructs influences the organisational research in many ways like the level of the constructs, duration and stability of a certain construct over time and the content of each construct. The happiness related constructs are usually measured and defined at the personal level like the job satisfaction, mood at work and effective commitment of the employee (Sharifzadeh, 2014).

Its concluded that happiness is the experience of the frequent positive feeling, infrequent negative feeling and the sense of satisfaction with life. To win satisfaction customers, the organisation needs enthusiastic employees who are capable of transferring the loyalty and enthusiasm to the customers, since the success of a business relies upon the satisfaction of the customers.

Work is a significant aspect of the lives of people. Work was done in exchange to intrinsic and extrinsic rewards. The nature and the consequences of work have been changing rapidly over the past few years. The changing environment of the organisations and work like the development of new technological products, the rapidly increasing globalisation and the employment of new organisational practices led to the changing nature of the work (Wesarat, 2015).

Certain practices and strategies adopted by the organisations tend to reduce the happiness and satisfaction of the employees like corporate restructuring and downsizing. Unhappy and unsatisfied employees feel less valued and perceive low job security. The organisations expect performance from their employees and employ managerial tools and techniques to enhance employee performance. By maintaining a higher level of employee happiness and satisfaction, organisations can achieve higher levels of employee performance.

Rego (2008) also suggested that happy employees are productive employees. There is a strong correlation between employee happiness and job satisfaction. In addition to this, job satisfaction and life satisfaction are also influenced by each other. The happiness at the workplace refers to the happiness of an individual at the workplace and life (Rego, 2008).

The significance of workplace happiness is important to understand because the performance of the organisations heavily relies on the happiness and satisfaction of the employees. Happy employees tend to add value towards the organisational goals and set them at their priority as compared to their counterparts who merely work for the earning and do not enjoy the content of their job.

8.2 Employee Performance

The performance of the employees can be perceived as a driver to the organisational performance. The employees who deliver help the organisation move a step forward towards the attainment of its goals and objectives.

Hanaysha (2016) found that one of the most important objectives of a business organisation is to enhance the level of the performance of the employees. The enhanced performance of the employees entitles an organisation and its employees with a wide range of advantages. Higher rate of performance of the employees leads to a higher rate of economic growth, the higher rate of profitability and faster progress of the society. The employees who are more productive and perform well in an organisation get higher wages, benefits, salary packages, better working conditions and other favourable employment opportunities. Better performance of the employees enhances the degree of output and reduces the costs associated with production

and operations thus tending to help the organisation gain a competitive advantage. Employee performance is essential to gain long term success of the organisation (Hanaysha, 2016).

Previous researchers have found that the companies must seek to invest in employee engagement to gain higher levels of employee performance. There exists a positive relationship between employee engagement and performance. The engaged employees are more involved in the work and tend to be more productive. They are more focused than disengaged employees. The engaged employees work more efficiently since they place the organisational success and goal achievement on the priority position in their minds. Employee engagement drives the performance of the employees and results in higher levels of organisational outcomes (Pradhan, 2016).

As highlighted by Pradhan (2016), nowadays, enhancing the level of employee performance are of major concern to every together business organisation. It can be defined as the measure of the efficiency of an employee or a group of employees. Performance, as defined in the objective terms, is the effort or the measures taken that enhance the profitability of the organisation. Performance can be gauged in terms of the output delivered by an employee over a specific period. The performance of an employee can be measured relative to the average work performed by the other employees doing a similar task. In addition to this, the performance of the employees can also be measured in terms of the units produced or managed by an employee in the defined period. The success of an organisation is defined by the level of the performance of the employees, thus making it an important objective for the businesses (Pradhan, 2017).

The performance of the employees can be assessed in several ways. However, there is a need for the development of some standardised criteria to measure the performance of the employees. Employee performance defined as the amount of the time that an employee spends on the job while being physically and mentally present and working efficiently. Time can effectively be as a measure of employee performance. The time that an employee spends at the job or while doing the task that he or she was hired to perform help in evaluating the performance of the employees (Muda, 2014).

The study of the past researches regarding employee performance is related to our study because the more productive the employees of an organisation would be, the more the company would have to deliver to its customers. Attaining customer satisfaction and loyalty is the ultimate goal of every business which can only be achieved when the employees are productive.

8.3 Employee Creativity

Creativity defined by several researchers in different ways. Some researchers defined it as a personal characteristic, and some define creativity as a process. The researchers suggest that a creative proposition can be a product, service or idea if it fulfils the following conditions: it must be original and made for the very first time and it must

be relevant to one's job or beneficial for the organisation towards the attainment of its goals. The researchers also determined the basic personality traits that are associated with the degree of creativity one can depict (Mubarak, 2018).

Hassan (2013) addressed the role of the personal attributes in determining the level of creativity of an employee. Unsworth's matrix of creativity that consists of four types of creativities that vary based on two dimensions I the driver of employee engagement that can be an internal or external stimulus and the problem that the employee is confronting that can be open or close. When the driver of the engagement it external, the employee is engaged to be creative by some external driver of stimulus, and when there is some internal engagement, the employee urges to be creative rather than being forced by some other or external stimulus. The open idea is those ideas that come from the individual employees, and the closed ideas are those that presented to the individuals.

The four types of creativity include the responsive creativity that arises to respond to the problems arising due to the external drivers, the expected creativity that helps in discovering the problems due to external drivers, contributory creativity responds to the problems arising from the internal drivers' proactive creativity that discovers the problems that arise due to the internal drivers. The creativity of the employees is enhanced by the personal as well as by the contextual factors. The contextual factors include the goals and expectations for the pursuance of the creative activities, social influence on the creativity of an individual, relationship with the employer, co-workers and the organisational work setting.

As found by Qureshi (2016), an employee who comes up with new and innovative ideas or suggestions is thought to be creative employee. A creative employee proposes the new ideas for the products or the services to be constructed, influences the communication and the perception which ultimately affects the way done during his or her labour hours. Creativity is the design in which the employee brings an innovation that seeks to resolve the work related problems following the step by step procedure. It can also be explained as the ability of the individuals to develop resourceful solutions to meet the challenges that the employees face while being at a job working individually and in groups.

The creative employee is aware of the organisation and the workplace setting. He or she can be flexible and sensitive to the problems and come up with innovative solutions. The creative employee tends to have a strong memory and remembers the task for a longer period. The creative employee is adaptive and easily copes up with the changing environment and readily accepts technological advancements. Thus, an individual who accepts all the changes or advancements like the change in the organisational culture of the technological changes which are essential to keep pace with the competition termed as a creative employee (Shahzadi, 2014).

The large organisations are more likely to have creative employees. In the current era, the employees constantly exposed to the challenging environment where it is essential to learn and adapt quickly to keep up with the pace of the competition. To achieve the goals promptly, the employees need to be creative. Creativity can also explain as the process of introducing new techniques by individuals and groups to achieve the goals efficiently. The firms that want to compete in the market hire creative

and extrovert employees. The creative employees are expected to bring positive and constructive change in the organisation. The creative employees are flexible and adapt to the technological advancements and cope up with the changes in the external environment of the business. The creative employee has strong interpersonal and analytical skills that enable him or her to devise the ways to resolve the business processes on time (Dul, 2010).

The studies conducted by Nawaz (2018) suggested that empowered employees tend to be more creative since they have a say in the matters of the organisation. Creativity may depend on the employee or the situation that the employee is subject to. The employee may put in all his or her efforts and capabilities to get the best outcome and develop resourceful and creative solutions (Nawaz, 2018).

The past researches suggest that creativity among the employees help the organisations find an efficient means of resolving the work and operational issues. The creative employees not only help the companies find resourceful solutions for the problems but also assist in enhancing the efficiency of the processes.

Fisher, Happiness at Work (2010) Found that happiness mediates the relationship between authentic leadership and employee creativity.

8.4 Antecedents of Employee Happiness

This section will discuss the factors that influence the degree of the happiness of the employees at the workplace. According to Herzberg's Theory of Employee motivations, the factors that influence the job satisfaction of an employee can categorise as the hygiene factors and the motivational factors. The motivational factors are those factors that are concerned with the content of the job and the factors like recognition, acknowledgement, growth opportunities, career advancement, responsibilities and the tasks assigned to him or her. On the other hand, the hygiene factors are the factors that are not related to the content of the job the employee is performing like the salary, job security, workplace settings, company policies and strategies and the interpersonal links at the workplace. As explained by Herzberg's Theory, the motivational factors being employee happiness and satisfaction while the absence of the hygiene factors brings dissatisfaction of the employees. The extrinsic factors are the events that arise from the efforts of the employees as well as the other factors that are not directly involved with the job of the employee. The compensation, benefits, interpersonal ties with the colleagues and the workplace setting influence the outcomes of the employees but they are not a fundamental part of the job of the employee (Pauceanu, 2016).

8.5 *The Extrinsic Factors of an Employee's Happiness at the Workplace*

The factors affecting the happiness of the employees at the workplace can categorise as the extrinsic and intrinsic factors (Shu Zhou, 2013). The extrinsic factors of an employee's happiness at the workplace are.

8.5.1 Workplace Environment

The level of the employees' happiness and their satisfaction gauged by the environment of the work placement. Since the employees spend the major part of their day at the workplace, so it is very important for the organisation to ensure the availability of a clean and suitable workplace for them. Proper working conditions promoting a professional culture must provide to the employees. Proper working conditions will promote the performance of the employees, and they will work in a relaxed manner, thus feeling happier with the workplace (Štreimikienė, 2009).

The organisation must ensure to provide all the necessary resources to the employee that are necessary to perform the particular task or the job that he assigned. If the work conditions are not appropriate, the employees might lose their interest in their work and will not enjoy it. The dimensions that constitute the work environment satisfaction are: the natural environment of the workplace like humidity, noise, brightness, cold, smell and other natural environmental factors, the second dimension of the workplace conditions is the availability of the required tools and equipment. Are the tools and equipment necessary to perform a job readily available to the employee?

The third dimensions are the working timings and hours and the overtime hours. The fourth factor is the safety of the workplace. Are the health and safety legislation properly being followed and the employees are safe?

8.5.2 Compensation

The pay and compensation include whatever the employee paid against the tasks that he performs while being at the job. Pay defined by the researchers in several ways like the basic salary and the other fringe benefits like the housing rent, medical allowance, transport allowance and the overtime salary. Pay or compensation includes the financial as well as the non-financial awards that the employee gets against his services for the organisation. If the organisation hinders the pay of the employees, their happiness and satisfaction levels will greatly decline. When the employees are compensated rightly and justifiably for the task that they are performing, and they can easily manage the workload assigned to them, they will feel happy with the job. Salary is one of the hygiene factors described by Herzberg's Theory, and it greatly accounts for the employee's happiness and satisfaction at the workplace. The

Licensed to (putm@utm.my)

compensation plan of the organisation greatly influences the level of the happiness of employees at the workplace. The better the compensation the company offers, the more satisfied and happier the employees would be. Compensation and benefits are very important factors influencing employee happiness in the workplace.

8.5.3 Organisational Commitment

The strongly committed the employees are to the organisation, the higher will be their loyalty and dependence with the organisation. When the employees are committed to the organisation, they have a stronger sense of ownership and thus feel happier.

8.5.4 Self-realisation

The self-realisation comes at the top of Maslow's Hierarchy of needs and is an important determinant of the employee happiness at the workplace. The feeling of self-fulfilment had a strong influence on the level of employee happiness.

8.5.5 Health Concerns

The organisations focus on employee health and well-being. The organisations invest in employee health maintenance programs and policies. The organisations that impart significance to the employee well-being and health tend to have satisfied and happier employees.

8.5.6 Nature of the Job

In addition to the hygiene factors, the motivational factor that is the nature of the job also greatly influences the happiness of the employees at the workplace. Different aspects of the job like the salaries of the growth opportunities and terms with the supervisors. Influence the happiness level of the employees. When employees perceive that they are performing a productive task, they feel happier and more satisfied. The challenges associated with the tasks that are worthwhile in an organisation, drive the motivation and confidence of the employees and they develop an interest in their work, thus feeling happier with the workplace.

8.6 The Intrinsic Factors Influencing the Level of Employee Happiness at the Workplace

The intrinsic factors influencing the level of employee happiness at the workplace are.

8.6.1 Degree of Autonomy Imparted to the Employee

The employees want to feel empowered in the organisation where they work. The employees need the authority to perform the tasks assigned to them properly. There is a positive relationship between employee happiness and autonomy in the workplace. When the employees empowered in their jobs, they take pride in the work that they do.

8.6.2 Recognition

Recognition can be defined as the situation in which the organisation acknowledges the efforts of the employees and appreciate them by rewarding them some status in the organisation. Among the recognition of the intrinsic and non-financial reward is the most important one. It makes the employees feel valued and appreciated, and they fee motivated thus doing all the tasks with more interest and focus. The organisation can gain a competitive advantage by awarding employees with recognition. When the employees rewarded for their efforts, they become more loyal and happier with the organisation and go the extra mile for the attainment of the organisational goals and objectives.

8.6.3 Meaningful Work

The meaningful work is a very important factor shaping up the perceived happiness of the employees. The employees want to be engaged in productive tasks and qualitative work. Meaningful work is very crucial for the success of the organisation as well as the employee. Apart from money, there are some factors that an employee wishes to share with the community and his circle. Sense of achievement and responsibility are among the most important such factors. The employees who are engaged in meaningful work feel happier and more satisfied because they perceive themselves responsible.

A large number of factors act as the antecedents of employee happiness and well-being. The wages and compensation do not always motivate the employees, but some hygienic factors as well that include the organisational work setting.

In this study, we decide to focus only on the work environment, leadership style and compensation as antecedents of workplace happiness.

8.7 Role of Workplace Happiness

The author says that it is necessary for an organization to understand what the employees feel and what they want. In this way, the organization can shape up its policies and strategies and can devise the ways to enhance the loyalty of the employees. Enhancing the happiness and satisfaction of the employees is crucial for the efficient performance of the organization (Malaolu, 2013).

Workplace happiness means how often the employee feels joy in relation to his or her job. The feelings of happiness are constructive and positive. There is a positive relation between employee happiness at the workplace and the organizational performance. The workplace happiness provides input for the better performance of the organization. Workplace happiness creates positive feelings among the employees regarding their jobs, and they tend to perform better resulting in greater outcomes for the organization.

The outputs are the obvious features of the performance of an organization. Most of the organizations measure their performance in relation to the degree to which they are achieving their mission. The organizations that are moving towards the attainment of their mission are said to be performing well. When the employees are happy and satisfied, they serve the customers of the organization as per plan and thus helps the organization increase the cash inflows (Nur, 2015).

9. Organizations can dramatically be changed by leveraging creativity and innovation. Creativity is the starting point of bringing innovation in an organization. The creativity is contagion across the organization. The individual creativity has an effect on the creativity of the group. The creativity of the group has an effect on the creativity of the organization and the creativity of the organization ultimately drives the innovation across the entire organization (Han, 2015). The creativity of the employees helps

9 Data Collection and Analysis

9.1 Keyword Search

The researcher has been used some key words in order to find similar factors, see the Table 1.

9.2 Journal Databases

The researcher has been found many results in the databases that has been used, Table 2.

Refer to search scores, the researcher found that 307 studies were gotten based on the search terms that are explained in Table 2 and Fig. 2. While presenting data analysis, the researcher removed some studies such as low-quality studies, and 27

Table 1 Keyword search

Keyword search
"Workplace" and "Happiness" and "Employee" and "Performance"
"Happiness" and "Work placement"
"Workplace happiness" and "Creativity" and "Performance"
"Happiness" and "Performance" and "Innovation"
"Happiness" and "Employee" systematic review
"Workplace happiness" and "Employees"
"Workplace happiness" and "Employees" and "Systematic review"

Table 2 Initial search results across the database

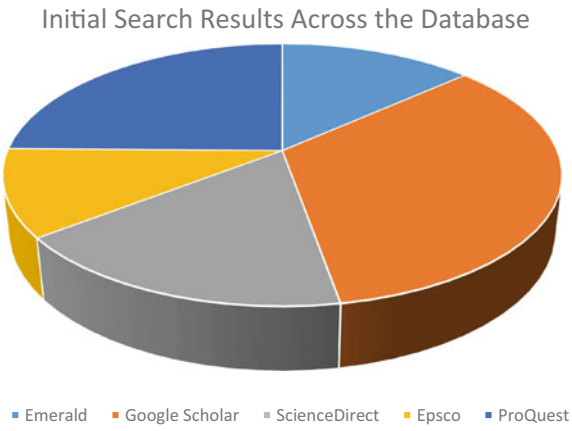
ProQuest	76
Total	307

duplicate results were excluded. The researcher also removed 231 articles from the remaining after screening inclusion and exclusion. Furthermore, qualitative studies that did not give specific information that help us in finding needed information were removed.

Fig. 2 Initial search results across the database



9.3 *Flowchart for the Selected Studies*

The researcher has been searching in five databases to find the external factors frequently used and joined the results together by using below criteria in order to give the connection between the papers Table 3. In around 80 studies there was more than 210 external factors were identified, but we chose only six external factors that have a relationship which described in Table 3 such as (Work Placement Happiness, leadership, Payment Methods, Work Environment, Creativity and Performance) (Figs. 3, 4 and 5).

Table 3 The most commonly used external factors across databases

External factors	Database					
	emerald	Google scholar	ProQuest	ScienceDirect	Epsco	Total
Work placement Happiness	5	7	9	4	2	27
Leadership style	4	5	0	10	3	22
Flexible pay	5	8	8	11	9	41
Work environment	3	8	9	2	7	29
Creativity	4	5	1	6	0	16
Performance	3	0	6	1	8	18

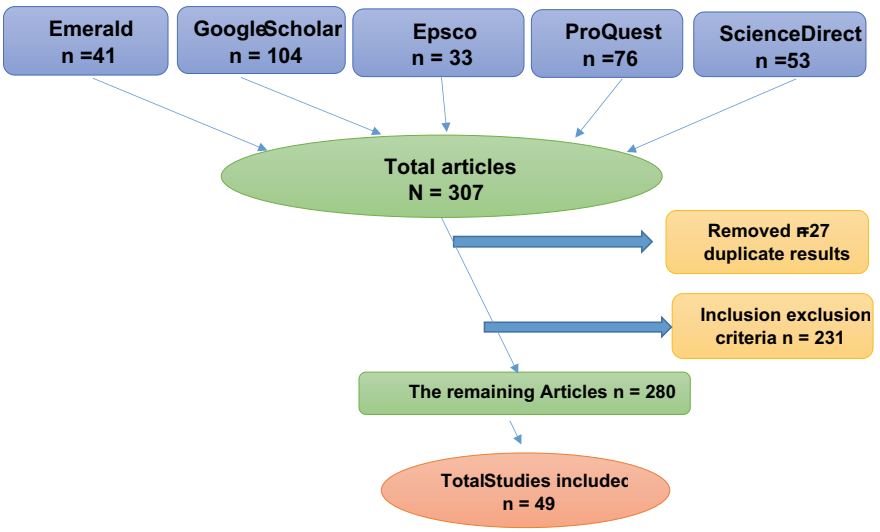


Fig. 3 Flowchart for the selected studies

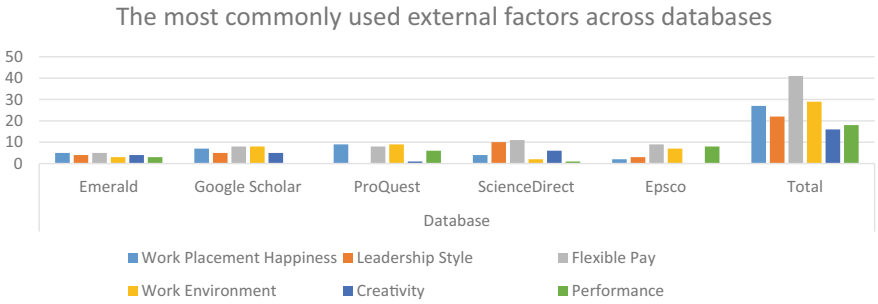

Fig. 4 The most commonly used external factors across databases

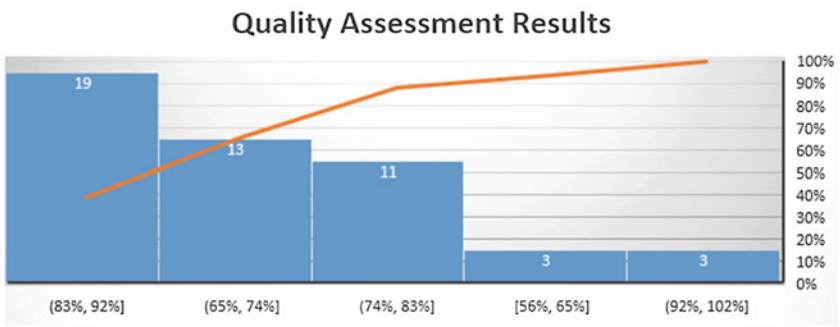

Fig. 5 Quality assessment results

9.4 Inclusion Criteria

There are specific inclusion/exclusion criteria for the systematic review such as specific data for the articles, type, design, context, outcomes, measurement as well as language which are as follows (Table 4).

9.5 Quality Assessment Checklist

See Table 5.

9.6 Quality Assessment Results

See Table 6.

Table 4 Inclusion and exclusion criteria for customer retention studies

Inclusion criteria	Exclusion criteria
– Context: should be in workplace happiness impact – Measurement: articles in which the impact of the workplace happiness on the employee performance and level of creativity – Language of articles should be In English – Date: Published in the period 2010 to 2020 – Type of Studies: Qualitative, Peer-reviewed, empirical studies – Outcome: employee performance and creativity – Study design: systematic, randomized and meta-analysis – Could include articles, reports, or theses	– Knowledge management process or factors that are used in context other than impact of workplace happiness – Information in knowledge management which not related and not support to Workplace happiness and impact on employee – Articles in not English Language

Table 5 Quality assessment checklist

Numbers	Questions
1.	Are the research aims clearly specified?
2.	Was the study designed to achieve these aims?
3.	Are the variables considered by the study clearly specified?
4.	Is the study context/discipline clearly specified?
5.	Are the data collection methods adequately detailed?
6.	Does the study explain the reliability/validity of the measures?
7.	Are the statistical techniques used to analyze the data adequately described?
8.	Do the results add to the literature?
9.	Does the study add to your knowledge or understanding?

Author	Year	Study title	Variables	Location & sample size	Findings
David Sweetman, Fred Luthans, James and Brett	2010	Relationship between positive psychological capital and creative performance	Positive organizational behavior—organizational—performance creative—employee	Working adults 459 males & 417 females N = 899	The study examine the significant relationship between working adults specific positive psychological resources with their performance in creative exercise. Employee creativity is a widely recognized ingredient of innovation in organizations
Micu Nngela & Necula Ramona	2017	Pursuing happiness in the workplace, purpose and challenge for human resources management	Job—happiness—satisfaction	N = 50 employee	study examine to be truly happy at work we need to contribute to the happiness of others who work with us and who also want their stat of well being-happiness at work cannot be overlooked but consciously assessed if it is to achieve organizational performance and profit
Abdul Ghani Kanesan	2016	Understanding wokplace happiness in schools: the relationship between workplace happiness, teachers' sense of efficacy, affective commitment and innovative behavior	Innovative behavior—self efficacy and trust	Teachers in Malaysia N = 835	This study show that workplace happiness has a relationship with teacher's innovative behavior and examine that, there is a direct Relationship between happiness at work on affective commitment

10 Research Limitations

The research limitations refer to the issues and problems which have been faced during the course of design and analysis. The research has been focused on workplace happiness and how it impacts employee creativity and performances. The overall research has been conducted in terms of primary data analysis. This method has posed different issues within the course of research. These issues include diverse

activities which are related to the data analysis and collection of data as well. The limitations which have been mentioned were tackled on the basis of using ethical guidelines and standards. These were also based on achieving the complete aims and analysis of the research.

11 Conclusion

The research has been compiled on the basis of workplace happiness and its impacts on employee creativity and performance as well. Human Resource Management practices revolve around the factors of implementing change and techniques. The implementation of these changes defines how the organizational structure is also balanced. These services and products also define the company values towards the people and the community. Workplace happiness is something that needs to be addressed in all organizations to ensure performance and success. The focus of this research is to develop different hypotheses about employee's happiness and his performance. Different factors will be tested to see their correlation with employees' happiness, and then this factor of happiness is used to evaluate its effect on employees' performance. It is concluded that leadership style, flexible pay, effective working environment positively affects employees' happiness at the workplace and in turn employees' happiness effects their performance at the organization.
